  its own URL. The portfolio is the point: every claim on your CV gets a working link behind
  it.

  Q: How is AI covered in this course?
  A: As an engineering skill. Students add AI features to their own applications the way
  production teams do: model calls made server-side, responses streamed into React, retrieval

over the app's own data, structured output validation, guardrails against prompt injection, and cost control. The result is a developer who can ship an AI feature responsibly, which in 2026 is a hiring differentiator, not a novelty.

Q: What job market context should I expect?
A: Full stack developers remain among the most consistently hired software roles. The salary ranges shown on this page are general market bands from public industry data, shown for context only, never a promise: actual outcomes depend on your skill, portfolio, location and the market. What this course controls is the input: real projects, real depth and interview-ready fundamentals.

Q: Is there a free demo class?
A: Yes, book a free, no-commitment demo at learn.modernagecoders.com/contact or message us on WhatsApp at +91 91233 66161. It is a real class, not a sales pitch: you will build something small in it and meet the teaching style directly.

Q: Are classes live or recorded?
A: Every class is live: a 1-hour online session where a real instructor works with a small group, never a pre-recorded video. You code during class, ask questions in the moment, and get unstuck immediately, which matters most in the early months.

To enrol, message Shivam Sir on +91 9123366161 or send the parent this link: https://learn.modernagecoders.com/courses/full-stack-web-development-masterclass-college
For a demo: the Priority Live Demo (guaranteed, today or tomorrow) is booked at https://learn.modernagecoders.com/priority-demo . The free demo is a waiting list with no fixed date.

==========
COURSE 62 OF 137: FULL STACK WEB DEVELOPMENT FOR TEENS: REACT AND NODE.JS
==========

Course link: https://learn.modernagecoders.com/courses/full-stack-web-development-teens-masterclass
Subject area: Web Development
Designed for: Teens
Who can join: Absolute beginner, ages 13 to 18
Course length: 12-14 months (48-56 weeks)
Time needed: 2 live classes/week + 3-4 hours practice
Certificate: Certificate from Modern Age Coders, awarded on passing the final exam

PRICE FOR THIS COURSE (quote only the one that applies to the person asking)
In India, per month: group Rs 1,499, mini batch Rs 2,999, one to one Rs 4,999
In Canada, per month: group CAD 140, one to one CAD 210
Anywhere else, per month: group $100, one to one $150
Classes: group and mini batch two live classes a week, eight a month; one to one in India one live class a week, four a month; one to one outside India two live classes a week, eight a month. Each class is one hour.

WHAT THIS COURSE IS

Full stack web development course for teens aged 13-18: HTML, CSS, JavaScript, React, Node.js, MongoDB, AI features and a deployed capstone in 12-14 months.

In one line: One honest stack, learned deeply: from a first hand-typed page to a deployed application with accounts, a database, live chat and an AI feature.

ABOUT THE PROGRAMME

Full stack means owning both halves of an application: the frontend people see and the backend that quietly runs it. This live online course takes students aged 13 to 18 from an empty folder to exactly that, a real deployed application with user accounts, a database, real-time features and an AI-powered capability, built with the stack that dominates modern development: JavaScript, React, Node.js and MongoDB, with SQL and TypeScript where the industry expects them. The arc is deliberate. Three months of true foundations: HTML, CSS, layouts that survive a phone screen, then JavaScript learned properly, including the asynchronous side that separates real developers from tutorial followers. Three months of React, the way it is actually written in 2026: hooks, routing, TypeScript, a taste of Next.js, and a frontend capstone. Three months of backend: Node and Express, MongoDB and SQL, authentication done safely, and an API deployed to a public URL. The final three months put the halves together: file uploads, live chat with Socket.io, AI features built with proper guardrails, testing, and a four-week capstone shipped like a product. The pace is honest: two live classes a week plus three to four hours of practice fits this in twelve months, and students who need longer take up to fourteen, the class adapts instead of rushing. Learning is checked the honest way too: homework after every class, monthly assignments that mix new questions with earlier topics, and a final exam that decides the certificate. Real knowledge, real work, real projects, depth over dopamine.

WHAT MAKES THIS COURSE DIFFERENT

- One stack learned deeply instead of four frameworks skimmed: JavaScript, React, Node and

MongoDB, with SQL and TypeScript where industry expects them
- Everything ships: projects go to real public URLs from month 3 onward, not screenshots on a laptop
- AI is built, not bolted on: students add AI features to their own apps with streaming, guardrails and cost control
- An honest 12-month arc with 2 months of margin built in: students who need more practice take up to 14, nobody is rushed
- Live batches capped at 20 students, with mini-batch and 1-on-1 options for closer attention
- Real assessment: weekly homework, mixed-review assignments every month, and a final exam that decides the certificate, with focused revision and a free retest for students who fall short

THE LEARNING PATH, STEP BY STEP

Phase 1: Web foundations (Months 1-3): HTML, CSS, responsive layouts, then JavaScript learned properly through the async side
Phase 2: React frontend (Months 4-6): components, hooks, routing, TypeScript, a taste of Next.js, and a frontend capstone
Phase 3: Backend (Months 7-9): Node, Express, MongoDB and SQL, safe authentication, and a deployed full-stack app
Phase 4: The full picture (Months 10-12): uploads, live chat, AI features with guardrails, testing, and the final capstone

WHAT A STUDENT NEEDS BEFORE STARTING

Coding experience: None. The course starts from the very first HTML tag
Computer skills: Comfortable typing and managing files and folders
Equipment: A computer with a stable internet connection; every tool used in the course is free
Age: 13 to 18. Batches are grouped by age and pace so the room always fits
Time commitment: 2 live classes plus 3-4 hours of practice a week

WHO THIS COURSE IS FOR

Complete beginners: Teens starting from zero who want the full picture of how real applications are built
App dreamers: Students who look at the apps they use daily and think: I want to build one of those
Future engineers: Teens eyeing computer science degrees who want live products behind their applications
Makers: The kind of student who finishes a tutorial and immediately asks what they can build for real
Ai curious: Teens who want to put AI inside real products, not just talk to chatbots

FULL CURRICULUM, WEEK BY WEEK

This is the complete teaching plan. Parents can ask about any week.

PHASE 1: WEB FOUNDATIONS (MONTHS 1-3, WEEKS 1-12)

The real base: HTML with meaning, CSS that survives a phone, and JavaScript learned deeply enough that React will make sense instead of feeling like magic.

Month 1: HTML and CSS (Weeks 1-4)
How the Web Works, and Your First Pages
Topics:
- How the internet works - explained for teens
- What happens when you open Instagram or YouTube
- Frontend vs Backend - what's the difference?
- Setting up your coding environment (VS Code)
- Essential VS Code extensions and themes
- Introduction to HTML - the skeleton of websites
- HTML tags and structure basics
- Creating your first webpage
- Adding text, headings, and paragraphs
- Links and navigation between pages
- Images and media elements
- Git and GitHub - saving your code like a pro
Projects built:
- Personal profile page
- Favorite band/artist fan page
- School project presentation website
Practice: Create 5 HTML pages about things you actually care about
Forms, Structure and Meaning
Topics:
- HTML5 semantic elements for better structure
- Creating forms - how login pages work
- Input types: text, email, password, number, date
- Dropdowns, checkboxes, and radio buttons

- HTML tables for displaying data
- Embedding content: YouTube videos, Spotify, Maps
- Audio and video elements
- Canvas element introduction
- Meta tags for SEO
- Accessibility - making sites for everyone
- HTML best practices
- Validating HTML code

Projects built:
- Multi-page school website
- Survey form for friends
- Restaurant menu with ordering form

Practice: Build 5 different forms, each validated by the browser

CSS: Making It Look Right

Topics:
- CSS basics - adding style to HTML
- Selectors: targeting elements precisely
- Colors, backgrounds, and gradients
- Typography - making text look professional
- Box Model - spacing and layout basics
- Borders, shadows, and visual effects
- CSS units: px, %, em, rem, vh, vw
- Positioning elements on the page
- Display properties and visibility
- Overflow and scrolling
- Z-index and layering
- Pseudo-classes and pseudo-elements

Projects built:
- Style your HTML projects beautifully
- Create a magazine-style layout
- Design product cards like Amazon

Practice: Recreate 5 popular website components from screenshots

Flexbox, Grid and Responsive Design

Topics:
- Flexbox - create flexible layouts easily
- CSS Grid - magazine and blog layouts
- Responsive design - mobile-first approach
- Media queries for different screen sizes
- CSS animations and transitions
- Keyframe animations
- Transform and 3D effects
- CSS variables (custom properties)
- Modern CSS features
- CSS best practices and organization

Projects built:
- Responsive portfolio website
- Animated landing page
- Instagram-style photo grid

Practice: Make every page you have built responsive

Assessment: Month 1 check: build a responsive layout live from a wireframe, plus a take-home assignment mixing all of month 1

Month 2: JavaScript, Properly (Weeks 5-8)

JavaScript Fundamentals

Topics:
- What is JavaScript? Why it's everywhere
- Variables and data types
- let, const, var - which to use when
- Numbers and math operations
- Strings and text manipulation
- Booleans and logical thinking
- Arrays - managing lists of data
- Array methods: push, pop, shift, unshift
- Objects - grouping related data
- Accessing and modifying object properties
- Console.log and debugging basics
- Comments and code documentation

Projects built:
- Interactive calculator
- Mad libs game generator
- Grade calculator for school

Practice: Solve 25 JavaScript basics challenges

Control Flow and Functions

Topics:
- If-else statements - making decisions
- Switch statements for multiple choices
- Comparison operators
- Logical operators (AND, OR, NOT)
- Ternary operator - shorthand conditions

- For loops - repeating tasks
- While and do-while loops
- Break and continue statements
- Functions - reusable code blocks
- Parameters and arguments
- Return values
- Arrow functions - modern syntax

Projects built:

- Rock, paper, scissors game
- Password strength checker
- Number guessing game

Practice: Build 8 small games and tools with JavaScript

The DOM: Making Pages Interactive

Topics:

- What is the DOM?
- Selecting elements with JavaScript
- querySelector and querySelectorAll
- Changing content with innerHTML and textContent
- Modifying styles with JavaScript
- Adding and removing CSS classes
- Creating new elements dynamically
- Event listeners - responding to user actions
- Click, hover, and keyboard events
- Form handling with JavaScript
- Local storage - saving data
- Building interactive UIs

Projects built:

- Interactive todo list
- Color scheme switcher
- Typing speed test game

Practice: Add real interactivity to 5 of your static pages

Interactive Projects Week

Topics:

- Combining structure, style and behavior in one build
- Reading someone else's code without panic
- Planning a feature before typing it
- Debugging with DevTools: breakpoints over guesswork
- Local storage: pages that remember
- Polish: empty states, small screens, keyboard use
- Presenting a build in two minutes

Projects built:

- Interactive quiz with scoring and review
- Habit tracker that survives refresh
- A mini game of your own design

Practice: One extra interactive build, chosen and scoped by you

Assessment: Month 2 check: build a small interactive feature live, with quiz questions reaching back to month 1

Month 3: Modern JavaScript and the First Deploy (Weeks 9-12)

Arrays, Objects and Data Thinking

Topics:

- Array methods: map, filter, reduce
- forEach vs map - when to use each
- Finding and searching arrays
- Sorting and reversing data
- Object methods and manipulation
- Destructuring arrays and objects
- Spread and rest operators
- Template literals for dynamic strings
- Regular expressions basics
- Date and time in JavaScript
- Math object and random numbers
- JSON - working with data

Projects built:

- Student grade management system
- Playlist manager like Spotify
- Search and filter application

Practice: Master array methods with 20 exercises

Async JavaScript and Real APIs

Topics:

- Synchronous vs asynchronous code
- setTimeout and setInterval
- Promises - handling future values
- Async/await - modern async syntax
- Fetch API - getting data from servers
- Working with REST APIs
- Handling API responses
- Error handling in async code
- Loading states and spinners

```
        - Environment variables for API keys
        - CORS and API security basics
        - Popular APIs for teen projects
      Projects built:
        - Weather app for your city
        - Meme generator using API
        - Movie search app
      Practice: Integrate 3 public APIs into your own pages
    ES6+, Modules and npm
      Topics:
        - ES6+ features overview
        - Classes and object-oriented programming
        - Constructor functions
        - Inheritance with extends
        - Static methods and properties
        - Modules - organizing code properly
        - Import and export statements
        - Default vs named exports
        - NPM - the package manager
        - Installing and using packages
        - Package.json explained
        - Building modern JavaScript projects
      Projects built:
        - Modular JavaScript application
        - Object-oriented game
        - NPM-based project setup
      Practice: Refactor two old projects with modern JavaScript
    Phase 1 Capstone: Ship a Real Site
      Topics:
        - Scoping a multi-page interactive site you can finish
        - Project structure a stranger could navigate
        - Fetching and displaying live API data
        - Deploying to Netlify: your work on the public internet
        - A pre-launch checklist: links, responsiveness, console errors
        - Writing a README that explains the build
      Projects built:
        - The phase capstone: a multi-page, API-powered, responsive site, live at a public URL
      Practice: Share the live link with three people and fix the most confusing thing
      Assessment: Phase 1 exam: build a small page with live data in class, plus a written
      mixed paper over months 1-3

---------------------------------------------------------------
PHASE 2: THE REACT FRONTEND (MONTHS 4-6, WEEKS 13-24)
---------------------------------------------------------------
React the way it is actually written now: components, hooks, routing, real styling,
TypeScript, a taste of Next.js, and a frontend capstone.

  Month 4: React Core (Weeks 13-16)
    Thinking in React
      Topics:
        - What is React? Why it's so popular
        - React vs vanilla JavaScript
        - Vite setup
        - JSX - HTML in JavaScript
        - Components - building blocks of React
        - Props - passing data to components
        - State - making components dynamic
        - useState hook basics
        - Handling events in React
        - Conditional rendering
        - Lists and keys in React
        - Basic React project structure
      Projects built:
        - React todo application
        - Instagram post component
        - Interactive quiz in React
      Practice: Convert 3 vanilla JavaScript projects to React
    Hooks and Effects
      Topics:
        - useEffect hook - side effects in React
        - useEffect dependencies and cleanup
        - Data fetching in React
        - Loading and error states
        - useContext for global state
        - useReducer for complex state logic
        - Custom hooks creation
        - useRef for DOM access
        - React DevTools mastery
      Projects built:
```

- Twitter clone with React
- Real-time chat interface
- YouTube video player clone

Practice: Build 5 custom hooks for patterns you keep repeating

Routing and Multi-Page Apps

Topics:

- Single Page Applications (SPAs)
- React Router setup and configuration
- Routes, Route, and Switch components
- Link and NavLink components
- URL parameters with useParams
- Query strings with useLocation
- Nested routing patterns
- Protected routes and authentication
- Route guards and redirects
- Lazy loading routes
- Browser history management

Projects built:

- Multi-page blog platform
- E-commerce site with routing
- Admin dashboard with nested routes

Practice: Add routing to two existing projects

Fetching Data Like a Professional

Topics:

- Data fetching patterns in React
- Loading, error and empty states, always
- Search and filter over API data
- Pagination and infinite scroll basics
- Debouncing input before it hits the network
- Keeping API keys out of frontend code
- Caching responses sensibly

Projects built:

- Movie or music explorer with search, filters and clean loading states

Practice: Refit an old project with proper loading and error states

Assessment: Month 4 check: build a small data-driven component live, plus a mixed assignment reaching back to phase 1

Month 5: React Craft (Weeks 17-20)

State Management That Scales

Topics:

- When component state stops being enough
- Redux core concepts: Store, Actions, Reducers
- Setting up Redux in React
- React-Redux hooks: useSelector, useDispatch
- Redux Toolkit - modern Redux
- CreateSlice and createAsyncThunk
- Handling async operations
- Redux DevTools for debugging
- Redux best practices

Projects built:

- Instagram clone with Redux
- Shopping cart with Redux
- Real-time notification system

Practice: Move one app from prop-drilling to context, then to Redux Toolkit

TypeScript for React

Topics:

- TypeScript fundamentals
- Types and interfaces
- Generics in TypeScript
- TypeScript with React
- Type-safe props and state
- TypeScript configuration
- Third-party library types
- Advanced TypeScript patterns
- TypeScript best practices
- TypeScript tooling

Projects built:

- Convert JS project to TypeScript
- Type-safe React application
- TypeScript component library

Practice: Write all new components in TypeScript from here on

UI/UX for Developers

Topics:

- Design principles for developers
- Color theory and palettes
- Typography on the web
- Layout and composition
- Visual hierarchy
- User experience basics

- Wireframing and prototyping
- Figma for developers
- Design systems creation
- Responsive design patterns
- Accessibility (a11y) standards

Projects built:
- Design and build a design system
- Redesign existing project
- Create accessible component library

Practice: Redesign one old project applying the principles

Tailwind and Component Libraries

Topics:
- Tailwind CSS - utility-first styling
- Theme management
- Responsive design patterns
- Mobile-first development
- Accessibility best practices
- Performance optimization
- Choosing the right framework
- Tailwind as the industry default, used with restraint
- One component library, learned properly
- Building your own small design system

Projects built:
- A polished dashboard built with Tailwind and one component library

Practice: Restyle your best project with Tailwind

Assessment: Month 5 check: style a component set live, plus a mixed quiz over months 1-5

Month 6: Next.js Taste and the Frontend Capstone (Weeks 21-24)

Performance and PWA Basics

Topics:
- React performance profiling
- Identifying performance bottlenecks
- Code splitting strategies
- Lazy loading components
- Image optimization techniques
- Virtual scrolling for long lists
- Debouncing and throttling
- Service Workers and PWAs
- Caching strategies
- Bundle size optimization

Projects built:
- Optimize slow React app
- Build performant social feed
- PWA with offline support

Practice: Measure and improve your slowest project

A Taste of Next.js

Topics:
- Why the industry wraps React in Next.js
- Pages, layouts and file-based routing
- Server components in plain words
- When Next.js is overkill, honestly
- Deploying a Next.js site
- How this course's skills map onto any framework

Projects built:
- A small blog or portfolio rebuilt in Next.js

Practice: Compare your Vite and Next builds: what changed and why

Frontend Capstone

Topics:
- Choosing the capstone: a streaming-style UI, a social feed, or a dashboard product
- Component architecture planned before coding
- TypeScript throughout, loading states everywhere
- Responsive, accessible, and fast
- Instructor checkpoint mid-build
- Deploying and writing the case study README

Projects built:
- The frontend capstone: a polished, deployed React application that looks and feels like a real product

Practice: Daily commits; one feature finished per session

Assessment: Phase 2 exam: capstone walkthrough plus a written mixed paper spanning phases 1 and 2

PHASE 3: BACKEND AND DATABASES (MONTHS 7-9, WEEKS 25-36)

The engine room: Node and Express, MongoDB and SQL, authentication done safely, and the moment the two halves connect into one deployed application.

Month 7: Node, Express and MongoDB (Weeks 25-28)

Node.js Fundamentals
  Topics:
    - What is Node.js? JavaScript on the server
    - Node.js installation and setup
    - Node REPL and running scripts
    - CommonJS modules and require
    - NPM and package management
    - Core modules: fs, path, http, os
    - File system operations
    - Creating HTTP servers
    - Handling requests and responses
    - Streams and buffers
    - Events and EventEmitter
    - Asynchronous programming in Node
  Projects built:
    - CLI todo application
    - File management system
    - Basic HTTP API server
  Practice: Build 5 Node.js command-line tools
Express: Your First Server
  Topics:
    - Introduction to Express.js
    - Setting up Express server
    - Routing and route handlers
    - Request and response objects
    - Middleware concept and usage
    - Built-in and custom middleware
    - Handling different HTTP methods
    - Route parameters and query strings
    - Serving static files
    - Template engines (EJS, Pug)
    - Error handling in Express
    - Express best practices
  Projects built:
    - RESTful blog API
    - User management system
    - File upload service
  Practice: Build 3 small APIs with Express
MongoDB and Mongoose
  Topics:
    - NoSQL vs SQL databases
    - MongoDB introduction and setup
    - MongoDB Atlas cloud database
    - CRUD operations in MongoDB
    - Data modeling for NoSQL
    - Mongoose ODM setup
    - Schemas and models
    - Validation and middleware
    - Relationships and population
    - Aggregation pipeline
    - Indexing for performance
    - MongoDB best practices
  Projects built:
    - Social media backend
    - E-commerce product catalog
    - Blog with comments system
  Practice: Design and build 3 database schemas
REST API Design
  Topics:
    - REST principles and constraints
    - API endpoint design
    - HTTP status codes usage
    - Request/response formats
    - API versioning strategies
    - Pagination and filtering
    - Sorting and searching
    - Error handling standards
    - API documentation with Swagger
    - Postman for API testing
    - API rate limiting
    - CORS configuration
  Projects built:
    - Complete REST API for social app
    - E-commerce API with all features
    - Real-time chat API
  Practice: Design, build and document one clean API end to end
  Assessment: Month 7 check: build a small CRUD endpoint live, plus a mixed quiz reaching
  back to earlier phases

Month 8: Authentication, SQL and Safety (Weeks 29-32)
  Authentication Done Safely
    Topics:
      - Authentication vs authorization explained
      - Password hashing with bcrypt
      - JWT tokens - how they work
      - Creating and verifying JWTs
      - Refresh tokens pattern
      - Session-based authentication
      - Role-based access control (RBAC)
      - Protecting API routes
      - Password reset functionality
      - Why passwords are never stored in plain text, ever
    Projects built:
      - Complete auth system with JWT
      - Social login integration
      - Multi-role permission system
    Practice: Add signup, login and protected routes to your API
  SQL and PostgreSQL Essentials
    Topics:
      - Relational database concepts
      - PostgreSQL installation and setup
      - SQL syntax and commands
      - Creating tables and relationships
      - Primary and foreign keys
      - Joins: INNER, LEFT, RIGHT, FULL
      - Aggregate functions
      - Indexes and optimization
      - Transactions and ACID
      - Database design principles
    Projects built:
      - School management database
      - E-commerce database design
      - Social network database
    Practice: Write 40 SQL queries against a real schema
  API Security and Performance
    Topics:
      - API security best practices
      - Input validation and sanitization
      - SQL injection prevention
      - Rate limiting implementation
      - API key management
      - HTTPS and SSL/TLS
      - Security headers
      - API performance optimization
      - Caching strategies
      - Performance monitoring
    Projects built:
      - Secure API implementation
      - Performance testing suite
      - API monitoring dashboard
    Practice: Harden your API against the OWASP basics you now know
  Backend Capstone: A Deployed API
    Topics:
      - Scoping an API product: resource design first
      - Auth, validation and sensible error responses
      - Environment variables and secrets, done right
      - Deploying the API to Render
      - Testing everything with a REST client
      - Writing API documentation a stranger could use
    Projects built:
      - The backend capstone: a documented, authenticated API live on a public URL
    Practice: Have a classmate build against your API using only your docs
    Assessment: Phase check: API walkthrough plus a cumulative quiz from phases 1-3 so far

Month 9: The Two Halves Connect (Weeks 33-36)
  Full-Stack Architecture with MERN
    Topics:
      - Full stack application planning
      - Choosing the right tech stack
      - MERN stack deep dive
      - Frontend-backend communication
      - API design for frontends
      - State management across stack
      - File upload architecture
      - Email service integration
      - Full stack best practices
    Projects built:
      - Instagram full stack clone

- E-commerce platform
- Project management tool

Practice: Wire your React capstone to your own API

Real-Time with Socket.io

Topics:

- WebSocket protocol explained
- Socket.io with Node.js
- Real-time events and broadcasting
- Rooms and namespaces
- Socket authentication
- Server-Sent Events (SSE)
- Real-time notifications
- Live collaboration features
- Chat application architecture

Projects built:

- WhatsApp clone backend
- Live collaboration tool
- Real-time gaming server

Practice: Add one live feature to your app: chat, presence or notifications

Full-Stack Deployment

Topics:

- Deploying frontend and backend as one product
- Environment configuration across services
- CORS, cookies and auth across origins, demystified
- Custom domains and HTTPS
- Reading production logs when something breaks
- A deployment checklist you will reuse for years

Projects built:

- Your full-stack app live: React frontend, Node API, database, one URL

Practice: Deploy a second app solo using only your checklist

Full-Stack Mini Build

Topics:

- A one-week product: scope ruthlessly
- Feature slices: database to API to UI, one at a time
- Where bugs hide when the stack is yours end to end
- Code review across the whole stack
- Presenting a product, not a repo

Projects built:

- A complete mini product built solo in one week: tracker, board, library or your own idea

Practice: Write the one-page retrospective: what you would do differently

Assessment: Phase 3 exam: full-stack walkthrough from schema to deployed URL, plus a written mixed paper over phases 1-3

PHASE 4: AI, QUALITY AND THE CAPSTONE (MONTHS 10-12, WEEKS 37-48)

The final level: uploads and integrations, AI features built with guardrails, testing across the stack, and a four-week capstone shipped like a product.

Month 10: Power-Ups and AI (Weeks 37-40)

Uploads, Email and Integrations

Topics:

- File uploads: images from the browser to storage
- Serving user images safely
- Sending transactional email from the backend
- Working with third-party APIs server-side
- Webhooks: when other services call you
- Background jobs for slow work
- Rate limits and being a polite API citizen

Projects built:

- Profile pictures and image posts added to your app
- Email notifications for real events

Practice: Integrate one external service end to end

Machine Learning for Web Developers

Topics:

- ML basics for web developers
- TensorFlow.js introduction
- Pre-trained models usage
- Image recognition in browser
- Natural language processing
- Recommendation systems
- Sentiment analysis
- ML APIs integration
- Ethical AI considerations

Projects built:

- Image recognition app
- Recommendation engine
- Sentiment analysis tool

Practice: Add one pre-trained model feature to a project

AI Features with Guardrails
Topics:
- Where AI belongs in a full-stack app (accounts set up with a parent where a service requires it)
- Server-side model calls: never from the browser
- Streaming a response into React without jank
- Retrieval over your own database
- Vector search basics, and when plain SQL wins
- Function calling to trigger real app actions
- A minimal agent loop: plan, act, verify
- Guardrails and output validation
- Cost control: tokens, caching, per-user caps
- Evaluating quality: how do you know it got better?
- Privacy and what you must not send to a provider
- Shipping honestly: telling users what the AI did

Projects built:
- AI-powered search over your own data
- Agentic task assistant
- AI feature with full guardrails + evals

Practice: Run 20 real queries through your AI feature and grade the answers

Testing Across the Stack
Topics:
- Why testing matters
- Jest testing framework
- React Testing Library
- Writing unit tests for components
- Testing props and state
- Testing user interactions
- Mocking API calls
- Integration testing
- Code coverage reports
- Test-driven development (TDD)
- Testing API endpoints with supertest
- What to test first when time is short

Projects built:
- Test suites for your capstone's core logic, frontend and backend

Practice: Write 25 tests across your two best projects

Assessment: Month 10 check: a mixed assignment spanning AI, testing and earlier phases

Month 11: Ship Like a Professional (Weeks 41-44)
Git Workflow and CI Basics
Topics:
- DevOps culture and practices
- Version control with Git (advanced)
- GitHub Actions for CI/CD
- Docker in one honest lesson: what it is and when you need it
- Branches, pull requests and reviewing a teammate's code

Projects built:
- A GitHub Actions check that runs your tests on every push

Practice: Two weeks of professional Git habits: branches and clean commits

Security Hardening Pass
Topics:
- Common frontend vulnerabilities
- XSS prevention techniques
- Content Security Policy (CSP)
- HTTPS and SSL/TLS
- Authentication best practices
- Secure token storage
- Input validation and sanitization
- CORS and security headers
- Dependency security scanning
- OWASP Top 10 for frontend

Projects built:
- Security audit of projects
- Implement secure authentication
- Build security scanner tool

Practice: Run the full security checklist against your own app and fix what fails

Performance and Polish Pass
Topics:
- Measuring before optimizing: Lighthouse honestly
- Image and bundle weight: the usual suspects
- Database queries that quietly get slow
- Caching where it actually helps
- Accessibility pass: keyboard, contrast, labels
- The empty-state and error-page polish that separates products from projects

Projects built:
- A measured before/after performance report on your own app

Practice: Fix the three worst findings from your report

Capstone Planning

Topics:
- Choosing the final capstone: your best idea, scoped to four weeks
- A one-page spec: users, features, stack, milestones
- Database schema and API sketch before any UI
- Cutting scope without cutting the soul of the idea
- Milestones: working core by week 2, feature-complete by week 3

Projects built:
- Approved capstone spec plus the repository, schema and first endpoints

Practice: Pitch the spec to the batch and absorb one hard question

Assessment: Month 11 check: spec review plus a mixed quiz over the whole course so far

Month 12: The Capstone (Weeks 45-48)

Capstone Build

Topics:
- Building in vertical slices: database to UI, one feature at a time
- Instructor checkpoints and course corrections
- Using everything: React, TypeScript, Node, database, auth, maybe AI
- Tests on the logic that must not break
- Daily commits and an always-working build
- A mid-build demo to a real user

Projects built:
- The final capstone, built over two focused weeks with version control and tests

Practice: A working build at the end of every session, no exceptions

Launch Week

Topics:
- Production deployment: frontend, API, database
- Custom domain, HTTPS and final configuration
- Error tracking so you know when it breaks
- The launch checklist run end to end
- README, screenshots and a two-minute demo video
- Collecting first real user feedback

Projects built:
- The capstone live on its own URL with documentation worth reading

Practice: Onboard three real users and ship one fix from their feedback

Demo Day and What Comes Next

Topics:
- Presenting the capstone: live demo plus the hardest bug story
- Portfolio final pass: GitHub profile, project pages, case studies
- An honest skills inventory: strong, shaky, next
- Where each path leads: DSA for interviews, deeper backend, or design
- Staying sharp: projects, communities and healthy practice habits

Projects built:
- Demo day presentation delivered to the batch and parents

Assessment: FINAL EXAM: a practical build plus a written paper with questions mixed from every phase. Passing earns the certificate; a student who falls short gets a focused revision plan and a free retest

PROJECTS THE STUDENT BUILDS AND KEEPS

- Phase 1: hand-built responsive sites, interactive JavaScript apps, and an API-powered capstone deployed to a public URL
- Phase 2: React applications with routing, TypeScript and Tailwind, ending in a polished frontend capstone
- Phase 3: Express APIs with MongoDB and SQL, safe authentication, and a full-stack app live on one URL
- Phase 4: file uploads, live chat, AI features with guardrails, tests, and the final four-week capstone

Total projects: 30+ real projects, crowned by a deployed full-stack application with accounts, live features and an AI capability

SKILLS THE STUDENT WILL HAVE AT THE END

- Frontend: HTML, CSS, responsive layouts, JavaScript to real depth, React with hooks and routing
- Modern tooling: TypeScript, Tailwind, npm, Vite and a working taste of Next.js
- Backend: Node.js, Express, REST API design, MongoDB with Mongoose, SQL with PostgreSQL
- Auth and safety: password hashing, JWT sessions, protected routes and the OWASP basics
- Real-time and integrations: Socket.io chat, file uploads, email and third-party APIs
- AI features: model calls from the server, streaming responses, guardrails and cost control
- Professional habits: Git and GitHub, tests with Jest, CI checks, deployment and code review

HOW A TYPICAL WEEK IS SPLIT

Live classes: 2 live one-hour classes per week, coding along with the instructor

Homework: Homework after every class, and a mixed-review assignment at the end of every month so earlier skills stay sharp

Practice: 3-4 hours of projects and challenges between classes

Review: Every submitted project reviewed with written feedback; recurring issues reopened in class

SUPPORT INCLUDED

  Doubt support: WhatsApp doubt support between classes, so nobody stays stuck on a broken
    build for days
  Progress updates: Regular progress notes to parents: what was built, what comes next, and
    where encouragement at home helps

CERTIFICATION DETAIL

  Completion: Certificate from Modern Age Coders, awarded on passing the final exam. Fall short
    and there is focused revision and a free retest: the certificate certifies knowledge, not
    attendance

WHERE THIS CAN LEAD

  - Data Structures and Algorithms: the interview-and-competition muscle to pair with building
    skill
  - Deeper backend engineering: from Express into production architectures
  - Design directions: UI/UX foundations are already laid here
  - College applications: a deployed product portfolio speaks louder than grades alone
  - Real small projects: sites and tools for family, school clubs and local groups

COMMON QUESTIONS ABOUT THIS COURSE

  For anything about cost, use PART 4 and RULE 1. Do not quote two regions.

  Q: What will my teen build in this full stack course?
  A: More than 30 real projects across twelve months, each phase ending with something
  deployed: a multi-page API-powered site in month 3, a polished React frontend capstone in
  month 6, an authenticated API and full-stack app in month 9, and a final capstone with user
  accounts, a database, live chat and an AI-powered feature, live on its own URL. Every project
  is built by the student and reviewed with written feedback.

  Q: How long does it take a teenager to learn full stack development?
  A: Full stack is genuinely the biggest track we teach, both halves of an application, so the
  honest answer is 12 months at 2 live classes a week plus 3 to 4 hours of practice. The
  syllabus keeps 2 months of margin in hand: students who need more repetition take up to 14
  months with no rushing and no penalty. The first deployed site goes live in month 3, so the
  motivation never has to wait.

  Q: How is my teen assessed? Is the certificate just for attending?
  A: No. Classwork runs inside every session, homework follows every class, and each month ends
  with an assignment that deliberately mixes new questions with earlier topics so knowledge
  compounds instead of fading. Every phase closes with a cumulative exam, and the course ends
  with a final exam: a practical build plus written questions drawn from the whole syllabus.
  Passing earns the certificate; falling short earns a focused revision plan and a free retest.
  We optimize for real knowledge and real depth, not a stream of feel-good badges.

  Q: Why React and Node instead of teaching many frameworks?
  A: Because depth beats a tour. React and Node dominate real-world hiring and share one
  language, JavaScript, so a teen's effort compounds instead of splitting. We add TypeScript,
  SQL and a taste of Next.js because the industry expects them. A student who truly understands
  this one stack can pick up Vue, Angular or anything else in weeks, the concepts transfer;
  skimming four frameworks transfers nothing.

  Q: What does full stack actually mean?
  A: A full stack developer can build both, which is why this course covers the entire journey
  from a first webpage to a complete working application with accounts, data and live features.

  Q: Can a complete beginner join, and at what age?
  A: Yes, the course assumes zero coding knowledge and is designed for ages 13 to 18. The early
  months are deliberately gentle, real foundations before any framework, and batches are
  grouped by age and pace so nobody is racing or waiting.

  Q: How is AI part of this course?
  A: As a builder's tool, in two layers: pre-trained models in the browser with TensorFlow.js,
  then AI features added to the student's own full-stack app, model calls made safely from the
  server, streamed into React, with guardrails, cost control and honest evaluation. Where an AI
  service requires an account, it is set up together with a parent. The result is a teen who
  ships AI features, not one who only chats with AI.

  Q: Does the course offer a free demo?
  A: Yes, book a free, no-commitment demo class at learn.modernagecoders.com/contact or message
  us on WhatsApp at +91 91233 66161. Parents are welcome to sit in; it is the easiest way to
  see whether the teaching style clicks for your teen.

  Q: What format do the classes follow?
  A: Live 1-hour online classes with a real teacher, never pre-recorded videos. Groups are

small and hands-on: students build during class, ask questions, and get unstuck immediately.

Q: Will my teen be certified at the end?
A: Yes, and it is earned, not handed out: the certificate is awarded on passing the final exam, with a free retest after revision if the first attempt falls short. More importantly, they finish holding a portfolio of deployed applications, live products that prove the certificate means something.

To enrol, message Shivam Sir on +91 9123366161 or send the parent this link: https://learn.modernagecoders.com/courses/full-stack-web-development-teens-masterclass
For a demo: the Priority Live Demo (guaranteed, today or tomorrow) is booked at https://learn.modernagecoders.com/priority-demo . The free demo is a waiting list with no fixed date.

==========
COURSE 63 OF 137: FUNCTIONAL SKILLS MATHS LEVEL 1 AND LEVEL 2 COURSE ONLINE
==========

Course link: https://learn.modernagecoders.com/courses/functional-skills-maths-course
Subject area: UK Adult and Post-16 Mathematics
Designed for: College students
Who can join: Adults, apprentices and post-16 learners working towards Functional Skills maths at Level 1 or Level 2
Course length: 6 months (24 weeks) for a full level; shorter for learners who start part-way
Time needed: 2 live classes/week + 2-3 hours of practice, fitted around work
Certificate: Course-completion certificate from Modern Age Coders

PRICE FOR THIS COURSE (quote only the one that applies to the person asking)
In India, per month: group Rs 1,499, mini batch Rs 2,999, one to one Rs 4,999
In Canada, per month: group CAD 140, one to one CAD 210
Anywhere else, per month: group $100, one to one $150
Classes: group and mini batch two live classes a week, eight a month; one to one in India one live class a week, four a month; one to one outside India two live classes a week, eight a month. Each class is one hour.

WHAT THIS COURSE IS

Functional Skills maths online for adults, apprentices and post-16 learners: Level 1 and Level 2 taught live, with calculator and non-calculator practice.

In one line: Maths for work and everyday life, taught to adults as adults: percentages, budgets, measures and data, with the exam rules learned early so nothing surprises you on the day.

ABOUT THE PROGRAMME

Functional Skills maths is a qualification built around using maths in real situations: a pay rise worked out as a percentage, a room measured for flooring, a timetable read correctly, a chart that might be misleading. The Department for Education sets the content at Entry Levels 1 to 3 and Levels 1 and 2, and every level is organised into the same three areas: using numbers and the number system, using common measures, shape and space, and handling information and data. Level 2 is the level many employers, apprenticeships and college courses ask for. Ofqual's rules shape how it is examined. A quarter of the marks are for questions done without a calculator and three quarters with one. A quarter assess underpinning skills, maths on its own, and three quarters assess problem solving in context. Several awarding organisations offer the qualification, each setting its own papers within those rules, so we teach the shared content and practise in the style your exam centre uses. The course runs in four phases: number, then measures, shape and space, then data, then exam practice with both the non-calculator and calculator sections. Lessons are live and small, aimed at people who may not have done maths for years, and they run at times that fit around work and family.

WHAT MAKES THIS COURSE DIFFERENT

- Built from the Department for Education's Functional Skills maths subject content and Ofqual's conditions and requirements
- The non-calculator quarter of the exam practised from week one, so mental methods and written methods are secure
- Problems set in real contexts adults recognise: pay, bills, recipes, travel, home improvement and workplace data
- Level 1 and Level 2 taught as clear tracks, with a starting check that places you correctly
- Practice in the style of your exam centre's awarding organisation in the final phase
- Patient, judgement-free teaching for adults returning to maths after a long break

THE LEARNING PATH, STEP BY STEP

Phase 1: Using numbers: whole numbers, fractions, decimals, percentages, ratio and proportion, with and without a calculator
Phase 2: Using measures, shape and space: money and budgeting, units and conversion, area, perimeter, volume and scale
Phase 3: Handling information and data: tables, charts and graphs, averages and range, and

probability
Phase 4: Exam practice: underpinning skills and problem solving, the non-calculator and calculator sections, and full practice assessments

WHAT A STUDENT NEEDS BEFORE STARTING

Maths level: None beyond everyday numbers. The starting check places you on Level 1 or Level 2, and we fill gaps as they appear
Exam entry: The qualification is examined by an awarding organisation through an approved exam centre, such as a college or training provider. You arrange the entry; we teach the content and the exam style
Equipment: A basic calculator, a ruler, paper, and a device with stable internet for live classes
Timing: Start any month. Most learners finish a level in about six months; those already part-way through take less

WHO THIS COURSE IS FOR

Adults returning: Adults who need a maths qualification for a job, promotion or course and have not studied maths for years
Apprentices: Apprentices who need Functional Skills maths as part of their programme
Post 16 learners: Post-16 learners working towards a level 2 maths qualification
Career changers: Career changers applying for roles or training that ask for level 2 maths
Parents: Parents who want to feel confident helping with homework and family budgets

FULL CURRICULUM, WEEK BY WEEK

This is the complete teaching plan. Parents can ask about any week.

PHASE 1: USING NUMBERS (MONTHS 1-2, WEEKS 1-8)

The number skills every other part of the course depends on. Level 1 learners build the foundations; Level 2 learners extend them to percentage change, ratio and inverse proportion.

Month 1: Whole Numbers, Fractions and Decimals (Weeks 1-4)
Weeks 1-2: Starting Check and Whole Numbers
Topics:
- A friendly starting check that places you on the Level 1 or Level 2 track
- Large numbers, negative numbers and place value
- Written methods for the four operations, without a calculator
- Order of operations, including brackets and powers
- Estimating and rounding to check an answer
- Times tables refreshed for the non-calculator section

Projects built:
- Personal method sheet: one worked example of each written method

Practice: 15 short non-calculator questions a week, plus 5 problems in context
Weeks 3-4: Fractions and Decimals
Topics:
- Equivalent fractions and simplifying
- Fractions of amounts in everyday situations
- Adding, subtracting and comparing fractions
- Decimals in money and measurement
- Converting between fractions and decimals
- Calculating with decimals to three decimal places at Level 2

Projects built:
- Real-life problem set: a recipe scaled and a bill split, solved with fractions

Practice: 15 fraction and decimal questions a week, half without a calculator
Assessment: Month 1 check: a 30-minute mixed number paper with a non-calculator section

Month 2: Percentages, Ratio and Proportion (Weeks 5-8)
Weeks 5-6: Percentages
Topics:
- Percentages of amounts with and without a calculator
- One amount as a percentage of another
- Percentage increase and decrease: pay rises, discounts, price rises
- Original value after a percentage change at Level 2
- Equivalence between fractions, decimals and percentages
- Checking whether a deal is really a deal

Projects built:
- Shopping comparison: three offers compared with percentages and a written recommendation

Practice: 12 percentage problems a week in work and shopping contexts
Weeks 7-8: Ratio, Proportion and Formulae
Topics:
- Ratio in mixing, sharing and scaling
- Direct proportion with recipes and costs
- Inverse proportion at Level 2: workers and time
- Formulae written in words and in symbols
- Substituting values into a formula

- Choosing whether a calculator helps or slows you down
Projects built:
- Workplace task: a staffing or mixing problem solved and explained in a short note
Practice: 12 ratio and formula problems a week
Assessment: Month 2 check: a 40-minute number paper with calculator and non-calculator sections

---

PHASE 2: MEASURES, SHAPE AND SPACE (MONTHS 3-4, WEEKS 9-16)

Maths for money, measuring and making things fit. Contexts include budgets, travel, decorating, delivery and the workplace.

Month 3: Money, Time and Units (Weeks 9-12)
Weeks 9-10: Money and Budgeting
Topics:
- Budgets, income and spending
- Simple and, at Level 2, compound interest
- Discounts and tax as percentages
- Rates of pay and comparing deals
- Reading and checking a bill
- Explaining a money decision in writing
Projects built:
- Monthly budget: a realistic household or event budget built and checked
Practice: 10 money problems a week, each with a written conclusion
Weeks 11-12: Time, Units and Compound Measures
Topics:
- Time calculations and elapsed time
- Timetables and journey planning
- Converting metric units of length, weight and capacity
- Converting between metric and imperial with a conversion factor or graph
- Speed, density and rates at Level 2
- Reading scales on measuring equipment
Projects built:
- Journey plan: a trip timed and costed from a real timetable
Practice: 12 time and unit problems a week
Assessment: Month 3 check: a 40-minute measures paper

Month 4: Shape and Space (Weeks 13-16)
Weeks 13-14: Perimeter, Area and Volume
Topics:
- Perimeter and area of rectangles and composite shapes
- Area of triangles and circles at Level 2
- Volume of cuboids and, at Level 2, cylinders
- Surface area for painting and wrapping problems
- Working out how many items fit in a space
- Adding waste allowances to real jobs
Projects built:
- Room project: flooring and paint worked out for a real room plan, with costs
Practice: 10 area and volume problems a week
Weeks 15-16: Scale, Plans and Position
Topics:
- Scale drawings and maps
- Working out real dimensions from a plan
- Plans and elevations of 3-D objects
- Coordinates, including negative values at Level 2
- Angles and direction
- Checking a plan makes sense before using it
Projects built:
- Scale plan: a simple floor plan drawn to scale from real measurements
Practice: 8 scale and plan problems a week
Assessment: Month 4 check: a 45-minute shape and space paper with a non-calculator section

---

PHASE 3: HANDLING INFORMATION AND DATA (MONTH 5, WEEKS 17-20)

Reading, presenting and questioning data, the skill employers notice most when it is missing.

Month 5: Data, Averages and Probability (Weeks 17-20)
Weeks 17-18: Tables, Charts and Graphs
Topics:
- Reading and building tables and tally charts
- Bar charts, pie charts and line graphs
- Scatter diagrams and what they suggest at Level 2
- Choosing a suitable chart for the data
- Spotting a misleading chart
- Writing one clear sentence about what data shows
Projects built:

- Data report: a small real data set presented two ways with a written comparison
Practice: 10 data questions a week from real tables and charts
Weeks 19-20: Averages, Range and Probability
Topics:
- Mean and range, with median and mode at Level 2
- Comparing two sets of data with an average and the range
- Estimating the mean from grouped data at Level 2
- Probability as a fraction, decimal or percentage
- Likely and unlikely events in everyday contexts
- Combined outcomes at Level 2
Projects built:
- Comparison task: two shops, teams or months compared with averages and range
Practice: 10 averages and probability questions a week
Assessment: Month 5 check: a 45-minute data paper

PHASE 4: EXAM PRACTICE (MONTH 6, WEEKS 21-24)

Full practice assessments in the style of your exam centre's awarding organisation, with the non-calculator and calculator sections taken under real timing.

Month 6: Practice Assessments (Weeks 21-24)
Weeks 21-22: Underpinning Skills and Problem Solving
Topics:
- A non-calculator section under timing
- A calculator section of longer problems in context
- Marking against a published-style mark scheme
- Sorting lost marks: method, accuracy or reading the question
- Re-teaching the two weakest areas
- Showing working so method marks are earned
Projects built:
- Error log started from the first practice assessment
Practice: One full practice assessment a week
Weeks 23-24: Final Practice and Exam Readiness
Topics:
- A final full practice assessment under timing
- Review of every lost mark
- What to expect on the day, on screen or on paper
- Equipment and calculator checks
- Managing time across the paper
- Planning the next step: Level 2 or GCSE maths
Projects built:
- Completed error log and method sheet, kept for revision
Practice: Short targeted practice on the error log
Assessment: Final practice assessment, marked and reviewed one to one

PROJECTS THE STUDENT BUILDS AND KEEPS

- A personal method sheet for every written calculation
- A shopping comparison and a monthly budget
- A room flooring and paint plan with costs
- A journey plan from a real timetable
- A data report and a comparison task
- An error log built from practice assessments

Total projects: Six practical projects drawn from real life, plus a method sheet and error log for revision

SKILLS THE STUDENT WILL HAVE AT THE END

- Number, fractions, decimals, percentages and ratio with and without a calculator
- Money, budgeting and interest
- Measures, units, time and compound measures
- Area, perimeter, volume and scale
- Reading, presenting and comparing data
- Solving problems in context and showing the working

HOW A TYPICAL WEEK IS SPLIT

Live classes: 2 live one-hour classes per week, including evening options for working adults
Practice: 2 to 3 hours of practice a week, in short sessions
Review: Practice marked with comments; practice assessments marked against published-style schemes

SUPPORT INCLUDED

Doubt support: WhatsApp support between classes, with worked examples for stuck questions
Progress updates: A short written progress note each month

CERTIFICATION DETAIL

  Completion: Course-completion certificate from Modern Age Coders

WHERE THIS CAN LEAD

  - Jobs, apprenticeships and college courses that ask for level 2 maths; check each one's exact requirement
  - Our GCSE maths resit course for learners who want a GCSE as well
  - Our statistics and data courses for learners who enjoyed the data phase

COMMON QUESTIONS ABOUT THIS COURSE

  For anything about cost, use PART 4 and RULE 1. Do not quote two regions.

  Q: What is Functional Skills maths?
  A: A qualification that tests maths in real situations. The Department for Education sets the content at Entry Levels 1 to 3 and Levels 1 and 2, in three areas: using numbers and the number system, using common measures, shape and space, and handling information and data.

  Q: Is Functional Skills maths Level 2 equivalent to a GCSE?
  A: Both are level 2 qualifications, but they are different qualifications with different content and exams. Check the exact requirement with the organisation you are applying to.

  Q: Can you use a calculator in Functional Skills maths?
  A: For most of it. Ofqual's rules say 25% of the marks are for questions done without a calculator and 75% for questions where a calculator is allowed. This course practises the non-calculator section from the first week.

  Q: How long does it take to pass Functional Skills maths Level 2?
  A: It depends on where you start. This course is planned as about six months for a full level, and the starting check shows whether you need all of it. We cannot promise a result, but we make sure every part of the content and both exam sections are covered.

  Q: Can I study Functional Skills maths online?
  A: Yes, the teaching is fully online and live. The exam is taken through an approved exam centre, such as a college or training provider, which makes the entry. We teach the content and practise in the style of the awarding organisation you will sit with.

  Q: What is the difference between Level 1 and Level 2?
  A: The subject content describes problem solving as straightforward at Level 1 and complex at Level 2.

  Q: I failed GCSE maths. Should I do Functional Skills instead?
  A: It can be a good route, especially for work or an apprenticeship. If you are 16 to 18 on a study programme, your college follows the government's condition of funding rules, which link the choice to your GCSE grade. We also run a GCSE maths resit course, and the free demo can help you decide. (Agent note: the free demo is a waiting list with no fixed date. The Priority Live Demo is a guaranteed class today or tomorrow, booked at https://learn.modernagecoders.com/priority-demo . Offer both, as RULE 3 says.)

  Q: Are classes available in the evening?
  A: Yes. Most learners on this course work, so we run evening and weekend options, and one-to-one lessons can be booked at times that suit you.

  Q: How are the classes run?
  A: Live online classes with a real teacher, in a group of 15 to 20 adults at a similar level or one to one. Current fees for your region are shown in the pricing section of this page.

  Q: Can I try a lesson first?
  A: Yes. Book a free demo class. The teacher works through a few everyday maths problems with you, sees where you are, and suggests Level 1 or Level 2 and group or one-to-one teaching. There is no obligation to enrol. (Agent note: the free demo is a waiting list with no fixed date. The Priority Live Demo is a guaranteed class today or tomorrow, booked at https://learn.modernagecoders.com/priority-demo . Offer both, as RULE 3 says.)

  To enrol, message Shivam Sir on +91 9123366161 or send the parent this link: https://learn.modernagecoders.com/courses/functional-skills-maths-course
  For a demo: the Priority Live Demo (guaranteed, today or tomorrow) is booked at https://learn.modernagecoders.com/priority-demo . The free demo is a waiting list with no fixed date.

==========
COURSE 64 OF 137: GAME DEVELOPMENT COURSE: UNITY, C# & UNREAL ENGINE
==========

Course link: https://learn.modernagecoders.com/courses/game-development-complete-masterclass-college
Subject area: Game Development
Designed for: College students
Who can join: Complete beginner (18+); college students, graduates and working professionals

Course length: 10-12 months (44-52 weeks)
Time needed: 2 live classes/week + 4-6 hours practice
Certificate: Certificate from Modern Age Coders, awarded on passing the final exam

PRICE FOR THIS COURSE (quote only the one that applies to the person asking)
  In India, per month: group Rs 1,499, mini batch Rs 2,999, one to one Rs 4,999
  In Canada, per month: group CAD 140, one to one CAD 210
  Anywhere else, per month: group $100, one to one $150
  Classes: group and mini batch two live classes a week, eight a month; one to one in India one live class a week, four a month; one to one outside India two live classes a week, eight a month. Each class is one hour.

WHAT THIS COURSE IS

  Game development course for college students and professionals: Unity and C# from 2D to 3D with game AI, an Unreal and C++ phase, multiplayer, and a shipped capstone in 10-12 months.

  In one line: Both engines the industry runs on: Unity and C# from 2D to 3D and game AI, then Unreal with C++, multiplayer, and a capstone you actually ship.

ABOUT THE PROGRAMME

  Game development is a craft with two centers of gravity, Unity with C# and Unreal with C++, and serious studios expect you to be deep in one and conversant in the other. This live online masterclass builds both in the right order: game design and complete 2D games first, because finished small games teach more than unfinished big ones, then 3D in Unity, advanced C#, game AI and real 3D projects, plus mobile and cross-platform shipping. Then the second engine: Unreal fundamentals, C++ for games, graphics programming and engine architecture, followed by multiplayer, the hardest and most requested skill in modern game work. A finale month ships a polished capstone game and sits the final exam. The pace is honest: ten teaching months at two live classes a week plus four to six hours of practice, with two more in hand. Problem sets, monthly mixed reviews, phase exams, and a final exam that decides the certificate with a free retest.

WHAT MAKES THIS COURSE DIFFERENT

  - Finished games from month one: complete 2D games before 3D ambitions
  - Both industry engines: Unity/C# depth plus a real Unreal/C++ phase, in the order studios expect
  - Game AI and multiplayer taught properly, the two topics tutorials always skip
  - Craft over hype: no VR/AR tourism, no live-service fantasies, just shippable skill
  - An honest 10-month arc with 2 months in hand
  - Real assessment: weekly problem sets, monthly mixed reviews, phase exams and a final exam with a free retest

THE LEARNING PATH, STEP BY STEP

  Phase 1: Foundations (Months 1-3): game design, C# and complete 2D games with art and audio
  Phase 2: Unity mastery (Months 4-6): 3D, advanced C#, game AI, mobile and cross-platform
  Phase 3: Unreal and multiplayer (Months 7-9): C++, graphics, engine architecture and networking
  Phase 4: The finale (Month 10): a polished capstone game and the final exam

WHAT A STUDENT NEEDS BEFORE STARTING

  Coding experience: None. Everything is taught from the first line
  Equipment: Any reasonably recent computer handles the Unity phases; the Unreal phase is smoother with a mid-range graphics card, and we tell you exactly what matters before it starts
  Age: 18+; college students, graduates and working professionals
  Time commitment: 2 live classes plus 4-6 hours of practice a week

WHO THIS COURSE IS FOR

  College students: Students who want game development as a serious engineering path
  Career switchers: Professionals moving into games with the two-engine profile
  Programmers: Developers who want C# and C++ craft with something playable to show
  Indie dreamers: Builders who want to actually finish and ship games, not collect prototypes
  Portfolio builders: Graduates who need finished, playable work interviews can hold

FULL CURRICULUM, WEEK BY WEEK

  This is the complete teaching plan. Parents can ask about any week.

  PHASE 1: GAME FUNDAMENTALS & 2D DEVELOPMENT (MONTHS 1-3, WEEKS 1-13)

  Build solid foundations in game design theory, 2D game development, and Unity basics while creating your first playable games.

Months 1-2: Game Design & 2D Fundamentals (Weeks 1-7)
  Introduction to Game Development
    Topics:
      - History of video games and industry overview
      - Game development roles: programmer, artist, designer, producer
      - Game genres and their characteristics
      - Game development pipeline: concept to release
      - Introduction to game engines vs frameworks
      - Setting up development environment
      - Unity installation and interface tour
      - Version control with Git for games
      - Game development terminology
      - Analyzing successful games
      - Game documentation: GDD (Game Design Document)
      - Prototyping and iteration methodology
    Projects built:
      - Write your first Game Design Document
      - Analyze 5 favorite games critically
      - Create paper prototype of simple game
      - Set up Unity and development environment
    Practice: Play and analyze 20 games across different genres
  Game Design Fundamentals
    Topics:
      - Core game mechanics vs meta mechanics
      - Game loops: core, meta, and social
      - Player motivation and psychology
      - Flow theory and difficulty curves
      - Reward systems and progression
      - Game balance fundamentals
      - Level design principles
      - Tutorial design and onboarding
      - Narrative in games
      - Player types: Bartle's taxonomy
      - Playtesting and feedback incorporation
    Projects built:
      - Design a complete game concept with mechanics
      - Create difficulty curve for a game
      - Design reward system for mobile game
      - Build paper prototype and playtest it
    Practice: Design 10 different game mechanics on paper
  2D Game Development with Unity
    Topics:
      - Unity 2D workspace and tools
      - Sprites and sprite sheets
      - 2D physics and colliders
      - Rigidbody2D and physics materials
      - Animation basics: sprite animation
      - Animator controller and state machines
      - Tilemaps and tilemap colliders
      - 2D lighting with URP
      - Particle systems for 2D
      - Camera setup for 2D games
      - Sorting layers and order
      - 2D audio and sound effects
    Projects built:
      - Create animated sprite character
      - Build tilemap-based level
      - Implement 2D platformer mechanics
      - Add particle effects and polish
    Practice: Create 10 different 2D game prototypes
  Programming Fundamentals with C#
    Topics:
      - C# basics: variables, data types, operators
      - Control flow: if-else, switch, loops
      - Functions and methods
      - Object-oriented programming in C#
      - Classes and objects for games
      - Inheritance and polymorphism
      - Unity-specific C# features
      - MonoBehaviour lifecycle
      - Coroutines and timing
      - Events and delegates
      - Debugging in Unity
      - Performance considerations
    Projects built:
      - Player movement controller
      - Enemy AI basic behavior
      - Inventory system

```
        - Score and UI management system
      Practice: Write 50 Unity scripts for different purposes

  Month 3: Complete 2D Games (Weeks 8-13)
    Building Complete 2D Games
      Topics:
        - Game architecture patterns
        - Scene management and loading
        - Save/load systems
        - UI design with Unity UI
        - Menu systems and navigation
        - Input handling: keyboard, mouse, touch
        - Mobile input and virtual joysticks
        - Object pooling for performance
        - 2D pathfinding basics
        - Power-ups and collectibles
        - Health and damage systems
        - Game state management
      Projects built:
        - Complete 2D platformer game
        - Top-down shooter with enemies
        - Puzzle game with 10 levels
        - Mobile endless runner
      Practice: Build 5 different 2D game genres
    2D Art and Animation
      Topics:
        - Pixel art fundamentals
        - Color theory for games
        - Creating game sprites
        - Animation principles: squash, stretch, anticipation
        - Sprite sheet creation
        - 2D skeletal animation with Unity
        - Visual effects for 2D games
        - UI/UX design for games
        - Asset optimization
        - Free and paid asset resources
        - Art style consistency
        - Creating game atmosphere
      Projects built:
        - Create full sprite set for character
        - Design and animate enemy types
        - Create tileset for platformer
        - Design complete UI theme
      Practice: Create art assets for 5 games
    Audio and Polish
      Topics:
        - Game audio fundamentals
        - Sound effects creation and editing
        - Music theory for games
        - Unity audio system
        - 3D spatial audio
        - Audio mixing and mastering
        - Creating atmosphere with audio
        - Audio feedback for player actions
        - Performance optimization
        - Game juice and polish techniques
        - Screen shake and effects
        - Testing and debugging
      Projects built:
        - Add complete audio to previous games
        - Create dynamic music system
        - Polish one game to release quality
        - PHASE 1 CAPSTONE: Complete 2D Game with Original Art and Audio
      Assessment: Phase 1 exam: a practical build defended live, plus a written paper mixing
      this phase with everything before it

------------------------------------------------------------
PHASE 2: 3D DEVELOPMENT & ADVANCED UNITY (MONTHS 4-6, WEEKS 14-26)
------------------------------------------------------------
Master 3D game development, advanced C# programming, and professional Unity techniques.

  Months 4-5: 3D Game Development (Weeks 14-23)
    3D Fundamentals in Unity
      Topics:
        - 3D coordinate systems and transforms
        - 3D modeling basics and terminology
        - Importing and configuring 3D models
        - Materials and textures
        - Shader basics and Shader Graph
```

```
    - Lighting: directional, point, spot, area
    - Lightmapping and global illumination
    - Shadows and shadow settings
    - 3D physics: Rigidbody and colliders
    - Physics materials and joints
    - Terrain creation and editing
    - ProBuilder for level design
  Projects built:
    - 3D character controller
    - Physics-based puzzle
    - Terrain with environment
    - Indoor level with lighting
  Practice: Create 10 different 3D scenes
3D Animation and Characters
  Topics:
    - 3D animation principles
    - Humanoid vs generic rigs
    - Animation import and retargeting
    - Mecanim animation system
    - Blend trees and layers
    - Animation events and curves
    - Root motion
    - Inverse Kinematics (IK)
    - Ragdoll physics
    - Facial animation basics
    - Motion capture data usage
    - Cinematics with Timeline
  Projects built:
    - Third-person character controller
    - Combat system with animations
    - Cutscene using Timeline
    - Character customization system
  Practice: Implement 15 different animation systems
Advanced C# for Games
  Topics:
    - Design patterns for games: Singleton, Observer, State
    - Generic programming in Unity
    - LINQ for game data
    - Async/await in Unity
    - Unity Job System basics
    - Burst Compiler
    - ECS (Entity Component System) introduction
    - Custom editors and tools
    - PropertyDrawers and Attributes
    - ScriptableObjects for data
    - Addressables for asset management
    - Performance profiling and optimization
  Projects built:
    - Modular weapon system
    - Quest system with ScriptableObjects
    - Custom Unity tools
    - Performance-optimized game
  Practice: Implement 20 design patterns in games
AI for Games
  Topics:
    - Game AI fundamentals
    - Finite State Machines (FSM)
    - Behavior Trees introduction
    - Navigation and pathfinding
    - NavMesh and NavMesh agents
    - A* pathfinding implementation
    - Steering behaviors: seek, flee, wander
    - Flocking and swarm AI
    - Decision trees
    - Goal-Oriented Action Planning (GOAP)
    - Machine learning in games basics
    - Enemy AI patterns
  Projects built:
    - Stealth game with AI guards
    - RTS unit movement system
    - Boss AI with multiple phases
    - Companion AI system
  Practice: Create 10 different AI behaviors
3D Game Projects
  Topics:
    - First-person shooter mechanics
    - Third-person action games
    - Racing game physics
    - Survival game systems
```

- Inventory and crafting
- Dialogue systems
- Quest and mission systems
- Procedural generation basics
- Level streaming
- Optimization techniques
- Platform-specific considerations
- Beta testing process

Projects built:
- FPS prototype with AI enemies
- Racing game with 3 tracks
- Survival game vertical slice
- Action RPG with inventory

Practice: Build prototypes of 5 different 3D genres

Month 6: Mobile & Cross-Platform Games (Weeks 24-26)

Mobile Game Development

Topics:
- Mobile game market analysis
- Touch input and gestures
- Mobile UI/UX principles
- Screen resolution handling
- Mobile performance optimization
- Battery and thermal management
- Mobile-specific shaders
- Asset bundling for mobile
- In-app purchases implementation
- Ads integration: Unity Ads, AdMob
- Analytics integration
- Push notifications

Projects built:
- Hypercasual mobile game
- Mobile puzzle game with IAP
- Mobile multiplayer game
- Port PC game to mobile

Practice: Optimize 5 games for mobile

Cross-Platform Development

Topics:
- Platform-specific code management
- Input system abstraction
- Save data across platforms
- Cloud saves implementation
- Platform-specific features
- Console development basics
- Nintendo Switch considerations
- PlayStation requirements
- Xbox Live integration
- Steam integration
- Build automation
- Testing across platforms

Projects built:
- Cross-platform game with cloud saves
- Platform-specific features implementation
- Console-ready game prototype
- Multi-platform build pipeline

Practice: Deploy game to 3 different platforms

Phase 2 Capstone Project

Topics:
- Scope and project planning
- Vertical slice development
- Iterative design process
- Playtesting and feedback
- Polish and optimization
- Marketing materials creation

Projects built:
- PHASE 2 CAPSTONE: Complete 3D Game
- Develop full 3D game with 30 minutes of gameplay
- Include: menus, save system, 5 levels, original assets
- Target platform: PC and one other platform

Assessment: Phase 2 exam: a practical build defended live, plus a written paper mixing this phase with everything before it

---

PHASE 3: UNREAL ENGINE & ADVANCED PROGRAMMING (MONTHS 7-9, WEEKS 27-39)

Master Unreal Engine, C++ game programming, graphics programming, and advanced game systems.

Months 7-8: Unreal Engine Mastery (Weeks 27-36)

Unreal Engine Fundamentals

```
  Topics:
    - Unreal Engine philosophy vs Unity
    - UE5 interface and workflow
    - Blueprints visual scripting
    - Actor and component system
    - Level design in Unreal
    - Materials and material instances
    - Lighting with Lumen
    - Nanite virtualized geometry
    - World Partition system
    - Niagara particle system
    - Physics with Chaos
    - World building tools
  Projects built:
    - First Unreal project setup
    - Blueprint character controller
    - Environment with Nanite and Lumen
    - Particle effects showcase
  Practice: Create 10 Unreal Blueprint systems
C++ Game Programming
  Topics:
    - C++ in Unreal Engine
    - Unreal coding standards
    - UCLASS, UPROPERTY, UFUNCTION
    - Actor lifecycle in C++
    - Components in C++
    - Gameplay framework classes
    - Input handling in C++
    - Collision and physics in code
    - Unreal's reflection system
    - Debugging C++ in Unreal
    - Blueprint and C++ interaction
    - Performance profiling
  Projects built:
    - C++ character class
    - Weapon system in C++
    - AI controller in C++
    - Custom game mode
  Practice: Convert 10 Blueprint systems to C++
Advanced Unreal Systems
  Topics:
    - Animation blueprints and state machines
    - Control Rig and IK
    - Procedural animation
    - Behavior trees in Unreal
    - Environmental Query System (EQS)
    - Smart objects
    - Level streaming and world composition
    - Sequencer for cinematics
    - Audio with MetaSounds
    - UI with UMG and Slate
    - Common UI framework
    - Gameplay Ability System (GAS)
  Projects built:
    - Complex animation system
    - Advanced AI with behavior trees
    - Cinematic sequence
    - Complete UI system
  Practice: Master 10 advanced Unreal systems
Graphics Programming
  Topics:
    - Rendering pipeline overview
    - Shader programming basics
    - HLSL for Unreal
    - Custom materials and shaders
    - Post-processing effects
    - Render targets
    - Compute shaders
    - Ray tracing basics
    - Global illumination techniques
    - LOD systems
    - Texture streaming
    - GPU profiling
  Projects built:
    - Custom shader effects
    - Post-processing pipeline
    - Procedural materials
    - Performance optimization study
  Practice: Create 15 custom shaders
```

```
  Engine Architecture
    Topics:
      - Game engine architecture overview
      - Memory management in games
      - Object pooling patterns
      - Resource management
      - Threading in game engines
      - Job systems
      - Entity Component Systems (ECS)
      - Custom engine modules
      - Plugin development
      - Engine modification
      - Source control for large projects
      - Build systems and CI/CD
    Projects built:
      - Custom Unreal plugin
      - Memory optimization system
      - Multithreaded game system
      - Engine feature extension
    Practice: Understand and modify engine code

Month 9: Multiplayer & Networking (Weeks 37-39)
  Multiplayer Fundamentals
    Topics:
      - Networking basics for games
      - Client-server architecture
      - Peer-to-peer vs dedicated servers
      - Unity Netcode for GameObjects
      - Mirror networking
      - Photon PUN2
      - Network synchronization
      - Lag compensation
      - Client prediction
      - Server reconciliation
      - Interest management
      - Cheat prevention
    Projects built:
      - LAN multiplayer game
      - Online PvP arena
      - Co-op puzzle game
      - Battle royale prototype
    Practice: Build 5 different multiplayer games
  Advanced Multiplayer Systems
    Topics:
      - Unreal replication system
      - RPCs and ownership
      - State synchronization
      - Deterministic physics
      - Rollback netcode
      - Server authoritative systems
      - Matchmaking systems
      - Lobby implementation
      - Voice chat integration
      - Dedicated server setup
      - Cloud hosting (AWS, Azure)
      - Load balancing
    Projects built:
      - Competitive multiplayer FPS
      - MMO prototype with 100 players
      - Dedicated server deployment
      - Matchmaking system
    Practice: Deploy 3 games with dedicated servers
  Phase 3 Capstone Project
    Topics:
      - Large project management
      - Team collaboration tools
      - Asset pipeline
      - Performance targets
      - Platform certification requirements
      - Submission preparation
    Projects built:
      - PHASE 3 CAPSTONE: AAA-Quality Game Vertical Slice
      - Create 15-minute vertical slice of AAA-quality game
      - Use Unreal Engine with C++
      - Include multiplayer component
      - Target next-gen quality
    Assessment: Phase 3 exam: a practical build defended live, plus a written paper mixing
    this phase with everything before it
```

PHASE 4: THE FINALE (MONTH 10, WEEKS 40-44)

The capstone month: spec, build, ship and defend, then the final exam that decides the certificate.

Month 10: Capstone and the Final Exam (Weeks 40-44)
Capstone Spec and Setup
Topics:
- Choosing the capstone: a complete polished game in Unity or Unreal: a 2D gem, a 3D experience or a small multiplayer arena
- A one-page spec: scope, milestones, stack
- Repository and skeleton ready on day one
- Instructor sign-off before the build begins
Projects built:
- Approved capstone spec plus the running skeleton
Practice: Pitch the spec to the batch and absorb one hard question
Capstone Build
Topics:
- Two focused weeks in vertical slices
- Instructor checkpoints and honest scope cuts
- Using the whole course: engine depth, C# or C++ craft, game AI or networking, and the polish pass that makes it feel finished
- Daily commits and an always-working build
Projects built:
- The capstone, feature-complete with version control
Practice: A working build at the end of every session
Ship and Polish
Topics:
- The finishing pass: edge cases, errors, documentation
- Playtested and packaged: builds that run on machines that are not yours
- A README worth reading and a demo worth watching
- A full-course spiral review before the exam
Projects built:
- The capstone shipped, documented and rehearsed
Practice: Two mock demos, each tighter than the last
Demo Day and the Final Exam
Topics:
- Presenting the capstone: live demo plus the hardest bug story
- The honest map of next roads: gameplay engineering, engine and graphics specialization, or indie shipping
- Where our other courses continue the journey
Projects built:
- Demo day presentation delivered to the batch
Assessment: FINAL EXAM: a practical build plus a written paper with questions mixed from every phase. Passing earns the certificate; falling short earns a focused revision plan and a free retest

PROJECTS THE STUDENT BUILDS AND KEEPS

- Phase 1: complete 2D games with art, audio and polish
- Phase 2: 3D Unity projects with game AI and a mobile build
- Phase 3: Unreal/C++ builds and a working multiplayer prototype
- Phase 4: the capstone game, playtested, packaged and defended

Total projects: 15+ finished games and prototypes, crowned by a polished capstone

SKILLS THE STUDENT WILL HAVE AT THE END

- Game design fundamentals: loops, feel and scope discipline
- Unity and C# from complete 2D games to 3D with game AI
- Unreal Engine with C++: fundamentals, graphics and engine architecture
- Multiplayer: networking fundamentals through a working online prototype
- The polish craft: art integration, audio, playtesting and packaging

HOW A TYPICAL WEEK IS SPLIT

Live classes: 2 live one-hour classes per week, coding along with the instructor
Homework: A problem set after every class, and a mixed-review assignment at the end of every month
Practice: 4-6 hours of building between classes
Review: Every submission reviewed with written feedback; recurring gaps reopened in class

SUPPORT INCLUDED

Doubt support: WhatsApp doubt support between classes
Progress updates: Honest monthly progress reviews: what is solid, what is wobbly, and the plan for the wobble

CERTIFICATION DETAIL

  Completion: Certificate from Modern Age Coders, awarded on passing the final exam. Fall short
    and there is focused revision and a free retest: the certificate certifies knowledge, not
    attendance

WHERE THIS CAN LEAD

  - Gameplay engineering roles in Unity or Unreal studios
  - Engine, graphics and tools specializations for the systems-minded
  - Indie shipping: the capstone is your first release candidate
  - Our C++ course deepens the systems half of the Unreal road

EARNING POTENTIAL (share only if asked, and never promise it)

  Market context: The ranges below are general market salary bands for these roles in India and
    abroad, drawn from public industry data. They are shown for career context only and are not a
    promise or guarantee of income. Actual pay depends on your skills, experience, location, and
    the job market.
  Growing roles: Rs 4-8 LPA (Junior Game Developer)
  Experienced roles: Rs 8-15 LPA (Game Developer); Rs 12-25 LPA (Senior Game Developer); Rs
    20-40+ LPA (Lead Developer/Technical Director)
  Freelance: Rs 2,000-10,000/hour based on expertise
  International: $60k-150k USD (higher in AAA studios)

COMMON QUESTIONS ABOUT THIS COURSE

  For anything about cost, use PART 4 and RULE 1. Do not quote two regions.

  Q: What does this game development course cover?
  A: Game design and complete 2D games in Unity with C# first, then 3D development, advanced
  C#, game AI, mobile and cross-platform shipping. Then the second engine: Unreal fundamentals,
  C++ game programming, graphics programming and engine architecture, followed by multiplayer
  networking through a working online prototype. A finale month ships a polished capstone game
  and sits the final exam.

  Q: How long does it take to learn game development properly?
  A: Ten months of teaching at 2 live classes a week plus 4 to 6 hours of practice, with two
  more months in hand for learners who need them. The three teaching phases build the skill and
  its real-world application; the finale month ships a capstone and sits the final exam.

  Q: How am I assessed? Is the certificate just for attending?
  A: No. Problem sets follow every class with written feedback, monthly reviews deliberately
  mix new material with earlier topics, each phase ends with a cumulative exam, and the course
  ends with a final exam: a practical build plus written questions from the whole syllabus.
  Passing earns the certificate; falling short earns focused revision and a free retest.

  Q: Unity or Unreal: which should I learn?
  A: Both, in the order this course teaches them. Unity with C# is the gentler engine to learn
  deeply and dominates mobile and indie work; Unreal with C++ carries AAA and high-end 3D.
  Studios increasingly expect depth in one and literacy in the other, which is exactly the
  profile this course builds: Unity depth first, then a real Unreal phase, and you graduate
  knowing which one fits each project.

  Q: Do I need a powerful computer?
  A: Not for most of the course: the 2D and 3D Unity phases run happily on ordinary laptops.
  The Unreal phase is where hardware starts to matter, a mid-range graphics card makes it
  comfortable, and we tell you the honest requirements before that phase begins so nothing
  surprises you. No phase requires a high-end machine.

  Q: Can I try a class before enrolling?
  A: Yes, a free demo class with no commitment: book at learn.modernagecoders.com/contact or
  message us on WhatsApp at +91 91233 66161. (Agent note: the free demo is a waiting list with
  no fixed date. The Priority Live Demo is a guaranteed class today or tomorrow, booked at
  https://learn.modernagecoders.com/priority-demo . Offer both, as RULE 3 says.)

  Q: Are classes live or recorded?
  A: Live, always: small groups with a real instructor reading your actual code, never
  pre-recorded videos.

  To enrol, message Shivam Sir on +91 9123366161 or send the parent this link: https://learn.modernagecoders.com/courses/game-development-complete-masterclass-college
  For a demo: the Priority Live Demo (guaranteed, today or tomorrow) is booked at
  https://learn.modernagecoders.com/priority-demo . The free demo is a waiting list with no fixed date.

==========
COURSE 65 OF 137: GAME DEVELOPMENT FOR KIDS: SCRATCH, ROBLOX AND MINECRAFT
==========

Course link: https://learn.modernagecoders.com/courses/game-development-masterclass-for-kids
Subject area: Kids Coding
Designed for: Kids
Who can join: Complete beginner, ages 8 to 12
Course length: 6-8 months (26-32 weeks)
Time needed: 2 live classes/week + 2-3 hours practice
Certificate: Certificate from Modern Age Coders, awarded on passing the final exam

PRICE FOR THIS COURSE (quote only the one that applies to the person asking)
  In India, per month: group Rs 1,499, mini batch Rs 2,999, one to one Rs 4,999
  In Canada, per month: group CAD 140, one to one CAD 210
  Anywhere else, per month: group $100, one to one $150
  Classes: group and mini batch two live classes a week, eight a month; one to one in India one live class a week, four a month; one to one outside India two live classes a week, eight a month. Each class is one hour.

WHAT THIS COURSE IS

  Game development course for kids aged 8-12: live online classes building real games in Scratch, then Roblox and Minecraft worlds, in 6-8 months.

  In one line: From playing games to making them: real Scratch games first, then Roblox and Minecraft worlds, finished and shown off in six honest months.

ABOUT THE PROGRAMME

  Every child who loves games has the same secret wish: to make one. This live online course grants it properly for ages 8 to 12: game logic learned in Scratch, where scores, lives, levels and enemy behavior are built by the child, then complete 2D games polished until friends ask to play again, and finally the leap into 3D worlds with Roblox Studio and coded Minecraft builds, plus first multiplayer fun. Finishing is the discipline: every month ends with a playable build and a mixed challenge that quietly revises earlier skills, and the course ends with a capstone game, planned, built, playtested and presented at demo day. There is no monetization talk, no in-game purchase strategy and no chatbot dependence in this course; children this age should be building skill and joy, and that is the whole syllabus. The pace is honest and kid-sized: six months at two live classes a week plus two to three hours of playful practice, with two more months in hand when needed. A final exam, capstone demo plus a friendly viva, decides the certificate, with a free retest after revision. Real games, real pride, depth over dopamine.

WHAT MAKES THIS COURSE DIFFERENT

  - Finished beats fancy: every month ends with a playable build a child can demo at dinner
  - The kid-favorite trio done properly: Scratch mastery first, then Roblox Studio and coded Minecraft
  - Game design taste taught young: fairness, difficulty and fun, judged out loud kindly
  - No monetization talk, no purchase mechanics, no chatbot accounts: skill and joy only
  - An honest 6-month arc with 2 months in hand: nobody is rushed
  - Real assessment, gently done: monthly mixed challenges and a final capstone exam with a free retest

THE LEARNING PATH, STEP BY STEP

  Phase 1: Game logic in Scratch (Months 1-2): mechanics, scoring, enemies and complete first games
  Phase 2: 2D mastery (Months 3-4): polish, levels, game feel and bigger builds
  Phase 3: 3D worlds and the finale (Months 5-6): Roblox Studio, coded Minecraft, first multiplayer, and the capstone exam

WHAT A STUDENT NEEDS BEFORE STARTING

  Coding experience: None. Game logic is taught from the first block
  Reading: Comfortable reading simple instructions
  Equipment: A computer or laptop with a stable internet connection; Scratch, Roblox Studio and Minecraft coding tools are free to build with (accounts set up with a parent)
  Age: 8 to 12. Batches are grouped by age
  Time commitment: 2 live classes plus 2-3 hours of playful practice a week

WHO THIS COURSE IS FOR

  Game lovers: Children who play games and have started saying "I could make this better"
  Complete beginners: Kids with zero coding background: Scratch makes the start joyful
  Roblox minecraft fans: Children who live in those worlds and are ready to build them instead
  Future creators: Kids who will grow into our dedicated Roblox, Minecraft and Python courses
  Finishers in training: Children who start many things; this course teaches the pride of finishing

FULL CURRICULUM, WEEK BY WEEK

This is the complete teaching plan. Parents can ask about any week.

PHASE 1: GAME LOGIC IN SCRATCH (MONTHS 1-2, WEEKS 1-8)

The mechanics under every game, built by the child: movement, scoring, enemies, and complete first games that work.

- Months 1-2: Scratch Game Mastery (Weeks 1-8)
  - Introduction to Game Development
    - Topics:
      - What makes a game fun?
      - Types of games: arcade, puzzle, adventure, RPG
      - Game development process overview
      - Introduction to Scratch for games
      - Scratch interface for game makers
      - Sprites as game characters
      - Backgrounds and game worlds
      - Basic movement: arrow keys and WASD
      - Collision detection basics
      - Game coordinates (X and Y)
      - Your first playable game
      - Sharing games with friends
    - Projects built:
      - Catch the falling objects game
      - Simple maze game
      - Pet virtual game
      - Two-player tag game
    - Practice: Daily: Play and analyze 2 games, create 1 game mechanic
  - Game Mechanics & Player Control
    - Topics:
      - Player movement patterns
      - Jump mechanics and gravity
      - Speed and acceleration
      - Power-ups and collectibles
      - Enemy movement and AI basics
      - Health and lives system
      - Score and points tracking
      - Timer and countdown mechanics
      - Game over and restart
      - Win conditions
      - Difficulty levels
      - Checkpoints and saving progress
    - Projects built:
      - Platformer with jumping
      - Racing game with timer
      - Shooting game with score
      - Puzzle with levels
    - Practice: Create 10 different game mechanics
    - Assessment: Month 1 check: build a small game mechanic live, plus a fun take-home challenge
  - Advanced Scratch Game Development
    - Topics:
      - Scrolling backgrounds
      - Multiple levels design
      - Boss battles creation
      - Inventory systems
      - Dialog and storytelling
      - Cut scenes and intros
      - Sound effects and music
      - Particle effects with clones
      - Advanced animations
      - Cloud variables for high scores
      - Multiplayer with cloud data
      - Publishing and sharing games
    - Projects built:
      - Multi-level adventure game
      - RPG with inventory
      - Battle arena game
      - Story-driven game
    - Practice: Complete 5 advanced Scratch games
  - Introduction to GDevelop
    - Topics:
      - GDevelop interface tour
      - Objects and behaviors
      - Events system in GDevelop
      - Physics engine basics
      - Animations and sprites

- Sound and music integration
- Touch controls for mobile
- Scene management
- Variables and game logic
- Exporting games
- HTML5 game publishing
- Mobile game basics

Projects built:
- Physics puzzle game
- Endless runner
- Tower defense game
- Mobile tap game

Practice: Create 5 games in GDevelop

Assessment: Month 2 check: a complete mini-game demoed live, with challenge questions reaching back to month 1

PHASE 2: 2D GAME MASTERY (MONTHS 3-4, WEEKS 9-17)

From working to wonderful: levels, polish, game feel and bigger 2D builds that friends genuinely want to play.

Months 3-4: Bigger, Better 2D Games (Weeks 9-17)

Construct 3 Game Engine

Topics:
- Construct 3 interface
- Behaviors and effects
- Event sheets mastery
- Layouts and layers
- Sprite animations
- Tilemaps for levels
- Pathfinding for enemies
- Line of sight behavior
- Platform behavior advanced
- Mobile optimization
- Touch and gesture controls
- Debugging tools

Projects built:
- Zelda-style adventure
- Angry Birds clone
- Match-3 puzzle game
- Stealth game

Practice: Build 8 different game genres

Game Art & Animation

Topics:
- Pixel art basics
- Character design principles
- Animation fundamentals
- Background creation
- Tile sets design
- UI elements design
- Color theory for games
- Free art resources
- Piskel for pixel art
- Sound effect creation
- Music for games
- Asset optimization

Projects built:
- Design game character set
- Create animated sprites
- Design full game tileset
- Complete game art package

Practice: Create art for 5 games

Mobile Game Development

Topics:
- Mobile game design principles
- Touch control optimization
- Screen size adaptation
- Performance optimization
- Accelerometer controls
- Swipe and gesture mechanics
- Mobile UI/UX design
- Ad integration concepts
- App store preparation
- Testing on devices
- Analytics basics

Projects built:
- Mobile endless runner
- Puzzle game for phones

```
        - Casual tap game
        - Mobile multiplayer game
      Practice: Optimize 5 games for mobile
    GameMaker Studio Basics
      Topics:
        - GameMaker interface
        - GML Visual scripting
        - Rooms and objects
        - Sprites and animations
        - Collision systems
        - Camera and views
        - Particle systems
        - Sound management
        - Save systems
        - Menu creation
        - Polish and juice
        - Publishing options
      Projects built:
        - Retro arcade game
        - Metroidvania demo
        - Bullet hell shooter
        - Roguelike dungeon
      Practice: Master 10 GameMaker features
    Phase Review and Showcase
      Topics:
        - Portfolio preparation
        - Game trailers creation
        - itch.io publishing
        - Game documentation
        - Player feedback integration
        - Bug fixing strategies
        - Game updates and patches
      Projects built:
        - Polish best 2D game
        - Create game trailer
        - Publish to itch.io
        - Get player feedback
      Assessment: Phase check: showcase a polished 2D game, plus a mixed challenge spanning
      months 1-4

----------------------------------------------------------------
PHASE 3: 3D WORLDS AND THE FINALE (MONTHS 5-6, WEEKS 18-26)
----------------------------------------------------------------
The leap kids dream about: Roblox Studio worlds, coded Minecraft builds, first multiplayer
fun, and the capstone presented at demo day.

  Months 5-6: Roblox, Minecraft and the Capstone (Weeks 18-26)
    Roblox Studio Fundamentals
      Topics:
        - Roblox Studio interface
        - Parts and models
        - Terrain editor
        - Basic scripting with blocks
        - GUI creation
        - Character customization
        - Tools and weapons
        - Game passes creation
        - Team create feature
        - Publishing to Roblox
        - Roblox community
      Projects built:
        - Obby (obstacle course)
        - Tycoon game
        - Racing game
        - Battle royale map
      Practice: Create 5 Roblox experiences
    Advanced Roblox Development
      Topics:
        - Advanced building techniques
        - Scripting game mechanics
        - Datastores for saving
        - Leaderboards and stats
        - Custom animations
        - Particle effects
        - Lighting and atmosphere
        - Sound regions
        - NPCs and AI
        - Vehicle systems
        - Trading systems
```

- Group games
    Projects built:
      - RPG with quests
      - Simulator game
      - Horror experience
      - Social hangout game
    Practice: Master 15 Roblox features
  Minecraft Modding & Creation
    Topics:
      - Minecraft Education Edition
      - Command blocks mastery
      - Redstone mechanics
      - Custom maps creation
      - Adventure mode design
      - Resource packs basics
      - Function files
      - Custom structures
      - Minecraft marketplace
      - Server creation basics
      - Minigames design
      - Parkour map creation
    Projects built:
      - Adventure map with story
      - Minigame collection
      - Parkour challenge map
      - Survival challenge map
    Practice: Build 5 Minecraft experiences
  Unity with Visual Scripting
    Topics:
      - Unity Hub and installation
      - Unity interface basics
      - GameObject and components
      - Visual scripting with Bolt
      - Basic 3D movement
      - Physics and collisions
      - Lighting basics
      - Terrain creation
      - Asset store usage
      - UI in Unity
      - Build settings
      - WebGL publishing
    Projects built:
      - 3D platformer
      - First-person explorer
      - Ball rolling game
      - Simple VR experience
    Practice: Complete 3 Unity projects
  Capstone and the Final Exam
    Topics:
      - Choosing final project
      - Game design document
      - Production planning
      - Asset creation pipeline
      - Testing and debugging
      - Publishing preparation
      - Marketing basics
      - Community building
    Projects built:
      - THE CAPSTONE: an original game in the child's chosen world, Scratch, Roblox or Minecraft,
        playtested and presented at demo day
    Assessment: FINAL EXAM: capstone demo plus a friendly viva and a mixed quiz from the
    whole course. Passing earns the certificate; a child who falls short gets focused
    revision and a free retest

PROJECTS THE STUDENT BUILDS AND KEEPS

- Months 1-2: complete first Scratch games with scores, lives and enemies
- Months 3-4: polished 2D games with levels, difficulty curves and juice
- Months 5-6: a Roblox world, a coded Minecraft build, first multiplayer fun, and the capstone
  at demo day

Total projects: 15+ playable games and worlds, crowned by a capstone presented at demo day

SKILLS THE STUDENT WILL HAVE AT THE END

- Game logic: movement, collision, scoring, lives, levels and enemy behavior
- Scratch mastery: complete, polished games built independently
- World building: Roblox Studio basics and coded Minecraft creations
- Design taste: fairness, difficulty and fun, judged and fixed

- Finishing: planning, building, playtesting and presenting

HOW A TYPICAL WEEK IS SPLIT

Live classes: 2 live one-hour classes per week, building along with the teacher
Homework: A small game-build after every class, and a mixed challenge at the end of every month
Practice: 2-3 hours of playful practice between classes
Review: Every build reviewed with teacher feedback; wobbly skills reopened in class

SUPPORT INCLUDED

Doubt support: WhatsApp doubt support between classes, so no child stays stuck and discouraged
Progress updates: Regular progress notes to parents: what was built, what comes next, and how to encourage practice

CERTIFICATION DETAIL

Completion: Certificate from Modern Age Coders, awarded on passing the final exam, a capstone demo plus a friendly viva. A child who falls short gets focused revision and a free retest: the certificate certifies skills, not attendance

WHERE THIS CAN LEAD

- Roblox Game Coding: deeper Lua scripting for the Roblox-obsessed
- Minecraft Coding: more automation and invention inside Minecraft
- Python for Kids: the typed-code step, entered with strong logic
- Kids Coding journey: the full block-to-code path if they want everything
- Family fame: the household now has a game developer

COMMON QUESTIONS ABOUT THIS COURSE

For anything about cost, use PART 4 and RULE 1. Do not quote two regions.

Q: What games will my child actually make?
A: Fifteen-plus playable builds across six months: complete Scratch games with scores, lives and enemies in the first two months, polished 2D games with levels and difficulty curves by month four, then a Roblox Studio world, a coded Minecraft build and first multiplayer fun, ending with a capstone game in the child's chosen world, playtested and presented at demo day.

Q: What age is right for this course?
A: Ages 8 to 12, with batches grouped by age. Eight-year-olds thrive in the Scratch months and grow into the 3D tools; eleven and twelve-year-olds move faster and go deeper in Roblox and Minecraft. No coding background is needed.

Q: How long does it take a child to learn game development?
A: Six months at 2 live classes a week plus 2 to 3 hours of playful practice takes a child from first mechanic to a demo-day capstone. The course keeps two more months in hand for children who need more repetition, no rushing and no penalty. The first working game exists within the first month.

Q: How is my child assessed? Is the certificate just for attending?
A: No, and it is all gentle: a small build after every class, a mixed challenge at the end of every month that revisits earlier skills, and a final exam at the end, a capstone demo plus a friendly viva and short quiz. Passing earns the certificate; a child who falls short gets focused revision and a free retest.

Q: Does this course talk about making money from games?
A: No, deliberately. There is no monetization talk, no in-game purchase mechanics and no marketing lessons for children; those topics do not belong at 8 to 12. The course is about skill and joy: building games worth playing and finishing what you start. Sharing happens safely, with parent-managed accounts.

Q: Are Roblox and Minecraft really educational?
A: As building tools, genuinely yes: Roblox Studio teaches world design and first scripting, and coded Minecraft teaches logic and automation, both on platforms children already love, which makes the motivation free. The course uses them as classrooms, with accounts set up alongside a parent and sharing kept safe.

Q: Is any paid software needed?
A: No. Scratch is free, Roblox Studio is free to build with, and the Minecraft coding tools used in class are free. Any reasonably recent computer or laptop is enough.

Q: Is there a free trial class?
A: Yes, a free demo class with no commitment: book at learn.modernagecoders.com/contact or message us on WhatsApp at +91 91233 66161. Your child will build a tiny game mechanic inside the demo itself. (Agent note: the free demo is a waiting list with no fixed date. The

Priority Live Demo is a guaranteed class today or tomorrow, booked at
https://learn.modernagecoders.com/priority-demo . Offer both, as RULE 3 says.)

Q: Are classes live or recorded?
A: Live, always: small groups with a real teacher, never pre-recorded videos. Children build during class and get unstuck on the spot, which is exactly what keeps game-making joyful instead of frustrating.

To enrol, message Shivam Sir on +91 9123366161 or send the parent this link: https://learn.modernagecoders.com/courses/game-development-masterclass-for-kids
For a demo: the Priority Live Demo (guaranteed, today or tomorrow) is booked at
https://learn.modernagecoders.com/priority-demo . The free demo is a waiting list with no fixed date.

==========

COURSE 66 OF 137: GAME DEVELOPMENT FOR TEENS: UNITY, C# AND REAL SHIPPED GAMES

==========

Course link: https://learn.modernagecoders.com/courses/complete-game-development-masterclass-for-teens
Subject area: Game Development
Designed for: Teens
Who can join: Absolute beginner, ages 13 to 18
Course length: 10-12 months (40-48 weeks)
Time needed: 2 live classes/week + 3-4 hours practice
Certificate: Certificate from Modern Age Coders, awarded on passing the final exam

PRICE FOR THIS COURSE (quote only the one that applies to the person asking)
In India, per month: group Rs 1,499, mini batch Rs 2,999, one to one Rs 4,999
In Canada, per month: group CAD 140, one to one CAD 210
Anywhere else, per month: group $100, one to one $150
Classes: group and mini batch two live classes a week, eight a month; one to one in India one live class a week, four a month; one to one outside India two live classes a week, eight a month. Each class is one hour.

WHAT THIS COURSE IS

Game development course for teens aged 13-18: build and publish real 2D and 3D Unity games with C#, multiplayer basics, Blender and game design, in 10-12 months.

In one line: From playing games to shipping them: real Unity games, published where friends can actually play them, built in ten honest months.

ABOUT THE PROGRAMME

Every teenager who loves games has had the thought: I could make one of these. This live online course turns that thought into shipped games. Students aged 13 to 18 start from zero and learn game development the way it is genuinely practiced: C# and Unity, the engine behind Hollow Knight, Among Us and thousands of indie hits, with Blender for 3D assets and real game design theory underneath it all. The arc is built around finishing things. The first months produce complete 2D games, movement that feels good, enemies with real AI, menus, sound, save systems, and the phase ends with a finished game published on itch.io. The middle months move into 3D: character controllers, environments, animation with Mixamo, Blender modeling, shaders, procedural generation and optimization, ending in a complete 3D game. The later months add what makes games feel modern: multiplayer basics, mobile builds, an honest week inside Unreal Engine to understand the other side of the industry, game narrative, and accessibility, designing games more people can play. The final month is pure production: a capstone game, playtested, polished and published, presented at demo day. The pace is honest: two live classes a week plus three to four hours of practice fits this in ten months, and students who need longer take up to twelve, the class adapts. Learning is checked the honest way: homework after every class, monthly assignments mixing new questions with earlier topics, and a final exam that decides the certificate. Real knowledge, real work, real projects, depth over dopamine.

WHAT MAKES THIS COURSE DIFFERENT

- Finished beats fancy: students publish complete games on itch.io from phase 1, not endless unfinished prototypes
- One engine mastered: Unity and C# learned deeply, with an honest Unreal taste week instead of a shallow two-engine tour
- Real game design theory: flow, pacing, difficulty and ethical design, including why some games respect players and some exploit them
- Blender is in the syllabus: students model, texture and import their own 3D assets
- Accessibility and narrative get real weeks: the parts of game craft most courses skip
- Real assessment: weekly homework, mixed-review assignments every month, and a final exam that decides the certificate, with focused revision and a free retest for students who fall short

THE LEARNING PATH, STEP BY STEP

Phase 1: Complete 2D games (Months 1-3): C# through games, Unity 2D, physics, AI, UI, audio,

and a published capstone
Phase 2: 3D worlds (Months 4-6): controllers, animation, environments, Blender, shaders, procedural generation and a finished 3D game
Phase 3: Bigger systems (Months 7-8): multiplayer basics, mobile builds, an Unreal taste, AI in games, narrative and accessibility
Phase 4: Production (Months 9-10): pipeline, polish, publishing, and the final capstone shipped and presented

WHAT A STUDENT NEEDS BEFORE STARTING

Coding experience: None. C# is taught from the first variable
Computer skills: Comfortable installing software and managing files
Equipment: A computer with a stable internet connection. Unity runs on modest hardware; a dedicated graphics card helps for 3D but is not required
Age: 13 to 18. Batches are grouped by age and pace so the room always fits
Time commitment: 2 live classes plus 3-4 hours of practice a week

WHO THIS COURSE IS FOR

Players becoming makers: Teens who analyze the games they play and itch to build their own
Complete beginners: Students starting from zero: C# and Unity are taught from the first line
Finishers: Teens tired of tutorial graveyards who want complete, published games
Future engineers: Students who want serious programming skill wrapped in the most motivating subject there is
Creative all rounders: Teens who want code, art, design and storytelling in one craft

FULL CURRICULUM, WEEK BY WEEK

This is the complete teaching plan. Parents can ask about any week.

PHASE 1: COMPLETE 2D GAMES (MONTHS 1-3, WEEKS 1-12)

C# learned through games, Unity 2D mastered properly, and the phase ends the only way that matters: a finished game, published.

Month 1: Foundations Through Games (Weeks 1-4)
Welcome to Game Development
Topics:
- History of games: From Pong to Fortnite
- How games are made: The development pipeline
- Game genres: What makes each unique
- Setting up your game development environment
- Installing Unity Hub and Visual Studio
- Introduction to game engines
- Your first game: Pong in 1 hour
- Understanding game loops
- Frames, updates, and time in games
- Version control with Git for games
- Creating your game developer portfolio
Projects built:
- Pong remake
- Breakout/Arkanoid clone
- Simple clicker game
- Text adventure game
Practice: Play and analyze 3 games: write down what makes each one fun
C# for Games
Topics:
- Why C# for game development
- Variables: Storing player health, score, lives
- Data types: int, float, bool, string for games
- Game math: Vectors, positions, distances
- Functions: Creating reusable game actions
- Classes: Building game objects
- If statements: Game logic and decisions
- Loops: Spawning enemies, updating objects
- Arrays: Managing multiple enemies/items
- Lists: Dynamic game collections
- Debugging games with console logs
- Common game programming patterns
Projects built:
- Number guessing game
- Rock Paper Scissors with AI
- Simple RPG battle system
- Dice rolling game
Practice: Complete 25 C# coding challenges
Unity 2D Fundamentals
Topics:
- Unity interface mastery

- GameObjects and components
- Transform: Position, rotation, scale
- Sprites and sprite renderers
- 2D physics: Rigidbody2D and colliders
- Input system: Keyboard and mouse
- Prefabs: Reusable game objects
- Tags and layers
- Scene management
- Unity's coordinate system
- Game camera setup
- Building for different platforms

Projects built:
- Top-down shooter
- Endless runner like Temple Run
- 2D platformer basics
- Asteroids remake

Practice: Build 3 mini-games in Unity

Game Physics and Collision

Topics:
- Physics in games: Gravity, forces, velocity
- Rigidbody2D properties
- Colliders: Box, circle, polygon, edge
- Trigger vs collision detection
- OnCollisionEnter2D and OnTriggerEnter2D
- Physics materials: Bounce and friction
- Joints: Hinge, spring, fixed
- Effectors: Area, platform, point
- Raycasting for line of sight
- Optimizing physics performance
- Creating realistic movement
- Physics-based puzzles

Projects built:
- Angry Birds clone
- Pinball game
- Physics puzzle game
- Rope swing mechanics

Practice: Create 3 physics-based game mechanics

Assessment: Month 1 check: build a small physics mechanic live, plus a take-home assignment mixing everything from month 1

Month 2: Mechanics That Feel Good (Weeks 5-8)

Player Movement and Game Feel

Topics:
- Character controllers for different genres
- Platformer movement: Jump, double jump, wall jump
- Top-down movement: 8-directional, tank controls
- Side-scroller mechanics
- Mobile touch controls
- Controller/gamepad support
- Input buffering and coyote time
- Movement feel: Acceleration, deceleration
- Camera follow systems
- Parallax scrolling backgrounds
- Screen shake and juice
- Polish that makes movement fun

Projects built:
- Mario-style platformer
- Twin-stick shooter
- Racing game controls
- Fighting game inputs

Practice: Implement 5 different movement systems and tune each until it feels right

Enemy AI and Behaviors

Topics:
- Basic enemy AI patterns
- Patrol and chase behaviors
- State machines for AI
- Pathfinding basics: A* algorithm
- Line of sight detection
- Shooting and projectiles
- Enemy spawn systems
- Difficulty scaling
- Boss fight patterns
- Crowd AI and flocking
- AI debugging and visualization
- Balancing AI difficulty

Projects built:
- Pac-Man with ghost AI
- Tower defense game
- Stealth game with guards

- Boss battle system
Practice: Create 8 different enemy types
Game UI and Menus
Topics:
- Unity UI system (Canvas)
- UI elements: Buttons, text, images, sliders
- Anchoring and responsive UI
- Health bars and HUD elements
- Score and timer displays
- Main menu design
- Pause menu implementation
- Settings and options
- Inventory systems
- Dialog systems
- UI animations and transitions
- Mobile-friendly UI
Projects built:
- RPG inventory system
- Crafting interface
- Dialog tree system
- Complete menu system
Practice: Build a complete menu flow: title, pause, settings, game over
Animation and Visual Effects
Topics:
- Sprite animation basics
- Unity Animator and state machines
- Animation transitions and parameters
- Blend trees for smooth animation
- Sprite sheets and texture atlases
- Particle systems for effects
- Trail renderers
- Screen effects and post-processing
- Lighting in 2D games
- Shader basics for 2D
- Creating game juice
- Performance optimization
Projects built:
- Fully animated character
- Explosion and magic effects
- Weather system
- Animated cutscene
Practice: Add animation and effects polish to two earlier games
Assessment: Month 2 check: build an animated, juicy mechanic live, with quiz questions
reaching back to month 1

Month 3: Finish and Ship (Weeks 9-12)
Audio and Music in Games
Topics:
- Importance of game audio
- Unity's audio system
- Playing sounds and music
- 3D spatial audio
- Audio mixers and groups
- Dynamic music systems
- Sound effect creation basics
- Free audio resources
- Audio optimization
- Creating atmosphere with sound
- Audio feedback for actions
- Music synchronization
Projects built:
- Rhythm game prototype
- Dynamic soundtrack system
- 3D audio showcase
- Complete game with audio
Practice: Add sound and music to every game you have built
Level Design
Topics:
- Principles of level design
- Teaching through level design
- Difficulty curves and pacing
- Environmental storytelling
- Tilemap system in Unity
- Procedural generation basics
- Level editor tools
- Playtesting and iteration
- Secrets and collectibles
- Multiple paths and choices
- Boss arenas and set pieces

- Level design documentation
      Projects built:
        - 10-level platformer
        - Procedural dungeon generator
        - Puzzle game levels
        - Open world map
      Practice: Design 10 unique levels with a deliberate difficulty curve
    Save Systems and Progress
      Topics:
        - PlayerPrefs for simple data
        - JSON serialization
        - Binary save files
        - Profile and progress systems
        - Unlockables and achievements
        - Leaderboards implementation
        - Backup and recovery
      Projects built:
        - Complete save system
        - Achievement system
        - Local high-score table
      Practice: Add saving and unlockables to your best game
    Phase 1 Capstone: Publish Your Game
      Topics:
        - Planning a complete game
        - Scope management
        - Creating a development timeline
        - Asset lists and requirements
        - Playtesting plan
        - Publishing checklist
      Projects built:
        - CAPSTONE: a complete 2D game with levels, save system and polish
        - Published on itch.io with a proper game page
        - Playtested by classmates and family, with fixes shipped
      Practice: Send the link to five people and act on the best piece of feedback
      Assessment: Phase 1 exam: present the published game and rebuild a small mechanic live,
      with mixed questions from months 1-3

PHASE 2: 3D WORLDS (MONTHS 4-6, WEEKS 13-24)

The jump to 3D done properly: controllers, animation, environments, your own Blender assets,
shaders, procedural generation, and a finished 3D game.

  Month 4: 3D Fundamentals (Weeks 13-16)
    3D Basics in Unity
      Topics:
        - 3D vs 2D: Understanding the difference
        - 3D coordinate systems and space
        - 3D primitives: Cubes, spheres, capsules
        - Materials and textures
        - Basic shaders and rendering
        - 3D transforms and rotation
        - Cameras in 3D: Perspective vs orthographic
        - Lighting basics: Directional, point, spot
        - Shadows and quality settings
        - 3D physics: Rigidbody and colliders
        - Importing 3D models
        - ProBuilder for level design
      Projects built:
        - 3D obstacle course
        - Bowling game
        - Simple racing game
        - 3D puzzle game
      Practice: Create 5 small 3D prototypes
    3D Character Controllers
      Topics:
        - First-person controller setup
        - Third-person controller with camera
        - Character movement and physics
        - Jumping and gravity
        - Slopes and stairs
        - Moving platforms
        - Swimming mechanics
        - Flying and gliding
        - Vehicle controllers
        - Camera collision handling
        - Input smoothing
        - Controller feel and polish
      Projects built:

- FPS controller like Valorant
- Third-person like Fortnite
- Car racing mechanics
- Flight simulator controls

Practice: Build first-person and third-person controllers and tune both

3D Animation with Mixamo

Topics:

- 3D animation principles
- Humanoid vs generic rigs
- Importing animations from Mixamo
- Animation state machines
- Blend trees for movement
- Root motion
- IK (Inverse Kinematics) basics
- Animation events
- Cutscene creation with Timeline
- Performance optimization

Projects built:

- Animated player character
- Combat animation system
- Cinematic cutscene
- Dance game with mocap

Practice: Fully animate one character: idle, run, jump, attack

3D Environments and Terrain

Topics:

- 3D level design principles
- Terrain system in Unity
- Terrain painting and sculpting
- Vegetation and trees
- LOD (Level of Detail) systems
- Occlusion culling
- Light baking and probes
- Skyboxes and atmosphere
- Weather effects
- Day/night cycles
- Interior vs exterior design
- Performance optimization

Projects built:

- Open world environment
- Dungeon crawler levels
- Racing track design
- Atmospheric horror level

Practice: Design 2 contrasting 3D environments

Assessment: Month 4 check: build a small 3D scene live, plus a mixed assignment reaching back to phase 1

Month 5: The Craft Around the Code (Weeks 17-20)

Blender: Your Own 3D Assets

Topics:

- Introduction to Blender
- 3D modeling fundamentals
- Box modeling techniques
- Sculpting basics
- UV unwrapping introduction
- Texturing in Blender
- Low-poly modeling for games
- Optimization for game engines
- Exporting to Unity
- Creating game props
- Character modeling basics
- Animation in Blender

Projects built:

- Low-poly character model
- Game props collection
- Simple vehicle model
- Environment assets

Practice: Model 10 game props and import them into Unity

Game Design Theory

Topics:

- What makes games fun: Flow theory
- Core gameplay loops
- Game mechanics vs dynamics vs aesthetics
- Player motivation and rewards
- Progression systems
- Economy and balance
- Game design documentation (GDD)
- Prototyping and iteration
- Player psychology
- Addiction and ethical design

```
      - Analyzing successful games
    Projects built:
      - Game design document for your dream game
      - Progression system design
      - A written analysis of one game that respects players and one that exploits them
    Practice: Analyze and document 5 games using the theory
  Game AI and Pathfinding
    Topics:
      - Unity NavMesh system
      - NavMesh agents setup
      - Dynamic obstacles
      - Off-mesh links
      - Crowd simulation
      - Behavior trees introduction
      - State machines for complex AI
      - GOAP (Goal-Oriented Action Planning)
      - Machine learning agents basics
      - Enemy squad tactics
      - Stealth AI systems
      - AI performance optimization
    Projects built:
      - Zombie survival AI
      - Stealth game with smart guards
      - RTS unit control
      - Battle royale AI
    Practice: Build 10 AI behaviors
  Shader Graph and Visual Polish
    Topics:
      - Introduction to shaders
      - Shader Graph in Unity
      - Vertex and fragment shaders
      - Surface shaders
      - HLSL basics
      - Creating custom materials
      - Water shaders
      - Toon/cel shading
      - Dissolve and fade effects
      - Hologram effects
      - Outline shaders
      - Performance considerations
    Projects built:
      - Stylized water shader
      - Toon shaded game
      - Sci-fi hologram effects
      - Custom art style game
    Practice: Create 15 custom shaders
    Assessment: Month 5 check: a small AI or shader build live, plus a mixed quiz over
    months 1-5

Month 6: Finish a 3D Game (Weeks 21-24)
  Procedural Generation
    Topics:
      - Procedural generation concepts
      - Random vs seeded generation
      - Perlin noise for terrain
      - Dungeon generation algorithms
      - Infinite world generation
      - Procedural textures
      - Procedural meshes
      - L-systems for vegetation
      - Wave function collapse
      - Minecraft-style voxel worlds
      - Procedural quests and stories
      - Balancing randomness
    Projects built:
      - Minecraft-style terrain
      - Roguelike dungeon generator
      - Infinite runner levels
      - No Man's Sky planets
    Practice: Generate 10 different content types
  Optimization and Profiling
    Topics:
      - Unity Profiler mastery
      - Frame rate optimization
      - Draw call batching
      - Texture atlasing
      - Mesh combining
      - LOD implementation
      - Object pooling
```

- Coroutine optimization
- Job System and Burst Compiler
- ECS introduction
- Mobile optimization deep dive
- Memory management

Projects built:
- Optimize existing game
- 1000 enemy system
- Mobile performance test
- VR performance optimization

Practice: Optimize all projects to 60 FPS

3D Game Build Week

Topics:
- Scoping a 3D game you can finish in two weeks
- Blocking out the level before decorating it
- Bringing it together: controller, AI, UI, audio, saves
- Your own Blender assets in a real build
- Playtesting: watching a stranger play in silence
- The finish-line checklist

Projects built:
- A complete small 3D game: platformer, dungeon crawler or racing game

Practice: A working build at the end of every session

Phase 2 Capstone and Review

Topics:
- Polish pass: juice, sound, menus, feel
- Publishing the 3D game on itch.io
- Writing the game page like a small studio would
- A review week shaped by what the batch found hard
- Reading each other's projects: kind, useful feedback

Projects built:
- Phase capstone: the finished 3D game, published and playtested

Practice: Ship one improvement based on player feedback

Assessment: Phase 2 exam: capstone walkthrough plus a written mixed review spanning phases 1 and 2

PHASE 3: MULTIPLAYER, MOBILE AND THE WIDER CRAFT (MONTHS 7-8, WEEKS 25-32)

The systems that make games feel modern: multiplayer basics, mobile builds, an honest week inside Unreal, AI in game development, narrative, and accessibility.

Month 7: Multiplayer and Mobile (Weeks 25-28)

Multiplayer Basics

Topics:
- Networking fundamentals for games
- Client-server vs peer-to-peer
- Unity Netcode for GameObjects
- Setting up multiplayer
- Player spawning and management
- Synchronizing transforms
- RPCs (Remote Procedure Calls)
- Network variables
- Lag compensation
- Client prediction
- Server authority
- Cheating prevention basics

Projects built:
- 2-player Pong online
- Multiplayer racing game
- Co-op platformer
- Simple battle arena

Practice: Add multiplayer to 5 games

Multiplayer Systems in Practice

Topics:
- Netcode for GameObjects: Unity's modern networking
- Lobbies and rooms: getting friends into one game
- Synchronizing movement without jitter
- Client prediction and lag, explained honestly
- Simple matchmaking for small games
- Hosting options for student projects, free tiers first
- Testing multiplayer with the batch as your players
- Why 100-player games are a different profession, and what they add

Projects built:
- A small Among Us-style social game for the batch
- Two-player versus game with a lobby

Practice: Host a batch play-session of your multiplayer build and fix what broke

Mobile Game Builds

Topics:
- Mobile game market overview

- Touch input and gestures
- Accelerometer and gyroscope
- Mobile UI best practices
- Performance optimization for mobile
- Battery and thermal management
- Android build setup
- iOS build requirements
- Installing your game on your own phone, the honest thrill

Projects built:
- Endless runner built for touch
- Your best 2D game running on an Android phone

Practice: Optimize one game until it runs smoothly on a mid-range phone

Leaderboards, Achievements and Saves Online

Topics:
- What game services are: the invisible half of modern games
- Building an online leaderboard for your own game
- Achievements that reward mastery, not grind
- Cloud saves: progress that follows the player
- Simple analytics: which level do players quit on?
- Privacy first: what a game should never collect, especially from kids
- Wiring one service into your published game

Projects built:
- Global leaderboard added to your best game
- Achievement set designed and implemented

Practice: Use your own analytics to find and fix your game's quit-point

Assessment: Month 7 check: a small multiplayer or mobile build live, plus mixed questions from earlier phases

Month 8: The Wider Craft (Weeks 29-32)

An Honest Week in Unreal Engine

Topics:
- Why Unreal: Fortnite, Valorant, and AAA games
- Unreal Engine installation and setup
- Editor interface navigation
- Blueprints visual scripting
- Creating your first Blueprint
- Variables and functions in Blueprints
- Event graph and construction script
- Actor classes and components
- Level design in Unreal
- Lighting and atmosphere
- Materials and textures
- Project settings and configuration
- What transfers from Unity, and what to learn when you need Unreal for real

Projects built:
- FPS prototype in Unreal
- Racing game conversion
- Puzzle game with Blueprints
- Environment showcase

Practice: Rebuild one small Unity mechanic in Unreal Blueprints

AI in Game Development

Topics:
- Where AI genuinely helps a small team: ideas, placeholder assets, dialogue drafts
- AI-assisted NPC dialogue, with a human editor in charge
- Unity ML-Agents: training a simple agent to play
- Procedural content with constraints: generated but designed
- What AI tools cannot do: taste, tuning and game feel
- Where an AI account is needed, it is set up with a parent
- Crediting tools honestly in your game page

Projects built:
- An NPC with AI-drafted, human-edited dialogue
- A simple ML-Agents experiment that learns a behavior

Practice: One feature built twice: by hand and AI-assisted, with notes on the difference

Game Narrative and Writing

Topics:
- Interactive storytelling
- Branching narratives
- Character development
- World building
- Dialog writing
- Environmental storytelling
- Cutscene planning
- Voice acting direction
- Localization considerations
- Narrative tools (Yarn, ink)
- Player choice systems
- Emotional design

Projects built:

        - Narrative-driven game
        - Branching story system
        - Character backstories
        - World bible creation
      Practice: Write game narratives
    Accessibility and Inclusive Design
      Topics:
        - Accessibility importance
        - Visual accessibility
        - Audio accessibility
        - Motor accessibility
        - Cognitive accessibility
        - Colorblind modes
        - Subtitle systems
        - Control remapping
        - Difficulty options
        - Inclusive character design
        - Cultural sensitivity
        - Testing with disabled gamers
      Projects built:
        - Accessibility audit
        - Accessibility features implementation
        - Inclusive game design
        - Testing documentation
      Practice: Make all games accessible
      Assessment: Phase 3 exam: apply an accessibility audit to your own game live, plus a
      cumulative mixed paper from phases 1-3

PHASE 4: PRODUCTION AND THE CAPSTONE (MONTHS 9-10, WEEKS 33-40)

The final month pair runs like a small studio: pipeline, polish, publishing, and a capstone
game shipped and presented at demo day.

  Month 9: Studio Habits (Weeks 33-36)
    How Real Games Get Made
      Topics:
        - The production phases: concept, prototype, vertical slice, polish, ship
        - The vertical slice: one perfect level before forty rough ones
        - Scoping: why most games die of ambition, not difficulty
        - Task boards with Trello: seeing the work
        - Version control habits for game projects
        - Playtesting as a process, not an event
        - Bug triage: ship-stoppers, annoyances and wishes
        - Milestones a real team would recognize
      Projects built:
        - A one-page production plan for your capstone, with milestones and a task board
      Practice: Run your week like a studio: board updated daily, one milestone hit
    Polish and Game Feel Week
      Topics:
        - The juice checklist: screenshake, particles, sound, feedback
        - Menus and onboarding: the first 60 seconds decide everything
        - Difficulty tuning with real playtesters
        - Performance pass: stable frame rate as a feature
        - Bug triage: what to fix, what to cut, what to ship
        - Before-and-after: recording the polish difference
      Projects built:
        - A measured polish pass on your best game, with before/after footage
      Practice: Run three playtests and ship fixes from each
    Publishing on itch.io and Game Jams
      Topics:
        - itch.io done properly: where indie careers actually start
        - Writing a game page that makes strangers click play
        - Screenshots, GIFs and the thirty-second pitch
        - Game jams: the fastest way to grow as a developer
        - Jam survival: scope, sleep and shipping anyway
        - Age ratings and content honesty for your own games
        - The road beyond: what Steam and app stores ask for, told honestly
        - Handling feedback and reviews with a straight back
      Projects built:
        - All three finished games live on a polished itch.io profile
        - One weekend game-jam entry, built and submitted
      Practice: Enter one online game jam during the course
    Portfolio and Devlog
      Topics:
        - A game developer portfolio: playable links beat screenshots
        - Writing a short devlog: what you built, what fought back
        - Recording clean gameplay GIFs and clips
        - Your itch.io profile as the portfolio hub

```
          - Explaining one system deeply: the interview habit
          - Curating: your best three games, not all twenty
        Projects built:
          - Portfolio page with playable links, clips and one deep-dive writeup
        Practice: Publish one devlog post about your favorite build
        Assessment: Month 9 check: portfolio review plus a mixed assignment spanning the whole
        course so far

    Month 10: The Capstone (Weeks 37-40)
      Capstone Pre-Production
        Topics:
          - Choosing the capstone: your strongest idea, scoped to three weeks
          - The one-page design document: concept, core loop, scope
          - What makes it yours: the one unique element worth polishing
          - Technical checklist: which systems from the course it will use
          - Art and audio direction with the assets you can actually make
          - The cut list: features you already know you will drop
          - Instructor sign-off on scope before a single line is written
        Projects built:
          - Signed-off design document plus a greybox prototype of the core loop
        Practice: Prototype the core loop in greybox before the build weeks begin
      Capstone Build
        Topics:
          - Two focused weeks: working core by day 4, feature-complete by day 10
          - Instructor checkpoints and course corrections
          - Using everything: mechanics, AI, UI, audio, saves, polish
          - Daily builds that always run
          - Playtesting mid-build and acting on it
          - Cutting scope without cutting the soul of the game
        Projects built:
          - The capstone game, built over two weeks with version control and daily builds
        Practice: A playable build at the end of every session, no exceptions
      Launch, Demo Day and What Comes Next
        Topics:
          - Publishing the capstone with a proper game page and trailer GIF
          - Presenting at demo day: live gameplay plus the hardest bug story
          - An honest skills inventory: strong, shaky, next
          - Where each path leads: deeper Unity, Unreal, 3D art, or our DSA course for the CS side
          - Staying sharp: game jams, communities and healthy practice habits
        Projects built:
          - Demo day: the capstone played live by the audience
        Assessment: FINAL EXAM: a practical build plus a written paper with questions mixed
        from every phase. Passing earns the certificate; a student who falls short gets a
        focused revision plan and a free retest

PROJECTS THE STUDENT BUILDS AND KEEPS

  - Phase 1: Pong, Breakout, physics games, a polished platformer, and a complete 2D capstone
    published on itch.io
  - Phase 2: 3D prototypes, an animated character, environments with your own Blender assets, and
    a finished 3D game
  - Phase 3: multiplayer experiments, a mobile build on a real phone, an Unreal Blueprints
    mechanic, and an accessibility audit
  - Phase 4: a polish pass with before/after footage, a game-jam entry, and the final capstone
    presented at demo day

  Total projects: 20+ games and prototypes, with at least three complete games published on itch.io

SKILLS THE STUDENT WILL HAVE AT THE END

  - C# programming: from variables to classes and game architecture, learned through play
  - Unity 2D: physics, movement feel, enemy AI, UI, audio, saves, complete shipped games
  - Unity 3D: controllers, animation, terrain, lighting, shaders, procedural generation,
    optimization
  - Blender: modeling, texturing and importing your own game assets
  - Game design: flow, pacing, difficulty, narrative, accessibility, and ethical design
  - Multiplayer and mobile: networked basics and builds that run on real phones
  - Production habits: scoping, playtesting, polishing, publishing and presenting

HOW A TYPICAL WEEK IS SPLIT

  Live classes: 2 live one-hour classes per week, building along with the instructor
  Homework: Homework after every class, and a mixed-review assignment at the end of every month
    so earlier skills stay sharp
  Practice: 3-4 hours of building and playtesting between classes
  Review: Every submitted build reviewed with written feedback; recurring issues reopened in
    class

SUPPORT INCLUDED
```

Doubt support: WhatsApp doubt support between classes, so nobody stays stuck on a broken build for days
Progress updates: Regular progress notes to parents: what was built, what comes next, and where encouragement at home helps

CERTIFICATION DETAIL

Completion: Certificate from Modern Age Coders, awarded on passing the final exam. Fall short and there is focused revision and a free retest: the certificate certifies knowledge, not attendance

WHERE THIS CAN LEAD

- Deeper Unity and C#: the direct road toward junior game programming roles later
- Data Structures and Algorithms: the computer science muscle for engineering paths and interviews
- 3D art and design: Blender skills here open the art-side road
- Game jams and communities: the ecosystem where young developers actually grow
- Transferable skill: everything here, C#, systems thinking, shipping, carries into any software path

COMMON QUESTIONS ABOUT THIS COURSE

For anything about cost, use PART 4 and RULE 1. Do not quote two regions.

Q: What will my teen build in this game development course?
A: More than 20 games and prototypes across ten months, including at least three complete, published games: a polished 2D game on itch.io by month 3, a finished 3D game with their own Blender assets by month 6, and a final capstone presented live at demo day. Along the way they build multiplayer experiments, a mobile game running on a real phone, and a game-jam entry. Finishing and publishing is the point: the course is built against the tutorial graveyard.

Q: How long does it take a teenager to learn game development?
A: To genuinely build and ship games: 10 months at 2 live classes a week plus 3 to 4 hours of practice, and the first published game happens in month 3, not month 10. The syllabus keeps 2 months of margin in hand: students who need more repetition take up to 12 months with no rushing and no penalty.

Q: How is my teen assessed? Is the certificate just for attending?
A: No. Classwork runs inside every session, homework follows every class, and each month ends with an assignment that deliberately mixes new questions with earlier topics so knowledge compounds instead of fading. Every phase closes with a cumulative exam, and the course ends with a final exam: a practical build plus written questions drawn from the whole syllabus. Passing earns the certificate; falling short earns a focused revision plan and a free retest. We optimize for real knowledge and real depth, not a stream of feel-good badges.

Q: Unity or Unreal: which engine does the course teach?
A: Unity, deeply, and that is a deliberate choice: Unity with C# is the standard indie and mobile engine, gentler to learn, and its concepts transfer everywhere. Month 8 includes an honest week inside Unreal with Blueprints, so students understand the other side of the industry and know exactly what to learn if a future project demands it. A shallow two-engine tour would leave a teen fluent in neither.

Q: What computer does my teen need?
A: Any reasonably recent laptop or desktop with a stable internet connection. Unity runs comfortably on modest hardware for 2D work; for the 3D months a dedicated graphics card is nice but not required, we scope the 3D projects so integrated graphics can handle them. All software used, Unity, Visual Studio, Blender, Mixamo and itch.io, is free.

Q: Is game development actually useful, or just play?
A: It is one of the most demanding forms of programming: real-time systems, physics, AI, optimization and user experience in one discipline. The C# skills transfer directly to general software roles, the math quietly reinforces school physics and geometry, and shipping a real product teaches scoping and follow-through. Game development is the most motivating wrapper serious programming has ever had.

Q: Does the course cover multiplayer games?
A: Yes, at an honest level: month 7 covers networked multiplayer fundamentals in Unity, enough to build small online games and understand how the big ones work. Full production netcode for thousands of players is a professional specialization; this course builds the base it stands on and says so plainly.

Q: Will my teen publish real games?
A: Yes, on itch.io, the platform where real indie careers start, with a proper game page and playtested builds. At least three finished games go live during the course, plus a game-jam entry. We do not promise Steam releases or player counts; we teach the craft of finishing and shipping, which is what those things grow from.

  Q: Is there a trial class?
  A: Yes, a free demo class with no commitment: book at learn.modernagecoders.com/contact or
  message us on WhatsApp at +91 91233 66161. It is a real class, your teen will build something
  small in it, and parents are welcome to sit in. (Agent note: the free demo is a waiting list
  with no fixed date. The Priority Live Demo is a guaranteed class today or tomorrow, booked at
  https://learn.modernagecoders.com/priority-demo . Offer both, as RULE 3 says.)

  Q: How are classes delivered?
  A: Live 1-hour online classes with a real instructor, never pre-recorded videos. Groups are
  small and hands-on: students build during class and get unstuck on the spot, which matters
  enormously in game development where one misconfigured component can stall a beginner for
  hours.

  To enrol, message Shivam Sir on +91 9123366161 or send the parent this link: https://learn.modernagecoders.com/courses/complete-game-development-masterclass-for-teens
  For a demo: the Priority Live Demo (guaranteed, today or tomorrow) is booked at
  https://learn.modernagecoders.com/priority-demo . The free demo is a waiting list with no fixed date.

==
COURSE 67 OF 137: GCSE COMPUTER SCIENCE: AQA, OCR AND EDEXCEL EXAM PREP
==

Course link: https://learn.modernagecoders.com/courses/gcse-computer-science-course
Subject area: GCSE Computer Science
Designed for: Teens
Who can join: GCSE students on AQA, OCR or Edexcel Computer Science; taught from the basics, no prior coding required
Course length: 6 months (24 weeks), joinable any month
Time needed: 2 live classes/week + weekly programming and past-paper practice
Certificate: Certificate from Modern Age Coders, awarded on passing the final assessment

PRICE FOR THIS COURSE (quote only the one that applies to the person asking)
  In India, per month: group Rs 1,499, mini batch Rs 2,999, one to one Rs 4,999
  In Canada, per month: group CAD 140, one to one CAD 210
  Anywhere else, per month: group $100, one to one $150
  Classes: group and mini batch two live classes a week, eight a month; one to one in India one
  live class a week, four a month; one to one outside India two live classes a week, eight a
  month. Each class is one hour.

WHAT THIS COURSE IS

  Live online GCSE Computer Science classes taught to your child's actual board. AQA 8525, OCR
  J277 and Edexcel 1CP2 set different papers, and the course is built around the one they will
  sit.

ABOUT THE PROGRAMME

  The three GCSE Computer Science specifications share a name and set different exams. AQA 8525
  runs a two-hour Paper 1 on computational thinking and programming and a one-hour-forty-five
  Paper 2 on computing concepts, each ninety marks and each half the qualification. OCR J277
  runs two papers of an hour and a half and eighty marks each. Edexcel sets its own 1CP2. A
  student revising from the wrong board's past papers is practising the wrong exam, and it is
  the commonest avoidable problem we see. The first thing we ask is which board, and the course
  is built around that answer. Everything is taught live, in a batch of fifteen to twenty or
  one to one, with programming in Python and past papers marked against the real mark scheme.

WHAT A STUDENT NEEDS BEFORE STARTING

  Title: What Your Child Needs to Start

WHO THIS COURSE IS FOR

  Title: Who This Course Is For

FULL CURRICULUM, WEEK BY WEEK

  This is the complete teaching plan. Parents can ask about any week.

  PHASE 1: PROGRAMMING THAT SURVIVES PAPER 1 (MONTHS 1-2)

  Real Python, written by hand, plus the code-tracing habit that carries more marks than any
  single topic on the specification.

    Month 1: Python Fundamentals and Code Tracing (Weeks 1-4)
      Variables, Input and Output, and Reading an Error
        Topics:
          - Data types, casting and the arithmetic that catches people out in exams

        - Writing to a specification instead of writing what you felt like writing
        - Reading a Python error message and fixing the cause rather than guessing
        - Why every answer in this course is written by hand before it is typed
    Selection, and the Conditions Examiners Set
      Topics:
        - if, elif and else, and the nested conditions that appear in longer questions
        - Boolean operators, and the compound conditions students misread under time
        - Common exam traps: assignment against comparison, and off-by-one boundaries
        - Writing the condition in words first, then in code
    Iteration, and Two-Column Trace Tables
      Topics:
        - for and while loops, and choosing the right shape for the problem
        - Nested loops, and stating the range out loud before writing them
        - The two-column trace table, drilled until it is the automatic first move
        - Why tracing in your head is slower and less accurate than writing it down
    Lists, Strings and Standard Algorithms
      Topics:
        - Lists and string handling exactly as the specifications describe them
        - Linear search, bubble sort and merge sort, traced as well as coded
        - Counting, totalling and finding a maximum, which recur across every board
        - First timed set of past-paper programming questions

  Month 2: Subprograms, Files and Robust Programs (Weeks 5-8)
    Functions, Procedures and Parameters
      Topics:
        - Writing a subprogram to a given signature, which is how questions are set
        - Parameters and return values, and the difference examiners test
        - Local and global scope, a reliable short-answer topic on every board
        - Decomposing a long question into subprograms before writing any code
    File Handling and Data Validation
      Topics:
        - Reading from and writing to text files as the specifications require
        - Validation and authentication routines, which appear as set-piece questions
        - Defensive design, and what makes a program robust in mark-scheme terms
        - Writing test data: normal, boundary and erroneous
    Testing, Debugging and the Language of Errors
      Topics:
        - Syntax, logic and runtime errors, named precisely as the exam names them
        - Building a test plan and completing a test table
        - Finding a fault by halving the search space rather than by guessing
        - Refining a program in response to a test result, which is examined directly
    Paper 1 Under Time
      Topics:
        - A full programming paper in the student's own board format
        - Marked against the real mark scheme rather than against intent
        - Pacing: how long each question is worth in minutes
        - Identifying which question type this student loses marks on

---
PHASE 2: COMPUTING CONCEPTS AND SYSTEMS (MONTHS 3-4)

The theory half, taught as systems that relate to each other rather than as vocabulary to be
memorised, because that is what the longer questions reward.

  Month 3: Data Representation and Computer Systems (Weeks 9-12)
    Binary, Hexadecimal and Binary Arithmetic
      Topics:
        - Converting between denary, binary and hexadecimal in both directions, quickly
        - Binary addition, overflow, and binary shifts with their effect explained
        - Character sets, and the size calculations that follow from them
        - Doing all of it by hand, at speed, because the paper expects it
    Images, Sound and Compression
      Topics:
        - Resolution, colour depth and the file-size calculation examiners set
        - Sample rate, bit depth and duration, calculated rather than described
        - Lossy against lossless compression, with a real reason for choosing one
        - The exact wording that earns the mark in a compression comparison
    The CPU, the Fetch-Decode-Execute Cycle and Memory
      Topics:
        - CPU components and what each one does, in the specification's language
        - The fetch-decode-execute cycle, sequenced correctly and explained
        - Factors affecting performance: clock speed, cores and cache
        - RAM, ROM, virtual memory and secondary storage compared
    Software, Translators and Systems Architecture
      Topics:
        - System software against application software
        - Compilers and interpreters, and where each is genuinely preferable
        - Utility software and the operating system's actual jobs
        - Embedded systems, and why the question always mentions a washing machine

  Month 4: Networks, Security, Databases and Impact (Weeks 13-16)
    Networks, Topologies and Protocols
      Topics:
        - LAN and WAN, wired and wireless, with the trade-offs stated
        - Star and mesh topologies, and the layered protocol stack
        - Packet switching, and what a protocol actually is
        - Performance factors, which are a reliable extended-response question
    Cyber Security and Threats
      Topics:
        - Malware, phishing, social engineering and brute force, distinguished properly
        - Penetration testing, firewalls, encryption and access levels as mitigations
        - Matching a threat to the correct prevention, which is how it is examined
        - Writing a security answer that names both the threat and the response
    Databases and SQL
      Topics:
        - Tables, records, fields, primary keys and data types
        - SELECT, FROM and WHERE, written correctly under exam conditions
        - Where SQL appears on each board, since this differs between them
        - Practising the query shapes that recur in past papers
    Ethical, Legal and Environmental Impact
      Topics:
        - Privacy, legislation and environmental impact, with real examples
        - Structuring an extended-response answer so it reaches the top band
        - Giving both sides and then a judgement, which the mark scheme wants
        - Timed practice on the longest questions on the paper

---
PHASE 3: BOARD-SPECIFIC EXAM MASTERY (MONTHS 5-6)

The half of the course that separates the three specifications, spent entirely on the papers
this student will actually sit.

  Month 5: Your Board's Papers, In Their Own Format (Weeks 17-20)
    Knowing Your Own Specification
      Topics:
        - AQA 8525: Paper 1 two hours and ninety marks, Paper 2 one hour forty-five and ninety marks
        - OCR J277: two papers, an hour and a half and eighty marks each
        - Edexcel 1CP2 in its own structure, for students entered on it
        - Why revising from another board's past papers wastes the term
    Command Words and the Mark Scheme
      Topics:
        - State, describe, explain, compare and evaluate ask for different things
        - Reading how many marks a question is worth and answering to that length
        - Marking your own work against the real scheme rather than against intent
        - The sentences that earn marks, and the correct ideas that do not
    The Long Questions
      Topics:
        - Extended-response structure: both sides, then a supported judgement
        - Programming questions worth eight marks or more, planned before written
        - Time budgeting across a whole paper, practised rather than assumed
        - Recovering when a question is not understood on first reading
    Full Paper 1, Marked and Reviewed
      Topics:
        - A complete paper under exam conditions in the student's board format
        - Detailed review of every lost mark, with the reason named
        - A revision list built from the actual errors rather than from the topic list
        - Re-testing the same question types two weeks later

  Month 6: Full Papers and Final Preparation (Weeks 21-24)
    Full Paper 2, Marked and Reviewed
      Topics:
        - The theory paper under time, in the correct board format
        - Extended responses marked to the band descriptors
        - Identifying whether the remaining risk is Paper 1 or Paper 2
        - Directing the last month at the weaker paper rather than at both
    Targeted Repair
      Topics:
        - Rebuilding the two or three topics the mocks exposed
        - Programming questions from a blank page, repeatedly
        - Trace tables and binary arithmetic drilled back to automatic
        - Short daily retrieval rather than long revision sessions
    Second Full Set
      Topics:
        - Both papers again, under time, from a different series
        - Measuring improvement against the first set question by question
        - Confirming pacing holds when the questions are unfamiliar
        - Final list of the specific things still costing marks
    Exam Week Readiness

Topics:
- A short, specific revision plan for the final fortnight
- The reference material allowed in your board's papers
- What to do in the first five minutes of each paper
- Walking in knowing the format, so the only new thing is the questions

HOW A TYPICAL WEEK IS SPLIT

Homework: A task or problem set after every class, and a monthly mixed-review assignment that deliberately folds in earlier topics

CERTIFICATION DETAIL

Completion: Certificate from Modern Age Coders, awarded on passing the final assessment. Fall short and there is focused revision and a free retest: the certificate certifies real learning, not attendance

WHERE THIS CAN LEAD

- A strong GCSE Computer Science grade across both papers
- A confident move into A Level Computer Science or an equivalent sixth-form course
- Real Python ability, which transfers to every later qualification and to work
- The code-tracing and debugging habits that A Level assumes and does not teach
- A foundation for AP Computer Science A, IB Computer Science or Cambridge A Level for students changing curriculum

COMMON QUESTIONS ABOUT THIS COURSE

For anything about cost, use PART 4 and RULE 1. Do not quote two regions.

Q: Which exam board do you teach?
A: All three, and separately. AQA 8525 sets a two-hour Paper 1 worth ninety marks and a one-hour-forty-five Paper 2 also worth ninety marks, each half the GCSE. OCR J277 sets two papers of an hour and a half and eighty marks each. Edexcel 1CP2 has its own structure. The first thing we ask is which board your child is entered for, because revising from the wrong board's past papers is the commonest avoidable problem in this subject.

Q: Which programming language do you teach?
A: Python, which is what the overwhelming majority of UK schools use and what most students meet in class. If your child's school teaches something else we will work in that instead, because the exam assesses computational thinking rather than a particular syntax, and consistency with school matters more than our preference.

Q: My child understands it in class but cannot start a question. Is that normal?
A: It is extremely common and it is the specific problem this course is built to fix. Following a worked example is a different action from producing an answer from a blank page, and only the second one is examined. Every programming session here starts from nothing, on paper, before anything is typed.

Q: How many classes a week, and how long is the course?
A: Two live classes a week over roughly twenty-four weeks, joinable in any month. A student in Year 10 usually spreads it across the year, and a Year 11 student closer to the exams normally goes one to one so the syllabus can be reordered around whichever paper is the risk.

Q: Do you mark past papers?
A: Yes, against the published mark scheme rather than against what the student meant. That distinction matters more than it sounds: students routinely write a correct idea in words the scheme does not credit, and finding that out in January is worth considerably more than finding it out in May.

Q: Is this the same as Cambridge IGCSE Computer Science?
A: No. Cambridge IGCSE 0478 is taken mainly in international schools, grades A star to G, and requires most coding answers in pseudocode rather than a real language. UK GCSE grades nine to one and generally expects answers in a real programming language. Two students of identical ability need genuinely different exam training.

Q: How am I assessed, and is the certificate just for showing up?
A: No. A task follows every class with feedback, monthly reviews deliberately mix new material with earlier topics so nothing is forgotten, and the course ends with a full mock paper as the final assessment. Passing earns the certificate; falling short earns focused revision and a free retest. We measure real learning, not attendance.

To enrol, message Shivam Sir on +91 9123366161 or send the parent this link: https://learn.modernagecoders.com/courses/gcse-computer-science-course
For a demo: the Priority Live Demo (guaranteed, today or tomorrow) is booked at https://learn.modernagecoders.com/priority-demo . The free demo is a waiting list with no fixed date.

==========

COURSE 68 OF 137: GCSE MATHS RESIT COURSE ONLINE: POST-16 AND ADULTS
==========

Course link: https://learn.modernagecoders.com/courses/gcse-maths-resit-course
Subject area: UK Exam Board Mathematics
Designed for: College students
Who can join: Learners aged 16 and over, and adults, resitting GCSE Maths with AQA, Edexcel or OCR
Course length: 6 months (24 weeks) for a summer entry; a shorter plan for the November series
Time needed: 2 live classes/week + 3 hours of practice, fitted around college or work
Certificate: Course-completion certificate from Modern Age Coders

PRICE FOR THIS COURSE (quote only the one that applies to the person asking)
  In India, per month: group Rs 1,499, mini batch Rs 2,999, one to one Rs 4,999
  In Canada, per month: group CAD 140, one to one CAD 210
  Anywhere else, per month: group $100, one to one $150
  Classes: group and mini batch two live classes a week, eight a month; one to one in India one live class a week, four a month; one to one outside India two live classes a week, eight a month. Each class is one hour.

WHAT THIS COURSE IS

  GCSE maths resit course online for post-16 learners and adults: a diagnostic, targeted repair of the topics that cost marks, then full papers for the November or summer series.

  In one line: Not the whole GCSE again from page one: a diagnostic finds the marks you are losing, we repair those topics, then we practise full papers until the exam feels familiar.

ABOUT THE PROGRAMME

  A resit is a different job from a first attempt. You have already seen most of the content, and the marks you missed usually cluster in a handful of topics and a few habits: rushing, not showing working, misreading what a question asks. This course starts with a diagnostic paper, maps exactly where the marks went, and spends the teaching time there. GCSE Maths is a linear qualification. AQA's specification, for example, has three papers of 1 hour 30 minutes and 80 marks each, the first without a calculator, and two tiers: Foundation, graded 1 to 5, and Higher, graded 4 to 9. All three papers are taken at the same tier in the same series. AQA offers November entries only to students who were at least 16 on the previous 31 August, which is why the November series is the resit series. For 16 to 18 year olds on a study programme, the government's condition of funding guidance sets out who must keep studying maths: students without a grade 4 continue, and full-time students with a grade 3 must study towards GCSE. We work alongside your college, or with you directly as an adult entering through an exam centre. Classes are live and small, and every paper you sit with us is marked against the published mark scheme so you can see the trend, not just hope for it.

WHAT MAKES THIS COURSE DIFFERENT

  - Starts with a diagnostic paper and a topic-by-topic map of lost marks, so the teaching time goes where the marks are
  - Built around the boards' own specifications: AQA 8300, Edexcel 1MA1 and OCR J560, all three papers at your tier
  - Non-calculator paper habits rebuilt from the first fortnight
  - A November plan for learners close to the grade they need and a summer plan for those who need more time
  - Evening and weekend classes for adults and learners at college during the day
  - Every practice paper marked against the published mark scheme, with an error clinic afterwards

THE LEARNING PATH, STEP BY STEP

  Phase 1: Diagnostic and number: a full diagnostic paper, the lost-marks map, then number, fractions, percentages and the non-calculator paper
  Phase 2: Algebra and ratio: expressions, equations, graphs, ratio, proportion and rates of change
  Phase 3: Geometry, probability and statistics: angles, area and volume, Pythagoras and trigonometry, probability and data
  Phase 4: Papers: full sets of three papers at your tier under real timing, marked, reviewed and repaired

WHAT A STUDENT NEEDS BEFORE STARTING

  Maths level: You have taken GCSE Maths before, or followed the course at school. The diagnostic paper shows exactly where to start
  Exam entry: Learners at college are entered by their college. Adults enter through an exam centre that accepts private candidates; you arrange the entry and we teach to your board and tier
  Equipment: A scientific calculator, ruler, protractor, compasses, and a device with stable internet for live classes
  Timing: For the November series, start as early in the autumn term as possible. For the summer series, start any time from September to January

WHO THIS COURSE IS FOR

College students: 16 to 18 year olds at college or sixth form who need to keep working towards GCSE Maths
Adults: Adults who need GCSE Maths for a job, training course or university application
Near miss learners: Learners who missed the grade they needed by a few marks and want a focused plan for November
Anxious learners: Learners who know more than their result shows but lose marks under pressure
International candidates: Candidates sitting UK GCSE Maths as private candidates from abroad

FULL CURRICULUM, WEEK BY WEEK

This is the complete teaching plan. Parents can ask about any week.

PHASE 1: DIAGNOSTIC AND NUMBER (MONTHS 1-2, WEEKS 1-8)

Find the lost marks first, then repair number, the strand that runs through every paper and dominates the non-calculator paper.

Month 1: Diagnostic and the Lost-Marks Map (Weeks 1-4)
Weeks 1-2: The Diagnostic Paper
Topics:
- A full past-style paper at your tier, sat under timing
- Marking against the official-style scheme together
- Sorting every lost mark: knowledge, method, accuracy or reading
- Building the lost-marks map topic by topic
- Choosing the tier with you and your college if it is still open
- Setting a realistic plan for November or summer
Projects built:
- Lost-marks map: every topic coloured by how many marks it cost
Practice: Short daily sets on the three topics that cost the most marks
Weeks 3-4: Number Without a Calculator
Topics:
- Written methods for the four operations, decimals included
- Order of operations and negative numbers
- Factors, multiples, primes and prime factorisation
- Estimation and rounding to check answers
- Powers, roots and, at Higher, index laws and standard form
- Setting out working so method marks are earned
Projects built:
- Non-calculator method sheet: one worked example of every written method
Practice: 20 non-calculator questions a week
Assessment: Month 1 check: a 40-minute non-calculator section

Month 2: Fractions, Decimals and Percentages (Weeks 5-8)
Weeks 5-6: Fractions and Decimals
Topics:
- The four operations with fractions and mixed numbers
- Converting between fractions, decimals and percentages
- Fractions of amounts in context
- Recurring decimals as fractions at Higher
- Bounds and error intervals
- Common slips and how to catch them
Projects built:
- Repair log: each fraction slip from the diagnostic re-done correctly
Practice: 15 fraction and decimal questions a week, half without a calculator
Weeks 7-8: Percentages and Money
Topics:
- Percentages of amounts and percentage change
- Reverse percentages
- Simple and compound interest, growth and depreciation
- Value-for-money comparisons set out clearly
- Multipliers as the quick calculator method
- Writing a conclusion that answers the question
Projects built:
- Money problem set: interest, discounts and comparisons solved two ways
Practice: 12 percentage problems a week
Assessment: Month 2 check: a 45-minute number paper with calculator and non-calculator parts

---
PHASE 2: ALGEBRA AND RATIO (MONTHS 3-4, WEEKS 9-16)

The strands where resit learners most often lose marks they could win: forming and solving equations, reading graphs, and ratio in context.

  Month 3: Expressions, Equations and Graphs (Weeks 9-12)
    Weeks 9-10: Expressions and Equations
      Topics:
        - Simplifying, expanding and factorising
        - Substituting into formulae
        - Solving linear equations, including unknowns on both sides
        - Forming an equation from words
        - Inequalities on a number line
        - At Higher: quadratics by factorising and the formula, and simultaneous equations
      Projects built:
        - Equation bank: one solved example of each equation type, with a check by substitution
      Practice: 15 algebra questions a week
    Weeks 11-12: Sequences and Graphs
      Topics:
        - Linear sequences and the nth term
        - Plotting and reading straight-line graphs
        - Gradient and y = mx + c
        - Real-life graphs: distance-time and conversion graphs
        - Quadratic graphs and reading roots
        - At Higher: graph transformations and equations of circles
      Projects built:
        - Graph file: six graph types drawn and annotated
      Practice: 12 sequence and graph questions a week
      Assessment: Month 3 check: a 45-minute algebra paper

  Month 4: Ratio, Proportion and Rates (Weeks 13-16)
    Weeks 13-14: Ratio and Proportion
      Topics:
        - Simplifying ratios and sharing in a ratio
        - Ratio problems from recipes, maps and mixtures
        - Direct and inverse proportion
        - Scale factors and similar shapes
        - Unit conversions
        - At Higher: proportion equations
      Projects built:
        - Ratio problem set: five real contexts solved with a bar model and then algebra
      Practice: 12 ratio and proportion questions a week
    Weeks 15-16: Rates and Compound Measures
      Topics:
        - Speed, distance and time
        - Density and pressure
        - Rates of pay and comparing value
        - Interpreting rates from graphs
        - Multi-step problems that mix ratio and percentages
        - Planning a long question before writing
      Projects built:
        - Repair log updated: ratio and rate errors from the diagnostic re-done
      Practice: 10 multi-step problems a week
      Assessment: Month 4 check: a full 1 hour 30 minute calculator paper, marked

---
PHASE 3: GEOMETRY, PROBABILITY AND STATISTICS (MONTH 5, WEEKS 17-20)

Shape, space and data, taught to the depth your tier needs and practised in exam-style
questions.

  Month 5: Geometry, Probability and Statistics (Weeks 17-20)
    Weeks 17-18: Geometry and Measures
      Topics:
        - Angle facts, parallel lines and polygons
        - Perimeter, area and volume, including circles and cylinders
        - Pythagoras' theorem
        - Right-angled trigonometry
        - Transformations and constructions
        - At Higher: sine and cosine rules, circle theorems and vectors
      Projects built:
        - Geometry sheet: every formula and angle fact with a worked example
      Practice: 15 geometry questions a week
    Weeks 19-20: Probability and Statistics
      Topics:
        - Probability scales, outcomes and relative frequency
        - Tree diagrams and Venn diagrams
        - Averages and range from lists and tables
        - Charts, scatter graphs and correlation
        - Spotting misleading statistics
        - At Higher: cumulative frequency, box plots and histograms
      Projects built:
        - Data question bank: one solved example of every chart and average type
      Practice: 12 probability and statistics questions a week

Assessment: Month 5 check: a full mixed paper at your tier, marked

---
PHASE 4: FULL PAPERS (MONTH 6, WEEKS 21-24)

No new content. Full sets of three papers at your tier under real timing, marked against published mark schemes, with repair lessons between papers.

Month 6: Paper Sets and Repair (Weeks 21-24)
Weeks 21-22: Full Sets Under Timing
Topics:
- A full set: non-calculator paper then two calculator papers
- Marking against the published mark scheme
- Updating the lost-marks map
- Repair lessons on the two weakest topics
- Time management: which questions to do first
- Checking in the last ten minutes
Projects built:
- Paper tracker: every paper's score on one chart
Practice: One full paper every few days, alternating calculator and non-calculator
Weeks 23-24: Final Set and Exam Readiness
Topics:
- A final full set under real timing
- Review of every lost mark
- Formulae sheet use where your board provides one
- Equipment check and calculator settings
- A calm plan for the days before the exam
- What to do on results day, whatever happens
Projects built:
- Completed paper tracker and lost-marks map, kept for revision
Practice: Short targeted sets from the lost-marks map
Assessment: Final paper set, marked and reviewed one to one

PROJECTS THE STUDENT BUILDS AND KEEPS

- A lost-marks map from the diagnostic, updated after every paper
- A non-calculator method sheet
- A repair log of every diagnostic error re-done correctly
- An equation bank, a graph file and a geometry sheet
- A data question bank
- A paper tracker across the whole course

Total projects: A personal resit kit: lost-marks map, method sheets, repair log and a marked paper tracker

SKILLS THE STUDENT WILL HAVE AT THE END

- Number and the non-calculator paper
- Fractions, decimals, percentages and money
- Algebra, sequences and graphs at your tier
- Ratio, proportion and rates of change
- Geometry, probability and statistics
- Paper technique: timing, showing working and checking

HOW A TYPICAL WEEK IS SPLIT

Live classes: 2 live one-hour classes per week, with evening and weekend options
Practice: About 3 hours a week of targeted practice from the lost-marks map
Review: Practice marked with comments; papers marked against published mark schemes

SUPPORT INCLUDED

Doubt support: WhatsApp support between classes, with worked solutions for stuck questions
Progress updates: A monthly progress note with paper scores and the updated lost-marks map

CERTIFICATION DETAIL

Completion: Course-completion certificate from Modern Age Coders

WHERE THIS CAN LEAD

- Jobs, apprenticeships, training and university courses that ask for GCSE Maths; check each one's exact grade requirement
- Our A Level Maths course for learners who discover they enjoy it
- Our Functional Skills Maths course as an alternative level 2 route where it is accepted

COMMON QUESTIONS ABOUT THIS COURSE

For anything about cost, use PART 4 and RULE 1. Do not quote two regions.

Q: When can I resit GCSE Maths?
A: There are November and summer series. AQA, for example, offers GCSE Mathematics every May/June and November, and November entries are only available to students who were at least 16 on the previous 31 August. Check your board and exam centre for the exact dates.

Q: Do I have to resit GCSE Maths if I got a grade 3?
A: If you are 16 to 18 on a full-time study programme in England, the government's condition of funding guidance says students with a grade 3 must study towards GCSE Maths. Students with grade 2 or below can work towards Functional Skills Level 2 or a GCSE. Adults are not bound by these rules and can choose.

Q: Should I sit the November resit or wait for the summer?
A: November suits learners who were close to the grade they need and can study steadily through the autumn. The government's guidance asks colleges to consider readiness, including attendance, engagement and progress, before entering students with a low grade 3 or below. Our diagnostic paper helps you and your college decide.

Q: Foundation or Higher tier for a resit?
A: Foundation is graded 1 to 5 and Higher 4 to 9. Many resit learners aiming for a 4 or 5 sit Foundation, and learners aiming higher sit Higher. Your diagnostic score and the grade you need decide it, together with your college or exam centre.

Q: Can adults resit GCSE Maths online?
A: The teaching can be fully online. The exams are sat in person at an exam centre that accepts private candidates, which makes your entry. We teach to your board and tier and practise its paper style.

Q: Is the whole GCSE taught again?
A: No. The diagnostic paper shows which topics are costing marks, and the course spends most of its time there, with full papers throughout. Topics you already handle well get a quick check rather than a re-teach.

Q: Can I do Functional Skills instead of a GCSE resit?
A: Sometimes. Some employers and courses accept Functional Skills Maths Level 2 and some ask for GCSE. For 16 to 18 year olds, the condition of funding rules link the choice to your GCSE grade. We run both courses, and the free demo can help you decide. (Agent note: the free demo is a waiting list with no fixed date. The Priority Live Demo is a guaranteed class today or tomorrow, booked at https://learn.modernagecoders.com/priority-demo . Offer both, as RULE 3 says.)

Q: How are the classes run?
A: Live online classes with a real teacher, in a group of 15 to 20 learners at a similar level or one to one, with evening and weekend options. Current fees for your region are shown in the pricing section of this page.

Q: Can I try a lesson first?
A: Yes. Book a free demo class. The teacher works through a few GCSE questions with you, sees where the marks are going, and suggests a November or summer plan and group or one-to-one teaching. There is no obligation to enrol. (Agent note: the free demo is a waiting list with no fixed date. The Priority Live Demo is a guaranteed class today or tomorrow, booked at https://learn.modernagecoders.com/priority-demo . Offer both, as RULE 3 says.)

To enrol, message Shivam Sir on +91 9123366161 or send the parent this link: https://learn.modernagecoders.com/courses/gcse-maths-resit-course
For a demo: the Priority Live Demo (guaranteed, today or tomorrow) is booked at https://learn.modernagecoders.com/priority-demo . The free demo is a waiting list with no fixed date.

==========
COURSE 69 OF 137: GCSE MATHS: FOUNDATION & HIGHER (9-1), AQA, EDEXCEL, OCR
==========

Course link: https://learn.modernagecoders.com/courses/gcse-mathematics-mastery
Subject area: Exam Board Mathematics
Designed for: High school
Who can join: Years 9-11 GCSE students, Foundation and Higher tiers, plus resit candidates
Course length: 18 months (72 weeks), joinable any month
Time needed: 2 live one-hour classes per week + weekly past-paper work
Certificate: Course completion certificate + documented paper-score progression

PRICE FOR THIS COURSE (quote only the one that applies to the person asking)
In India, per month: group Rs 1,499, mini batch Rs 2,999, one to one Rs 4,999
In Canada, per month: group CAD 140, one to one CAD 210
Anywhere else, per month: group $100, one to one $150
Classes: group and mini batch two live classes a week, eight a month; one to one in India one live class a week, four a month; one to one outside India two live classes a week, eight a month. Each class is one hour.

WHAT THIS COURSE IS

GCSE Maths course for AQA, Edexcel and OCR: Foundation and Higher tiers, non-calculator Paper 1 fluency, grade 7-9 reach and past-paper technique.

In one line: Foundation to grade 5 secure, Higher to grade 9, taught for understanding, trained for the papers.

ABOUT THE PROGRAMME

An 18-month live program for GCSE mathematics across AQA, Edexcel and OCR, at Foundation or Higher tier. GCSE maths is three papers, one strictly non-calculator, with grades that gatekeep sixth form, apprenticeships and A-Level maths. This course teaches the syllabus understanding-first (so the mock slide of year 11 never happens), trains bare-hands fluency for Paper 1 in every class, brings the Higher-tier grade 7-9 topics in early enough to settle, and converts it all into marks through past-paper cycles against your exact board's mark schemes.

WHAT MAKES THIS COURSE DIFFERENT

- Board-exact: AQA, Edexcel or OCR confirmed first, and every past paper comes from your board
- Tier-honest: evidence for Foundation-vs-Higher decisions, and a real runway from grade 4-risk to 6-secure, or 6 to 9
- Non-calculator Paper 1 fluency drilled in every class
- The grade 7-9 separator topics taught months early so they settle instead of being crammed
- Mark-scheme literacy: method marks, working discipline and the plus-minus habits that stop point leaks
- Understanding-first teaching: algebra as a language, so re-framed exam questions do not break the student
- One dedicated mentor across the whole GCSE run, a full interactive hour, twice a week
- Resit candidates welcome, with a compressed evidence-led plan

THE LEARNING PATH, STEP BY STEP

Phase 1: The Foundation core built properly: number fluency, algebra as a language, and the geometry and data basics
Phase 2: The Higher reach with settling time: quadratics, functions, trigonometry, vectors and the grade 7-9 separator topics
Phase 3: Past-paper craft by board: all three papers, timing plans, mark banking and full cycles into the exam series

WHAT A STUDENT NEEDS BEFORE STARTING

Education: Years 9-11 GCSE students (AQA, Edexcel or OCR), or post-16 resit candidates
Math background: Any, the diagnostic finds the real base; Foundation gaps are repaired before Higher reach
Equipment: Computer with stable internet; a scientific calculator for Papers 2-3
Time commitment: 2 live hours plus 1-2 practice hours weekly
English: Course taught in English
Motivation: An exam series on the calendar; we supply the method

WHO THIS COURSE IS FOR

Higher aimers: Students who need the move from Foundation-risk to Higher-comfortable made real
Grade 9 hunters: Grade 6-7 students converting understanding into 8-9 through separator topics and paper craft
Mock sliders: Students whose grades sink each mock as memorized methods run out
Paper 1 worriers: Calculator-raised students facing the non-calculator paper
Resitters: Post-16 candidates who need the threshold cleared with a method this time

FULL CURRICULUM, WEEK BY WEEK

This is the complete teaching plan. Parents can ask about any week.

PHASE 1: THE CORE, BUILT PROPERLY (MONTHS 1-6)

Foundation-tier territory owned deeply is what Higher-tier grades stand on. This phase rebuilds number fluency without a calculator, teaches algebra as a language, and secures the geometry and statistics basics, with the diagnostic finding the true starting point first.

Months 1-2: Diagnostic + Number, Bare-Handed (Weeks 1-8)

Diagnostic, Board and Tier Fit

Topics:

- Exam board confirmed: AQA, Edexcel or OCR
- Foundation versus Higher tier fit assessed honestly
- Non-calculator fluency screen
- Algebra base measured
- Number and ratio accuracy audit
- Honest starting-grade picture

Practice: A mixed non-calculator and algebra diagnostic set sized to the suspected tier.
Assessment: Baseline grade estimate with a written tier recommendation and a topic-priority map.
Detail: Full diagnostic: board confirmed, tier fit assessed honestly, non-calculator fluency and algebra base measured

Fractions, Decimals and Percentages to Fluency
Topics:
- The four operations with fractions
- Decimal calculations without a calculator
- Percentage of, increase, decrease and reverse
- Converting between the three forms
- Estimation and rounding as a check
- Paper 1 non-calculator territory

Practice: A non-calculator FDP set with estimation checks on every answer.
Detail: Fractions, decimals and percentages to fluency, Paper 1's exact territory, with estimation as a checking habit

Ratio and Proportion Reasoning
Topics:
- Sharing in a given ratio
- Best-buy and value comparisons
- Recipe scaling problems
- Map-scale and unit conversions
- Direct proportion reasoning
- Linking ratio to fractions

Practice: Ratio and proportion questions across the best-buy, recipe and map-scale families.
Detail: Ratio and proportion reasoning: the best-buy, recipe and map-scale families

Indices, Standard Form and Bounds
Topics:
- Index laws with integer and negative powers
- Standard form and its arithmetic
- Upper and lower bounds
- Error intervals and truncation
- Rounding to significant figures
- Bounds applied in calculations

Practice: An indices, standard-form and bounds set including error-interval questions.
Detail: Indices, standard form and bounds; error intervals done with meaning

Months 3-4: Algebra as a Language (Weeks 9-16)

Expressions, Expansion and Factorisation
Topics:
- Simplifying and collecting like terms
- Expanding single and double brackets
- The area model behind expansion
- Factorising into brackets
- Common-factor extraction
- Algebraic notation discipline

Practice: An expand-and-factorise set anchored by area-model diagrams.
Detail: Expressions, expansion and factorisation with the area model underneath

Linear Equations, Inequalities and Formulae
Topics:
- Solving linear equations step by step
- Equations with brackets and fractions
- Solving and representing inequalities
- Number-line representation of solutions
- Rearranging formulae to change the subject
- Reading an equation as a sentence

Practice: Linear equation, inequality and rearrangement questions with worded contexts.
Detail: Linear equations and inequalities read as sentences; rearranging formulae

Straight-Line Graphs and y = mx + c
Topics:
- Plotting straight-line graphs
- Gradient understood as a rate
- y = mx + c as intercept and slope
- Finding the equation of a line
- Parallel and intersecting lines
- Reading real-life graphs critically

Practice: Straight-line graph questions plus interpretation of a real-life rate graph.
Detail: Straight-line graphs: gradient as rate, y = mx + c as a story; real-life graphs read critically

Simultaneous Equations and Sequences
Topics:
- Simultaneous equations by elimination
- Simultaneous equations by substitution
- Choosing a method by structure
- Linear sequences and the nth term
- Finding and using the nth term rule
- Special sequences and patterns

      Practice: A simultaneous-equations and nth-term set graded by structure.
      Detail: Simultaneous equations by structure; sequences and the nth term

  Months 5-6: Shape and Data Foundations (Weeks 17-24)
    Angle Reasoning and Justification
      Topics:
        - Angles on lines and around points
        - Parallel-line angle rules
        - Interior and exterior angles of polygons
        - Bearings and direction problems
        - Stating a reason for every step
        - Multi-step angle chains
      Practice: Angle problems requiring named reasons, including bearings.
      Detail: Angle reasoning with justification language: parallel lines, polygons, bearings
    Area, Perimeter, Volume and Pythagoras
      Topics:
        - Area and perimeter of standard shapes
        - Compound and composite shapes
        - Volume and surface area of solids
        - Pythagoras derived from a picture
        - Applying Pythagoras in context
        - Units for length, area and volume
      Practice: A mensuration set combining compound shapes and Pythagoras problems.
      Detail: Area, perimeter and volume including compound shapes; Pythagoras from a picture
    Averages, Charts and Correlation
      Topics:
        - Mean, median, mode and range
        - Averages from frequency tables
        - Bar charts, pie charts and pictograms
        - Scatter graphs and lines of best fit
        - Correlation and its limits
        - Reading data critically
      Practice: A statistics set interpreting charts and a scatter graph with commentary.
      Detail: Averages, charts, scatter graphs and correlation, data read like a sceptic
    Phase 1 Checkpoint Paper
      Topics:
        - Full Foundation-standard paper under timing
        - Mark-scheme review of every question
        - Method-mark awareness introduced
        - Error log started from the checkpoint
        - Timing across a full paper
        - Presentation and working discipline
      Practice: A complete Foundation-standard paper sat to time, then self-marked.
      Assessment: Foundation-standard checkpoint paper marked against the real mark scheme,
      opening the error log.
      Detail: Phase checkpoint: a full Foundation-standard paper under timing, reviewed
      against the mark scheme

PHASE 2: THE HIGHER REACH, WITH SETTLING TIME (MONTHS 7-12)

The topics that separate grade 5 from grade 9, taught months before the exam so they are
owned rather than crammed: quadratics and functions, trigonometry beyond right angles,
vectors, circle theorems and the algebraic craft the top questions assume.

  Months 7-8: Quadratics and Functions (Weeks 25-32)
    Solving Quadratics Three Ways
      Topics:
        - Solving by factorising
        - Completing the square
        - The quadratic formula
        - Choosing the method by structure
        - Roots and their meaning
        - Higher-tier quadratic manipulation
      Practice: A quadratics set requiring choice of factorising, completing the square or
      the formula.
      Detail: Quadratics by factorising, completing the square and the formula, chosen by
      structure
    Quadratic Graphs and Turning Points
      Topics:
        - Sketching quadratic graphs
        - Turning points by completing the square
        - Roots, intercepts and symmetry
        - Quadratics in real contexts
        - Quadratic inequalities (Higher)
        - Reading a parabola for information
      Practice: Quadratic-graph questions including a Higher-tier quadratic inequality.
      Detail: Quadratic graphs, turning points and real contexts; quadratic inequalities
      (Higher)

```
  Functions: Composite and Inverse
    Topics:
      - Function notation and evaluation
      - Composite functions and order
      - Inverse functions and how to find them
      - Domain and range awareness
      - Common function-mark traps
      - Functions read as meaning
    Practice: A functions set focused on composite and inverse questions.
    Detail: Function notation, composite and inverse functions, where half the function
    marks are lost
  Graph Transformations and Algebraic Fractions
    Topics:
      - Translations and reflections of graphs
      - Cubic and reciprocal graph shapes
      - Recognising graphs from equations
      - Simplifying algebraic fractions (Higher)
      - Adding and subtracting algebraic fractions
      - Solving equations with algebraic fractions
    Practice: Graph-transformation questions plus a Higher-tier algebraic-fractions set.
    Detail: Graph transformations, cubic and reciprocal graphs; algebraic fractions
    (Higher)

Months 9-10: Trigonometry, Vectors and Circle Theorems (Weeks 33-40)
  Right-Triangle Trigonometry and Exact Values
    Topics:
      - Sine, cosine and tangent ratios
      - Finding sides and angles in right triangles
      - Choosing the correct ratio
      - Exact trig values for Paper 1
      - Trig in worded and 2D contexts
      - Non-calculator trig fluency
    Practice: Right-triangle trig questions including exact-value non-calculator items.
    Detail: Right-triangle trig consolidated; exact trig values for Paper 1
  Sine and Cosine Rules
    Topics:
      - The sine rule for sides and angles
      - The cosine rule for sides and angles
      - Area of a triangle with the sine formula
      - Bearings and non-right-triangle problems
      - Trig graphs and their features (Higher)
      - Choosing the correct rule
    Practice: A non-right-triangle set applying sine and cosine rules with bearings.
    Detail: Sine and cosine rules with bearings and area applications; trig graphs (Higher)
  Vectors and Geometric Proof
    Topics:
      - Vector notation and column vectors
      - Adding and scaling vectors
      - Position vectors and paths
      - The classic geometric vector proof
      - Proving points collinear or parallel
      - Structuring a vector argument (Higher)
    Practice: Vector questions building to a full geometric vector proof.
    Detail: Vectors and the classic geometric vector proof, defanged (Higher)
  Circle Theorems
    Topics:
      - The main circle theorems
      - Angle at the centre and at the circumference
      - Cyclic quadrilaterals and tangents
      - The alternate segment theorem
      - Proof-quality justification language
      - Multi-theorem angle chains
    Practice: Circle-theorem problems requiring a named theorem for each step.
    Detail: Circle theorems with proof-quality justification

Months 11-12: Probability, Proportion and the Grade 8-9 Craft (Weeks 41-48)
  Probability, Trees and Venn Diagrams
    Topics:
      - Probability of single and combined events
      - Tree diagrams for dependent events
      - Venn diagrams and set notation
      - Conditional probability by reasoning
      - With and without replacement
      - Avoiding formula-panic on conditionals
    Practice: A probability set using tree and Venn diagrams, including a conditional
    question.
    Detail: Probability with tree and Venn diagrams; conditional probability without
    formula-panic
  Proportion and Rates of Change
```

      Topics:
        - Direct proportion as an equation
        - Inverse proportion as an equation
        - Finding the constant of proportionality
        - Rates of change from graphs
        - Gradient of a curve by tangent (Higher)
        - Pre-calculus gradient ideas
      Practice: Proportion questions written as equations plus a rate-of-change graph task.
      Detail: Direct and inverse proportion as equations; rates of change and pre-calculus
      gradient ideas (Higher)
    Histograms and Cumulative Frequency
      Topics:
        - Histograms with unequal class widths
        - Frequency density
        - Cumulative frequency curves
        - Median, quartiles and interquartile range
        - Box plots and comparing distributions
        - Interpreting data like a statistician
      Practice: A set drawing and reading histograms, cumulative frequency curves and box
      plots.
      Detail: Histograms, cumulative frequency and comparing distributions like a
      statistician
    Phase 2 Higher-Tier Checkpoint
      Topics:
        - Full Higher-tier past-paper cycle
        - Mark-scheme review of long questions
        - Method-mark harvesting practice
        - Error-log update from the cycle
        - Timing across a Higher paper
        - Weak-topic list refreshed
      Practice: A full Higher-tier past paper sat to time and reviewed against the mark
      scheme.
      Assessment: Higher-tier past-paper cycle marked to the mark scheme, updating the error
      log and weak-topic list.
      Detail: Phase checkpoint: full Higher-tier past-paper cycle with mark-scheme review and
      error-log update

PHASE 3: PAPER CRAFT TO THE EXAM SERIES (MONTHS 13-18)

Three papers, one strictly non-calculator, sat over exam season: this phase turns
understanding into grades with board-exact past-paper cycles, personal timing plans,
mark-banking discipline and a peak plan that meets the series calmly.

  Months 13-14: The Three-Paper System (Weeks 49-56)
    Paper 1 Craft, Non-Calculator
      Topics:
        - Non-calculator discipline under time
        - Exact values for surds and trig
        - Clean written working at speed
        - Common Paper 1 question types
        - Banking marks on short questions
        - Order of attack on Paper 1
      Practice: Timed Paper 1 sections focused on non-calculator accuracy and clean working.
      Detail: Paper 1 craft: non-calculator discipline, exact values and clean written
      working at speed
    Papers 2 and 3 Calculator Craft
      Topics:
        - Calculator use that saves time
        - Multi-step problem chains
        - Method-mark harvesting on hard questions
        - Efficient calculator functions
        - Presenting working on calculator papers
        - Recovering marks when stuck
      Practice: Timed Paper 2 and 3 sections practising method-mark harvesting on unfinished
      problems.
      Detail: Papers 2-3 craft: calculator use that helps, multi-step chains, and method-mark
      harvesting on problems you cannot finish

  Months 15-16: Full Cycles by Board (Weeks 57-64)
    Full Board-Exact Paper Cycles
      Topics:
        - Full timed papers from the exact board
        - Tier-correct paper selection
        - A review ritual after every paper
        - Naming why each mark was lost
        - A named fix for each error
        - Board-specific question styles
      Practice: Complete board-exact papers sat to time, each followed by a why-and-fix

review.
Detail: Full timed papers from your exact board and tier; review rituals, why each mark was lost, and the named fix

Timing Plans and Weak-Topic Rotations
Topics:
- Personal timing plans from paper data
- Per-question time budgets
- Weakest-topic rotations by error-log priority
- Grade-boundary awareness used honestly
- Targeting the highest-value gaps
- Consistency across papers

Practice: Weak-topic rotation sets chosen by error-log priority, timed to the personal plan.
Detail: Timing plans from personal data; weakest-topic rotations by error-log priority; grade-boundary awareness used honestly

Months 17-18: The Series, Met Calmly (Weeks 65-72)
Final Cycles and Error-Log Closure
Topics:
- Final full paper cycles
- Documented score progression
- Error-log closure
- Targeted revision to the mocks calendar
- Sealing recurring mistakes
- Confidence on previously weak topics

Practice: Final paper cycles with progression charted and each closed error re-tested.
Detail: Final cycles with documented progression; error-log closure; targeted revision that respects the mocks calendar

Peak Plan and Exam-Day Routines
Topics:
- Light consolidation in the peak week
- Rest discipline before the series
- Exam-day routines rehearsed
- Routines across all three papers
- Calm pacing under real conditions
- The series met as a known place

Practice: Light consolidation tasks and a rehearsed exam-day routine across the three papers.
Assessment: Final full-series rehearsal across all three papers with documented progression before the exam.
Detail: Peak plan: light consolidations, rest discipline, and exam-day routines rehearsed across all three papers

PROJECTS THE STUDENT BUILDS AND KEEPS

- Personal error log and syllabus map across all 18 months
- Non-calculator fluency system built through daily-dose drills
- Self-graded past-paper portfolio against your board's real mark schemes
- Personal timing plans for all three papers
- Full timed cycles with documented score progression

Total projects: 5+ exam artifacts plus the student's own handbooks

SKILLS THE STUDENT WILL HAVE AT THE END

- Calculator-free number fluency
- Algebra as a language: equations, formulae, graphs
- Higher-tier functions, trigonometry and vectors
- Circle theorems and geometric justification
- Probability and statistics at exam depth
- Proportion and rates-of-change craft
- Mark-scheme literacy and working discipline
- Three-paper timing strategy

HOW A TYPICAL WEEK IS SPLIT

Live classes: 2 one-hour live classes with your mentor
Past paper work: Weekly question sets from your exact board
Fluency: Non-calculator warm-up in every class
Total per week: About 4 focused hours

SUPPORT INCLUDED

Live sessions: 8 live one-hour classes every month, 2 per week
Mentorship: One dedicated mentor across the whole GCSE run
Recordings: Every class recorded for revision
Progress tracking: Paper-score progression shared with parents
Flexibility: Intensity adjusts around mocks and the exam series

CERTIFICATION DETAIL

  Final certificate: Course completion certificate from Modern Age Coders
  Score record: Documented paper-score progression
  Portfolio projects: Past-paper portfolio and personal handbooks

WHERE THIS CAN LEAD

  - A GCSE grade that opens sixth-form and apprenticeship doors
  - A-Level Mathematics readiness for Higher-tier students
  - The numeracy base every career pathway quietly requires
  - Ready for IB or A-Level tracks, or competition mathematics

COMMON QUESTIONS ABOUT THIS COURSE

  For anything about cost, use PART 4 and RULE 1. Do not quote two regions.

  Q: Which exam boards does this course cover?
  A: AQA, Edexcel and OCR, the content overlaps heavily, but paper styles and mark schemes
  differ, so the first thing the mentor confirms is your school's board, and every past paper
  comes from it. The 9-1 grading system and three-paper structure (one non-calculator) frame
  all exam work.

  Q: Foundation or Higher, how should the decision be made?
  A: By destination, then evidence. Foundation caps the grade at 5, so if A-Level maths or a
  competitive sixth form is even possible, Higher is the default. Whether the gaps blocking
  Higher are repairable in the time available is a diagnostic question, and the free demo
  answers it with evidence you can take to school. (Agent note: the free demo is a waiting list
  with no fixed date. The Priority Live Demo is a guaranteed class today or tomorrow, booked at
  https://learn.modernagecoders.com/priority-demo . Offer both, as RULE 3 says.)

  Q: My child's grades slide every mock as content deepens. Why?
  A: That slide is the classic signature of procedure without understanding: memorized methods
  hold at grade 4-5 content and collapse when questions chain or re-frame. Understanding-first
  teaching is the fix, algebra as a language, geometry with justification, which is exactly how
  this course teaches.

  Q: Can you take a grade 6 student to grade 8-9?
  A: All are taught directly in Phases 2-3. The honest caveat: the earlier the start, the more
  settling time the grade 8-9 topics get.

  Q: Do you take resit candidates?
  A: Yes, post-16 resit students get a compressed, evidence-led version of the program
  prioritised by their diagnostic, aimed at the grade 4/5 threshold or beyond as their goals
  require.

  Q: How does this fit around school mocks and revision?
  A: The mentor plans against your school calendar: intensity rises before mocks, past-paper
  focus aligns with what school is testing, and the final months are sequenced around the real
  series. The course reinforces school rather than competing with it.

  Q: Can we try it before paying?
  A: Yes. Every student starts with a free live demo class that doubles as the diagnostic,
  board, tier, fluency and algebra base, with no card details required.

  To enrol, message Shivam Sir on +91 9123366161 or send the parent this link: https://learn.modernagecoders.com/courses/gcse-mathematics-mastery
  For a demo: the Priority Live Demo (guaranteed, today or tomorrow) is booked at
  https://learn.modernagecoders.com/priority-demo . The free demo is a waiting list with no fixed date.

==
COURSE 70 OF 137: GENERATIVE AI COURSE: LLMS, RAG AND AI AGENTS
==

Course link: https://learn.modernagecoders.com/courses/complete-generative-ai-masterclass-college
Subject area: Generative AI
Designed for: College students
Who can join: Complete beginner (18+); Python and the maths are built inside the course
Course length: 10-12 months (40-48 weeks)
Time needed: 2 live classes/week + 5-6 hours practice
Certificate: Certificate from Modern Age Coders, awarded on passing the final exam

PRICE FOR THIS COURSE (quote only the one that applies to the person asking)
  In India, per month: group Rs 1,499, mini batch Rs 2,999, one to one Rs 4,999
  In Canada, per month: group CAD 140, one to one CAD 210
  Anywhere else, per month: group $100, one to one $150
  Classes: group and mini batch two live classes a week, eight a month; one to one in India one
  live class a week, four a month; one to one outside India two live classes a week, eight a

month. Each class is one hour.

WHAT THIS COURSE IS

Generative AI course, live online: Python to LLM engineering, prompt craft, RAG, fine-tuning, AI agents and production skills in 10-12 months.

In one line: The modern AI stack, engineered rather than prompted at: LLMs understood, RAG built properly, agents shipped with guardrails, in ten honest months.

ABOUT THE PROGRAMME

Generative AI created a new engineering discipline in record time, and most courses responded with either hype or screenshots. This masterclass responds with engineering. It starts from zero, Python, the working mathematics, a fast pass through classical ML and neural networks, because LLM engineering without foundations is prompt-guessing with extra steps. Then it goes where the real demand is: transformer architecture understood deeply enough to reason about, LLM APIs across providers, prompt engineering with evaluation harnesses, embeddings and vector search, retrieval-augmented generation built and hardened twice, fine-tuning judgment, open-weight models run locally, and AI agents, architecture, tools, memory and the guardrails that keep them honest. The production phase is what separates this course from tutorials: application architecture, observability, security against prompt injection, cost control, and a capstone shipped behind an API and defended. What it refuses to fake: training frontier models from scratch, research careers and startup playbooks are mapped honestly as next roads, not sold as weeks. The pace is real: ten months at two live classes a week plus five to six hours of practice, with two more in hand when needed. Problem sets after every class, monthly mixed reviews, phase exams, and a final exam that decides the certificate, with focused revision and a free retest. Real systems, real evaluation, depth over dopamine.

WHAT MAKES THIS COURSE DIFFERENT

- Foundations first, honestly: Python, maths and ML basics built in-course, because prompt-guessing is not engineering
- RAG built twice: once to work, once to survive real documents, real users and real failure modes
- Agents with guardrails: architecture, tools and memory, plus the security layer most courses skip
- Provider-agnostic: OpenAI-class, Claude-class, Gemini-class and open-weight models, patterns over brand loyalty
- Evaluation harnesses everywhere: generated output scored honestly, never eyeballed
- Real assessment: weekly problem sets, monthly mixed reviews, and a final exam that decides the certificate, with focused revision and a free retest

THE LEARNING PATH, STEP BY STEP

Phase 1: Foundations (Months 1-3): Python, working mathematics, classical ML and neural network basics
Phase 2: LLM core (Months 4-6): transformers in depth, APIs across providers, prompt engineering with evals, embeddings, frameworks and first RAG
Phase 3: Agents and adaptation (Months 7-8): advanced RAG, agent architecture and tools, fine-tuning judgment
Phase 4: Production (Months 9-10): open-weight and local models, architecture, observability and security, ethics, and the shipped capstone

WHAT A STUDENT NEEDS BEFORE STARTING

Coding experience: None required; Python is built in phase 1. Existing developers move faster and go deeper
Maths background: School mathematics; the working maths is rebuilt in month 2
Equipment: A normal laptop with a stable internet connection; free tiers and cloud notebooks cover the coursework
Age: 18+; college students, graduates and working professionals
Time commitment: 2 live classes plus 5-6 hours of practice a week

WHO THIS COURSE IS FOR

Career movers: Professionals aiming at the LLM-engineering job family, the fastest-growing in software
Developers: Software engineers adding the GenAI layer properly, past the tutorial plateau
Builders: Founders and makers who want their AI product built on engineering, not vibes
Analysts and pms: Technical-adjacent professionals who need to reason about GenAI systems credibly
Serious beginners: Newcomers ready to earn the foundations that make the modern layer real

FULL CURRICULUM, WEEK BY WEEK

This is the complete teaching plan. Parents can ask about any week.

PHASE 1: FOUNDATIONS (MONTHS 1-3, WEEKS 1-12)

Python, the working mathematics, and enough real ML and neural-network understanding that everything generative later makes sense from the inside.

Month 1: Python for AI Engineering (Weeks 1-4)
Python Fundamentals & Development Setup
Topics:
- What is Artificial Intelligence? History and evolution
- Types of AI: Narrow AI, General AI, Superintelligence
- Machine Learning vs Deep Learning vs Generative AI
- Generative AI revolution: GPT, current image APIs, Stable Diffusion
- AI career paths and opportunities in 2026 and beyond
- Why Python for AI? Python ecosystem overview
- Installing Python (3.10+) and setting up environment
- Development environments: Jupyter Notebook, VS Code, Google Colab
- Python basics: variables, data types, operators
- Control structures: if-else, loops (for, while)
- Functions: definition, parameters, return values
- Python data structures: lists, tuples, dictionaries, sets
- List comprehensions and dictionary comprehensions
- File handling: reading and writing files
- Error handling: try-except blocks
- Python modules and packages
- Virtual environments with venv/conda
Projects built:
- Text-based calculator program
- Todo list application
- File organizer script
- Simple data analyzer from CSV
- Web scraper basics with requests
- Command-line application
- Personal expense tracker
- Password generator and validator
Practice: Daily: 45 min Python practice, solve 10-15 problems on HackerRank/LeetCode
Advanced Python & Data Manipulation
Topics:
- Object-Oriented Programming in Python
- Classes and objects: __init__, self
- Inheritance and polymorphism
- Magic methods: __str__, __repr__, __len__
- Decorators and their usage
- Lambda functions and functional programming
- Map, filter, reduce functions
- Generators and iterators
- Context managers and 'with' statement
- Regular expressions for text processing
- Working with JSON and CSV data
- Introduction to NumPy: arrays and operations
- NumPy array operations, broadcasting, indexing
- Introduction to Pandas: DataFrames and Series
- Data loading, cleaning, and exploration with Pandas
- Data visualization basics with Matplotlib
- Plotting: line plots, bar charts, scatter plots, histograms
Projects built:
- Data analysis pipeline for CSV files
- Student grade analyzer with Pandas
- Weather data visualizer
- E-commerce sales dashboard
- Stock price analyzer and plotter
- Text file analyzer with regex
- Custom data class library
- API wrapper class with error handling
Practice: Solve 30 Python problems, analyze 5 real-world datasets
Assessment: Month 1 check: a Python data task live, plus a take-home mixing everything so far

Month 2: The Working Mathematics (Weeks 5-8)
Mathematics for AI - Part 1
Topics:
- Why math matters for AI and ML
- Linear Algebra: vectors and vector operations
- Dot product and cross product
- Matrices and matrix operations
- Matrix multiplication and transposition
- Identity matrix and inverse matrix
- Eigenvalues and eigenvectors (intuition)
- Calculus: functions and limits
- Derivatives: concepts and rules

- Chain rule and partial derivatives
- Gradient: direction of steepest ascent
- Gradient descent algorithm basics
- Multivariable calculus for neural networks
- Probability theory: basics and terminology
- Probability distributions: uniform, normal (Gaussian)
- Expected value and variance
- Bayes' theorem and conditional probability

Projects built:
- Vector operations visualizer
- Matrix calculator with NumPy
- Gradient descent implementation from scratch
- Probability distribution plotter
- Coin flip simulator with statistics
- Linear regression using gradient descent
- Simple optimization problems solver
- Derivative calculator for basic functions

Practice: Solve 40 math problems relevant to ML, implement algorithms

Mathematics for AI - Part 2 & Statistics

Topics:
- Statistics for data science
- Descriptive statistics: mean, median, mode
- Variance and standard deviation
- Correlation and covariance
- Hypothesis testing basics
- P-values and statistical significance
- Central Limit Theorem
- Confidence intervals
- Linear regression: mathematical foundation
- Cost functions and loss functions
- Optimization: local minima, global minima
- Convex vs non-convex functions
- Introduction to information theory
- Entropy and cross-entropy
- KL divergence
- Dimensionality reduction concepts
- Principal Component Analysis (PCA) intuition

Projects built:
- Statistical analyzer for datasets
- Hypothesis testing tool
- Correlation matrix visualizer
- Simple linear regression implementation
- Cost function visualizer
- PCA implementation from scratch
- Data distribution analyzer
- A/B testing simulator

Practice: Analyze 10 datasets statistically, implement core algorithms

Assessment: Month 2 check: vectors, gradients and probability in code, plus mixed review

Month 3: ML and Neural Networks, the Fast Honest Pass (Weeks 9-12)

Introduction to Machine Learning

Topics:
- What is Machine Learning? Formal definition
- Types of learning: Supervised, Unsupervised, Reinforcement
- Machine learning workflow: data, model, evaluation
- Training, validation, and test sets
- Overfitting and underfitting
- Bias-variance tradeoff
- Introduction to scikit-learn library
- Linear regression with scikit-learn
- Logistic regression for classification
- Decision trees: intuition and implementation
- Random forests ensemble method
- K-Nearest Neighbors (KNN) algorithm
- Support Vector Machines (SVM) basics
- Naive Bayes classifier
- Model evaluation metrics: accuracy, precision, recall, F1
- Confusion matrix and ROC curves
- Cross-validation techniques

Projects built:
- House price predictor (linear regression)
- Email spam classifier (logistic regression)
- Iris flower classifier (decision trees)
- Handwritten digit recognizer (KNN)
- Customer churn predictor
- Movie recommendation system basics
- Credit card fraud detection
- Student performance predictor

```
      Practice: Build 15 ML models, solve Kaggle beginner competitions
    Neural Networks & Deep Learning Basics
      Topics:
        - From ML to Deep Learning: why neural networks?
        - Perceptron: the building block
        - Multi-layer perceptron (MLP) architecture
        - Activation functions: sigmoid, tanh, ReLU, Leaky ReLU
        - Forward propagation step-by-step
        - Loss functions: MSE, cross-entropy
        - Backpropagation algorithm intuition
        - Gradient descent and its variants (SGD, Adam)
        - Learning rate and hyperparameters
        - Introduction to TensorFlow and Keras
        - Building neural networks with Keras Sequential API
        - Training and evaluating neural networks
        - Regularization techniques: dropout, L1/L2
        - Batch normalization
        - Early stopping and model checkpoints
        - Introduction to PyTorch basics
        - PyTorch tensors and autograd
        - What generative means: from predicting labels to producing text, images and code
      Projects built:
        - Neural network from scratch in NumPy
        - MNIST digit classifier with Keras
        - Fashion MNIST classifier
        - Binary classification with neural network
        - Multi-class classification problem
        - Regression with neural networks
        - Simple image classifier
        - Neural network hyperparameter tuning
      Practice: Build 12 neural networks, compare frameworks
      Assessment: Phase 1 exam: train and evaluate a small model live, plus a written mixed
      paper

----------------------------------------------------------------
PHASE 2: THE LLM CORE (MONTHS 4-6, WEEKS 13-24)
----------------------------------------------------------------
Transformers understood deeply enough to reason about, APIs across providers, prompt
engineering with evaluation harnesses, embeddings, and RAG built for the first time.

  Month 4: Transformers and APIs (Weeks 13-16)
    Transformer Architecture Deep Dive
      Topics:
        - Limitations of RNNs and LSTMs
        - Attention mechanism: intuition and math
        - Self-attention and multi-head attention
        - Positional encoding in transformers
        - Transformer architecture: encoder-decoder
        - BERT: bidirectional encoder representations
        - GPT architecture: decoder-only transformers
        - Tokenization: BPE, WordPiece, SentencePiece
        - Embedding layers and embedding spaces
        - How GPT generates text: autoregressive generation
        - Temperature, top-k, top-p sampling
        - Model parameters: understanding 7B, 70B, 175B
        - Context windows and attention span
        - Fine-tuning vs prompt engineering vs RAG
        - Pre-training and transfer learning
        - Hugging Face Transformers library introduction
        - Loading and using pre-trained models
      Projects built:
        - Attention mechanism visualizer
        - Tokenizer comparison tool
        - Text generation with Hugging Face
        - Sentiment analysis with BERT
        - Text classification with transformers
        - Named Entity Recognition (NER) system
        - Question answering system
        - Text summarization tool
      Practice: Implement attention from scratch, use 10+ transformer models
    LLM APIs Across Providers
      Topics:
        - OpenAI API overview and capabilities
        - Getting API keys and authentication
        - Current OpenAI chat models, and how to choose between them
        - Chat completions API: messages and roles
        - System, user, and assistant messages
        - Completion parameters: temperature, max_tokens, top_p
        - Streaming responses for real-time output
```

- Function calling with frontier models
- JSON mode for structured outputs
- Vision API: frontier modelsV for image understanding
- current image APIs API for image generation
- Whisper API for speech-to-text
- TTS (Text-to-Speech) API
- Embeddings API and semantic search
- Moderation API for content filtering
- Token counting and cost optimization
- Rate limiting and error handling
- Claude and Gemini APIs, and the OpenAI-compatible pattern that unifies the field

Projects built:
- ChatGPT clone with OpenAI API
- AI content generator dashboard
- Function calling chatbot
- Image analyzer with GPT-4V
- AI image generator web app
- Voice-to-text transcription tool
- Semantic search engine
- AI content moderation system

Practice: Build 15 OpenAI API applications
Assessment: Month 4 check: the same task solved through two providers, compared honestly, plus mixed review

Month 5: Prompt Engineering and Embeddings (Weeks 17-20)
Advanced Prompt Engineering
Topics:
- Prompt engineering as a discipline
- Anatomy of effective prompts
- Zero-shot, one-shot, few-shot learning
- Chain-of-Thought (CoT) prompting
- Tree of Thoughts (ToT) technique
- Self-consistency prompting
- Role prompting and persona design
- Instruction tuning concepts
- Prompt templates and variables
- Output formatting and constraints
- Handling hallucinations and reducing errors
- Prompt injection and safety
- Meta-prompting and prompt generation
- Multi-turn conversation design
- Context management in long conversations
- Prompt optimization and A/B testing
- Domain-specific prompting strategies

Projects built:
- Prompt library and template system
- Chain-of-Thought problem solver
- AI tutor with CoT reasoning
- Code generator with prompts
- Creative writing assistant
- Structured data extractor
- Multi-step task planner
- Prompt testing and evaluation framework

Practice: Create 100+ optimized prompts for various use cases
Embeddings and Vector Databases
Topics:
- What are embeddings? Semantic representations
- Word2Vec, GloVe, and modern embeddings
- OpenAI embeddings (text-embedding-ada-002)
- Sentence embeddings and document embeddings
- Cosine similarity and semantic search
- Vector databases: purpose and architecture
- Pinecone: managed vector database
- Weaviate: open-source vector DB
- Chroma: simple vector store
- Qdrant: performance-focused vector DB
- FAISS: Facebook AI similarity search
- Indexing strategies: flat, HNSW, IVF
- Metadata filtering in vector search
- Hybrid search: vector + keyword
- Building semantic search systems
- Recommendation systems with embeddings
- Clustering and visualization of embeddings

Projects built:
- Semantic search engine for documents
- Similar article finder
- Customer support ticket classifier
- Product recommendation system
- Duplicate detection system

- Embedding visualizer (t-SNE/UMAP)
- Multi-language semantic search
- Knowledge base with vector search

Practice: Build 10 vector database applications

Assessment: Month 5 check: build a semantic search over real documents, plus mixed review

Month 6: Frameworks and First RAG (Weeks 21-24)

LangChain Fundamentals

Topics:

- Introduction to LangChain framework
- LangChain architecture and components
- LLMs and Chat Models in LangChain
- Prompt templates and prompt engineering
- Output parsers: structured data from LLMs
- Chains: sequential processing
- LLMChain, SimpleSequentialChain, SequentialChain
- Memory types: ConversationBufferMemory, ConversationSummaryMemory
- Conversation chains with memory
- Document loaders: PDF, CSV, web pages
- Text splitters and chunking strategies
- Vector stores integration in LangChain
- Retrievers for information retrieval
- Combining LLMs with external data
- Question-answering over documents
- LangChain Expression Language (LCEL)
- Debugging and tracing in LangChain
- Framework honesty: when LangChain-style tooling helps, and when the native SDK is cleaner

Projects built:

- Conversational chatbot with memory
- Document Q&A system with LangChain
- PDF analyzer and summarizer
- Web scraper with AI analysis
- Multi-step reasoning chain
- Structured data extraction pipeline
- Conversation summarizer
- Knowledge base chatbot

Practice: Build 15 LangChain applications

Retrieval Augmented Generation (RAG) - Part 1

Topics:

- What is RAG? Why RAG over fine-tuning?
- RAG architecture: retrieval + generation
- Building basic RAG pipeline
- Document preprocessing for RAG
- Chunking strategies: fixed-size, semantic
- Embedding generation for documents
- Vector store population
- Retrieval strategies: similarity search, MMR
- Reranking retrieved documents
- Context compression techniques
- Query transformation and expansion
- Retrieval quality evaluation
- Prompt engineering for RAG
- Handling long contexts
- Multi-query retrieval
- Hypothetical document embeddings (HyDE)
- Parent document retrieval

Projects built:

- Enterprise documentation Q&A system
- Academic paper search and summarization
- Legal document analyzer
- Customer support knowledge base
- Code documentation assistant
- Research paper recommendation system
- Meeting notes Q&A system
- Email archive search with AI

Practice: Build 10 RAG applications for different domains

Assessment: Phase 2 exam: a working RAG system with an evaluation harness, defended, plus a cumulative paper

---

PHASE 3: AGENTS AND ADAPTATION (MONTHS 7-8, WEEKS 25-32)

RAG hardened for the real world, agent architecture with tools and memory, and fine-tuning judgment: what it changes, what it costs, when it is wrong.

Month 7: Hardened RAG and First Agents (Weeks 25-28)

RAG for the Real World

Topics:

- Advanced RAG architectures
- Self-RAG: self-reflective retrieval
- Corrective RAG (CRAG)
- Agentic RAG with LangGraph
- Multi-document RAG systems
- Hierarchical retrieval strategies
- Graph-based RAG
- Conversational RAG with memory
- RAG with structured data (tables, charts)
- Multimodal RAG: text + images
- RAG evaluation metrics: faithfulness, relevance
- RAGAS framework for evaluation
- RAG optimization techniques
- Caching strategies for RAG
- Production RAG deployment
- RAG monitoring and observability
- Security and privacy in RAG systems

Projects built:

- Advanced enterprise RAG system
- Multi-source RAG pipeline
- Conversational RAG with context
- Evaluation framework for RAG
- Self-improving RAG system
- Multimodal document understanding
- RAG-powered coding assistant
- Production-ready RAG API

Practice: Build and optimize 8 advanced RAG systems

AI Agents Architecture - Part 1

Topics:

- What are AI agents? Autonomous systems
- Agent types: simple reflex, goal-based, utility-based
- Perceive-Think-Act loop
- ReAct: reasoning and acting
- Plan-and-Execute agents
- Cognitive architectures for agents
- Agent memory systems
- Short-term vs long-term memory
- Semantic memory and episodic memory
- Working memory implementation
- Tool use and function calling
- Multi-step reasoning with agents
- Error handling and recovery
- Agent observability and logging
- LangGraph for agent workflows
- State machines for agents
- Human-in-the-loop agents

Projects built:

- Autonomous research agent
- Data analysis agent
- Code generation and debugging agent
- Travel planning agent
- Email management agent
- Content creation agent
- Personal productivity agent
- Multi-step task automation agent

Practice: Build 12 AI agent systems

Assessment: Month 7 check: an agent that uses two tools reliably, plus mixed review

Month 8: Agent Systems and Fine-Tuning (Weeks 29-32)

Agent Systems: Memory, Planning and Guardrails

Topics:

- Multi-agent systems (MAS)
- Agent communication protocols
- Collaborative agents vs competitive agents
- Agent coordination and cooperation
- Hierarchical agent architectures
- AutoGPT and BabyAGI patterns
- Task decomposition and planning
- Sub-goal generation
- Agent self-evaluation and reflection
- MetaGPT and role-playing agents
- Specialized agent roles
- Agent orchestration frameworks
- Crew AI for multi-agent systems
- Agent security and sandboxing
- Rate limiting and cost control
- Agent performance optimization
- Debugging complex agent systems

Projects built:

- Multi-agent research team
- Collaborative writing agents
- Software development agent team
- Customer service agent system
- Agent-based simulation
- Hierarchical task planner
- Self-improving agent system
- Production multi-agent platform

Practice: Build 8 multi-agent systems

Fine-tuning Fundamentals

Topics:

- What is fine-tuning? When to fine-tune?
- Fine-tuning vs prompt engineering vs RAG
- Types of fine-tuning: full, parameter-efficient
- Transfer learning for LLMs
- Dataset preparation for fine-tuning
- Data annotation and labeling
- Instruction tuning datasets
- Supervised fine-tuning (SFT)
- Training loops and optimization
- Loss functions for language models
- Hyperparameter tuning
- Overfitting prevention in fine-tuning
- Evaluation metrics for fine-tuned models
- Benchmark datasets and tasks
- OpenAI fine-tuning API
- Fine-tuning current OpenAI models
- Cost considerations for fine-tuning

Projects built:

- Fine-tune a current OpenAI model for customer support
- Domain-specific chatbot fine-tuning
- Code completion model fine-tuning
- Fine-tuned model for legal documents
- Medical terminology fine-tuning
- Custom classifier with fine-tuning
- Sentiment analysis fine-tuned model
- Fine-tuning evaluation framework

Practice: Fine-tune 8 models for different domains

Assessment: Phase 3 exam: a guarded agent system defended end to end, plus a cumulative written paper

---

PHASE 4: PRODUCTION AND THE CAPSTONE (MONTHS 9-10, WEEKS 33-40)

Open-weight models run locally, production architecture with observability and security, responsible AI, and a capstone shipped behind an API and defended.

Month 9: Open Weights and Production Architecture (Weeks 33-36)

Open Source LLMs & Local Deployment

Topics:

- Open source LLM landscape
- Llama 2 and Llama 3 models
- Mistral and Mixtral models
- Falcon, MPT, and BLOOM
- Model cards and model documentation
- Downloading models from Hugging Face Hub
- Model quantization: GGUF, GPTQ, AWQ
- Running LLMs locally with Ollama
- llama.cpp for efficient inference
- vLLM for production serving
- Text Generation Inference (TGI)
- Model serving with FastAPI
- GPU vs CPU inference
- Batch inference optimization
- Caching and KV-cache optimization
- Model benchmarking: speed and quality
- Building custom inference servers
- Multimodal models in one honest lesson: vision-language and where it fits

Projects built:

- Local LLM deployment with Ollama
- Quantized model serving API
- Multi-model inference server
- LLM benchmarking suite
- Optimized inference pipeline
- Custom model hosting solution
- Edge deployment of LLMs
- Inference cost calculator

Practice: Deploy and optimize 10 open source models

Production Architecture, Observability and Security

    Topics:
      - Designing AI-powered applications
      - Microservices architecture for AI
      - FastAPI for ML/AI APIs
      - Request validation and error handling
      - Asynchronous processing with Celery
      - Message queues: RabbitMQ, Redis
      - Background tasks for AI workloads
      - Caching strategies for AI apps
      - Redis for response caching
      - Database integration: PostgreSQL, MongoDB
      - Storing embeddings in databases
      - User authentication and authorization
      - API rate limiting and throttling
      - Webhook integrations
      - Building SDKs for AI APIs
      - API documentation with OpenAPI
      - Postman and API testing
      - LLM observability: tracing, token accounting and quality dashboards
      - Security: prompt injection, data exfiltration and the guardrail stack
    Projects built:
      - Production AI API with FastAPI
      - Asynchronous AI processing system
      - Cached AI inference service
      - Multi-user AI application
      - AI API with usage tracking
      - Webhook-based AI integration
      - Client SDK for AI service
      - Complete AI backend system
    Practice: Build 10 production-ready AI APIs
    Assessment: Month 9 check: a production-readiness review of your own system, plus mixed
    review

Month 10: Ethics, Capstone and the Final Exam (Weeks 37-40)
  Responsible GenAI
    Topics:
      - AI ethics fundamentals
      - Bias in AI: sources and mitigation
      - Fairness metrics and evaluation
      - Transparency and explainability
      - LIME and SHAP for model interpretation
      - Privacy in AI: data protection
      - Differential privacy
      - Federated learning basics
      - AI safety and alignment
      - Constitutional AI principles
      - Red teaming and adversarial testing
      - Content moderation and filtering
      - Deepfakes: detection and prevention
      - AI regulations: GDPR, AI Act
      - Responsible AI deployment
      - Environmental impact of AI
      - AI for social good
      - Capstone planning: choosing a system worth defending
    Projects built:
      - Bias detection tool for models
      - Explainable AI dashboard
      - Content moderation system
      - Deepfake detector
      - Privacy-preserving AI application
      - AI impact assessment tool
      - Responsible AI checklist generator
    Practice: Evaluate and improve fairness in all projects
  Capstone Build
    Topics:
      - Two focused weeks: a complete GenAI system, RAG, agent or hybrid
      - Instructor checkpoints and honest scope cuts
      - The evaluation harness built before the excitement
      - Shipped behind an API with observability and guardrails
      - A system card a skeptic could audit
    Projects built:
      - The capstone: a deployed, evaluated, guarded GenAI system
    Practice: Daily build log; a working deployed system at all times
  Demo Day and the Final Exam
    Topics:
      - Presenting the capstone: live system plus the hardest failure story
      - A full-course spiral review before the exam
      - The honest map of next roads: enterprise agents, coding agents, deep ML and research
      - Where our Copilot Studio and Codex/Claude Code courses continue the applied layer

Projects built:
  - Demo day presentation delivered to the batch
Assessment: FINAL EXAM: a practical GenAI engineering task plus a written paper with questions mixed from every phase. Passing earns the certificate; falling short earns a focused revision plan and a free retest

PROJECTS THE STUDENT BUILDS AND KEEPS

- Phase 1: Python and maths problem sets, a first trained and evaluated model
- Phase 2: provider-compared LLM integrations, prompt suites with evaluation harnesses, semantic search, and a first working RAG
- Phase 3: a hardened RAG over messy real documents, tool-using agents with memory and guardrails, a fine-tuning study
- Phase 4: an open-weight model run locally, a production-readiness review, and the deployed capstone

Total projects: 20+ working GenAI builds, crowned by a deployed, evaluated capstone system

SKILLS THE STUDENT WILL HAVE AT THE END

- Foundations: Python, working mathematics and honest ML basics
- LLM engineering: transformer understanding, multi-provider APIs, prompt craft with evals
- Retrieval: embeddings, vector search and RAG built and hardened twice
- Agents: architecture, tools, memory, planning and guardrails
- Adaptation: fine-tuning judgment and open-weight local deployment
- Production: architecture, observability, security and cost control
- Ethics: responsible deployment argued, not recited

HOW A TYPICAL WEEK IS SPLIT

Live classes: 2 live one-hour classes per week, building real systems together
Homework: A problem set after every class, and a mixed-review assignment at the end of every month
Practice: 5-6 hours of system-building practice between classes
Review: Every submission reviewed with written feedback; recurring gaps reopened in class

SUPPORT INCLUDED

Doubt support: WhatsApp doubt support between classes, for the retrieval that returns nonsense at midnight
Progress updates: Honest monthly progress reviews: what is solid, what is wobbly, and the plan for the wobble

CERTIFICATION DETAIL

Completion: Certificate from Modern Age Coders, awarded on passing the final exam. Fall short and there is focused revision and a free retest: the certificate certifies knowledge, not attendance

WHERE THIS CAN LEAD

- LLM and AI engineering roles: this portfolio is what those interviews want to see
- AI Agents with Copilot Studio: the enterprise, low-code agent layer
- Codex and Claude Code: agentic coding as a daily working method
- Our AI/ML masterclass: the deep-model road, entered with the applied layer already owned
- Product work: GenAI features shipped inside existing products, immediately

EARNING POTENTIAL (share only if asked, and never promise it)

Market context: The ranges below are general market salary bands for these roles in India and abroad, drawn from public industry data. They are shown for career context only and are not a promise or guarantee of income. Actual pay depends on your skills, experience, location, and the job market.
Early career roles: Rs 4-7 LPA (Junior AI Developer / Prompt Engineer)
Growing roles: Rs 8-15 LPA (AI Application Developer / LLM Engineer); Rs 15-25 LPA (AI Engineer / Senior LLM Engineer)
Experienced roles: Rs 20-40 LPA (Senior AI Engineer / AI Architect / AI Lead); Rs 30-70 LPA (Lead AI Engineer / Principal Engineer)
Freelance: Rs 2,000-10,000/hour based on expertise and specialization
International usa: $120k-300k USD (AI Engineer to Senior/Staff level)
International europe: €70k-180k EUR based on country and experience

COMMON QUESTIONS ABOUT THIS COURSE

For anything about cost, use PART 4 and RULE 1. Do not quote two regions.

Q: How long does it take to become good at generative AI?
A: Ten months at 2 live classes a week plus 5 to 6 hours of practice, from zero, and that includes the foundations most GenAI courses skip. The course keeps two more months in hand

for learners who need them.

Q: How am I assessed? Is the certificate just for attending?
A: No. Problem sets follow every class with written feedback, monthly reviews mix new material with earlier topics deliberately, each phase ends with an exam, and the course ends with a final exam: a practical GenAI engineering task plus written questions from the whole syllabus. Passing earns the certificate; falling short earns focused revision and a free retest.

Q: Do I need to know Python or machine learning already?
A: No. Phase 1 builds Python, the working mathematics and honest ML basics precisely so that the generative phases rest on understanding rather than copy-paste. Existing developers skip nothing but move faster, and go deeper in the practice work.

Q: Which models and tools does the course use?
A: All the ones that matter, by design: frontier APIs (GPT-class, Claude-class, Gemini-class), open-weight models like the Llama family run locally, vector databases, and framework tooling with an honest verdict on when it helps versus native SDKs. The patterns are the syllabus; providers are examples, so the skills survive the next model release.

Q: Does the course cover AI agents?
A: As a core phase, not a teaser: agent architecture, tool use, memory, planning, failure modes and the guardrail stack, built into working systems and then hardened in the production phase. Students who want the enterprise low-code layer continue into our Copilot Studio courses; those who want agentic coding continue into Codex and Claude Code.

Q: Will I train my own large language model?
A: You will fine-tune and run open-weight models, and understand training deeply enough to reason about it. Training frontier models from scratch costs millions and is honestly mapped as a research-career road, not sold as a course week. What employers actually need, adaptation, retrieval, agents and production judgment, is exactly what the course builds.

Q: Can I try a class before enrolling?
A: Yes, a free demo class with no commitment: book at learn.modernagecoders.com/contact or message us on WhatsApp at +91 91233 66161. You will build a small working GenAI piece inside the demo itself. (Agent note: the free demo is a waiting list with no fixed date. The Priority Live Demo is a guaranteed class today or tomorrow, booked at https://learn.modernagecoders.com/priority-demo . Offer both, as RULE 3 says.)

Q: Are classes live or recorded?
A: Live, always: small groups with a real instructor reading your actual code and traces, never pre-recorded videos. GenAI systems fail in quiet, expensive ways; live review is the only honest way to build the judgment that catches them.

To enrol, message Shivam Sir on +91 9123366161 or send the parent this link: https://learn.modernagecoders.com/courses/complete-generative-ai-masterclass-college
For a demo: the Priority Live Demo (guaranteed, today or tomorrow) is booked at https://learn.modernagecoders.com/priority-demo . The free demo is a waiting list with no fixed date.

==========
COURSE 71 OF 137: GIT & GITHUB COURSE FOR COLLEGE STUDENTS: TEAM-READY SKILLS
==========

Course link: https://learn.modernagecoders.com/courses/git-github-version-control-course-for-college-students
Subject area: Version Control & Developer Tools
Designed for: College students
Who can join: Beginner to job-ready collaborator (college students and recent graduates)
Course length: 24 classes (12 weeks · 2 classes/week)
Time needed: 4-5 hours/week recommended
Certificate: Certificate from Modern Age Coders, awarded on passing the final assessment

PRICE FOR THIS COURSE (quote only the one that applies to the person asking)
In India, per month: group Rs 1,499, mini batch Rs 2,999, one to one Rs 4,999
In Canada, per month: group CAD 140, one to one CAD 210
Anywhere else, per month: group $100, one to one $150
Classes: group and mini batch two live classes a week, eight a month; one to one in India one live class a week, four a month; one to one outside India two live classes a week, eight a month. Each class is one hour.

WHAT THIS COURSE IS

Master Git and GitHub in a live 24-class course for college students: team branching workflows, pull requests and code review, GitHub Actions CI, open source contribution and Git interview prep for internships and placements.

In one line: Every internship, hackathon, and placement interview touches Git. Learn to work like an engineer on a team, and make your GitHub profile do the talking.

ABOUT THE PROGRAMME

Most college students can type git add and git commit, and that is where their Git knowledge ends. Then the first hackathon, group assignment, or internship arrives and everything falls apart: overwritten work, merge conflicts nobody can resolve, a single main branch with fifty messy commits, and a GitHub profile that tells recruiters nothing. This course closes that gap in 24 live, instructor-led classes. You start with version control fundamentals and command-line fluency, master the full undo toolkit, then move to the skills placements actually test: SSH and remotes, professional READMEs, a portfolio on GitHub Pages, the feature-branch workflow, merge vs rebase, pull requests with real code review, GitHub Actions CI with branch protection, open source contribution including Hacktoberfest and GSoC preparation, and the Git interview questions that appear in technical rounds. You finish with a team capstone executed exactly the way an engineering team ships software, plus a full GitHub profile audit, so your commits, pull requests, and green CI checks speak for you before you say a word.

WHAT MAKES THIS COURSE DIFFERENT

- Team-first, not command-first: you do not just memorize git commands, you run the full branch, PR, review, CI loop the way internship teams actually work.
- Live classes with a real instructor, never pre-recorded videos: every session is hands-on, with your terminal open and your questions answered on the spot.
- Career-wired from Class 5: SSH done properly, recruiter-grade READMEs, a profile that survives a 30-second scan, the GitHub Student Developer Pack, and a live portfolio on GitHub Pages.
- Real scenarios, not toy demos: staged three-person merge conflicts, rescue drills with reflog, a git bisect bug hunt, and a full live mock Git interview.
- Open source is in the syllabus: CONTRIBUTING.md etiquette, a first external pull request, and a personal Hacktoberfest and GSoC preparation roadmap.
- Living Syllabus: the curriculum is updated as Git and GitHub ship new features, so you always learn the current tools, not screenshots from three years ago.

WHAT A STUDENT NEEDS BEFORE STARTING

Device: A laptop or desktop (Windows, Mac, or Linux) with a stable internet connection; no special hardware needed
Coding experience: Basic familiarity with any one programming language (first-year college Python, C, Java, or JavaScript is plenty); this course teaches the workflow around your code, not the language itself
Accounts: A free GitHub account (GitHub's Terms of Service require users to be 13 or older); a college ID or institute email lets you claim the GitHub Student Developer Pack, and we walk you through it
Mindset: Willingness to practice in the terminal between classes; version control is muscle memory, and the drills are designed to build it

WHO THIS COURSE IS FOR

Engineering students: B.Tech, BCA, BSc, and diploma students who can write some code but have never worked on a shared repository like a team
Placement aspirants: Pre-final and final year students who know recruiters will open their GitHub profile and want it to say 'engineer', not 'tutorial follower'
Hackathon teams: Students whose group projects and hackathons keep dissolving into zip files on WhatsApp and overwritten work
Open source aspirants: Anyone targeting a first external pull request, Hacktoberfest, or a serious GSoC application
Recent graduates: Fresh graduates and self-taught coders who skipped Git fundamentals and now feel it in every interview and internship

FULL CURRICULUM, WEEK BY WEEK

This is the complete teaching plan. Parents can ask about any week.

PHASE 1: FOUNDATIONS FAST

Go from zero to confident daily Git use: how version control thinks, complete CLI fluency, an undo toolkit you can trust in any situation, and repository hygiene that keeps secrets and junk out of history.

Class 1: How Version Control Thinks: Concepts, Install & First Config
Topics:
- The problem Git solves: no more project_final_v2_REALLY_FINAL.zip, safe experiments, and a complete history of who changed what and why
- Centralized vs distributed version control, and why Git (created by Linus Torvalds in 2005 as a free, open source tool for Linux kernel development) is the system you should expect to meet at internships, placements, and beyond
- The core mental model: repository, commit, branch, remote, and how Git stores snapshots of your whole project rather than just file differences
- The three areas every command moves work between: working directory, staging area (the

index), and the repository
- Installing Git on Windows (with Git Bash), macOS, and Linux, and verifying with git --version
- First-time setup: git config --global user.name and user.email (the identity stamped on every commit you will ever make), init.defaultBranch main, and core.editor
- Reading your setup back with git config --list --show-origin, and understanding system vs global vs local config levels

Projects built:
- Install Git, complete your global configuration, create your first repository with git init, and explore the hidden .git folder to see where history actually lives

Practice: Run git config --list and explain out loud what each line you set does and where it applies.

Assessment: Explain the working directory, staging area, and repository to a classmate by narrating one real file's journey through all three.

Class 2: CLI Fluency: init, add, commit, log & diff Like You Mean It

Topics:
- Terminal survival kit: pwd, ls, cd, mkdir, and why interviewers and internship teams expect command-line comfort
- git status as your compass: reading untracked, modified, and staged states without guessing
- Staging with intent: git add <file>, git add -A, and the professional's git add -p to stage changes hunk by hunk
- Committing properly: git commit -m for quick saves, git commit opening your editor for detailed messages, and what a commit object actually contains (snapshot, author, timestamp, parent, SHA)
- Reading history: git log, git log --oneline --graph --all --decorate, and filtering with git log --author and git log -n 5
- Inspecting change: git diff for unstaged edits, git diff --staged for what will be committed, and git show <sha> for any past commit
- HEAD and relative references like HEAD~1 and HEAD~3: the addressing system the entire undo toolkit depends on

Projects built:
- Build a personal-notes repository with at least 8 meaningful commits, using git add -p at least twice and reading your own history with git log --oneline --graph

Practice: Complete one full edit, stage, commit cycle while narrating how git status output changes at each step.

Assessment: Given a repository with mixed staged and unstaged changes, correctly predict the output of git status and git diff --staged before running them.

Class 3: The Full Undo Toolkit: restore, reset, revert & When Each Is Safe

Topics:
- Undo an unstaged edit with git restore <file>, and unstage without losing work with git restore --staged <file>
- Fix the last commit with git commit --amend for a better message or a forgotten file, and why amend rewrites the commit SHA
- git reset --soft HEAD~1: move the branch pointer back but keep everything staged, the 'redo my commit' move
- git reset --mixed HEAD~1 (the default): also unstage, keeping all changes safe in your working directory
- git reset --hard HEAD~1: discard changes completely, the rare cases where it is justified, and why you type it slowly
- git revert <sha>: a new commit that undoes an old one, the ONLY safe undo on history you have already pushed and shared
- The decision table: private unpushed history means reset and amend freely; shared pushed history means revert only, and what a force push does to your teammates

Projects built:
- Run a scripted rescue drill: amend a bad message, soft-reset a premature commit, hard-reset a failed experiment, and revert a bad commit that was already pushed to a practice remote

Practice: For five written scenarios, state which undo command you would use and why it is safe in that exact situation.

Assessment: Correctly choose between reset and revert for shared vs private history across a set of real situations, losing zero work in the lab.

Class 4: .gitignore for Real Stacks, Secrets & Commit Craft

Topics:
- .gitignore syntax that matters: literal names, *.log wildcards, dir/ trailing slashes, ! negation, and how rule order works
- What real stacks must ignore: node_modules/ and dist/ for JavaScript, venv/ and __pycache__/ for Python, .DS_Store, and IDE folders like .idea/ and .vscode/
- Secrets discipline: .env files never enter history; what to do the moment a key IS committed (rotate the key first, then clean up), and why deleting the file in a later commit does not remove it from history
- Untracking without deleting: git rm --cached <file> for files that were committed before the ignore rule existed
- A machine-wide ignore file: git config --global core.excludesFile ~/.gitignore_global for editor junk on every project
- Commit message craft: imperative subject around 50 characters, blank line, body explaining why, the style engineering teams and open source maintainers expect
- Atomic commits: one logical change per commit, and searching history later with git log --grep and the pickaxe git log -S 'functionName'

    Projects built:
      - Take a messy starter project with node_modules, a fake .env, and editor junk already tracked;
        write a production-grade .gitignore, untrack the offenders with git rm --cached, and
        re-commit cleanly
    Practice: Write .gitignore rules for a Python project and a Node project from memory,
    then verify both with git status.
    Assessment: Your cleaned repository shows no generated files or secrets in git status,
    and your last five commit messages pass the message-quality checklist.

PHASE 2: GITHUB FOR YOUR CAREER

Turn GitHub into a career asset: SSH and remotes done properly, READMEs and licenses
recruiters respect, a profile that survives a 30-second scan, the Student Developer Pack
claimed, and a live portfolio on GitHub Pages.

  Class 5: GitHub, SSH Keys & Your First Push
    Topics:
      - Git vs GitHub: the tool vs the hosting platform (owned by Microsoft since 2018), and what
        GitHub Free includes: unlimited public and private repositories and 2,000 GitHub Actions
        minutes per month
      - Creating an account that will carry your career: choosing a username recruiters will read,
        and GitHub's Terms of Service age requirement of 13 or older
      - Authentication today: passwords do not work for pushing; SSH keys vs HTTPS with personal
        access tokens, and when each fits
      - Generating a key: ssh-keygen -t ed25519 -C 'you@college.edu', adding it to ssh-agent, and
        pasting the public key into GitHub Settings under SSH and GPG keys
      - Verifying the handshake with ssh -T git@github.com and reading what the greeting message
        confirms
      - Wiring local to remote: git remote add origin git@github.com:you/repo.git, then git push -u
        origin main, and what the -u upstream flag saves you forever after
      - Reading a repository page like a developer: commits, branches, browsing files at any point in
        history, and the Insights tab
    Projects built:
      - Create or clean up your GitHub account, set up ed25519 SSH authentication end to end, and
        push your Class 4 repository with git push -u origin main
    Practice: Break and re-verify your SSH setup once, so you can debug 'Permission denied
    (publickey)' on your own next time.
    Assessment: Your local repository pushes to GitHub over SSH with no password prompt, and
    the commit history renders correctly online.

  Class 6: Clone, Fetch, Pull & Speaking Remote Fluently
    Topics:
      - git clone <url>: what you actually get (full history, an origin remote, a tracked default
        branch), and cloning over SSH vs HTTPS
      - Remote-tracking branches: what origin/main really is, and why git status says 'ahead 2,
        behind 1'
      - git fetch: download remote changes WITHOUT touching your work, then inspect the gap with git
        log main..origin/main
      - git pull as fetch plus merge, git pull --rebase for linear history, and setting pull.rebase
        true the way many teams do
      - Push rejections decoded: 'non-fast-forward' means fetch first, integrate, then push;
        force-pushing a shared branch is never the reflex answer
      - Working from two machines (hostel laptop and lab computer): the pull-before-work,
        push-before-leave rhythm that prevents divergence
      - Remote management: git remote -v, git remote show origin, and renaming or removing remotes
        safely
    Projects built:
      - Simulate a two-computer workflow using two local clones of your own repository: make
        diverging changes, inspect with git fetch, reconcile with git pull --rebase, and push
    Practice: Trigger one rejected push on purpose and resolve it with fetch and rebase
    instead of a force push.
    Assessment: Explain the exact difference between fetch and pull, then demonstrate both
    live on a repository with pending remote changes.

  Class 7: READMEs & Licenses: Repos Recruiters Actually Read
    Topics:
      - What a recruiter or interviewer does in 30 seconds on your repository: README first, commit
        history second, code third, which makes the README your landing page
      - Professional README structure: one-line pitch, screenshot or GIF, features, tech stack, setup
        steps that actually work, usage, and what you would improve next
      - Markdown fluency: headings, code fences with language tags, tables, task lists, images, and
        status badges
      - Naming and describing repositories: expense-tracker-django beats project2-final; filling the
        description field and topics so your work is searchable
      - Licenses in plain language: MIT (permissive, common for student projects), Apache-2.0 (adds a
        patent clause), GPL-3.0 (copyleft), and what 'no license' legally means for your code
      - Adding a LICENSE file through GitHub's license chooser, and when a college project should
        have one

- Cleaning your existing account: archiving dead experiments, deleting empty repos, and making 3 repositories excellent instead of 20 mediocre

Projects built:

- Rewrite the README of your best existing project to the professional template, add a screenshot and a suitable license, and complete the repo description and topics

Practice: Review a classmate's README against the recruiter checklist and give two concrete, actionable improvements.

Assessment: A stranger can clone and run your project using only your README, verified by a classmate actually doing it.

Class 8: Profile README, Pinned Repos & the Student Developer Pack

Topics:

- The username/username repository: GitHub renders that repo's README at the top of your profile page, your one free billboard for recruiters
- What belongs in a profile README: who you are, what you build, current focus, top projects with links, and how to reach you; what to skip (walls of badges and fake stats)
- Pinning your best 6 repositories and choosing them for range: a web app, a tool, a contribution, not six versions of one tutorial
- The contribution graph: what actually counts toward it, why consistent real work beats gaming it, and how interviewers read it
- The GitHub Student Developer Pack: free for verified students enrolled at a degree or diploma granting school, and it includes GitHub Pro while you are a student; claim it at education.github.com with your college ID or institute email
- GitHub Copilot for students: Copilot has a free tier, and GitHub Education has offered free Copilot access to verified students; availability can change, so always check education.github.com
- Your public identity checklist: consistent handle, photo, a bio with your college and interests, location, and a pinned portfolio link

Projects built:

- Ship your profile README in the username/username repository, pin your best repositories, complete your bio, and submit your Student Developer Pack verification

Practice: Study three impressive real student profiles and write down one idea to borrow from each.

Assessment: Your profile passes the class rubric: profile README live, three or more pinned repos with descriptions, complete bio, and Pack verification submitted.

Class 9: Ship Your Portfolio on GitHub Pages

Topics:

- GitHub Pages: static hosting GitHub provides free, publishing files directly out of your repo, and why a live URL beats 'code available on request' on a resume
- User site vs project site: username.github.io serves at the root domain, while every other repository can publish under /repo-name
- Enabling Pages in Settings under Pages: deploy from a branch (main or a /docs folder) vs deploying with a GitHub Actions workflow
- Building a clean single-page portfolio: about, projects with live links and repo links, skills, and contact; plain HTML and CSS is enough
- Debugging deploys: a custom 404.html, relative path gotchas, and why case-sensitive file names break images that worked locally
- Pointing a custom domain at Pages with a CNAME record (optional) and enforcing HTTPS
- The portfolio loop from now on: every future project gets a live demo link in its README and a card on your portfolio site

Projects built:

- Deploy a portfolio site at username.github.io featuring at least three projects with live links, then add the portfolio URL to your GitHub bio and resume

Practice: Push one content update and watch GitHub Pages rebuild and redeploy it live.

Assessment: Your portfolio URL loads publicly, every link resolves, and it is referenced from your GitHub profile.

PHASE 3: TEAM WORKFLOWS

Work the way engineering teams work: feature branches, clean history with merge and rebase, real conflict resolution, pull requests with meaningful review, and issues and Projects boards that keep group assignments and hackathons on track.

Class 10: Branches & the Feature-Branch Workflow

Topics:

- What Git calls a branch: a lightweight named reference to a commit SHA, so creating, switching, and deleting branches costs nothing
- Modern commands: git switch -c feature/login, alongside the older git checkout -b you will still see in every tutorial and team
- The feature-branch workflow: main stays always-working, and every feature, fix, and experiment gets its own branch
- Branch naming conventions teams use: feature/, fix/, chore/, and docs/ prefixes plus a short descriptive slug
- Switching branches with uncommitted changes: when Git blocks you, why, and a first look at git stash as the escape
- Fast-forward merges: git merge feature/login when main has not moved, and reading the result in git log --graph

- Cleaning up: git branch -d (safe, merged work only) vs git branch -D (force), plus listing with git branch -a and git branch --merged

Projects built:

- Build two features of a small app on separate branches (feature/navbar and feature/contact-form), merge both into main, and delete the merged branches

Practice: Draw your repository's commit graph on paper mid-exercise, then verify it against git log --oneline --graph --all.

Assessment: Your history shows main receiving two feature branches through merges, with no work ever committed directly to main.

Class 11: Merge vs Rebase & Keeping History Clean

Topics:

- The three-way merge: how Git finds the common ancestor and combines both sides into a merge commit
- git merge --no-ff to force a merge commit that records the feature as one unit, and why some teams mandate it
- git rebase main from your feature branch: replaying your commits onto a new base for a straight-line history
- The golden rule of rebase: never rebase commits that others already have; rewriting shared history breaks every teammate's repository
- Interactive rebase: git rebase -i HEAD~4 to squash WIP commits, reword messages, and reorder work before opening a pull request
- git merge --squash: landing a messy branch as one clean commit, and how it differs from GitHub's squash-merge button
- Choosing a team policy: merge-commit history vs linear rebase history, and reading each style fluently in git log --graph

Projects built:

- Take a feature branch with five messy WIP commits, use git rebase -i to squash and reword them into two clean commits, then rebase onto an updated main and merge

Practice: Integrate the same branch in two clone copies, once with merge and once with rebase, and compare the resulting graphs.

Assessment: Explain to the class when rebase is safe and when it is forbidden, giving one correct example of each.

Class 12: Resolving Merge Conflicts Under Deadline Pressure

Topics:

- The anatomy of a conflict: both branches touched identical lines since their common ancestor, so Git stops and makes you decide
- Reading conflict markers: <<<<<<< HEAD, =======, and >>>>>>> feature, and what each side represents in a merge vs during a rebase
- Resolving by hand and in VS Code's merge editor: accept current, accept incoming, accept both, or write the correct combination yourself
- Escape hatches: git merge --abort and git rebase --abort return you to safety, and git rebase --continue moves forward after each fixed commit
- Taking a whole side deliberately: git checkout --ours <file> and git checkout --theirs, and how their meaning flips during a rebase
- Conflict prevention as a team habit: pull main into your branch often, keep pull requests small, and split files everyone edits
- The full drill: conflicting a shared team file, resolving it, staging the resolution, and completing the merge commit

Projects built:

- Run a staged three-person conflict lab: all three teammates edit the same function on separate branches, then merge every branch into main resolving each conflict correctly

Practice: Abort a scary conflicted merge with git merge --abort, then redo it and resolve it for real.

Assessment: You resolve a two-file conflict with the intended code surviving and no conflict markers left behind, verified with git diff.

Class 13: Pull Requests With Meaningful Descriptions

Topics:

- What a pull request is: a request to merge a branch, plus the conversation, review, and checks that professionalize the merge
- Opening a PR properly: base vs compare branch, a title that summarizes the change, and the shortcut link Git prints after every push
- The PR description that gets fast reviews: what changed, why, how you tested it, screenshots for UI work, and where reviewers should focus
- Linking work: 'Closes #12' auto-closes the issue on merge, and referencing related PRs and commits by SHA keeps the trail connected
- Draft PRs for early feedback, requesting specific reviewers, and updating a PR by pushing new commits to the same branch
- GitHub's three merge buttons: create a merge commit vs squash and merge vs rebase and merge, and when a team picks each
- PR templates: a .github/PULL_REQUEST_TEMPLATE.md so every teammate's pull request arrives complete

Projects built:

- Open a real PR on your team repository with a complete description, screenshots, and a linked issue; get it reviewed by a classmate and squash-merge it

Practice: Rewrite a terrible one-line PR description ('fixed stuff') into one a reviewer can actually act on.

Assessment: Your PR history shows a described, linked, reviewed pull request merged with the strategy your team agreed on.

Class 14: Code Review: Giving & Receiving Like a Professional
Topics:
- Why review exists: catching bugs early, spreading knowledge, and keeping a codebase consistent; it is the daily collaboration ritual at real companies
- Reviewing a diff on GitHub: the Files changed tab, viewed checkboxes, and commenting on specific lines or line ranges
- Suggested changes: proposing exact replacement code the author can apply with one click
- The three review verdicts: Comment, Approve, and Request changes, and what each one signals to the author
- Giving feedback that lands: comment on the code not the person, ask questions before issuing orders, and mark non-blockers with a 'nit:' prefix
- Receiving feedback without ego: respond to every comment, push fixes to the same branch, re-request review, and disagree with reasons rather than defensiveness
- Review culture tools: a CODEOWNERS file to auto-assign reviewers, and requiring one approval before merge

Projects built:
- Complete a paired review cycle: review a classmate's PR leaving at least one suggested change and one question, and shepherd your own PR from Request changes to Approved

Practice: Rewrite three blunt review comments into constructive ones without losing their technical point.
Assessment: Your review on a peer PR includes a line-level suggestion the author applied, and your own PR reached Approved after addressing feedback.

Class 15: Issues, Projects, Forks & Running a Team Repo
Topics:
- Issues as your team's shared brain: writing a reproducible bug report and a clearly scoped feature request
- Labels (bug, enhancement, good first issue), assignees, and milestones that group issues toward a deadline like a semester submission
- GitHub Projects: a board with Todo, In progress, and Done columns that updates automatically as linked issues and PRs move
- Issue templates and Markdown task lists so bug reports arrive with the information you need
- Fork vs clone: a fork is your own server-side copy under your account, the standard route for contributing when you lack push access
- Keeping your fork current: register the original repo with git remote add upstream, pull its history with git fetch upstream, integrate with git merge upstream/main, or click Sync fork on GitHub
- The hackathon playbook: repo plus board plus issues plus branch-per-feature plus PRs, set up in the first 30 minutes so the team never blocks

Projects built:
- Set up your capstone team repository: issue templates, labels, a milestone, a Projects board with 10+ scoped issues, and a fork-based contributor test run with upstream syncing

Practice: Convert a vague idea ('make the app better') into three well-scoped, labeled, assignable issues.
Assessment: Your team board shows issues flowing from Todo to Done via linked PRs, and every teammate has synced a fork with upstream at least once.

PHASE 4: AUTOMATION & OPEN SOURCE

Automate quality and step into the open source world: CI that runs your tests on every push, branch protection that enforces discipline, professional versioning and releases, and a real contribution roadmap through Hacktoberfest and GSoC preparation.

Class 16: GitHub Actions: CI That Runs Your Tests on Every Push
Topics:
- What continuous integration is and why teams refuse to live without it: every push gets built and tested automatically, so 'it works on my machine' dies
- Anatomy of a workflow: .github/workflows/ci.yml with name, on (push and pull_request), jobs, runs-on: ubuntu-latest, and steps
- Reusable building blocks: uses: actions/checkout@v4, plus actions/setup-node or actions/setup-python with the language version you need
- Running your real test command (npm test or pytest) as a step, and letting a failing test fail the whole build
- Reading the Actions tab: live logs, the red X and green check on commits and PRs, and re-running failed jobs
- Your free budget: the GitHub Free plan includes 2,000 GitHub Actions minutes per month, and public repositories are the friendliest place to learn CI
- Debugging CI failures: environment differences, missing dependencies, and printing your way to the root cause

Projects built:
- Add a working CI workflow to your team repository that installs dependencies and runs the test suite on every push and pull request, then break it and fix it once on purpose

Practice: Read one failed Actions log top to bottom and identify the exact failing line before touching any code.
Assessment: Your repository shows green checks on the latest commits and one PR that was

blocked by a failing test and then fixed.

Class 17: Status Checks, Branch Protection & Team Discipline
Topics:
- Required status checks: a pull request cannot merge until CI is green, turning tests from a suggestion into a gate
- Branch protection rules and rulesets on main: require a pull request before merging, require one approving review, and block force pushes and deletions
- Why protection matters for student teams: nobody, including you at 2 a.m. before a deadline, can push broken code straight to main
- Keeping reviews honest: dismissing stale approvals when new commits land, and requiring conversation resolution before merge
- Speeding CI up: caching dependencies with actions/cache and splitting independent jobs to run in parallel
- A build status badge in your README that shows live CI health to every visitor, including recruiters
- The protected-main loop end to end: branch, push, PR, review, green checks, merge; the exact rhythm you will run at every internship

Projects built:
- Protect main on your team repository (PR required, one review, CI check required, force pushes blocked), then prove it by attempting a direct push and watching it fail

Practice: Attempt to merge a PR with failing CI and another with no review, and document exactly what blocks each.
Assessment: Demonstrate your full protected workflow from new branch to merged PR, with review and green checks, in one live run-through.

Class 18: Conventional Commits, Tags & Releases
Topics:
- Conventional Commits: feat:, fix:, docs:, refactor:, test:, and chore:, plus scopes like feat(auth): and the BREAKING CHANGE footer
- Why the convention pays off: readable history, automated changelogs, and commit messages interviewers actually compliment
- Semantic versioning: MAJOR.MINOR.PATCH, what bumps each number, and how it connects to conventional commit types
- Lightweight vs annotated tags: git tag v1.0.0 vs git tag -a v1.0.0 -m 'First stable release', and why releases use annotated tags
- Pushing tags explicitly: git push origin v1.0.0 (or --tags), and checking out any tagged version later to reproduce it
- GitHub Releases: turning a tag into a release page with notes, an auto-generated changelog from merged PRs, and downloadable assets
- Release hygiene for team projects: tagging the submission version of a group assignment so 'which version did we demo?' is never a question again

Projects built:
- Adopt conventional commits on your team repository, then cut v1.0.0: an annotated tag pushed to GitHub and a Release with auto-generated notes plus a short highlights section

Practice: Rewrite ten of your older commit messages as conventional commits on a practice branch.
Assessment: Your repository shows a published v1.0.0 release, and your last ten commits all follow the conventional-commit format.

Class 19: Contributing to Open Source: Etiquette & Your First PR
Topics:
- Why open source is the strongest signal on a student profile: real code, review by strangers, and proof you can work inside someone else's codebase
- Finding a first target: 'good first issue' and 'help wanted' labels, projects you already use, and matching issue difficulty to your current skill
- Read before you write: CONTRIBUTING.md, CODE_OF_CONDUCT.md, the issue tracker, and recently merged PRs that reveal the project's norms
- The contribution loop: fork the repo, clone your fork, branch, make one focused change, push to your fork, and open a PR against upstream
- Upstream etiquette: comment on the issue before starting, keep the PR small, follow the project's style and commit conventions, and stay patient and responsive with maintainers
- Handling maintainer review: expect change requests, iterate on the same branch, and never take a closed PR personally
- Non-code contributions that count: documentation fixes, reproducible bug reports, and issue triage are all legitimate first steps

Projects built:
- Make one real contribution attempt: pick an external project, claim or file an issue, and open a properly formed PR from your fork (a documentation fix is a valid target)

Practice: Read the CONTRIBUTING.md of two major projects and list three rules that differ between them.
Assessment: You have a live PR, or a well-formed filed issue plus a prepared branch, on an external repository following that project's contribution rules.

Class 20: Hacktoberfest, GSoC & Your Open Source Roadmap
Topics:
- Hacktoberfest: the annual October event that rewards quality pull requests to participating projects, and why your target list should be ready in September
- Quality over spam: why low-effort PRs get marked invalid, and how maintainers spot them

instantly
- Google Summer of Code: mentored, stipend-backed contribution to real open source organizations; what the program involves and why you must check the current year's eligibility rules yourself
- The GSoC timeline shape: organizations announced, application window, community bonding, then coding periods, and why strong applicants engage with an org months before applying
- Choosing an organization: match your language and interests, study their project ideas list, and build credibility with small merged PRs first
- What a strong proposal contains: specific understanding of the project, a realistic milestone plan, and evidence you have already contributed
- Your personal 6-month open source roadmap: from a first documentation PR to a consistent contributor profile that stands out in placements

Projects built:
- Write your open source roadmap: three target projects with justification, five candidate issues, and a month-by-month plan toward Hacktoberfest or a GSoC application

Practice: Study one past accepted GSoC proposal from any organization's public archives and note what made it concrete.

Assessment: Present your roadmap and defend your project choices and timeline in a five-minute review with your mentor.

PHASE 5: ADVANCED GIT & CAPSTONE

The finishing layer: advanced rescue and history-debugging tools, the interview questions that filter candidates, and a team capstone shipped with the complete professional workflow, followed by your certificate.

Class 21: stash, cherry-pick & reflog: The Rescue Kit

Topics:
- git stash push -m 'wip: form validation': shelving work instantly when you must switch branches right now
- Managing the shelf: git stash list, git stash pop vs git stash apply (pop applies AND drops), git stash drop, and including untracked files with -u
- git cherry-pick <sha>: copying a single commit onto your current branch, with -x to record its origin, and when it beats merging a whole branch
- Cherry-pick under fire: multi-commit ranges with git cherry-pick A..B, plus --continue and --abort when conflicts appear
- git reflog: the private journal of everywhere HEAD has been, surviving resets and branch deletions
- The classic rescues: undo a wrong git reset --hard with git reset --hard HEAD@{1}, and resurrect a deleted branch with git branch saved <reflog-sha>
- Detached HEAD demystified: how you get there (checking out a SHA or tag), why commits made there can be lost, and escaping cleanly with git switch -c

Projects built:
- Complete the rescue gauntlet: stash mid-feature to hotfix main, cherry-pick the hotfix back to your branch, then 'accidentally' hard-reset a branch and recover it fully via reflog

Practice: Delete a branch containing unmerged work, then bring every commit back using only git reflog.

Assessment: You recover a hard-reset commit and a deleted branch unaided, explaining each reflog entry you used along the way.

Class 22: git bisect & Debugging With History

Topics:
- The scenario: the app broke somewhere in the last 60 commits, and reading them one by one is not a strategy
- Binary search over history: git bisect start, git bisect bad, git bisect good v1.0.0, then testing each checkout Git hands you
- Marking your way to the culprit: bisect halves the range each step, so even a long history takes only a handful of tests
- Full automation: git bisect run pytest (or any script whose exit code means pass or fail) finds the bad commit while you watch
- Finishing up: reading the 'first bad commit' report, git bisect reset, then fixing forward or reverting the culprit
- git blame -L 10,25 app.py: which commit last touched these exact lines, used to understand intent rather than assign blame
- History as a search engine: git log -S 'functionName' (the pickaxe) for when code appeared or vanished, and git log -p <file> to walk a file's evolution

Projects built:
- In a provided repository with a hidden bug among 40+ commits, find the exact breaking commit with git bisect, first manually and then with bisect run, and revert it

Practice: Use git blame and git log -S to answer three 'when and why did this change?' questions about a real codebase.

Assessment: You identify the breaking commit's SHA and author date, and your written explanation matches the actual bug introduced there.

Class 23: Git Interview Questions & Whiteboard Scenarios

Topics:
- The classics, answered precisely: git fetch vs pull, merge vs rebase, reset vs revert, clone vs fork, and what the staging area is actually for

- 'How do you undo a commit that is already pushed?': the revert answer interviewers want, and why 'reset and force push' is a red flag on shared branches
- Explaining detached HEAD, the difference between HEAD~2 and HEAD^2, and why branches are just pointers, with a whiteboard diagram you can redraw from memory
- Scenario drills: you committed to main instead of a feature branch; a teammate force-pushed over your work; a secret key entered history; .gitignore seems to be ignored
- 'Describe your team workflow' answers that prove experience: branch protection, PRs, reviews, CI checks, and conventional commits, evidenced by your capstone repo
- Walking an interviewer through your GitHub profile: choosing the repository, narrating one PR with review, and showing the CI pipeline you built
- Rapid-fire command recall under pressure: mock rounds covering the commands this course drilled, with follow-up 'what if' probes

Projects built:

- Complete a live mock Git interview: 15 rapid-fire questions plus 2 whiteboard scenarios, then write model answers for every question you missed

Practice: Run a 10-minute peer quiz each day this week, swapping interviewer and candidate roles.

Assessment: Clear the final mock interview against your mentor's rubric and deliver a confident 3-minute walkthrough of your own GitHub profile.

Class 24: Capstone: Ship a Team Project the Professional Way + Certificate

Topics:

- Capstone kickoff: a small team application, or your real group assignment, run exactly the way an engineering team would run it
- Repository setup from memory: protected main, issue templates, labels, a milestone, and a Projects board of scoped issues
- Executing the loop: feature branches, conventional commits, PRs with real descriptions, peer review with suggested changes, and green CI required to merge
- Handling the mess like a professional: at least one real conflict resolved and one revert or reflog rescue documented in the repo
- Cutting the release: an annotated v1.0.0 tag, a GitHub Release with generated notes, and a live demo link on GitHub Pages where applicable
- The GitHub profile audit: profile README, pins, portfolio link, contribution history, and your capstone repository as the centerpiece recruiters land on
- Presenting your work to the class and earning the Modern Age Coders 'Git & GitHub for College' certificate

Projects built:

- Deliver the capstone: a team repository showing 15+ issues, 10+ merged PRs with reviews, protected main, green CI, a v1.0.0 release, and a demo link, plus your fully audited GitHub profile

Practice: Dry-run your capstone presentation with a teammate playing a skeptical interviewer.

Assessment: Final review: the capstone repository meets the full professional-workflow checklist and your profile audit passes; success earns the certificate.

PROJECTS THE STUDENT BUILDS AND KEEPS

- Phase 1: your first configured repository, a personal-notes repo with clean history built using git add -p, a complete undo rescue drill, and a messy project cleaned with a production-grade .gitignore
- Phase 2: an SSH-authenticated first push, a two-clone remote workflow simulation, a recruiter-grade README with a license, a profile README with pinned repos and a Student Developer Pack claim, and a live portfolio on GitHub Pages
- Phase 3: two features merged through the feature-branch workflow, a messy branch cleaned with interactive rebase, a three-person conflict lab, a fully described and reviewed pull request, a paired code review cycle, and a team repo with issues, labels, and a Projects board
- Phase 4: a working GitHub Actions CI pipeline, a protected main branch proven by a blocked direct push, a v1.0.0 tagged release with notes, a real external open source contribution attempt, and a personal Hacktoberfest and GSoC roadmap
- Phase 5: the rescue gauntlet with stash, cherry-pick, and reflog, a git bisect bug hunt in a 40-commit repository, a full live mock Git interview, and the team capstone with a release, green CI, and an audited GitHub profile
- Total: 24 hands-on deliverables, one per class, finishing with a team capstone and a placement-ready GitHub profile

Total projects: 24 hands-on deliverables, one per class, culminating in a team capstone shipped with the full professional workflow

SKILLS THE STUDENT WILL HAVE AT THE END

- Core Git: init, status, add -p, commit, log, diff, and the complete undo toolkit (restore, reset soft/mixed/hard, revert, amend)
- Remotes: SSH keys, clone, fetch vs pull, push, tracking branches, and multi-machine workflows
- Branching: the feature-branch workflow, merge vs rebase, interactive rebase, and calm conflict resolution
- GitHub Collaboration: pull requests, code review, suggested changes, issues, labels, milestones, and Projects boards
- Automation: GitHub Actions CI, required status checks, branch protection, dependency caching, and build badges

- Release Engineering: conventional commits, semantic versioning, annotated tags, and GitHub Releases
- Advanced Rescue and Debugging: stash, cherry-pick, reflog recoveries, git bisect, and blame plus pickaxe history searches
- Career Skills: recruiter-grade READMEs and profile, a GitHub Pages portfolio, open source etiquette, and Git interview answers

HOW A TYPICAL WEEK IS SPLIT

Live classes: 2 live classes per week, about 1 hour each, across 12 weeks
Hands on git work: 1.5-2 hours running the real git commands and GitHub workflows from each class
Project time: 1-1.5 hours completing each class deliverable on your own repositories
Review and doubts: 30-60 minutes reviewing your work, clearing doubts over WhatsApp, and preparing for the next class
Homework: A task or problem set after every class, and a monthly mixed-review assignment that deliberately folds in earlier topics

SUPPORT INCLUDED

Doubt support: WhatsApp doubt support between classes for setup issues, scary git states, and workflow questions
Small batches: Small batches, with mini-batch and 1-on-1 options, so every student's terminal gets individual attention
Mentor guidance: Live guidance from mentors who use Git and GitHub on real engineering teams daily
Project feedback: Feedback on every class deliverable, plus a personal capstone and profile review before certification
Living syllabus: Curriculum updated as Git and GitHub ship new features, at no extra cost

CERTIFICATION DETAIL

Completion: Certificate from Modern Age Coders, awarded on passing the final assessment. Fall short and there is focused revision and a free retest: the certificate certifies real learning, not attendance

WHERE THIS CAN LEAD

- Internship-ready developer who can join any team repository and contribute from day one
- Open source contributor with merged external pull requests and a Hacktoberfest or GSoC trajectory
- Hackathon team lead who sets up the repo, board, and workflow in the first 30 minutes
- Placement candidate with a defensible GitHub profile and confident answers to Git interview questions
- A foundation for every developer role: web, app, data, and ML teams all live in Git and GitHub daily

COMMON QUESTIONS ABOUT THIS COURSE

For anything about cost, use PART 4 and RULE 1. Do not quote two regions.

Q: Why do I need a Git and GitHub course for placements?
A: Because almost every technical recruiter and interviewer will open your GitHub profile, and almost every internship starts with 'clone the repo and open a PR'. Knowing git add and commit is not the same as working confidently on a shared repository with branches, reviews, and CI. This course teaches the team-workflow side that college courses skip, and finishes with dedicated Git interview preparation.

Q: What is the difference between Git and GitHub?
A: Git is the version control tool itself: free, open source, and distributed, created by Linus Torvalds in 2005 for Linux kernel development, and it runs entirely on your machine tracking your project's history. GitHub hosts Git repositories online so teams can collaborate through pull requests, issues, and reviews; Microsoft has owned it since 2018. This course teaches both deeply: Git for control of your history, GitHub for teamwork and your public developer profile.

Q: Is GitHub free for college students?
A: Yes, for everything this course needs. Beyond that, verified students enrolled at a degree or diploma granting school can claim the GitHub Student Developer Pack free of charge, and it includes GitHub Pro for as long as you are a student. We walk you through claiming it at education.github.com in Class 8.

Q: Do I need to be good at coding before joining?
A: You only need basic familiarity with one programming language, at the level of a first-year college course. Git manages code rather than being a language itself, so the course focuses on workflow, collaboration, and career skills around whatever code you write. Complete command-line beginners are fine: Classes 1 and 2 build terminal fluency from scratch.

  Q: Are the classes live or recorded?
  A: Every class is live and interactive with a real instructor; we never teach from
  pre-recorded videos. You run the commands on your own machine during class, get unstuck in
  real time, and have WhatsApp doubt support between sessions. Group batches are capped at 20
  students, with mini-batch and 1-on-1 options available.

  Q: Will this course help me with Hacktoberfest and GSoC?
  A: Yes, Phase 4 is built for exactly that. You learn to find beginner-friendly issues, read
  CONTRIBUTING.md, follow upstream etiquette, and open a properly formed pull request from a
  fork, then build a personal roadmap targeting Hacktoberfest and a future GSoC application.
  Program rules and timelines change from year to year, so we also teach you how to verify the
  current cycle's details yourself.

  Q: What Git questions are asked in coding interviews?
  A: The most common are the difference between fetch and pull, merge vs rebase, reset vs
  revert, how to undo a pushed commit, what detached HEAD means, and describing your team
  workflow. Class 23 is a dedicated interview class with rapid-fire drills, whiteboard
  scenarios, and a full live mock round. Better still, the whole course gives you real
  experience so your answers come from practice, not memorization.

  Q: How long does it take to learn Git and GitHub properly?
  A: This course runs 24 live classes over about 12 weeks, at 2 classes per week, with 4-5
  hours of weekly commitment recommended. The basic commands take days, but team readiness,
  conflict resolution, CI, and open source etiquette need structured practice, which is what
  the drills and capstone provide. You finish with a certificate, a live portfolio, and a
  capstone repository, not just theory.

  Q: How am I assessed, and is the certificate just for showing up?
  A: No. A task follows every class with feedback, monthly reviews deliberately mix new
  material with earlier topics so nothing is forgotten, and the course ends with a final
  project defended live, plus a written assessment. Passing earns the certificate; falling
  short earns focused revision and a free retest. We measure real learning, not attendance.

  To enrol, message Shivam Sir on +91 9123366161 or send the parent this link: https://learn.modernagecoders.com/courses/git-github-version-control-course-for-college-students
  For a demo: the Priority Live Demo (guaranteed, today or tomorrow) is booked at
  https://learn.modernagecoders.com/priority-demo . The free demo is a waiting list with no fixed date.

==
COURSE 72 OF 137: GIT & GITHUB COURSE FOR TEENS: VERSION CONTROL FROM ZERO
==

Course link: https://learn.modernagecoders.com/courses/git-github-version-control-course-for-teens
Subject area: Version Control & Developer Tools
Designed for: Teens
Who can join: Beginner-friendly (ages 13-18) to confident GitHub collaborator
Course length: 24 classes (12 weeks · 2 classes/week)
Time needed: 3-4 hours/week recommended
Certificate: Certificate from Modern Age Coders, awarded on passing the final assessment

PRICE FOR THIS COURSE (quote only the one that applies to the person asking)
  In India, per month: group Rs 1,499, mini batch Rs 2,999, one to one Rs 4,999
  In Canada, per month: group CAD 140, one to one CAD 210
  Anywhere else, per month: group $100, one to one $150
  Classes: group and mini batch two live classes a week, eight a month; one to one in India one
  live class a week, four a month; one to one outside India two live classes a week, eight a
  month. Each class is one hour.

WHAT THIS COURSE IS

  Learn Git and GitHub from zero in 24 live classes for teens 13-18: commits, branching, pull
  requests, merge conflicts, a free GitHub Pages portfolio and your first real open source
  contribution.

  In one line: Never lose your work again: master the one tool every real developer uses daily, publish a live portfolio site, and make your first open source contribution in 24 live classes.

ABOUT THE PROGRAMME

  Every serious young coder eventually loses work: the game mod that got overwritten, the
  school project that vanished the night before submission, the website folder named
  final-version-3-REAL. This course ends that forever. In 24 live, project-based classes for
  teens aged 13 to 18 (GitHub itself requires users to be 13 or older, so this is the perfect
  starting age), you learn Git and GitHub from absolute zero, with no terminal experience
  assumed. You will master real commands like git init, git commit, git branch, git merge and
  git rebase, resolve merge conflicts calmly, open and review pull requests, publish a free
  portfolio website with GitHub Pages, automate it with GitHub Actions, and make a genuine
  contribution to a real open source project. Every class is taught live by an instructor,

using the same small-batch, mentorship-first method Modern Age Coders has used since 2020 to teach 10,000+ students across 25+ countries. You finish with a GitHub profile that colleges and internship reviewers can actually read: pinned projects with proper READMEs, a live portfolio URL, and a real pull request to someone else's codebase.

WHAT MAKES THIS COURSE DIFFERENT

- Zero terminal assumed: Class 2 is a full, friendly terminal bootcamp (pwd, ls, cd, mkdir) before any Git command is expected of you.
- Built around YOUR projects: practice on your own website, Python script, or game mod files; we provide starter projects if you don't have one yet.
- Live and interactive: every class is taught live by a real instructor in a small batch, never pre-recorded videos.
- Real developer workflows, not toy demos: branches, pull requests, code reviews, project boards, and a two-person team project on one shared repo.
- Living Syllabus: the curriculum is updated as Git and GitHub ship new features, so you always learn the current tool, not a frozen tutorial.
- Real outcomes: a polished GitHub profile, a live GitHub Pages portfolio, one external open source pull request, and a certificate.

WHAT A STUDENT NEEDS BEFORE STARTING

Device: A laptop or desktop (Windows, Mac, or Linux) with a stable internet connection: that is the main requirement

Coding experience: None required for Git itself, and zero terminal experience is assumed. If you have any hobby project (a webpage, Python script, or game mod files) you can practice on it; if not, we provide starter projects

Accounts: A free GitHub account, created in Class 6. GitHub's Terms of Service require users to be 13 or older, which is exactly why this course starts at 13

Mindset: Willingness to type commands instead of clicking, and to break things on purpose in practice repos: that is how the undo skills become permanent

WHO THIS COURSE IS FOR

Teen coders: Ages 13-18 already building websites, Python projects, or games who are one accidental overwrite away from disaster

School project teams: Students doing group coding assignments or hackathons who are still emailing zip files back and forth

Game modders and hobby builders: Teens tinkering with mods, scripts, and side projects who want every experiment safely versioned

Future cs applicants: Students aiming at computer science who want a GitHub profile that strengthens college and internship applications

Self taught beginners: Teens learning to code from tutorials who keep hearing 'just clone the repo' and want to finally understand what that means

FULL CURRICULUM, WEEK BY WEEK

This is the complete teaching plan. Parents can ask about any week.

PHASE 1: GIT FOUNDATIONS

Understand why version control exists, install Git on your own machine, get comfortable in the terminal from zero, and master the everyday cycle of init, status, add, commit, log, diff, and safe undo.

Class 1: Why Version Control? (The Lost Homework Horror Story)

Topics:

- The horror story every student knows: project-final-v2-REAL(3), an overwritten game mod, a school submission lost the night before deadline, and how version control ends it forever
- What a version control system actually does: full snapshots of your project you can return to at any moment, with a message explaining each one
- Git in one line: a free, open source distributed version control system created by Linus Torvalds in 2005 to manage Linux kernel development
- Centralized vs distributed: why every Git user carries the complete project history on their own machine, so no single crash can destroy it
- Git vs GitHub: Git is the tool on your computer, GitHub (owned by Microsoft since 2018) is the website where Git repositories live online and people collaborate
- The four words you will use every day, defined simply: repository, commit, branch, remote
- Installing Git: the git-scm.com installer on Windows (Git Bash included), Homebrew or Xcode command line tools on Mac, sudo apt install git on Linux, then verify with git --version

Projects built:

- Install Git on your own computer, run git --version to prove it works, and write a half-page version-control horror story from your own life (or a friend's) that this course will make impossible

Practice: Explain the difference between Git and GitHub to a family member in under a minute without notes.

Assessment: Screenshot of git --version output on your machine plus a two-sentence definition of a commit in your own words.

Class 2: Terminal Survival Skills (Zero Assumed)
  Topics:
    - Opening your terminal: Git Bash on Windows, Terminal on Mac and Linux, and why developers live here instead of clicking through folders
    - Finding your way: pwd to see where you are, ls to list files (ls -a reveals hidden ones like .git), cd foldername, cd .. to go up, cd ~ to go home
    - Making and removing things: mkdir for folders, creating empty files, and why rm deserves respect before you press Enter
    - Speed skills: Tab completion so you never mistype a filename, and the up arrow to replay previous commands
    - Paths made simple: absolute vs relative paths, and why file names with spaces need quotes
    - Escape hatches: clear to clean the screen, Ctrl+C to cancel a stuck command, and q to exit the pager that git log opens
    - One-time Git setup: git config --global user.name 'Your Name', git config --global user.email, git config --global init.defaultBranch main, then check it all with git config --list
  Projects built:
    - Build a coding-projects folder tree (three nested folders and two files) entirely from the terminal, no mouse allowed, and configure your Git name and email
  Practice: Navigate from your home folder to your deepest project folder and back using only cd, pwd, and Tab completion.
  Assessment: Live terminal check: reach a named folder, list its hidden files, and show your git config user.name without help.

Class 3: Your First Repository: init, status, add, commit
  Topics:
    - git init: turning any folder into a repository, and the hidden .git folder that IS your history (never delete it)
    - The three-room mental model: files change in the working directory, wait in the staging area (the index), and become permanent snapshots once committed to the repository
    - git status as the command you run constantly: it names every file as untracked, modified, or staged so nothing sneaks into a commit by accident
    - Staging deliberately: git add file.html for one file, git add . for everything, and why choosing files on purpose makes better commits
    - git commit -m 'Add homepage heading': writing messages in present tense that say what and why, not 'stuff' or 'changes'
    - The git commit -am shortcut, and the catch: it only works for files Git already tracks
    - Reading your story back with git log: author, date, hash, and message of every snapshot you have ever taken
  Projects built:
    - Create my-first-repo and build a tiny webpage across 5 separate commits, each with a clear message, so git log reads like a story of how the page grew
  Practice: Run git status after every single command for one whole session until you can predict what it will say before you press Enter.
  Assessment: Show a repository with at least 5 commits whose messages let a stranger understand the project's history without opening any file.

Class 4: Time Travel: log, diff, and Inspecting History
  Topics:
    - Power views of history: git log --oneline for a compact list, git log --graph --oneline --all to see the shape of your project
    - Commit hashes demystified: the long SHA-1 identifier, the 7-character short form, and HEAD as 'where you are right now'
    - git diff: exactly what changed but is not staged yet; git diff --staged for what is about to be committed
    - git show <hash>: opening any single commit to see precisely what it changed and why
    - One file's biography: git log -p filename to see every change ever made to it
    - git blame filename: which commit and author last touched each line, and why it is a debugging tool, not an accusation tool
    - Visiting the past safely: git checkout <hash> to look at an old version, what 'detached HEAD' really means, and git switch main to come home
  Projects built:
    - History detective challenge: in a prepared repo, use log, show, diff, and blame to answer five questions like 'which commit broke the page title and what did it change?'
  Practice: Pick any two commits in your Class 3 repo and describe the difference between them using only git diff output.
  Assessment: Check out an old commit, read it, return to main correctly, and explain detached HEAD in one sentence.

Class 5: Undoing Safely + .gitignore
  Topics:
    - The undo ladder: from harmless to serious, and why you always reach for the safest rung first
    - git restore file to throw away working-directory changes, and git restore --staged file to unstage without losing work
    - git commit --amend to fix your last commit message or include a forgotten file, and why you only amend commits you have not pushed
    - git reset --soft HEAD~1 to un-commit while keeping your changes staged, and why beginners treat --hard as radioactive

- git revert <hash>: the safe, history-preserving undo that creates a new commit cancelling an old one
- .gitignore: keeping node_modules, __pycache__/, .DS_Store, and secret API keys out of your history, with * wildcards and folder/ patterns
- The oops recovery: git rm --cached secrets.txt when you committed something you meant to ignore, and why leaked secrets must also be changed

Projects built:
- Rescue mission: in a prepared practice repo, unstage a file, discard a bad edit with git restore, amend a commit message, revert a bad commit, and write a .gitignore that keeps secrets.txt out forever

Practice: Deliberately make each of the five mistakes covered in class and undo each one with the safest command that fixes it.
Assessment: Given three broken-repo scenarios, name the correct undo command for each and explain why a harsher one was not needed.

PHASE 2: GITHUB ESSENTIALS

Take your repositories online: create your GitHub account, set up SSH keys, push and pull, write READMEs people actually read, build your profile page, understand licenses and issues, and publish a free website with GitHub Pages.

Class 6: Joining GitHub (13+) and Your First Push

Topics:
- Creating your account: GitHub's Terms of Service require users to be 13 or older, which is exactly why this course starts at 13, plus choosing a username you will still like on a college application
- What GitHub Free includes: unlimited public and private repositories and 2,000 GitHub Actions minutes per month, more than enough for everything in this course
- A guided tour: repositories, your profile, notifications, the new-repo button, and the real difference between public and private repos
- Creating a repository on GitHub: initializing with a README, picking a .gitignore template, and what the license dropdown is for (Class 10 goes deep)
- Wiring local to remote: git remote add origin <url> and confirming it with git remote -v
- The first upload: git push -u origin main, and what --set-upstream actually saves you from typing forever after
- Securing your account with two-factor authentication before you build anything worth stealing

Projects built:
- Create your GitHub account with 2FA enabled, make your first online repository, connect your Class 3 local repo to it, and push all 5 commits so they appear on github.com

Practice: Make one more local commit and push it, then refresh the GitHub page and find your exact change in the web interface.
Assessment: Your Class 3 repository is visible on your GitHub account with full commit history and git remote -v shows origin correctly.

Class 7: HTTPS vs SSH: Keys, Cloning, and Pulling

Topics:
- Why GitHub removed password pushes: HTTPS with tokens vs SSH keys, and which one professionals set up on day one
- Generating your key pair: ssh-keygen -t ed25519 -C 'your_email', where keys live in ~/.ssh, and the golden rule that the private key never leaves your machine
- Installing the key: starting ssh-agent, ssh-add, pasting the .pub file into GitHub Settings under SSH keys, and testing with ssh -T git@github.com
- git clone <url>: pulling down any repository, and understanding that a clone contains the complete history, not just the latest files
- git fetch vs git pull: fetch downloads new history to look at, pull is fetch plus merge into your branch
- What 'origin' actually is: just the default nickname for a remote URL, changeable with git remote set-url
- The two-machine workflow: clone your own repo onto a second computer (or a school machine) and keep both in sync with push and pull

Projects built:
- Set up a working SSH key, clone your own repository into a second folder to simulate a second computer, make a change there, push it, and pull it back into the original

Practice: Run ssh -T git@github.com and read the greeting, then clone one interesting public repository and explore its git log.
Assessment: Demonstrate a full round trip: commit on 'computer B' clone, push, pull on 'computer A', and point to the change arriving.

Class 8: READMEs That Make People Care (Markdown)

Topics:
- Why README.md is your project's front door: GitHub renders it automatically on the repo homepage, and most visitors never look past it
- Markdown core: # and ## headings, **bold** and *italic*, bulleted and numbered lists, [links](url), and images with ![alt](path)
- Code that looks like code: inline backticks and fenced code blocks with language names for syntax highlighting
- The anatomy of a great project README: what it is, a screenshot, how to run it, features, what you learned, credits

    - Fancier moves: tables, task lists with - [ ], and collapsible details sections for long content
    - Badges from shields.io, used tastefully: one or two that say something true, not a wall of stickers
    - Previewing before pushing: VS Code's built-in Markdown preview (Ctrl+Shift+V) so you never push a broken layout
  Projects built:
    - Write a complete README.md for your webpage project with a heading, screenshot, run instructions, a feature table, and one code block, then push it and admire the rendered result
  Practice: Find a popular open source README you admire, list three techniques it uses, and steal one for your own.
  Assessment: Your pushed README renders correctly on GitHub with at least five different Markdown elements used properly.

Class 9: Your Profile README and GitHub Identity
  Topics:
    - The special repo trick: create a repository named exactly your username and its README becomes your public profile page
    - What belongs there at your age: who you are, what you are learning, projects you are proud of, and school-safe contact info (no address, no phone)
    - Pinned repositories: choosing up to 6 repos that represent your best work, and why order matters
    - The contribution graph decoded: what the green squares actually count, and why steady real work beats gaming the graph
    - Stars as bookmarks: starring repos you want to learn from, and building a feed by following builders you admire
    - Watch vs star vs fork: notifications, bookmarks, and copies, and when each one is the right click
    - Playing the long game: colleges and internship reviewers really do open GitHub profiles, so keep every claim honest
  Projects built:
    - Create your username/username repository with a profile README introducing yourself, your current projects, and what you are learning, then pin your two best repos
  Practice: Visit five classmates' new profiles, star one repo from each, and leave one genuine compliment as an issue or comment.
  Assessment: Your profile shows a rendered profile README and at least two pinned repositories with descriptions.

Class 10: Licenses, Issues, and Repo Housekeeping
  Topics:
    - The surprise default: a repo with no license means all rights reserved, so others technically cannot reuse your code even though they can read it
    - The big three in plain English: MIT (do almost anything, keep the notice), Apache-2.0 (MIT plus patent protection), GPL-3.0 (share-alike), and choosealicense.com for deciding
    - Adding a LICENSE file the easy way with GitHub's built-in template picker
    - Issues as a project's memory: writing a bug report with steps to reproduce, expected behavior, and actual behavior
    - Organizing with labels, assignees, and milestones, even on a solo school project
    - Closing issues from commits: writing 'fixes #12' in a commit message and watching GitHub close the issue automatically
    - Housekeeping: repo descriptions and topics for discoverability, renaming safely, and archiving old projects instead of deleting history
  Projects built:
    - Add an MIT license to your webpage project, open three well-written issues on it (one bug, two feature ideas), and close one automatically with a 'fixes #N' commit
  Practice: Read the licenses of three repos you starred and identify which of the big three (or something else) each one uses.
  Assessment: Your repo has a LICENSE file, at least two open issues with labels, and one issue closed by a linked commit.

Class 11: Publish Your First Website Free with GitHub Pages
  Topics:
    - What GitHub Pages is: free static site hosting served straight from a repository, no server rental, no credit card
    - The two flavors: a user site from a repo named username.github.io, and project sites served at username.github.io/repo-name
    - Turning it on: Settings, then Pages, then deploy from branch, choosing main and the root folder (or /docs)
    - Push an index.html and watch it go live: how long deploys take and how to check progress in the Actions tab
    - Project-site gotchas: why relative links and image paths break under /repo-name and how to write them correctly
    - A custom 404.html page so even your error page has personality
    - Why this matters: this URL becomes your portfolio home for the rest of the course, and every push updates it automatically
  Projects built:
    - Publish your webpage project live on GitHub Pages, fix any broken image paths, add a custom 404 page, and share your working URL with the class

Practice: Change your page's heading locally, commit, push, and time how long the live site takes to update.
Assessment: A live GitHub Pages URL that loads your site correctly, including images and your custom 404 page.

PHASE 3: BRANCHING & COLLABORATION

Learn the skill that separates solo coders from teammates: branches, merges, calm conflict resolution, pull requests end to end, kind code review, forks with upstream syncing, and a real two-person project on one shared repository.

Class 12: Branches: Parallel Universes for Your Code
Topics:
- What a branch really is under the hood: a movable pointer to a commit, which is why creating one is instant and free
- The modern commands: git branch to list, git switch -c feature-dark-mode to create and move, and the older git checkout -b you will see in tutorials
- Naming branches so future-you understands: feature/dark-mode, fix/broken-nav-link, experiment/crazy-idea
- Switching with uncommitted changes: when Git lets you carry work across and when it stops you to protect it
- Seeing the universe split: git log --oneline --graph --all as branches diverge from main
- Cleaning up: git branch -d for merged branches, and why -D (force delete) deserves a moment of doubt
- The golden rule real teams follow: main always stays working and deployable, experiments live on branches

Projects built:
- On your live website repo, build a new feature (a dark theme or a new section) entirely on a feature branch while main stays untouched and your live site keeps working

Practice: Create three branches with proper names, make one commit on each, and draw the resulting graph on paper before checking it with git log --graph.
Assessment: Show a repo where main is clean, a feature branch holds new commits, and you can explain the graph line by line.

Class 13: Merging Branches Like a Pro
Topics:
- The merge ritual: switch to the receiving branch first (git switch main), then git merge feature-dark-mode
- Fast-forward merges: when main has not moved, Git just slides the pointer ahead, no new commit needed
- Three-way merges: when both branches moved, Git creates a merge commit with two parents, and you can edit its message
- git merge --no-ff to force a merge commit and keep the branch's shape visible in history, and why some teams prefer it
- Reading history after merging: spotting merge commits and branch shapes in git log --graph
- git branch --merged: finding branches that are fully merged and safe to delete
- The strategy that prevents pain: small, short-lived branches merged often beat giant branches merged rarely

Projects built:
- Merge your dark-theme branch into main (watching your live Pages site update), then create, merge, and delete a second small feature branch using --no-ff and compare the two history shapes

Practice: Predict before each merge whether it will fast-forward or create a merge commit, then verify with git log --graph.
Assessment: Explain the difference between your fast-forward and no-ff merges using your own repo's graph as the evidence.

Class 14: When Branches Collide: Conflicts Made Simple
Topics:
- Why conflicts happen: two branches edited the same lines of the same file, and Git refuses to guess which version you want
- Decoding the conflict markers: <<<<<<< HEAD, =======, and >>>>>>> branch-name, and what sits between each
- Resolving in VS Code: Accept Current, Accept Incoming, Accept Both, or hand-editing to something better than either
- Finishing the job: git add the resolved files, then git commit to seal the merge
- The eject button: git merge --abort to back out cleanly and try again with a clearer head
- Your tools mid-conflict: git status lists exactly which files still conflict, git diff shows the battleground
- Prevention beats cure: pull often, keep commits small, and talk to teammates about who is touching what

Projects built:
- Conflict laboratory: follow a script that manufactures a two-branch conflict in your repo, resolve it three ways (current, incoming, hand-crafted blend), and keep the best resolution

Practice: Create and resolve one fresh conflict from scratch without the script, timing yourself from conflict to clean commit.
Assessment: Given a conflicted file, correctly identify which branch each block came from and produce a sensible resolved commit.

Class 15: Pull Requests End to End
Topics:
- What a pull request actually is: a proposed merge plus a conversation about it, the center of collaboration on GitHub
- The flow: push your branch (git push -u origin feature-name), then GitHub's 'Compare & pull request' button, understanding base vs compare
- Writing a PR people want to review: a clear title, what changed and why, screenshots for visual changes, and 'closes #7' to auto-close the issue
- Draft pull requests for work in progress, and requesting a specific reviewer when it is ready
- Living in the Files changed tab: reading the diff, leaving comments on exact lines
- Updating a PR: push more commits to the same branch and the PR updates itself, no new PR needed
- The three merge buttons: merge commit, squash and merge (your 12 tiny commits become 1 clean one), and rebase and merge, with squash as the tidy default for small PRs

Projects built:
- Ship a real feature to your website through a complete PR: branch, push, open a PR with description and screenshot, link an issue, then squash-merge it and watch the issue close

Practice: Open a second PR as a draft, convert it to ready for review, push one more commit to it, and observe the PR update.
Assessment: A merged pull request on your repo with a proper description, a linked closed issue, and a clean squash-merged history on main.

Class 16: Reviewing Kindly + Forks and Upstream
Topics:
- Reviewing a friend's PR: the three verdicts (comment, approve, request changes) and how to phrase feedback that is specific, kind, and about the code, never the person
- The suggestion superpower: proposing an exact code change in a review comment that the author can commit with one click
- What a fork is: your own full copy of someone else's repository under your account, the key to contributing to projects you cannot push to
- The cross-repo loop: fork, clone your fork, branch, push to your fork, then open a PR back to the original repository
- Keeping a fork fresh: git remote add upstream <original-url>, git fetch upstream, git merge upstream/main, or GitHub's Sync fork button
- Why this design is brilliant: strangers can safely propose changes to any project on Earth without anyone granting them access first
- Star vs fork, settled: star to bookmark and learn, fork only when you intend to change

Projects built:
- Pair up: review a classmate's real PR using at least one line comment and one one-click suggestion, then fork a classmate's repo, improve their README, and send them a cross-repo PR

Practice: Set up an upstream remote on your fork and sync it after your classmate merges someone else's change.
Assessment: One thoughtful review submitted with a committed suggestion, and one cross-repo PR opened from your fork.

Class 17: Team Project: Two People, One Repo
Topics:
- Adding a collaborator: Settings, Collaborators, the invite, and what write access actually allows
- Branch protection basics: requiring a pull request review before anything merges to main, so nobody (including you) pushes straight to main
- The daily team loop: pull main, branch, commit, push, PR, review, merge, repeat until the project ships
- When your partner merges first: bringing main into your branch with git pull origin main and resolving any conflict on YOUR branch, not on main
- GitHub Projects boards: To do, In progress, Done columns with issues as draggable cards, perfect for school assignments
- Assigning issues so two people never silently build the same thing
- Communication as a Git skill: PR descriptions, issue comments, and review replies are how remote teams actually talk

Projects built:
- Two-person mini-sprint: with a partner, plan a small shared website on a Projects board, split it into assigned issues, and build it over branch-PR-review cycles with branch protection on

Practice: Complete one full loop where your partner merges before you and you resolve the resulting conflict on your own branch.
Assessment: The shared repo shows commits from both partners, at least four merged PRs with reviews, and a board with every card in Done.

PHASE 4: LEVEL UP

Move past the basics with the tools developers reach for daily: a safe introduction to rebase, git stash for interruptions, tags and releases for shipping versions, your first GitHub Actions automation, and a portfolio pass that makes your profile genuinely readable.

Class 18: Merge vs Rebase, a Safe Introduction
Topics:

    - What git rebase actually does: lifts your branch's commits and replays them on top of a new base, rewriting them into new commits
    - Merge vs rebase honestly: merge preserves true history with merge commits, rebase produces a straight readable line, and teams simply pick a convention
    - The golden rule that keeps you safe: never rebase commits you have already pushed and shared with others
    - git pull --rebase: updating your own branch without littering it with merge commits
    - Conflicts during rebase: fix the file, git add it, then git rebase --continue, or bail out completely with git rebase --abort
    - A peek at interactive rebase: git rebase -i HEAD~3 to squash or reword your own local commits before anyone sees them
    - The beginner's default when unsure: just merge, it is always safe
  Projects built:
    - Rebase experiment in a sandbox copy of your repo: create the same divergence twice, resolve it once with merge and once with rebase, and screenshot the two different history graphs side by side
  Practice: Use git rebase -i on three messy local commits to squash them into one well-named commit before pushing.
  Assessment: Explain, using your own two screenshots, what rebase changed about history and recite the golden rule from memory.

Class 19: Stash, Tags, and Releases
  Topics:
    - The interruption problem: you are mid-feature and must switch branches NOW, and committing half-broken work feels wrong
    - git stash push -m 'half-done navbar': shelving working-directory changes instantly, and -u to include untracked files
    - Managing the shelf: git stash list, git stash pop (apply and remove) vs git stash apply (keep a copy), and git stash drop
    - Tags: permanent bookmarks on commits, lightweight (git tag v1.0.0) vs annotated (git tag -a v1.0.0 -m 'First public version')
    - Semantic versioning in one line: major.minor.patch, and what bumping each number promises
    - Tags are not pushed by default: git push origin v1.0.0 or git push --tags
    - GitHub Releases: turning a tag into a release page with human-readable notes and downloadable files, shipping v1.0.0 of your site like real software
  Projects built:
    - Practice a real interruption (stash mid-edit, fix an urgent 'bug' on main, pop your stash back), then tag your portfolio site v1.0.0 and publish a GitHub Release with proper notes
  Practice: Stash with a message, list your stashes, and explain to a partner the difference between pop and apply before using each once.
  Assessment: Your repo shows a pushed annotated v1.0.0 tag and a published Release whose notes summarize the version accurately.

Class 20: Your First GitHub Actions Workflow
  Topics:
    - What CI and automation mean: robots that run your chosen steps automatically on every push, so checks never depend on memory
    - What you get free: GitHub Free includes 2,000 Actions minutes per month, far more than this course needs
    - Anatomy of a workflow file at .github/workflows/deploy.yml: name, the on: push trigger, jobs, runs-on: ubuntu-latest, steps, and uses: actions/checkout@v4
    - YAML survival: indentation is meaning, and one stray space is the classic first bug
    - Reading the Actions tab: live logs, green checks and red X marks on every commit, and finding the exact failing line
    - Upgrading your site: deploying GitHub Pages through an Actions workflow, the modern flow that runs on every push to main
    - Wearing it proudly: adding the workflow status badge to your README
  Projects built:
    - Write your first workflow from scratch: auto-deploy your Pages portfolio via Actions on every push to main, break it once on purpose, fix it by reading the logs, and add the status badge to your README
  Practice: Push three commits and narrate to a partner exactly what the Actions tab shows for each, from trigger to green check.
  Assessment: A green workflow run visible in your Actions tab that deployed your live site, plus a working status badge in your README.

Class 21: A Portfolio Recruiters and Colleges Can Actually Read
  Topics:
    - Thinking like your reader: an admissions reviewer or intern recruiter gives your profile about two minutes, so structure for skimming
    - Pinned repos as your headline: choose 6, order them by impressiveness, and give every one a real README with a screenshot
    - Repo metadata that sells: one-line descriptions, topic tags, and the live demo URL in the About box of every project
    - The About box link trick: every project with a Pages site gets its URL right there, one click from visitor to live demo
    - Writing project blurbs in outcomes language: what it does, what you built it with, and one thing you learned, not 'a simple website'
    - The honest graph: steady real contributions beat manufactured green squares, and reviewers

can tell the difference
- Your recurring 5-minute self-audit checklist: profile README current, pins ordered, descriptions filled, demos alive, no broken links

Projects built:
- Full portfolio pass: apply the audit checklist to your entire account, fixing every pinned repo's README, description, topics, and About-box demo link until a stranger can navigate your work unaided

Practice: Swap profiles with a classmate, spend exactly two minutes on theirs, and report what you understood and where you got lost.
Assessment: A classmate reviewing your profile cold can name your best project, open its live demo, and say what it does within two minutes.

PHASE 5: OPEN SOURCE & CAPSTONE

Graduate from your own repos to the world's: find a genuine good first issue, learn the etiquette that gets contributions merged, open a real external pull request, and complete a capstone that earns your certificate.

Class 22: Finding Your First Open Source Issue

Topics:
- Why contribute at all: real codebases, review from experienced maintainers, and public proof you can collaborate, the exact thing schools and employers cannot verify from solo projects
- Where to hunt: the good first issue and help wanted labels, curated first-issue lists, and GitHub search filters like label:"good first issue" language:python
- Reading the house rules first: CONTRIBUTING.md and CODE_OF_CONDUCT.md exist so you do not have to guess how a project works
- Sizing your first issue honestly: documentation fixes, typos, small bugs, and missing tests beat ambitious features every time
- Claiming politely: comment asking to take the issue and wait for a maintainer's reply before starting serious work
- Setting up the contribution: fork the project, clone YOUR fork, and create a branch named for the issue
- Reproducing before touching: run the project locally and confirm you can see the issue yourself before changing a single line

Projects built:
- Build a shortlist of three real candidate issues in projects you actually use or understand, pick one, claim it politely in a comment, and get your fork cloned and branched locally

Practice: Read the CONTRIBUTING.md of all three shortlisted projects and note one rule from each that you would have broken without reading it.
Assessment: A claimed (or claim-requested) real issue, a fork with an issue-named branch, and the project running on your machine.

Class 23: Making the Contribution: Etiquette and the External PR

Topics:
- Matching the project's style: read the neighboring code, follow their naming and formatting, and keep your diff as small as the fix allows
- Commit message conventions some projects require, like Conventional Commits (fix: correct typo in install guide), and finding the rule in CONTRIBUTING.md
- Opening the PR against the upstream repository: filling their PR template honestly and linking the issue you claimed
- Responding to review like a professional: make the requested changes, push to the same branch, reply to each comment, and resolve conversations
- Patience and kindness: maintainers are often volunteers, so wait about a week before a polite nudge, and never demand a merge
- If it is not merged: what you still gained (a public PR, review experience, a work sample) and how to reference it anyway
- After the merge: sync your fork from upstream, thank the reviewer, and add the contribution to your profile README

Projects built:
- Make the fix on your branch, open a real pull request to the upstream project with their template filled properly and the issue linked, and respond to any review feedback that arrives

Practice: Before submitting, self-review your own PR diff line by line and remove anything not needed for the fix.
Assessment: A real external pull request open (or merged) on a project you do not own, with a clean diff and an honest description.

Class 24: Capstone: Profile, Portfolio, Merged PR + Certification

Topics:
- The capstone checklist: polished profile README, pinned repos each with a real README, your live GitHub Pages portfolio, and one external pull request submitted or merged
- Final repo audit: a license on everything public, correct .gitignore files, and absolutely no secrets in any history (plus the rotation rule if one ever slips)
- A history a stranger can follow: sensible branch names, clear commit messages, and merged PRs that tell the story of each project
- Presenting with Git itself: walking your reviewer through a project using git log --oneline --graph as the narrative
- What unlocks next: the GitHub Student Developer Pack is free for verified students at degree

or diploma granting schools and includes GitHub Pro while a student, and GitHub Education has offered free Copilot access to verified students (availability can change, check education.github.com)
- Your 90-day plan: a sustainable contribution rhythm, the next two open source targets, and using branches and PRs on every school project from now on
- Demo day: present your profile, live portfolio, and external PR to the class and earn your certificate

Projects built:
- Complete and present the full capstone: a polished GitHub profile, a live GitHub Pages portfolio linking every pinned project, and one real external pull request, defended in a demo-day walkthrough

Practice: Do a full dress rehearsal of your demo with a partner, including the git log --graph walkthrough of your best project.

Assessment: Final capstone review passed: profile, live portfolio URL, and external PR verified, earning the Modern Age Coders 'Git & GitHub for Teens' certificate.

PROJECTS THE STUDENT BUILDS AND KEEPS

- Phase 1: Git installed and configured, a terminal-built folder tree, a 5-commit story repo, a history-detective investigation, and a full rescue-mission undo drill with .gitignore
- Phase 2: your secured GitHub account with a pushed repo, an SSH key with a two-machine sync round trip, a rich project README, your profile README with pinned repos, a licensed repo with linked issues, and your first live GitHub Pages website
- Phase 3: a feature built safely on a branch, fast-forward and no-ff merges compared, a conflict resolved three ways, a complete squash-merged pull request, a kind review plus a cross-repo fork PR, and a two-person team sprint on one protected repo
- Phase 4: a merge vs rebase side-by-side experiment, a stash interruption drill plus a v1.0.0 tagged Release, a from-scratch GitHub Actions deploy workflow with status badge, and a full recruiter-readability portfolio audit
- Phase 5: a shortlist and claim of a real good first issue, a genuine external pull request to an open source project, and the capstone: polished profile, live portfolio, and demo-day walkthrough
- Total: 24 hands-on deliverables, one per class, culminating in a public portfolio and a real open source contribution

Total projects: 24 hands-on deliverables, one per class, finishing with a live portfolio site and a real open source pull request

SKILLS THE STUDENT WILL HAVE AT THE END

- Git Fundamentals: init, status, add, commit, log, diff, show, blame, and the three areas of every repository
- Safe Undo: restore, restore --staged, commit --amend, reset --soft, revert, and .gitignore discipline
- Terminal Fluency: navigating, creating, and managing projects entirely from the command line
- GitHub Essentials: remotes, clone, push, pull, fetch, SSH keys, Markdown READMEs, licenses, and issues
- Branching & Merging: switch -c, merge, fast-forward vs three-way, conflict resolution, stash, and a safe rebase introduction
- Collaboration: pull requests end to end, kind code review, forks with upstream syncing, branch protection, and Projects boards
- Publishing & Automation: GitHub Pages hosting, tags, Releases, and a GitHub Actions deploy workflow
- Open Source & Portfolio: finding good first issues, contribution etiquette, external PRs, and a recruiter-readable profile

HOW A TYPICAL WEEK IS SPLIT

Live classes: 2 live classes per week, about 1 hour each, across 12 weeks

Hands on git work: 1-1.5 hours running real Git and GitHub commands from each class on your own machine

Project time: 1 hour completing each class deliverable, from commits and PRs to your live Pages site

Review and doubts: 30-60 minutes reviewing your history, practicing undo drills, and clearing doubts before the next class

Homework: A task or problem set after every class, and a monthly mixed-review assignment that deliberately folds in earlier topics

SUPPORT INCLUDED

Doubt support: WhatsApp doubt support between classes for install issues, scary error messages, and conflict emergencies

Small batches: Small batches, with mini-batch and 1-on-1 options, so every teen gets individual attention at the terminal

Mentor guidance: Live guidance from mentors who use Git and GitHub daily on real projects

Project feedback: Feedback on every class deliverable and a personal capstone review before certification

Living syllabus: Curriculum updated as Git and GitHub ship new features, at no extra cost

CERTIFICATION DETAIL

Completion: Certificate from Modern Age Coders, awarded on passing the final assessment. Fall short and there is focused revision and a free retest: the certificate certifies real learning, not attendance

WHERE THIS CAN LEAD

- Confident collaborator on any school team or hackathon, fluent in branches, pull requests, and reviews
- Open source contributor with a real external pull request as public proof of collaboration
- Portfolio-ready applicant: a pinned, documented GitHub profile plus a live Pages site for college and internship applications
- Prepared for every future language and course: the same Git workflow powers Python, web, Java, C++, and AI projects
- On track for developer roles: version control is a day-one, non-negotiable requirement in every software job

COMMON QUESTIONS ABOUT THIS COURSE

For anything about cost, use PART 4 and RULE 1. Do not quote two regions.

Q: What age do you need to be to use GitHub?
A: GitHub's Terms of Service require users to be at least 13 years old to create an account. That is exactly why this course is designed for ages 13-18: every student can legally have their own real account from Class 6. We also walk through securing it with two-factor authentication.

Q: What is the difference between Git and GitHub?
A: Git is a free, open source distributed version control system that runs on your own computer; it was created by Linus Torvalds in 2005 for Linux kernel development. GitHub is a website (owned by Microsoft since 2018) where Git repositories are hosted online so people can collaborate through pull requests, issues, and reviews. This course teaches both, in that order.

Q: Is GitHub free for students?
A: On top of that, the GitHub Student Developer Pack is free for verified students enrolled at a degree or diploma granting school and includes GitHub Pro while you are a student. GitHub Education has also offered free Copilot access to verified students; availability can change, so we point students to education.github.com.

Q: Do I need to know how to code before learning Git and GitHub?
A: No. Git tracks files, so you can learn it with a simple webpage or even text files, and we assume zero terminal experience: Class 2 teaches the command line from scratch. If you already have a hobby project like a website, Python script, or game mod, you will practice on that; if not, we provide starter projects.

Q: How long does it take to learn Git and GitHub?
A: You will be committing confidently within the first five classes, and the full course runs 24 live classes over 12 weeks at two classes per week. We recommend 3-4 hours per week including practice. By the end you are not just 'familiar' with Git: you have merged pull requests, resolved real conflicts, and contributed to an open source project.

Q: Are the classes live or recorded?
A: Every class is live and interactive with a real instructor, never pre-recorded videos. Group batches are capped at 20 students, with mini-batch and 1-on-1 options, and you get WhatsApp doubt support between classes. You can also take a free demo class before deciding. (Agent note: the free demo is a waiting list with no fixed date. The Priority Live Demo is a guaranteed class today or tomorrow, booked at https://learn.modernagecoders.com/priority-demo . Offer both, as RULE 3 says.)

Q: Can I host a website for free on GitHub?
A: Yes. GitHub Pages provides free static site hosting straight from a repository, with no server costs. You publish your first live site in Class 11, automate its deployment with a GitHub Actions workflow in Class 20, and it becomes the portfolio you present at the capstone.

Q: What will my teen actually have at the end of this course?
A: Four concrete things: a polished GitHub profile with a profile README and pinned, documented projects; a live portfolio website on GitHub Pages; a real pull request to an external open source project; and the Modern Age Coders 'Git & GitHub for Teens' certificate. Together they form public, verifiable proof of skill that colleges and internship reviewers can check themselves.

Q: How am I assessed, and is the certificate just for showing up?
A: No. A task follows every class with feedback, monthly reviews deliberately mix new material with earlier topics so nothing is forgotten, and the course ends with a final project defended live, plus a written assessment. Passing earns the certificate; falling short earns focused revision and a free retest. We measure real learning, not attendance.

To enrol, message Shivam Sir on +91 9123366161 or send the parent this link: https://learn.modernagecoders.com/courses/git-github-version-control-course-for-teens

For a demo: the Priority Live Demo (guaranteed, today or tomorrow) is booked at https://learn.modernagecoders.com/priority-demo . The free demo is a waiting list with no fixed date.

==========

COURSE 73 OF 137: GO COURSE: BACKEND SERVICES FROM ZERO TO PRODUCTION HABITS

==========

Course link: https://learn.modernagecoders.com/courses/complete-golang-programming-masterclass-college
Subject area: Backend Engineering
Designed for: College students
Who can join: Complete beginner (18+); college students, graduates and working professionals
Course length: 10-12 months (44-52 weeks)
Time needed: 2 live classes/week + 4-6 hours practice
Certificate: Certificate from Modern Age Coders, awarded on passing the final exam

PRICE FOR THIS COURSE (quote only the one that applies to the person asking)

In India, per month: group Rs 1,499, mini batch Rs 2,999, one to one Rs 4,999
In Canada, per month: group CAD 140, one to one CAD 210
Anywhere else, per month: group $100, one to one $150
Classes: group and mini batch two live classes a week, eight a month; one to one in India one live class a week, four a month; one to one outside India two live classes a week, eight a month. Each class is one hour.

WHAT THIS COURSE IS

Go course for college students and professionals: the language, concurrency done right, then real backend services, APIs and deployment habits in 10-12 months.

In one line: The language cloud infrastructure is written in, learned the Go way: small, sharp and honest, from fundamentals to production-shaped services.

ABOUT THE PROGRAMME

Go was designed by people tired of complexity, and it shows: a small language, a legendary concurrency story, and a standard library that ships real services without a framework safari. This live online masterclass teaches it the Go way: fundamentals fast but properly, concurrency, goroutines, channels and the patterns that make them safe, learned as the centerpiece it is, then real backend engineering: HTTP services, APIs, databases, testing as a first-class habit, and the deployment shape of production Go. A finale month ships a capstone service and sits the final exam. The pace is honest: ten teaching months at two live classes a week plus four to six hours of practice, with two more in hand. Problem sets, monthly mixed reviews, phase exams, and a final exam that decides the certificate with a free retest. Small language, deep skill, depth over dopamine.

WHAT MAKES THIS COURSE DIFFERENT

- Concurrency as the centerpiece: goroutines and channels taught with patterns and pitfalls, not just syntax
- The standard library first: real services before frameworks, the way Go culture actually works
- Testing as a habit from month one: table tests and benchmarks are just how Go is written
- Production shape included: configuration, logging, graceful shutdown and deployment honesty
- An honest 10-month arc with 2 months in hand
- Real assessment: weekly problem sets, monthly mixed reviews, phase exams and a final exam with a free retest

THE LEARNING PATH, STEP BY STEP

Phase 1: The language (Months 1-3): Go fundamentals learned fast but properly
Phase 2: Concurrency and craft (Months 4-6): goroutines, channels, patterns and the tooling culture
Phase 3: Backend services (Months 7-9): HTTP, APIs, databases, testing and production shape
Phase 4: The finale (Month 10): the capstone service, shipped and defended, and the final exam

WHAT A STUDENT NEEDS BEFORE STARTING

Coding experience: None. The language is taught from the first line
Equipment: Any computer; Go and every tool used are free
Age: 18+; college students, graduates and working professionals
Time commitment: 2 live classes plus 4-6 hours of practice a week

WHO THIS COURSE IS FOR

Backend bound: Developers and students aiming at backend and infrastructure work, where Go hiring lives

Simplicity lovers: People exhausted by framework churn who want one sharp tool
Concurrency curious: Engineers who want the best concurrency story in mainstream programming
Career switchers: Professionals entering software through a small, learnable, employable language
Second language seekers: Python or JS developers adding the performance-and-services language

FULL CURRICULUM, WEEK BY WEEK

This is the complete teaching plan. Parents can ask about any week.

PHASE 1: FOUNDATION & CORE GO SKILLS (MONTHS 1-3, WEEKS 1-13)

Build rock-solid Go fundamentals. Learn programming logic, master Go syntax, understand Go's philosophy, and create your first applications.

Months 1-2: Go Fundamentals & Programming Basics (Weeks 1-7)
Introduction to Go & Development Environment Setup
Topics:
- What is Go? History, creators (Google), and philosophy
- Go's design principles: simplicity, reliability, efficiency
- Why Go? Use cases and advantages
- Go vs other languages: Python, Java, Rust, C++
- Go ecosystem and community
- Installing Go (latest stable version)
- GOPATH and Go Modules explained
- Setting up development environment: VS Code with Go extension
- GoLand IDE setup (optional)
- Understanding Go workspace structure
- Your first Go program: Hello, World!
- Go program structure: package, import, main function
- Running and building Go programs
- go run, go build, go install commands
- Comments: single-line (//) and multi-line (/* */)
- Go documentation with godoc
- gofmt for code formatting
- Go conventions and effective Go guidelines
Projects built:
- Hello World with command-line arguments
- Personal information display program
- ASCII art generator in Go
- Simple text output variations
- Environment variable reader
Practice: Daily: 30 min Go syntax practice, write 5-10 simple programs
Variables, Data Types & Operators
Topics:
- Variables: declaration with var keyword
- Short variable declaration with :=
- Variable naming conventions in Go
- Zero values in Go
- Basic data types: bool, string, int, float64
- Integer types: int8, int16, int32, int64, uint variants
- Floating-point types: float32, float64
- Complex numbers: complex64, complex128
- Type inference in Go
- Constants with const keyword
- Iota for enumerated constants
- Type conversion and type assertion
- Operators: arithmetic (+, -, *, /, %, ++, --)
- Comparison operators: ==, !=, <, >, <=, >=
- Logical operators: &&, ||, !
- Bitwise operators: &, |, ^, &^, <<, >>
- Assignment operators: =, +=, -=, *=, /=, %=
- Operator precedence
- String operations and string formatting
- fmt package for formatted I/O
Projects built:
- Calculator with all arithmetic operations
- Temperature converter (Celsius, Fahrenheit, Kelvin)
- Unit converter (length, weight, volume)
- BMI calculator with health assessment
- Currency converter with live rates simulation
- Bitwise operations demonstrator
- Type conversion examples program
- Interest calculator (simple and compound)
Practice: Solve 30 problems on variables, data types, and operators
Control Flow & Functions
Topics:
- If statements in Go (no parentheses required)

- If with initialization statement
- If-else and else-if chains
- Switch statement: more powerful than other languages
- Switch without expression (replaces if-else chains)
- Switch with multiple cases
- Type switch for interface types
- For loop: Go's only loop construct
- Classic for loop with initialization, condition, post
- While-style for loop
- Infinite loops with for
- Range loops for arrays, slices, maps, channels
- Break and continue statements
- Labeled break and continue
- Goto statement (rarely used)
- Functions: first-class citizens in Go
- Function declaration and parameters
- Multiple return values
- Named return values
- Variadic functions with ...
- Anonymous functions and closures
- Functions as values and parameters
- Recursion in Go

Projects built:

- Number guessing game
- Grade calculator with switch
- Prime number generator
- Fibonacci calculator (iterative and recursive)
- Factorial calculator
- Pattern printer (pyramids, diamonds)
- FizzBuzz implementation
- Menu-driven calculator
- Password strength checker
- Palindrome checker with multiple approaches
- Function library for math operations

Practice: Solve 40 control flow and function problems

Arrays, Slices & Maps

Topics:

- Arrays: fixed-size sequences
- Array declaration and initialization
- Array literals and zero values
- Iterating arrays with for and range
- Multidimensional arrays
- Slices: dynamic arrays
- Creating slices with make()
- Slice literals
- Slice internals: pointer, length, capacity
- Appending to slices with append()
- Copying slices with copy()
- Slicing operations and reslicing
- Nil slices vs empty slices
- Maps: Go's hash tables
- Creating maps with make() and literals
- Adding, updating, deleting map entries
- Checking key existence with comma ok idiom
- Iterating maps with range
- Maps of structs
- Nested maps
- Common slice and map patterns

Projects built:

- Dynamic array operations library
- Student grade management with slices
- Word frequency counter with maps
- Phonebook application with maps
- Inventory management system
- Matrix operations (2D slices)
- Shopping cart with slices and maps
- Duplicate remover
- Sorting algorithms implementation
- Search algorithms (linear, binary)
- Statistics calculator for datasets

Practice: Solve 35 slice and map problems

Month 3: Structs, Methods & Interfaces (Weeks 8-13)

Structs & Methods

Topics:

- Structs: custom types in Go
- Struct declaration and fields
- Struct literals and zero values
- Anonymous structs

```
    - Nested structs and embedded fields
    - Struct tags for JSON, XML, database
    - Methods: functions with receivers
    - Value receivers vs pointer receivers
    - When to use pointer receivers
    - Method sets and interfaces
    - Struct composition over inheritance
    - Embedding structs for composition
    - Promoted fields and methods
    - Constructor functions in Go
    - Factory patterns
    - Encapsulation with exported/unexported fields
    - Getters and setters conventions
    - String() method for custom string representation
    - Comparing structs
    - Anonymous struct fields
  Projects built:
    - Person struct with methods
    - Bank account with transactions
    - Book library management
    - Employee management system
    - Geometric shapes with area/perimeter
    - Car dealership system
    - Student enrollment system
    - Product inventory with methods
    - Time tracker application
    - Contact management system
  Practice: Create 20 different structs with methods
Interfaces & Polymorphism
  Topics:
    - Interfaces: defining contracts
    - Interface declaration and implementation
    - Implicit interface satisfaction
    - Empty interface: interface{}
    - Type assertions and type switches
    - Interface composition
    - Common interfaces: Stringer, error, io.Reader, io.Writer
    - Polymorphism through interfaces
    - Duck typing in Go
    - Interface best practices
    - Small interfaces principle
    - Accept interfaces, return structs
    - Interface segregation
    - Dependency injection with interfaces
    - Mocking with interfaces for testing
    - Sort interface implementation
    - Custom sorting with sort.Interface
    - Error interface and custom errors
    - Wrapping errors
    - Interface values: dynamic type and value
  Projects built:
    - Shape calculator with interfaces
    - Payment processing system
    - Notification system (Email, SMS, Push)
    - Database abstraction layer
    - Animal hierarchy with interfaces
    - Plugin system using interfaces
    - Custom error types
    - Logging abstraction
    - Event system with interfaces
    - Repository pattern implementation
  Practice: Build 15 interface-based systems
Packages & Error Handling
  Topics:
    - Packages: organizing Go code
    - Creating packages
    - Package naming conventions
    - Exported vs unexported identifiers
    - Package initialization with init()
    - Import statements and aliases
    - Blank imports with _
    - Internal packages
    - Vendoring and dependency management
    - Go modules in detail
    - go.mod and go.sum files
    - Module versioning
    - Error handling philosophy in Go
    - Error as values
    - Creating errors with errors.New() and fmt.Errorf()
```

```
        - Error wrapping with %w verb
        - errors.Is() and errors.As()
        - Panic and recover mechanism
        - When to panic
        - Defer statement for cleanup
      Projects built:
        - Multi-package application
        - Custom package library
        - Error handling patterns library
        - Configuration package
        - Utility package creation
        - Logging package
        - PHASE 1 MINI CAPSTONE: Task Management CLI Tool
        - Features: Add tasks, list tasks, mark complete, persistence, packages, error handling
      Practice: Create 10 reusable packages
      Assessment: Phase 1 exam: a practical build defended live, plus a written paper mixing
      this phase with everything before it

------------------------------------------------------------
PHASE 2: ADVANCED GO & SYSTEMS PROGRAMMING (MONTHS 4-6, WEEKS 14-26)
------------------------------------------------------------
Master Go's concurrency model, advanced features, testing, performance optimization, and
systems programming.

  Month 4: Concurrency & Advanced Features (Weeks 14-19)
    Goroutines & Channels Fundamentals
      Topics:
        - Concurrency vs parallelism
        - Go's concurrency philosophy
        - Goroutines: lightweight threads
        - Starting goroutines with go keyword
        - Goroutine scheduling and GOMAXPROCS
        - Channels: communication between goroutines
        - Creating channels with make()
        - Sending and receiving on channels
        - Channel directions: send-only, receive-only
        - Buffered channels
        - Channel closing and range loops
        - Select statement for multiple channels
        - Default case in select
        - Channel patterns: fan-in, fan-out
        - Worker pools with goroutines
        - Pipeline pattern
        - Timeout handling with channels
        - Context package for cancellation
        - sync.WaitGroup for goroutine coordination
        - Race conditions and data races
      Projects built:
        - Concurrent web scraper
        - Worker pool implementation
        - Pipeline data processor
        - Concurrent file downloader
        - Chat server with goroutines
        - Parallel image processor
        - Rate limiter with channels
        - Concurrent cache implementation
        - Producer-consumer pattern
        - Merge sort with goroutines
      Practice: Solve 35 concurrency problems
    Advanced Concurrency Patterns
      Topics:
        - Mutex and RWMutex for synchronization
        - Atomic operations with sync/atomic
        - sync.Once for one-time initialization
        - sync.Map for concurrent map access
        - sync.Pool for object reuse
        - Condition variables with sync.Cond
        - Semaphores implementation
        - Context package deep dive
        - Context cancellation and timeouts
        - Context values and best practices
        - Errgroup for error handling in goroutines
        - Advanced channel patterns
        - Pub-sub pattern with channels
        - Circuit breaker pattern
        - Retry with exponential backoff
        - Rate limiting algorithms
        - Lock-free programming basics
        - Memory model and happens-before
```

    - Detecting race conditions
    - Benchmarking concurrent code
  Projects built:
    - Thread-safe data structures
    - Concurrent web crawler with limits
    - Distributed task queue
    - Event bus implementation
    - Load balancer simulator
    - Concurrent database connection pool
    - Caching with TTL
    - Retry mechanism library
    - Circuit breaker library
    - Concurrent metrics collector
  Practice: Build 25 advanced concurrent systems
Reflection & Generics
  Topics:
    - Reflection in Go with reflect package
    - Type and Value in reflection
    - Inspecting types at runtime
    - Modifying values through reflection
    - Struct tag parsing with reflection
    - Method invocation via reflection
    - Creating generic functions with reflection
    - Reflection performance considerations
    - When to use reflection
    - Generics in Go (Go 1.18+)
    - Type parameters and constraints
    - Generic functions
    - Generic types and structs
    - Type inference with generics
    - Type sets and interface constraints
    - Comparable constraint
    - Generic slice operations
    - Generic data structures
    - Generics best practices
    - Migrating from interface{} to generics
  Projects built:
    - JSON marshaler with reflection
    - ORM-like query builder
    - Dependency injection container
    - Generic stack and queue
    - Generic set implementation
    - Type-safe cache with generics
    - Generic algorithms library
    - Struct validator with tags
    - Configuration parser
    - Generic repository pattern
  Practice: Implement 20 generic and reflection-based utilities
Testing & Benchmarking
  Topics:
    - Testing in Go philosophy
    - Writing tests with testing package
    - Test file naming conventions
    - Test function signatures
    - Running tests with go test
    - Table-driven tests
    - Subtests with t.Run()
    - Test helpers and cleanup
    - Testing packages and examples
    - Benchmark functions
    - Running and interpreting benchmarks
    - Benchmark comparisons
    - Coverage analysis with go test -cover
    - Coverage reports and visualization
    - Mocking and test doubles
    - Dependency injection for testing
    - Integration testing
    - End-to-end testing
    - Fuzzing with go test
    - Property-based testing
    - Test fixtures and golden files
    - Testing concurrent code
    - Race detection in tests
  Projects built:
    - Comprehensive test suite
    - Benchmark suite for algorithms
    - Mock implementations
    - Integration test framework
    - Test data generators

- Coverage improvement project
- Fuzz testing examples
- Testing utilities library
- Test assertion library
- BDD-style testing framework

Practice: Write tests achieving 80%+ coverage for all projects

Performance Optimization & Profiling

Topics:

- Performance optimization principles
- Profiling with pprof
- CPU profiling
- Memory profiling and allocation
- Goroutine profiling
- Block profiling
- Mutex profiling
- Trace collection and analysis
- Benchmark-driven optimization
- Memory management in Go
- Garbage collection tuning
- Escape analysis
- Stack vs heap allocation
- Reducing allocations
- String optimization techniques
- Slice performance tips
- Map optimization
- Compiler optimizations
- Assembly in Go
- CGO and performance implications
- Performance monitoring in production

Projects built:

- Performance profiling toolkit
- Memory-efficient data processor
- Optimized string operations
- Zero-allocation HTTP handler
- High-performance cache
- Profiling dashboard
- Performance regression tests
- Allocation tracker

Practice: Optimize 15 programs for performance

Month 5: CLI Tools & Systems Programming (Weeks 20-23)

Building CLI Applications

Topics:

- Command-line argument parsing with flag package
- Positional arguments and subcommands
- Cobra framework for complex CLIs
- Viper for configuration management
- Environment variables handling
- Configuration file formats: JSON, YAML, TOML
- Interactive CLIs with prompts
- Terminal colors and formatting
- Progress bars and spinners
- Table output formatting
- Shell completion scripts
- Cross-platform considerations
- Signal handling
- Daemon processes
- CLI testing strategies
- Distribution and installation
- Self-updating CLIs
- CLI documentation generation
- Man pages creation
- CLI best practices

Projects built:

- Git-like version control CLI
- Database migration tool
- File manager CLI
- HTTP client like curl
- System monitoring tool
- Log analyzer CLI
- Task runner like Make
- Package manager CLI
- Deployment tool
- CLI framework

Practice: Build 15 production-ready CLI tools

File I/O & System Programming

Topics:

- File operations with os package
- Reading files: various techniques

    - Writing files efficiently
    - File permissions and metadata
    - Directory operations
    - Path manipulation with filepath
    - Temporary files and directories
    - File watching and monitoring
    - Memory-mapped files
    - Buffered I/O with bufio
    - CSV and JSON file processing
    - Binary file handling
    - Archive formats: tar, zip
    - Compression: gzip, zlib
    - Process execution with os/exec
    - Pipes and inter-process communication
    - System calls and syscall package
    - Platform-specific code with build tags
    - CGO for C integration
    - Unsafe package usage
  Projects built:
    - File synchronization tool
    - Backup utility
    - Log rotation system
    - File encryption tool
    - Directory tree analyzer
    - File compression utility
    - Process manager
    - System information collector
    - File watcher service
    - Binary parser
  Practice: Build 12 system-level applications
Networking & Protocols
  Topics:
    - TCP/IP programming with net package
    - TCP server and client
    - UDP programming
    - Unix domain sockets
    - Network protocols implementation
    - HTTP client customization
    - WebSocket implementation
    - TLS/SSL configuration
    - Certificate handling
    - DNS operations
    - Port scanning
    - Network interfaces information
    - Raw sockets (with x/net)
    - Packet capture basics
    - Network monitoring
    - Load balancing algorithms
    - Proxy server implementation
    - Tunneling and VPN basics
    - Network security basics
    - Rate limiting at network level
  Projects built:
    - TCP chat server
    - HTTP proxy server
    - Port scanner
    - Network monitor
    - Load balancer
    - VPN client prototype
    - DNS server
    - WebSocket server
    - File transfer protocol
    - Network diagnostic tool
  Practice: Implement 10 networking applications
Data Serialization & Encoding
  Topics:
    - JSON encoding/decoding with encoding/json
    - Custom JSON marshaling
    - JSON streaming
    - XML processing
    - Protocol Buffers with protobuf
    - MessagePack encoding
    - YAML handling
    - TOML configuration
    - CSV processing
    - Binary encoding with encoding/binary
    - Base64 encoding
    - Hex encoding
    - Custom encoders and decoders

```
      - Schema validation
      - Data transformation pipelines
      - ETL processes in Go
      - Data compression techniques
      - Encryption and decryption
      - Hashing and checksums
      - Digital signatures
    Projects built:
      - Data transformation pipeline
      - Configuration management system
      - Protocol buffer service
      - ETL tool
      - Data validator
      - Encryption utility
      - File format converter
      - Schema validator
      - Binary protocol implementation
      - Serialization benchmark tool
    Practice: Build 15 data processing applications

Month 6: Tooling, Quality & Debugging (Weeks 24-26)
  Build Tools & Dependency Management
    Topics:
      - Go modules deep dive
      - Module versioning strategies
      - Semantic versioning
      - Module proxies and private modules
      - Vendoring dependencies
      - go.work for multi-module repos
      - Build flags and tags
      - Cross-compilation
      - Static vs dynamic linking
      - Build optimization flags
      - Makefile for Go projects
      - Task automation with Mage
      - CI/CD for Go projects
      - GitHub Actions for Go
      - GitLab CI for Go
      - Release management
      - Semantic release
      - Containerizing Go applications
      - Multi-stage Docker builds
      - Minimal Docker images with scratch
    Projects built:
      - Module management system
      - Build automation pipeline
      - Cross-platform builder
      - Release automation tool
      - Docker image optimizer
      - CI/CD pipeline setup
      - Version management tool
    Practice: Set up professional build pipelines for all projects
  Code Quality & Best Practices
    Topics:
      - Go code style and conventions
      - Effective Go guidelines
      - go fmt and goimports
      - Linting with golangci-lint
      - Static analysis tools
      - Code review practices
      - Design patterns in Go
      - SOLID principles in Go
      - Domain-Driven Design with Go
      - Clean Architecture in Go
      - Hexagonal architecture
      - Documentation with godoc
      - README best practices
      - API documentation
      - Code comments guidelines
      - Error handling patterns
      - Logging best practices
      - Configuration management patterns
      - Security best practices
      - Code metrics and complexity
    Projects built:
      - Code quality analyzer
      - Design pattern examples
      - Clean architecture project
      - Documentation generator
```

```
        - Code review checklist tool
        - Security scanner
        - Best practices linter
      Practice: Refactor all projects with best practices
    Debugging & Troubleshooting
      Topics:
        - Debugging with Delve
        - Remote debugging
        - Debugging goroutines
        - Core dumps analysis
        - Stack traces interpretation
        - Panic recovery strategies
        - Memory leaks detection
        - Goroutine leaks
        - Deadlock detection
        - Race condition debugging
        - Performance bottleneck identification
        - Distributed tracing
        - Logging strategies
        - Structured logging
        - Log aggregation
        - Metrics collection
        - Error tracking services
        - Debugging production issues
        - Post-mortem analysis
        - Debugging tools and techniques
      Projects built:
        - Debugging toolkit
        - Memory leak detector
        - Goroutine analyzer
        - Trace analyzer
        - Log aggregator
        - Error tracking system
        - Performance debugger
      Practice: Debug and fix 20 complex issues
      Assessment: Phase 2 exam: a practical build defended live, plus a written paper mixing
      this phase with everything before it

----------------------------------------------------------------
PHASE 3: WEB DEVELOPMENT & ENTERPRISE APPLICATIONS (MONTHS 7-9, WEEKS 27-39)
----------------------------------------------------------------
Master web development with Go, build REST APIs, GraphQL, gRPC services, work with databases,
and deploy production applications.

  Month 7: Web Development & APIs (Weeks 27-32)
    HTTP & Web Fundamentals
      Topics:
        - HTTP protocol deep dive
        - HTTP/1.1 vs HTTP/2 vs HTTP/3
        - net/http package fundamentals
        - HTTP handlers and HandlerFunc
        - ServeMux and routing
        - Middleware pattern in Go
        - Request context and cancellation
        - Request parsing and validation
        - Response writing techniques
        - Cookie handling
        - Session management
        - File uploads and downloads
        - Streaming responses
        - Server-Sent Events (SSE)
        - WebSocket upgrade
        - HTTP/2 Server Push
        - TLS/HTTPS configuration
        - HTTP client best practices
        - Connection pooling
        - Timeouts and deadlines
      Projects built:
        - HTTP server from scratch
        - Custom router implementation
        - Middleware chain builder
        - File server with upload
        - Session management system
        - Real-time chat with WebSocket
        - SSE notification system
        - HTTP proxy server
        - Load tester tool
      Practice: Build 10 HTTP-based applications
    Web Frameworks & REST APIs
```

  Topics:
    - Gin framework introduction
    - Gin routing and parameters
    - Gin middleware
    - Request binding and validation
    - Echo framework
    - Fiber framework overview
    - Chi router
    - Gorilla toolkit
    - REST API design principles
    - RESTful routing conventions
    - API versioning strategies
    - Request/response formatting
    - Content negotiation
    - CORS handling
    - Authentication methods: Basic, Token, OAuth
    - JWT implementation
    - Rate limiting
    - API documentation with Swagger
    - OpenAPI specification
    - Postman collections
  Projects built:
    - Blog REST API with Gin
    - E-commerce API with Echo
    - User management API
    - Todo application backend
    - Social media API
    - File storage API
    - Payment gateway integration
    - Multi-tenant API
    - API gateway implementation
    - REST API testing suite
  Practice: Build 12 production REST APIs
Database Programming
  Topics:
    - database/sql package
    - Database drivers for MySQL, PostgreSQL
    - Connection pooling configuration
    - Prepared statements
    - Transactions handling
    - Batch operations
    - SQL injection prevention
    - Query builders
    - GORM introduction and setup
    - GORM models and migrations
    - GORM associations
    - GORM hooks and callbacks
    - SQLX for enhanced database operations
    - SQLBoiler for type-safe ORM
    - Ent framework overview
    - Database migrations with golang-migrate
    - Connection management best practices
    - Read replicas and write masters
    - Database testing strategies
    - Fixtures and seed data
  Projects built:
    - User authentication system
    - Blog with comments (associations)
    - E-commerce database layer
    - Inventory management
    - Booking system database
    - Migration management tool
    - Database abstraction layer
    - Multi-database support
    - Database monitoring tool
    - Query performance analyzer
  Practice: Build 15 database-driven applications
NoSQL & Caching
  Topics:
    - MongoDB driver for Go
    - MongoDB CRUD operations
    - Aggregation pipelines
    - MongoDB transactions
    - Redis with Go
    - Redis data structures
    - Redis pub/sub
    - Redis Streams
    - Caching strategies
    - Cache-aside pattern

```
      - Write-through caching
      - Cache invalidation
      - Distributed caching
      - Memcached integration
      - ElasticSearch with Go
      - Full-text search implementation
      - Time-series databases: InfluxDB
      - Graph databases: Neo4j
      - Key-value stores
      - Document stores
    Projects built:
      - MongoDB-based blog platform
      - Redis cache layer
      - Real-time leaderboard with Redis
      - Session store with Redis
      - Search engine with ElasticSearch
      - Metrics collector with InfluxDB
      - Social graph with Neo4j
      - Hybrid database application
      - Cache performance tester
      - NoSQL migration tool
    Practice: Implement 10 NoSQL solutions
  GraphQL & Modern APIs
    Topics:
      - GraphQL introduction and concepts
      - GraphQL vs REST comparison
      - GraphQL schema definition
      - Types and resolvers
      - Queries and mutations
      - Subscriptions for real-time
      - gqlgen framework
      - Graph-gophers library
      - Schema-first vs code-first
      - DataLoader pattern
      - N+1 query problem solutions
      - GraphQL federation
      - Error handling in GraphQL
      - Authentication and authorization
      - Rate limiting GraphQL
      - GraphQL testing
      - Apollo integration
      - GraphQL documentation
      - Performance optimization
      - Caching strategies
    Projects built:
      - GraphQL API for blog
      - E-commerce GraphQL service
      - Real-time chat with subscriptions
      - Social media GraphQL API
      - GraphQL gateway
      - Federation example
      - DataLoader implementation
      - GraphQL testing framework
      - Schema stitching tool
      - GraphQL to REST adapter
    Practice: Build 8 GraphQL services

Month 8: gRPC & Microservices Foundations (Weeks 33-36)
  gRPC & Protocol Buffers
    Topics:
      - gRPC introduction and architecture
      - Protocol Buffers (protobuf) syntax
      - Defining services and messages
      - protoc compiler usage
      - Code generation for Go
      - Unary RPC
      - Server streaming RPC
      - Client streaming RPC
      - Bidirectional streaming
      - gRPC error handling
      - Status codes and details
      - Metadata and headers
      - Interceptors (middleware)
      - Authentication in gRPC
      - TLS/mTLS configuration
      - Load balancing gRPC
      - Service discovery
      - gRPC-Gateway for REST
      - gRPC reflection
```

```
    - Testing gRPC services
  Projects built:
    - User service with gRPC
    - Streaming file transfer
    - Real-time chat with gRPC
    - Microservice communication
    - gRPC gateway implementation
    - Service mesh with gRPC
    - gRPC load balancer
    - Authentication service
    - gRPC monitoring system
    - Protocol evolution example
  Practice: Build 10 gRPC services
Message Queues & Event-Driven
  Topics:
    - Message queue patterns
    - RabbitMQ with Go
    - AMQP protocol
    - Exchanges, queues, bindings
    - Apache Kafka with Go
    - Producers and consumers
    - Kafka Streams equivalent
    - NATS messaging system
    - NATS Streaming/JetStream
    - AWS SQS integration
    - Google Pub/Sub
    - Event sourcing pattern
    - CQRS implementation
    - Saga pattern
    - Outbox pattern
    - Event-driven architecture
    - Eventual consistency
    - Idempotency handling
    - Dead letter queues
    - Message ordering
  Projects built:
    - Order processing with RabbitMQ
    - Event streaming with Kafka
    - NATS-based microservices
    - Event sourcing example
    - CQRS implementation
    - Saga orchestration
    - Event store
    - Message broker comparison
    - Event-driven e-commerce
    - Real-time analytics pipeline
  Practice: Build 12 event-driven systems
Authentication & Security
  Topics:
    - Authentication strategies
    - Password hashing with bcrypt
    - Session-based authentication
    - Token-based authentication
    - JWT implementation and validation
    - OAuth 2.0 implementation
    - OpenID Connect
    - Social login integration
    - Multi-factor authentication
    - API key management
    - Role-based access control (RBAC)
    - Attribute-based access control (ABAC)
    - Security middleware
    - CSRF protection
    - XSS prevention
    - SQL injection prevention
    - Rate limiting implementation
    - DDoS protection
    - Secrets management
    - Vault integration
  Projects built:
    - Complete auth system
    - OAuth provider
    - Social login integration
    - MFA implementation
    - RBAC system
    - API key manager
    - Security scanner
    - Rate limiter library
    - Secrets management tool
```

- Security audit tool
    Practice: Implement security in all applications
  Observability & Monitoring
    Topics:
      - Observability principles
      - Structured logging with zap/zerolog
      - Log levels and formatting
      - Distributed tracing with OpenTelemetry
      - Jaeger integration
      - Zipkin integration
      - Metrics with Prometheus
      - Custom metrics and labels
      - Grafana dashboards
      - Application Performance Monitoring (APM)
      - Health checks implementation
      - Readiness and liveness probes
      - Error tracking with Sentry
      - Distributed logging with ELK
      - CloudWatch integration
      - DataDog integration
      - Alerts and notifications
      - SLA monitoring
      - Performance monitoring
      - Cost monitoring
    Projects built:
      - Observability platform
      - Distributed tracing system
      - Metrics collection service
      - Log aggregation pipeline
      - Custom APM tool
      - Health check framework
      - Alert manager
      - Dashboard builder
      - Performance monitor
      - SLA tracker
    Practice: Add observability to all services

Month 9: Shipping Go: Containers, CI & Production Habits (Weeks 37-39)
  Containerization & Orchestration
    Topics:
      - Docker deep dive for Go
      - Multi-stage builds optimization
      - Minimal images with distroless
      - Docker Compose for development
      - Container networking
      - Volume management
      - Docker registry
      - Kubernetes concepts
      - Pods, Services, Deployments
      - ConfigMaps and Secrets
      - Ingress controllers
      - StatefulSets for databases
      - Jobs and CronJobs
      - Helm charts creation
      - Operators in Go
      - kubebuilder framework
      - operator-sdk
      - Custom Resource Definitions (CRDs)
      - Admission webhooks
      - Service mesh with Istio
    Projects built:
      - Optimized Docker images
      - Kubernetes manifests
      - Helm chart for application
      - Custom Kubernetes operator
      - CRD implementation
      - Admission webhook
      - Service mesh setup
      - Auto-scaling configuration
      - Blue-green deployment
      - Canary deployment
    Practice: Deploy all applications to Kubernetes
  CI/CD & Automation
    Topics:
      - CI/CD principles
      - GitHub Actions for Go
      - GitLab CI configuration
      - Jenkins pipelines
      - CircleCI setup

```
        - Build automation
        - Test automation
        - Code quality gates
        - Security scanning
        - Dependency scanning
        - Container scanning
        - Artifact management
        - Semantic versioning
        - Release automation
        - GitOps with ArgoCD
        - Flux CD
        - Infrastructure as Code with Terraform
        - Ansible for configuration
        - Monitoring CI/CD
        - Rollback strategies
      Projects built:
        - Complete CI/CD pipeline
        - Multi-environment setup
        - GitOps implementation
        - IaC with Terraform
        - Automated testing pipeline
        - Security scanning pipeline
        - Release automation
        - Rollback mechanism
        - Pipeline monitoring
        - Cost optimization
      Practice: Set up CI/CD for all projects
    Production Best Practices
      Topics:
        - Production readiness checklist
        - High availability design
        - Disaster recovery planning
        - Backup strategies
        - Data retention policies
        - Compliance requirements
        - GDPR considerations
        - Security hardening
        - Performance tuning
        - Capacity planning
        - Cost optimization
        - Documentation standards
        - Runbooks creation
        - On-call procedures
        - Incident management
        - Post-mortem process
        - Change management
        - Feature flags
        - A/B testing
        - Production debugging
      Projects built:
        - Production checklist tool
        - Disaster recovery plan
        - Runbook generator
        - Incident response system
        - Feature flag service
        - A/B testing framework
        - Compliance checker
        - Cost analyzer
        - Capacity planner
        - Production readiness review
      Practice: Make all applications production-ready
      Assessment: Phase 3 exam: a practical build defended live, plus a written paper mixing
      this phase with everything before it

---------------------------------------------------------------
PHASE 4: THE FINALE (MONTH 10, WEEKS 40-44)
---------------------------------------------------------------
The capstone month: spec, build, ship and defend, then the final exam that decides the
certificate.

  Month 10: Capstone and the Final Exam (Weeks 40-44)
    Capstone Spec and Setup
      Topics:
        - Choosing the capstone: a production-shaped API service, a concurrent data pipeline, or a CLI
          tool people would actually use
        - A one-page spec: scope, milestones, stack
        - Repository and project skeleton ready on day one
        - Instructor sign-off before the build begins
      Projects built:
```

- Approved capstone spec plus the running skeleton
    Practice: Pitch the spec to the batch and absorb one hard question
  Capstone Build
    Topics:
      - Two focused weeks of building in vertical slices
      - Instructor checkpoints and honest scope cuts
      - Using the whole course: the language, concurrency where it earns it, the standard library, and tests throughout
      - Daily commits and an always-working build
    Projects built:
      - The capstone, feature-complete with version control
    Practice: A working build at the end of every session
  Ship and Polish
    Topics:
      - The finishing pass: edge cases, errors, documentation
      - Production-shape pass: config, logging, graceful shutdown, and a load test that predicts
      - A README worth reading and a demo worth watching
      - A full-course spiral review before the exam
    Projects built:
      - The capstone shipped, documented and rehearsed
    Practice: Two mock demos, each tighter than the last
  Demo Day and the Final Exam
    Topics:
      - Presenting the capstone: live demo plus the hardest bug story
      - The honest map of next roads: cloud-native infrastructure, platform engineering, and distributed systems
      - Where our other courses continue the journey
    Projects built:
      - Demo day presentation delivered to the batch
    Assessment: FINAL EXAM: a practical build plus a written paper with questions mixed from every phase. Passing earns the certificate; falling short earns a focused revision plan and a free retest

PROJECTS THE STUDENT BUILDS AND KEEPS

- Phase 1: CLI tools and programs that use Go the Go way
- Phase 2: concurrent systems: workers, pipelines and safe patterns
- Phase 3: HTTP services with databases, tests and production shape
- Phase 4: the capstone service, load-tested and defended at demo day

Total projects: 20+ real builds, crowned by a production-shaped capstone service

SKILLS THE STUDENT WILL HAVE AT THE END

- Go fundamentals: the small language learned completely
- Concurrency: goroutines, channels and the patterns that keep them safe
- Backend engineering: HTTP services, APIs and databases with the standard library first
- Testing culture: table tests and benchmarks as reflex
- Production shape: configuration, logging, shutdown and deployment honesty

HOW A TYPICAL WEEK IS SPLIT

Live classes: 2 live one-hour classes per week, coding along with the instructor
Homework: A problem set after every class, and a mixed-review assignment at the end of every month
Practice: 4-6 hours of building between classes
Review: Every submission reviewed with written feedback; recurring gaps reopened in class

SUPPORT INCLUDED

Doubt support: WhatsApp doubt support between classes
Progress updates: Honest monthly progress reviews: what is solid, what is wobbly, and the plan for the wobble

CERTIFICATION DETAIL

Completion: Certificate from Modern Age Coders, awarded on passing the final exam. Fall short and there is focused revision and a free retest: the certificate certifies knowledge, not attendance

WHERE THIS CAN LEAD

- Backend and platform roles: Go is the language of cloud infrastructure
- Distributed systems: the road Go was built for, entered with real fundamentals
- Our GenAI course: Go services increasingly front AI systems
- Kubernetes-world later: the ecosystem is written in the language you now read

EARNING POTENTIAL (share only if asked, and never promise it)

  Market context: The ranges below are general market salary bands for these roles in India and abroad, drawn from public industry data. They are shown for career context only and are not a promise or guarantee of income. Actual pay depends on your skills, experience, location, and the job market.
  Early career roles: Rs 4-7 LPA (Junior Go Developer)
  Growing roles: Rs 7-12 LPA (Go Developer / Backend Engineer); Rs 12-20 LPA (Senior Go Developer)
  Experienced roles: Rs 18-35 LPA (Lead Developer / Cloud Architect); Rs 25-55 LPA (Principal Engineer / Solutions Architect)
  Freelance: Rs 2,000-8,000/hour based on expertise
  International usa: $100k-220k USD (Go Developer to Principal)
  International europe: €60k-150k EUR based on country and experience

COMMON QUESTIONS ABOUT THIS COURSE

  For anything about cost, use PART 4 and RULE 1. Do not quote two regions.

  Q: What does this Go course cover?
  A: The language learned completely (it is famously small), concurrency as the centerpiece, goroutines, channels, patterns and pitfalls, then real backend engineering: HTTP services and APIs with the standard library first, databases, testing as a habit, and production shape: config, logging, graceful shutdown. A finale month ships a load-tested capstone service and sits the final exam.

  Q: How long does it take to learn Go properly?
  A: Ten months of teaching at 2 live classes a week plus 4 to 6 hours of practice, with two more months in hand for learners who need them. The three teaching phases build the language and its real-world domain; the finale month ships a capstone and sits the final exam.

  Q: How am I assessed? Is the certificate just for attending?
  A: No. Problem sets follow every class with written feedback, monthly reviews deliberately mix new material with earlier topics, each phase ends with a cumulative exam, and the course ends with a final exam: a practical build plus written questions from the whole syllabus. Passing earns the certificate; falling short earns focused revision and a free retest.

  Q: Why learn Go instead of Python or Node for backend?
  A: Different sweet spots, honestly: Python wins for data and AI glue, Node for JS-everywhere teams. Go wins where services must be fast, concurrent and operationally boring, which is why Docker, Kubernetes and most cloud infrastructure are written in it. It is also one of the fastest languages to become productive in: small surface, sharp tools, one way to format.

  Q: Can I try a class before enrolling?
  A: Yes, a free demo class with no commitment: book at learn.modernagecoders.com/contact or message us on WhatsApp at +91 91233 66161. (Agent note: the free demo is a waiting list with no fixed date. The Priority Live Demo is a guaranteed class today or tomorrow, booked at https://learn.modernagecoders.com/priority-demo . Offer both, as RULE 3 says.)

  Q: Are classes live or recorded?
  A: Live, always: small groups with a real instructor reading your actual code, never pre-recorded videos.

  To enrol, message Shivam Sir on +91 9123366161 or send the parent this link: https://learn.modernagecoders.com/courses/complete-golang-programming-masterclass-college
  For a demo: the Priority Live Demo (guaranteed, today or tomorrow) is booked at https://learn.modernagecoders.com/priority-demo . The free demo is a waiting list with no fixed date.

COURSE 74 OF 137: GODOT GAME DEVELOPMENT FOR KIDS AND TEENS: GDSCRIPT, 2D AND 3D
==

Course link: https://learn.modernagecoders.com/courses/godot-game-development-course-for-kids-and-teens
Subject area: Game Development
Designed for: Teens
Who can join: Beginner to text coding, ages 10 to 17
Course length: 6 months (24 weeks)
Time needed: 2 live classes/week + 2-3 hours practice
Certificate: Certificate from Modern Age Coders, awarded on passing the final assessment

PRICE FOR THIS COURSE (quote only the one that applies to the person asking)
  In India, per month: group Rs 1,499, mini batch Rs 2,999, one to one Rs 4,999
  In Canada, per month: group CAD 140, one to one CAD 210
  Anywhere else, per month: group $100, one to one $150
  Classes: group and mini batch two live classes a week, eight a month; one to one in India one live class a week, four a month; one to one outside India two live classes a week, eight a month. Each class is one hour.

WHAT THIS COURSE IS

Godot game development course for ages 10 to 17: live online classes building real 2D and 3D games in Godot 4 with GDScript, from first scene to a finished web build.

In one line: A real game engine, a real scripting language, and games your child actually finishes.

ABOUT THE PROGRAMME

Godot is a free and open source game engine released under the MIT license, so a student can download it, build anything, and keep everything they make, with no account, subscription or fee. It runs on Windows, macOS and Linux, and its own scripting language, GDScript, is designed to be easy to pick up for beginners while still being the language professional Godot developers use every day. That makes it the natural step for a child who has outgrown block coding and wants to write real code inside a real engine. This 6-month live course is built around Godot 4. Students learn the engine's core idea first: everything is a node, nodes combine into scenes, and scenes combine into games. In the first two months they finish a complete 2D arcade game with a score, a game over screen and a restart button. Months three and four build a proper platformer with gravity, tile map levels, enemies, animation and sound. Month five moves into 3D, and month six is a capstone: each student designs, builds, playtests and exports a game of their own. The course is taught live by a teacher who reads each student's code as they write it. Younger students build the core version of each project; older or faster students take the stretch features, so a 10-year-old and a 16-year-old are both working at the edge of what they can do. Every month ends with a playable game and a short assessment, so progress is something parents can see and play.

WHAT MAKES THIS COURSE DIFFERENT

- Godot 4 and GDScript from the first week: real text code inside a real engine, not a toy editor
- A finished, playable game every month, ending in a web build that family and friends can open in a browser
- Engine ideas taught properly: nodes, scenes, signals and the physics process, so students understand why their game works
- Core and stretch versions of every project, so ages 10 to 17 each work at the right level in the same course
- Game feel treated as a skill: animation, sound, camera and juice are taught, not left to chance
- A capstone where each student scopes, builds and playtests an original game from a written design document

THE LEARNING PATH, STEP BY STEP

Phase 1: Godot foundations and a first finished game: the editor, nodes and scenes, GDScript, movement, collisions, signals, a HUD and a web export
Phase 2: Platformers and game feel: CharacterBody2D physics, tile map levels, cameras, enemies with simple states, animation, sound and menus
Phase 3: 3D and the capstone: 3D scenes, lights and cameras, a 3D level, then an original game designed, built, playtested and exported

WHAT A STUDENT NEEDS BEFORE STARTING

Coding experience: No text coding needed. Students who have used Scratch or similar block tools settle in fastest, but it is not required
Computer skills: Comfortable with a keyboard and mouse, saving files and finding them again
Equipment: A laptop or desktop running Windows, macOS or Linux with a stable internet connection. Godot is a free download; tablets and phones are not enough for building
Age: 10 to 17. Every project has a core version and stretch features, so younger and older students both work at the right level
Time commitment: 2 live hours plus 2-3 hours of building each week

WHO THIS COURSE IS FOR

Block coding graduates: Children who have done Scratch or similar and are ready for real text code in a real engine
Players becoming makers: Kids and teens who play a lot of games and want to understand and build them
Complete beginners: Students aged 10 and up who have never coded and want their first language to come with instant, visible results
Finishers in training: Students with many half-built projects who need a structure that gets games finished
Future developers: Teens weighing game development or computer science who want an honest first taste of both

FULL CURRICULUM, WEEK BY WEEK

This is the complete teaching plan. Parents can ask about any week.

PHASE 1: GODOT FOUNDATIONS AND A FIRST FINISHED GAME (MONTHS 1-2, WEEKS 1-8)

Students learn how Godot thinks, write their first GDScript, and finish a complete 2D arcade game with scoring, a game over screen and a browser build.

  Month 1: Nodes, Scenes and Scripts (Weeks 1-4)
    Weeks 1-2: The Godot Editor and Your First Scene
      Topics:
        - Installing Godot 4 and creating a first project
        - A tour of the editor: scene dock, inspector, viewport and file system
        - Nodes as building blocks and scenes as saved groups of nodes
        - Sprite2D, positions and the 2D coordinate system
        - Attaching a first GDScript and printing to the output panel
        - The _ready function and what happens when a scene starts
      Projects built:
        - Hello Godot: a scene with a moving title, a sprite and a script that greets the player by name
      Practice: Build three small scenes from memory and change one property of each from code
    Weeks 3-4: Movement, Input and the Game Loop
      Topics:
        - Variables, types and the @export annotation for values you tune in the inspector
        - The difference between _process and _physics_process, and why delta matters
        - Reading the keyboard with Input.get_axis and input actions
        - Velocity as speed with a direction, using Vector2
        - Keeping the player on screen with clamp
        - Reading error messages and fixing them calmly
      Projects built:
        - Top-down mover: a player ship that moves smoothly in eight directions and stays inside the screen
      Practice: Add a speed boost key and a slow-motion key, each tuned from the inspector
      Assessment: Month 1 check: build a moving player from a blank project and explain each line of the script

  Month 2: A Complete Arcade Game (Weeks 5-8)
    Weeks 5-6: Collisions, Signals and Spawning
      Topics:
        - Area2D and collision shapes, and how Godot detects overlap
        - Signals: how one node tells another that something happened
        - Connecting signals in the editor and from code
        - Saving an enemy as its own scene and creating copies with instantiate
        - Timer nodes for spawning on a rhythm
        - Removing nodes safely with queue_free
      Projects built:
        - Dodge the falling objects: enemies spawn at random positions and the game reacts when the player is hit
      Practice: Add a second enemy type with a different speed and a different signal response
    Weeks 7-8: Score, HUD, Game Over and Export
      Topics:
        - A HUD on a CanvasLayer with Label and Button nodes
        - Keeping score and showing it on screen
        - Game states: title, playing and game over
        - Restarting the game cleanly
        - Adding sound effects with AudioStreamPlayer
        - Exporting a web build so the game runs in a browser
      Projects built:
        - First finished game: the dodge game with title screen, score, high score for the session, sound and a web build
      Practice: Playtest the game with two family members and fix the first two things they find confusing
      Assessment: Phase 1 assessment: a playable game handed in with a short written note on how signals connect its parts

---
PHASE 2: PLATFORMERS AND GAME FEEL (MONTHS 3-4, WEEKS 9-16)

The genre that teaches the most: gravity, jumping, levels built from tiles, enemies that think a little, and the animation and sound that make a game feel alive.

  Month 3: Platformer Physics and Levels (Weeks 9-12)
    Weeks 9-10: CharacterBody2D, Gravity and Jumping
      Topics:
        - CharacterBody2D and why it suits a player character
        - Gravity as a steady change to velocity every physics frame
        - move_and_slide and checking is_on_floor before a jump
        - Variable jump height by releasing the jump key early
        - Coyote time and jump buffering as small kindnesses to the player
        - Using StaticBody2D for solid ground
      Projects built:
        - Jump lab: a test room where every jump setting can be tuned live and compared

Practice: Write down three jump settings that feel good and three that feel bad, and explain the difference

Weeks 11-12: Tile Maps, Cameras and Animation

Topics:

- Building levels with a TileSet and the TileMapLayer node
- Adding collision to tiles so the player can stand on them
- Camera2D that follows the player with smoothing and limits
- AnimatedSprite2D for idle, run and jump animations
- Choosing the right animation from the player's state in code
- Collectibles and a level exit that loads the next scene

Projects built:

- Two-level platformer: tile map levels, collectibles, an animated player and a working exit

Practice: Design a third level on paper first, then build it and count how many changes playtesting forced

Assessment: Month 3 check: add a new mechanic, such as a double jump or a moving platform, to the platformer without help

Month 4: Enemies, Menus and Game Feel (Weeks 13-16)

Weeks 13-14: Enemies and Simple State Machines

Topics:

- An enemy that patrols between two points
- States with an enum and the match statement: patrol, chase and hurt
- Detecting the player with an Area2D vision zone
- Health, damage and a short invincibility window after a hit
- Knockback and a flash effect when something is hit
- Groups as a simple way to find all enemies or all coins

Projects built:

- Enemy pack: three enemies with different behaviours added to the platformer

Practice: Draw the state diagram for one enemy before coding it, then compare the code to the diagram

Weeks 15-16: Animation, Sound, Menus and Saving

Topics:

- AnimationPlayer for doors, platforms and screen effects
- Music and sound effects with volume set on audio buses
- Main menu, pause menu and settings screen built from Control nodes
- Changing scenes and passing information between them
- Saving a best time or high score to a file with FileAccess
- Particles for dust, sparkles and hits

Projects built:

- Polished platformer: menus, pause, music, particles and a saved best time, exported for the web

Practice: Make a before and after video of the same level to show what game feel changes

Assessment: Phase 2 assessment: the polished platformer plus a short live walkthrough of the enemy code

---

PHASE 3: 3D AND THE CAPSTONE GAME (MONTHS 5-6, WEEKS 17-24)

Students carry what they know into 3D, then design and ship an original game of their own, from written plan to playable build.

Month 5: Into 3D (Weeks 17-20)

Weeks 17-18: 3D Scenes, Cameras and Movement

Topics:

- Node3D, MeshInstance3D and the three axes
- Lights, a WorldEnvironment and why a 3D scene looks flat without them
- Camera3D that follows the player from behind
- CharacterBody3D movement and jumping with Vector3
- Collision shapes in 3D
- Importing a simple 3D model in glTF format

Projects built:

- 3D playground: a lit scene where a character runs, jumps and pushes objects around

Practice: Rebuild the 2D jump settings in 3D and note what had to change

Weeks 19-20: A 3D Collect-a-thon Level

Topics:

- Designing a 3D level so the player can see where to go
- Collectibles that spin, glow and play a sound
- A timer and a finish gate
- Simple 3D enemies that reuse the state machine from month 4
- Keeping a 3D game running smoothly on an ordinary laptop
- Exporting the 3D game for the web

Projects built:

- 3D level: collect every item before the timer runs out, with a finish screen and a best time

Practice: Ask two people to play without instructions and note where they get lost

Assessment: Month 5 check: a working 3D level and a short explanation of how it differs from the 2D projects

Month 6: The Capstone Game (Weeks 21-24)

Weeks 21-22: Design Document, Scope and Prototype
Topics:
- Writing a one-page game design document: idea, controls, goal and win and lose rules
- Cutting scope so the game can be finished in three weeks
- Building the core loop first and testing it ugly
- Using placeholder art and swapping it later
- Version control habits: saving numbered copies or using Git with the teacher
- Peer playtesting with structured feedback
Projects built:
- Capstone prototype: the core loop of the student's own game, playable from start to finish
Practice: Run a playtest with two people and write the three most useful pieces of feedback
Weeks 23-24: Polish, Export and Showcase
Topics:
- Adding the menus, sound and effects the prototype skipped
- Fixing the bugs found in playtesting, most important first
- Exporting a web build and a desktop build
- Writing a short game page: title, controls and credits
- Presenting the game and the design decisions behind it
- Where to go next: bigger Godot projects or our teen game development course
Projects built:
- Finished capstone game, exported and presented at the class showcase
Practice: Write a short post-mortem: what went well, what you cut and what you would do next
Assessment: Final assessment: the capstone game, the design document and a short code walkthrough with the teacher

PROJECTS THE STUDENT BUILDS AND KEEPS

- Dodge arcade game with score, sound and a web build
- Two-level platformer with tile map levels and animation
- Enemy pack with patrol, chase and hurt states
- Polished platformer with menus, saving and particles
- 3D collect-a-thon level with a timer and best time
- Original capstone game with a design document

Total projects: 6 finished games plus smaller weekly builds, all exported so they can be played

SKILLS THE STUDENT WILL HAVE AT THE END

- The Godot 4 editor: nodes, scenes, the inspector and project settings
- GDScript: variables, functions, conditions, loops, arrays, enums and signals
- 2D game physics with CharacterBody2D, collisions and tile map levels
- Game feel: animation, sound, particles and camera work
- 3D basics: meshes, lights, cameras and 3D movement
- Designing, scoping, playtesting and exporting a finished game

HOW A TYPICAL WEEK IS SPLIT

Live classes: 2 live one-hour classes per week, building in Godot with the teacher watching the code
Homework: A build task after every class, and a monthly mixed-review task that brings back earlier skills
Practice: 2-3 hours a week of building, tuning and playtesting
Review: Every project played and reviewed by the teacher, with written notes on code and game feel

SUPPORT INCLUDED

Doubt support: WhatsApp doubt support between classes, including screenshots of errors and short screen recordings
Progress updates: Regular progress notes to parents, with a playable build of each finished game

CERTIFICATION DETAIL

Completion: Certificate from Modern Age Coders, awarded on passing the final assessment. Fall short and there is focused revision and a free retest: the certificate certifies real learning, not attendance

WHERE THIS CAN LEAD

- Our Game Development for Teens course, which moves to Unity and C# with larger 2D and 3D projects
- Bigger personal Godot projects, game jams and school showcases, entered with a real portfolio
- Python or C++ courses, where the logic learned in GDScript transfers directly
- Computer science electives and clubs, with practical programming experience behind them
- A clear sense of whether game development is something worth pursuing further

COMMON QUESTIONS ABOUT THIS COURSE

  For anything about cost, use PART 4 and RULE 1. Do not quote two regions.

  Q: What is Godot, and is it really free?
  A: Godot is a free and open source 2D and 3D game engine. It is released under the MIT
  license, which means there are no fees, no subscription and no royalties, and the games a
  student makes belong to them. It runs on Windows, macOS and Linux, and the course uses Godot
  4.

  Q: Is Godot good for kids, or is it only for professionals?
  A: Both. Professional studios ship games with it, yet the editor is light, it installs in
  minutes, and its scripting language, GDScript, is designed to be easy to pick up for
  beginners. With a teacher guiding the first steps, children from about 10 handle it well, and
  the projects grow with them into the teen years.

  Q: What language does my child learn?
  A: GDScript, Godot's own scripting language. It reads a lot like Python, so the variables,
  functions, conditions, loops and arrays students learn here transfer directly to Python and
  other languages later. We teach GDScript rather than C# because it is the language Godot is
  built around and it can export games for the web.

  Q: My child is 10 and their cousin is 16. Can both take this course?
  A: Yes. Every project has a core version that every student finishes and stretch features for
  students who are older or faster, such as double jumps, extra enemy states or a saved high
  score. The teacher sets each student's stretch goals, so nobody is bored and nobody is lost.

  Q: How is this different from your other game development courses?
  A: Our Game Development for Kids course uses Scratch, Roblox and Minecraft, and our Game
  Development for Teens course uses Unity and C#. This course sits between them and is built
  entirely on Godot: real text code from the first week, but a lighter engine and a gentler
  language than Unity. Many students take it before moving on to the teen Unity course.

  Q: What will my child have built by the end?
  A: Each one is exported so it can be played in a browser.

  Q: What computer do we need?
  A: A laptop or desktop running Windows, macOS or Linux, plus a stable internet connection for
  the live classes. Godot is a small free download, and the teacher helps with installation in
  the first class. Tablets and phones are not enough for building games.

  Q: Will my child's games be published online?
  A: Only if the family chooses. Students learn to make a web build that can be shared
  privately with family and friends. Uploading a game to a public site is optional and is
  always the parent's decision.

  Q: How are the classes run?
  A: Live online classes, twice a week, with a real teacher, in a group of 15 to 20 students, a
  mini batch of up to 6, or one to one. Current fees for your region are shown in the pricing
  section of this page.

  Q: Can we try a class first?
  A: Yes. Book a free demo class. The teacher builds a small piece of a Godot game with your
  child, sees where they are, and suggests whether group, mini batch or one-to-one classes fit
  best. There is no obligation to enrol. (Agent note: the free demo is a waiting list with no
  fixed date. The Priority Live Demo is a guaranteed class today or tomorrow, booked at
  https://learn.modernagecoders.com/priority-demo . Offer both, as RULE 3 says.)

  To enrol, message Shivam Sir on +91 9123366161 or send the parent this link: https://learn.modernagecoders.com/courses/godot-game-development-course-for-kids-and-teens
  For a demo: the Priority Live Demo (guaranteed, today or tomorrow) is booked at
  https://learn.modernagecoders.com/priority-demo . The free demo is a waiting list with no fixed date.

==
COURSE 75 OF 137: GRE & GMAT QUANTITATIVE PREP: LIVE MATHS COACHING
==

Course link: https://learn.modernagecoders.com/courses/gre-gmat-quant-maths-prep-course
Subject area: Graduate Exam Mathematics
Designed for: Working professionals
Who can join: Adults preparing for graduate admissions; school maths is refreshed from the ground up
Course length: 6 months (24 weeks)
Time needed: 2 live classes/week + 4-5 hours practice
Certificate: Certificate from Modern Age Coders, awarded on passing the final assessment

PRICE FOR THIS COURSE (quote only the one that applies to the person asking)
  In India, per month: group Rs 1,499, mini batch Rs 2,999, one to one Rs 4,999
  In Canada, per month: group CAD 140, one to one CAD 210

Anywhere else, per month: group $100, one to one $150
Classes: group and mini batch two live classes a week, eight a month; one to one in India one live class a week, four a month; one to one outside India two live classes a week, eight a month. Each class is one hour.

WHAT THIS COURSE IS

Live online GRE and GMAT quantitative maths prep for adults: arithmetic, algebra, statistics and data sufficiency, taught to the current exam formats.

In one line: The quantitative sections of both tests are built on school maths done under time pressure with tricks laid deliberately in the way. This course rebuilds the maths and then trains the exam.

ABOUT THE PROGRAMME

The quantitative sections of the GRE and the GMAT do not test advanced mathematics. The GRE goes no higher than a second course in school algebra, and the GMAT Focus Edition covers arithmetic, algebra and statistics with no plane geometry at all. What makes them hard is that they test speed, careful reading and trap-awareness on maths most adults last touched years ago. This 6-month live course treats that honestly. The first two months rebuild the arithmetic and algebra foundation from the ground up, because a shaky foundation is where most lost marks actually come from. The middle two months cover the full content map of both exams: word problems, ratios and rates, exponents and roots, the geometry the GRE still tests, coordinate geometry, and the descriptive statistics both exams lean on. The final two months are pure exam craft: quantitative comparison for the GRE, data sufficiency and the GMAT Data Insights section, timing strategy, educated guessing, and full timed practice sets reviewed question by question. We teach to the current formats, not the old ones. That means the shorter GRE introduced in September 2023, with its two quant sections of twelve and fifteen questions, and the GMAT Focus Edition with its three forty-five-minute sections and data sufficiency moved into Data Insights. A course still teaching the old GMAT with sentence correction and an in-quant data sufficiency block is a course teaching an exam that no longer exists.

WHAT MAKES THIS COURSE DIFFERENT

- Taught to the current exams: the shorter GRE (from September 2023) and the GMAT Focus Edition, including data sufficiency now living in the Data Insights section, not the quant section
- Foundation rebuilt first: two full months of arithmetic and algebra before any exam tricks, because that is where most lost marks come from
- One course for both tests: the shared arithmetic, algebra, word-problem and statistics core taught once, then the GRE-specific and GMAT-specific pieces taught separately and clearly labelled
- Trap-awareness as a taught skill: the specific ways each exam sets bait, drilled until you see them coming
- Timed from the middle of the course, not just at the end, so pace becomes a habit rather than a panic
- Every full practice set reviewed question by question, with the focus on why the wrong answer was tempting

THE LEARNING PATH, STEP BY STEP

Phase 1: Foundations rebuilt: number properties, fractions, decimals, percentages, ratios, exponents, roots and the algebra of equations and inequalities, all at exam speed
Phase 2: The full content map: word problems, rates and work, geometry for the GRE, coordinate geometry, and the descriptive statistics and data interpretation both exams test
Phase 3: Exam craft: quantitative comparison, data sufficiency, the GMAT Data Insights section, timing and guessing strategy, and repeated full timed practice with question-by-question review

WHAT A STUDENT NEEDS BEFORE STARTING

Maths level: School maths up to about class 10, even if it is rusty. The course rebuilds arithmetic and algebra from the ground up, so being out of practice is expected and planned for, not a problem
Programming: None. This is a maths and exam-strategy course with no coding at all
Equipment: A computer with a stable internet connection, and paper and pen, since both exams reward working things out by hand at speed
Audience: Adults preparing for graduate admissions who need the quantitative section of the GRE, the GMAT, or both. Final-year undergraduates planning ahead are welcome

WHO THIS COURSE IS FOR

Mba applicants: MBA applicants sitting the GMAT Focus Edition who need to lift a quant score that stands between them and their target schools
Masters applicants: Applicants to masters and PhD programmes sitting the GRE, where a strong quant score matters most for quantitative and technical fields
Both exam takers: Candidates deciding between the two exams, or sitting both, who want the shared maths taught once and the differences taught clearly

Rusty professionals: Working professionals years out of school who are strong in their field but need the exam maths rebuilt from the foundation
Self study stalled: Self-preppers who have plateaued and know the missing piece is structured teaching and reviewed timed practice, not another book

FULL CURRICULUM, WEEK BY WEEK

This is the complete teaching plan. Parents can ask about any week.

PHASE 1: REBUILDING THE MATHS FOUNDATION (MONTHS 1-2, WEEKS 1-8)

The arithmetic and algebra both exams assume you already own, rebuilt from the ground up and drilled at exam speed, because this is where the majority of lost marks quietly come from.

Month 1: Arithmetic and Number Properties (Weeks 1-4)

Diagnostic and the Number System

Topics:

- A full diagnostic to locate your real starting point, not your assumed one
- How the current GRE and GMAT quant sections are actually built, question by question
- Integers, factors, multiples and the properties that questions hinge on
- Prime numbers, prime factorisation and why the exams love them
- Even, odd, positive, negative: the rules that turn a hard question easy
- Divisibility rules that save real seconds under time pressure

Projects built:

- Personal weakness map: your diagnostic broken down by topic into a ranked list of what to fix first

Practice: 20 number-property questions, timed loosely at first, with every mistake tagged by cause: knowledge, careless, or misread

Fractions, Decimals and Percentages

Topics:

- Fractions without a calculator: comparing, combining and simplifying at speed
- Decimals and place value, and converting fluently between the three forms
- Percentages, percentage change and the reversal trap that catches everyone
- Successive percentage changes and why they do not simply add
- Estimation as a real technique: when the exam wants an approximate answer
- The on-screen GRE calculator and the GMAT Data Insights calculator: when they help and when they waste time

Projects built:

- Percentage trap set: ten deliberately baited percentage questions worked slowly, then reworked at speed

Practice: 24 fraction, decimal and percentage questions, half of them worded to hide which operation is needed

Ratios, Proportions and Rates

Topics:

- Ratios and how to scale them without losing the units
- Proportions and direct and inverse variation
- Rates: speed, work and price per unit, all as the same idea
- Mixtures and blends, a favourite of both exams
- Reading a multi-part ratio question without dropping a condition
- The bridge from ratios to the word problems of month 3

Projects built:

- Rate reasoning: five real-world rate scenarios set up as equations before any number is plugged in

Practice: 20 ratio and rate questions, each one required to be set up in writing before it is solved

Exponents, Roots and Number Sense

Topics:

- Exponent rules until they are automatic, not looked up
- Square roots, cube roots and simplifying surds
- Scientific notation and handling very large and very small numbers
- Absolute value and what it does to inequalities
- Number-sense shortcuts: last-digit tricks, sign tricks, magnitude checks
- Sanity-checking an answer in five seconds before you commit to it

Projects built:

- Shortcut library: your own one-page sheet of the number-sense checks that will not fit in a calculator

Practice: 22 exponent and root questions, with a sanity-check written next to each final answer

Assessment: Month 1 checkpoint: a timed arithmetic and number-properties set graded on accuracy and on whether the timing held

Month 2: The Algebra Foundation (Weeks 5-8)

Expressions and Linear Equations

Topics:

- Algebraic expressions: simplifying, expanding and factoring cleanly
- Solving linear equations and rearranging formulas under time
- Translating words into equations, the single most valuable exam skill
- Substitution and picking smart numbers to test answer choices

- Working backwards from the answer options when it is faster
- Common algebra traps and the misreads that trigger them

Projects built:
- Translation drill: fifteen word phrases each converted to an equation, the step where most marks are won or lost

Practice: 24 algebra questions solved twice each: once by direct algebra, once by testing the options, to learn which is faster when

Systems, Inequalities and Absolute Value

Topics:
- Systems of equations by substitution and elimination
- Inequalities and the sign-flip rule that quietly loses marks
- Compound inequalities and interval reasoning
- Absolute value equations and inequalities
- When a system has one solution, none, or infinitely many, and why the exam asks
- Recognising a system hiding inside a word problem

Projects built:
- Two-variable challenge: a set of word problems that each resolve to a two-equation system, set up before solving

Practice: 20 systems and inequalities questions with the setup shown in full before any solving

Quadratics and Functions

Topics:
- Factoring quadratics and the common exam-friendly forms
- The quadratic formula and completing the square, used sparingly and correctly
- Functions and function notation without the fear
- Reading a function defined by a rule or a table
- Sequences: arithmetic and geometric, as the exams present them
- Spotting the quadratic buried in a word problem

Projects built:
- Quadratic recognition: ten problems where the challenge is realising a quadratic is involved at all

Practice: 22 quadratics and functions questions, each opened by naming the structure before touching the algebra

Algebra Under Exam Pressure

Topics:
- Choosing between algebra, plugging in numbers, and testing options, deliberately
- Algebraic word problems: age, mixture, work and money set up cleanly
- Multi-step problems and keeping track without losing the thread
- Where the two exams differ in how they dress algebra questions
- Building a personal decision rule for which method to reach for
- Timed algebra: getting the right answer inside the clock

Projects built:
- Method-choice audit: a mixed algebra set where you record which method you chose and whether it was the fastest available

Practice: 24 mixed algebra questions under a soft timer, reviewed for method choice as much as for the answer

Assessment: Month 2 checkpoint: a timed algebra section, marked on accuracy, timing and whether the fastest method was chosen

---

PHASE 2: THE FULL CONTENT MAP OF BOTH EXAMS (MONTHS 3-4, WEEKS 9-16)

Word problems, the geometry the GRE still tests, coordinate geometry that the GMAT counts as algebra, and the descriptive statistics and data interpretation both exams rely on.

Month 3: Word Problems and Geometry (Weeks 9-12)

Word Problems That Actually Appear

Topics:
- Distance, rate and time, including two-traveller and round-trip variants
- Work and combined-work problems set up without the classic error
- Mixture, interest and profit-and-loss problems
- Overlapping-sets problems and the two-way table that tames them
- Age and consecutive-integer problems
- A method for translating any dense word problem into a clean setup

Projects built:
- Word-problem playbook: your own labelled template for each of the six recurring problem types

Practice: 24 word problems spanning all six types, each set up in writing before it is solved

Geometry for the GRE: Lines, Angles and Triangles

Topics:
- Why this month matters for the GRE and not for the GMAT Focus quant section
- Lines, angles and the parallel-line rules the exam reuses constantly
- Triangles: properties, the Pythagorean theorem and the special right triangles
- Similar and congruent triangles and the ratios they give you
- Perimeter and area worked cleanly
- The figure-not-to-scale warning and how the GRE uses it against you

Projects built:
- Triangle toolkit: a reference of every triangle fact the GRE reuses, drawn and annotated by you

Practice: 20 GRE-style geometry questions, GMAT-only students substituting an equivalent Data Insights set

Geometry for the GRE: Circles, Polygons and Solids

Topics:

- Circles: radius, diameter, circumference, area, arcs and sectors
- Quadrilaterals and regular polygons and their angle sums
- Three-dimensional solids: volume and surface area of boxes, cylinders and spheres
- Inscribed and combined figures, a favourite GRE construction
- Estimating from a figure when exact computation is slow
- Knowing which formulas to memorise and which to reconstruct

Projects built:

- Formula sheet, earned: build the geometry formula reference yourself, which is how it actually sticks

Practice: 20 circle, polygon and solid questions, each with a labelled diagram drawn before solving

Coordinate Geometry

Topics:

- The coordinate plane, distance and midpoint
- Slope and the equation of a line in its several forms
- Parallel and perpendicular lines by their slopes
- Why the GMAT Focus Edition counts coordinate geometry as algebra and still tests it
- Intersections, and reading a graph the exam gives you
- Reflections and simple transformations on the plane

Projects built:

- Line investigation: a set of coordinate problems solved both algebraically and by sketching, to see which is faster where

Practice: 22 coordinate geometry questions relevant to both exams, since this topic survives on the GMAT as algebra

Assessment: Month 3 checkpoint: a timed section mixing word problems, GRE geometry and coordinate geometry

Month 4: Statistics and Data Interpretation (Weeks 13-16)

Descriptive Statistics

Topics:

- Mean, median, mode and range, and which one a question is really testing
- Weighted averages, a heavily tested and heavily missed idea
- Standard deviation conceptually: the exams test understanding, not hand calculation
- Quartiles, percentiles and the reasoning around them
- How adding or changing a value moves the mean and the median
- The statistics traps both exams set, catalogued

Projects built:

- Average-shift study: a set of questions about how statistics change when the data changes, reasoned without brute force

Practice: 22 statistics questions weighted towards weighted averages and standard-deviation reasoning

Counting and Probability

Topics:

- The fundamental counting principle applied cleanly
- Permutations and combinations, and telling which the question wants
- Basic probability and the complement shortcut
- Probability with and without replacement
- Combined events and when to add versus multiply
- The exam-realistic level of difficulty, so you neither under nor over-prepare

Projects built:

- Counting decision tree: your own flowchart for choosing between permutation, combination and direct counting

Practice: 20 counting and probability questions pitched at the exams' actual difficulty, not competition-maths depth

Data Interpretation and Graphs

Topics:

- Reading tables, bar charts, line graphs and pie charts accurately and fast
- Multi-source questions where two graphs must be combined
- GRE data interpretation sets and how they are scored
- The visual and quantitative formats inside GMAT Data Insights
- Percentage and ratio reasoning applied to chart data
- Not being fooled by a chart drawn to mislead

Projects built:

- Graph deconstruction: a real multi-graph data set answered, then examined for how it could have been misread

Practice: 20 data-interpretation questions across chart types, timed as the sets are on the real exams

Consolidation and First Full Quant Section

Topics:

- Pulling the whole content map together into one map you can see
- A personal error log built from every month so far
- Your two or three recurring mistake patterns, named and targeted
- Pacing across a full section rather than a single question
- A pre-test routine for the quant section
- Setting a realistic target score band for your programme

Projects built:
- First full timed quant section, GRE or GMAT to match your goal, followed by a written self-review

Practice: One complete timed quant section plus a question-by-question review of every miss and every lucky guess

Assessment: Month 4 checkpoint: a full timed quant section scored, with an honest read on your current band and gap to target

---

PHASE 3: EXAM CRAFT AND TIMED MASTERY (MONTHS 5-6, WEEKS 17-24)

The question formats unique to each exam, the timing and guessing strategy that protects a score, and repeated full timed practice reviewed until the mistake patterns are gone.

Month 5: Exam-Specific Formats and Strategy (Weeks 17-20)

GRE Quantitative Comparison

Topics:
- The four answer choices of quantitative comparison and what each really means
- Why quantitative comparison rewards reasoning over full computation
- Testing cases: zero, one, negatives, fractions and the numbers that break patterns
- The must-not-compute mindset for a whole question type
- The specific traps built into quantitative comparison
- GMAT-only students spend this session on an equivalent problem-solving intensive

Projects built:
- Case-testing drill: quantitative comparison questions solved purely by choosing the numbers that expose the answer

Practice: 24 quantitative comparison questions, no full calculation permitted where case-testing will do

Data Sufficiency and the GMAT Data Insights Section

Topics:
- Data sufficiency: the format that asks whether you can answer, not what the answer is
- The fixed five answer choices and a reliable order to eliminate them
- Why data sufficiency now lives in GMAT Data Insights, not the quant section
- The other Data Insights formats: table analysis, graphics interpretation, multi-source reasoning, two-part analysis
- The calculator that Data Insights allows and quant does not
- GRE-only students use this session to deepen data interpretation instead

Projects built:
- Data sufficiency ladder: a graded set that builds the elimination habit from simple to genuinely tricky

Practice: 24 data sufficiency and Data Insights questions worked with the elimination framework applied every time

Timing, Pacing and Educated Guessing

Topics:
- The real time budget: roughly one minute forty-five per GRE quant question, just over two minutes on GMAT quant
- The thirty-second rule for deciding to move on
- Educated guessing that beats random, and when to deploy it
- Section-level pacing rather than fighting for every single question
- Managing the adaptive nature of the GMAT and the section-adaptive GRE
- Recovering calmly from a question that goes wrong mid-section

Projects built:
- Pacing plan: your written per-section time strategy, including your personal move-on triggers

Practice: Timed blocks focused purely on pacing decisions, tracking how many move-on calls were correct

Error Patterns and Targeted Repair

Topics:
- Mining your accumulated error log for the two or three patterns that cost the most
- Careless-error reduction as a trainable, measurable skill
- Rebuilding any content weakness the practice sections have exposed
- Distinguishing knowledge gaps from timing errors from misreads, because the fixes differ
- Re-attempting past misses cold to confirm the repair held
- Adjusting the target band with real evidence now in hand

Projects built:
- Repair sprint: your top mistake pattern attacked with a focused set until the error rate on it visibly drops

Practice: Targeted sets built from your own error log, retested a week later to prove the fix stuck

Assessment: Month 5 checkpoint: a full timed section compared against month 4 to measure real movement

Month 6: Full Timed Practice and Test-Ready Review (Weeks 21-24)

Full Section One and Deep Review

Topics:
- A complete timed quant section under genuine exam conditions
- Question-by-question review focused on why the wrong answer was tempting
- Separating unlucky guesses from real knowledge, since only one needs fixing
- Updating the error log with the newest patterns
- Retiming the questions that were slow but correct

- Setting the single focus for the coming week
Projects built:
- Full section one, reviewed in a written report: score, error breakdown and the one thing to fix next
Practice: The full section plus a complete written review; slow-but-correct questions retimed to build margin

Full Section Two and Format Sharpening
Topics:
- A second full timed section, rotating to the other exam if you are sitting both
- Sharpening the exam-specific formats: quantitative comparison or data sufficiency, whichever is yours
- Comparing this section against the last for direction of travel
- Fatigue management across a real testing block
- Fine-tuning the pacing plan with fresh data
- Locking in the guessing strategy so it is automatic on the day
Projects built:
- Full section two, with a side-by-side comparison against section one and a revised pacing plan
Practice: The second full section plus focused drilling on whichever format still leaks marks

Full Section Three and Final Content Gaps
Topics:
- A third full timed section to make exam pace feel ordinary
- Closing the last content gaps the three sections have exposed
- A calm, repeatable pre-section routine rehearsed until it is automatic
- Test-day logistics: what to expect at the centre or on the online exam
- Building the mental stamina for a full test, not just a section
- Confirming a realistic, evidence-based target for test day
Projects built:
- Full section three, with the final short list of content gaps and a plan to close each one
Practice: The third full section plus targeted repair of any content weakness still standing

Test-Ready: Final Review and Plan
Topics:
- A final mixed timed set drawing on everything the course covered
- The last pass over the error log, now much shorter than it started
- Your personal test-day playbook: pacing, guessing rules and pre-section routine on one page
- Managing exam nerves with preparation rather than hope
- A realistic score expectation grounded in your practice results
- Where to go next if you want to lift a strong score to an excellent one
Projects built:
- Test-day playbook: a single sheet with your pacing plan, guessing rules, routine and target, ready for the exam
Practice: A final timed set and a full walk-through of the test-day playbook
Assessment: Final review: a complete timed section, a progress summary from diagnostic to now, and certificate review

PROJECTS THE STUDENT BUILDS AND KEEPS

- A personal weakness map built from the opening diagnostic
- A shortcut and number-sense reference sheet you build yourself
- A word-problem playbook covering all six recurring types
- A geometry formula sheet earned by reconstruction, not handout
- A running error log that drives the whole second half of the course
- A written per-section pacing and guessing plan
- Three fully reviewed timed quant sections in the final month
- A one-page test-day playbook ready to take into the exam

Total projects: A complete personal prep kit: weakness map, reference sheets, error log, pacing plan and a test-day playbook, plus multiple fully reviewed timed sections

SKILLS THE STUDENT WILL HAVE AT THE END

- A rebuilt arithmetic and algebra foundation worked at exam speed
- The full content map of both exams: word problems, GRE geometry, coordinate geometry, statistics and data interpretation
- Quantitative comparison for the GRE and data sufficiency and Data Insights for the GMAT
- Timing, pacing and educated-guessing strategy that holds under pressure
- Trap-recognition as a trained reflex on both exams
- A disciplined review habit that turns practice sections into real improvement

HOW A TYPICAL WEEK IS SPLIT

Live classes: 2 live one-hour classes per week, solving and reviewing questions live rather than watching worked solutions go by
Practice: 4-5 hours weekly of timed problem sets and full sections between classes
Review: Homework and practice sections reviewed with written feedback, with equal attention to timing, method choice and accuracy
Homework: A task or problem set after every class, and a monthly mixed-review assignment that

deliberately folds in earlier topics

SUPPORT INCLUDED

Doubt support: WhatsApp doubt support between classes, with worked solutions for the questions that stall you
Progress updates: Monthly progress notes tracking practice-section scores and movement toward your target band
Career guidance: Honest guidance on realistic target scores for your programme and on what the quant score does and does not decide in an application

CERTIFICATION DETAIL

Completion: Certificate from Modern Age Coders, awarded on passing the final assessment. Fall short and there is focused revision and a free retest: the certificate certifies real learning, not attendance

WHERE THIS CAN LEAD

- A completed graduate-admissions application with the quantitative section prepared for, whether that is an MBA, an MS, or a PhD track
- The quantitative reasoning base that graduate business and technical programmes assume from day one
- A stronger footing for any role or programme that leans on analytical and quantitative reasoning
- A foundation you can extend into our statistics or data courses if your path runs toward analytics
- The habit of timed, reviewed practice that transfers to any high-stakes exam you sit later

EARNING POTENTIAL (share only if asked, and never promise it)

Market context: The GRE and GMAT are gateways to graduate programmes, and it is those programmes, not this course, that connect to long-term career outcomes years later. The figures below are broad, publicly reported market ranges for the kinds of graduate paths these exams lead toward, shown purely for context. They are not a promise of any score, admission, or income, all of which depend on your application as a whole, the programme, the market and your own work. This course prepares you for the quantitative section and does not guarantee a score, an admission, or a salary.
Context note: A quant score is one input among many in an application. It opens doors; it does not by itself determine the outcome on the other side of them
Mba pathways: Graduate business programmes report a wide range of post-degree outcomes depending heavily on school, industry, geography and prior experience
Ms and analytics pathways: Masters routes in data, analytics, finance and engineering lead into quantitative roles whose pay varies widely by field, location and experience
Honest framing: Treat the exam as a step, not a guarantee. The honest promise this course can make is quantitative readiness and reviewed timed practice, not a number on a payslip

COMMON QUESTIONS ABOUT THIS COURSE

For anything about cost, use PART 4 and RULE 1. Do not quote two regions.

Q: Does this course cover both the GRE and the GMAT, or do I have to choose?
A: Both, and that is deliberate. The two exams share most of their quantitative content: arithmetic, algebra, word problems, statistics and data interpretation are common ground, so we teach that core once, to everyone. The exam-specific pieces are then taught separately and clearly labelled: quantitative comparison and geometry for the GRE, data sufficiency and the Data Insights formats for the GMAT. If you are sitting only one exam, you focus your practice there while the other exam's students do their format-specific session; if you are sitting or still deciding between both, you get the full picture. Tell us your target at the diagnostic and we tune your practice accordingly.

Q: The exams changed recently. Is this course current?
A: Yes, and this matters more than it sounds. We teach the shorter GRE introduced in September 2023, with its two quant sections of twelve and fifteen questions, and the GMAT Focus Edition with its three forty-five-minute sections. A crucial change many older courses miss: on the GMAT, data sufficiency is no longer in the quant section at all. It now lives in the Data Insights section, and the Focus Edition quant section has no plane geometry. We teach the exams as they are today, not as they were before 2023.

Q: My maths is very rusty. Am I too far behind for this?
A: No. Rusty is the assumption the course is built on, which is exactly why the first two full months rebuild arithmetic and algebra from the ground up before any exam strategy appears. Most adults sitting these exams last studied this maths years ago, and the biggest score gains usually come from repairing that foundation rather than from clever tricks. The week 1 diagnostic tells us precisely where you stand so the early weeks target your real gaps. What the course does need from you is the practice hours; the starting level it can work with is genuinely low.

Q: Do you guarantee a particular score?

A: No, and you should be wary of any course that does. Your score depends on your starting point, the hours you put in, and your performance on the day, none of which a course can guarantee. What this course does guarantee is honest: live teaching that rebuilds the maths and drills the exam, small batches, real doubt support, and multiple full timed sections reviewed question by question. We will give you a clear, evidence-based read on a realistic target band from your practice results, and we will be straight with you about the gap and the work it takes to close it.

Q: How much time do I need to put in each week?
A: Two live one-hour classes plus four to five hours of practice a week is the plan the course is paced around. The practice is not optional padding: these exams reward drilled speed and reviewed mistakes, and the improvement happens in that practice time as much as in class. In the final month the practice includes full timed sections, which take longer in a single sitting, so allow for that. The schedule offers evening and weekend slots so working professionals can fit it around a job.

Q: Does the maths on these exams get very advanced?
A: No, and this reassures most people. Neither exam tests advanced mathematics. The GRE goes no higher than a second course in school algebra, with no trigonometry and no calculus, and the GMAT Focus quant section covers arithmetic, algebra and statistics with no plane geometry. The difficulty is not the depth of the maths; it is the speed, the careful reading, and the traps deliberately laid in the questions. That is genuinely good news, because those are trainable skills, which is exactly what the second half of the course trains.

Q: Can I use a calculator on the exam?
A: Partly, and knowing when is itself a skill. The GRE gives you an on-screen calculator for the quant section. On the GMAT Focus Edition, the quant section does not allow a calculator at all; only the Data Insights section does. Because of this, we drill mental and paper methods hard, since leaning on a calculator you may not have is a costly habit. We also teach when reaching for the calculator, where you are allowed one, actually wastes time versus estimating or reasoning to the answer.

Q: How am I assessed, and is the certificate just for showing up?
A: No. A task follows every class with feedback, monthly reviews deliberately mix new material with earlier topics so nothing is forgotten, and the course ends with a full mock paper as the final assessment. Passing earns the certificate; falling short earns focused revision and a free retest. We measure real learning, not attendance.

Q: Will this course help with the rest of the exam too, not just quant?
A: This course is focused specifically on the quantitative section, which is where a structured maths rebuild and timed practice make the biggest, most reliable difference. It does not teach the verbal sections or the GMAT Data Insights verbal-style reasoning beyond the quantitative and data-analysis parts. Many students take this course precisely because quant is their weak half and they can prepare verbal on their own. In the career-guidance sessions we are happy to point you to sensible resources for the other sections so your overall preparation is balanced.

To enrol, message Shivam Sir on +91 9123366161 or send the parent this link: https://learn.modernagecoders.com/courses/gre-gmat-quant-maths-prep-course
For a demo: the Priority Live Demo (guaranteed, today or tomorrow) is booked at https://learn.modernagecoders.com/priority-demo . The free demo is a waiting list with no fixed date.

==========
COURSE 76 OF 137: HACKATHON FOR ADULTS: FREE EVENT + 12-WEEK PRO PREP (18+)
==========

Course link: https://learn.modernagecoders.com/courses/hackathon-prep-for-adults-professionals-coding-ai-innovation-course
Subject area: Hackathons & Professional Innovation Programs
Designed for: Working professionals
Who can join: Beginner-Friendly to Advanced (Adults 18+)
Course length: 12 weeks pro prep + Live Hackathon Weekend
Time needed: 8-10 hours/week
Certificate: Pro Hackathon Builder, Modern Age Coders Certified

PRICE FOR THIS COURSE (quote only the one that applies to the person asking)
In India, per month: group Rs 1,499, mini batch Rs 2,999, one to one Rs 4,999
In Canada, per month: group CAD 140, one to one CAD 210
Anywhere else, per month: group $100, one to one $150
Classes: group and mini batch two live classes a week, eight a month; one to one in India one live class a week, four a month; one to one outside India two live classes a week, eight a month. Each class is one hour.

WHAT THIS COURSE IS

Free hackathon for adults, professionals and founders (18+), plus a 12-week Pro Prep in full-stack engineering, AI agents, system design and pitching.

In one line: Free hackathon for everyone. Pro-grade prep for those who want to build at production scale.

ABOUT THE PROGRAMME

Hackathon for Adults & Professionals is a free-to-enter hackathon and a 12-week pro-grade prep course at Modern Age Coders, designed for working professionals, career switchers, founders, students 18+, and anyone who has ever said 'I wish I could just build that idea myself.' The hackathon participation is 100% free, no fee, no employer endorsement needed. You can be a software engineer, a product manager, a designer, a marketer, a teacher, a doctor, a small-business owner, or a fresh graduate. If you're 18+ and want to build, you're in. Our only motive: build something great. Build something innovative. Use coding logic, efficient algorithms, AI agents and modern infrastructure to ship real production software in 48 hours that solves a problem people would actually pay for. The optional 12-week Pro Prep Course is for adults who want to walk into a hackathon (or a startup) with deep, current technical fluency. It is priced the same as our other professional courses, Group Rs 1,499/mo, Mini Batch Rs 2,999/mo, or 1-on-1 Rs 4,999/mo. The curriculum is dense and modern. We cover full-stack engineering with Next.js 16 + Server Actions + Cache Components, distributed system design, AI agents with tool calling and durable workflows, RAG pipelines with vector databases, prompt engineering with frontier models (Claude-class, GPT-class, Gemini-class), observability, security, and shipping to production on Vercel / AWS / Cloudflare. We also cover the soft skills that actually matter, scoping under time pressure, founder-grade pitching, sponsor relationship management, and demo storytelling. By Week 12, every participant has a polished GitHub portfolio, a deployed capstone with paying-customer-ready quality, a 3-minute investor-style pitch video, and competes in the Live Modern Age Coders Pro Hackathon Weekend with sponsor prizes (cloud credits, API credits, mentor calls, and cash awards).

WHAT MAKES THIS COURSE DIFFERENT

- Free hackathon participation, anyone 18+ can register at zero cost
- Prep course priced same as other Modern Age Coders professional programs
- Built for working adults: evening and weekend live sessions with structured catch-up support
- Curriculum led by senior engineers, ex-CTOs and YC-alumni founders
- Modern 2026 stack: Next.js 16, Server Actions, AI SDK, Workflow DevKit, Vercel Sandbox
- AI Agents focus, tool calling, multi-step workflows, durable execution
- RAG done properly, chunking, embeddings, hybrid search, reranking
- System design depth: queues, caches, sharding, event-driven architectures
- Real production concerns: observability, security, on-call, cost
- 1-on-1 mentor matching with senior engineers / founders in capstone phase
- Founder-grade pitch lab with VC-style critique
- Sponsor prizes from cloud, AI and developer-tool partners
- Internship and full-time role referrals for top performers
- Career-switch friendly: pathway from non-tech career to first tech role

THE LEARNING PATH, STEP BY STEP

Phase 1: Foundations (Weeks 1-4): Python + TypeScript, Git/GitHub, full-stack fundamentals, first solo hackathon
Phase 2: Pro Stack (Weeks 5-8): Next.js 16 + Server Actions + Cache Components, AI agents + tool calling + RAG, system design, observability, mock hackathon
Phase 3: Hackathon Sprint (Weeks 9-12): Capstone build, mentor coaching, pitch lab, Live Pro Hackathon Weekend

WHAT A STUDENT NEEDS BEFORE STARTING

Age: 18+
Experience: Zero coding experience welcome, career switchers and non-technical adults thrive here
Equipment: Laptop with stable internet (16GB RAM recommended for AI dev work)
Software: All free / open-source tiers (VS Code, Cursor free tier, Vercel hobby tier, Supabase free tier)
Mindset: Willingness to ship rough first versions and iterate publicly

WHO THIS COURSE IS FOR

Career switchers: Adults moving from non-tech careers (medicine, law, finance, teaching, marketing) into tech
Working engineers: Software engineers who want to upskill on AI agents, RAG, and modern Next.js
Product managers: PMs who want to ship their own ideas without waiting for engineering
Founders: Aspiring or early-stage founders building MVPs and looking for traction
Fresh graduates: Recent college grads who want to stand out with a real portfolio
Small business owners: Entrepreneurs who want to build internal tools for their business

FULL CURRICULUM, WEEK BY WEEK

This is the complete teaching plan. Parents can ask about any week.

PHASE 1: FOUNDATIONS, ENGINEERING FLUENCY FOR ADULTS (WEEKS 1-4)

Adults arrive from very different starting points, some are seasoned engineers, some are PMs who've never written code, some are career switchers from medicine or finance. Phase 1 is the great equalizer. By Week 4, every participant ships a deployed full-stack app and competes in their first solo mini-hackathon.

Week 1: Hackathon Culture, Python + TypeScript Setup, Engineering Mindset

Topics:

- What hackathons reward in 2026: shippable demos, AI-native UX, clear pitches
- MLH, SIH-grad, NASA Space Apps, AngelHack, internal corporate hacks
- Setting up a pro dev environment: VS Code, Cursor, GitHub CLI, Node 22, Python 3.12
- Python 3.12 essentials: types, dataclasses, async/await, packaging
- TypeScript 5 essentials: types, generics, narrowing, async patterns
- Reading and writing kind, clear code
- Engineering values: ship rough, refactor later; correctness over cleverness
- Git deep-dive: rebase vs merge, cherry-pick, bisect
- GitHub workflow at hackathons: feature branches, draft PRs, conflict resolution
- Hacker etiquette and 'kind code review'

Projects built:

- CLI tool in Python and same tool in TypeScript
- Personal landing page deployed to Vercel
- First open-source PR to a public repo

Practice: Configure your full pro environment with Cursor, GitHub CLI, Node 22 and Python 3.12, then write the same small utility in Python and TypeScript to compare ergonomics.

Week 2: Full-Stack Fundamentals, REST, Databases, Auth

Topics:

- REST API design: resources, verbs, status codes, idempotency
- Postgres fundamentals: schemas, indexes, transactions
- Supabase fast track: DB + auth + storage + realtime in 30 minutes
- Connection pooling, migrations, seed data
- Authentication: Clerk vs Auth0 vs custom NextAuth, tradeoffs
- RBAC and row-level security
- Caching basics: HTTP, CDN, Redis
- Email + magic links + OAuth flows
- API testing with Hoppscotch
- Production-grade error handling

Projects built:

- CRUD app with Supabase + Next.js
- Auth flow with Clerk + RBAC
- Public + private routes split with middleware

Practice: Model a two table Postgres schema in Supabase with auth enabled and expose one authenticated REST endpoint with correct status codes.

Week 3: Modern Frontend, Next.js 16, Server Actions, Tailwind, shadcn/ui

Topics:

- Next.js 16 App Router fundamentals
- Server Components vs Client Components, when to use which
- Server Actions for form submissions and mutations
- Cache Components: PPR, use cache, cacheLife, cacheTag
- Streaming and Suspense
- Route handlers and middleware (proxy)
- Tailwind CSS productivity setup
- shadcn/ui, install, customize, theme
- Dark mode, responsive design, accessibility minimums
- Image and font optimization with Next.js

Projects built:

- Marketing landing page with shadcn/ui
- Dashboard with charts (Recharts) + Cache Components
- Form-heavy app using Server Actions exclusively

Practice: Build a Next.js 16 page that mixes Server and Client Components, handles a form through one Server Action and streams a slow section with Suspense.

Week 4: First Solo Pro Mini Hackathon, Ship Production-Ready in 12 Hours

Topics:

- 12-hour pro hackathon template: 1 hr ideate, 8 hr build, 1 hr deploy, 2 hr polish + pitch
- Picking a problem worth solving, adult-grade scoping
- Building solo with Cursor + Claude + Vercel preview
- Production checklist: env vars, error pages, monitoring, mobile
- Deployment with custom domain and SSL
- Recording a 2-minute demo with Loom
- Writing a judge-ready README + architecture diagram
- First pro pitch, 2 minutes with slides
- Self-grading using rubric
- Phase 1 retrospective

Projects built:

- PHASE 1 CAPSTONE, Solo Pro Mini Hackathon: 12-hour build, deployed to a real domain, 2-minute pro demo, judge-ready README

Assessment: Phase 1 Pro Mini Hackathon Score Card with mentor feedback letter

---
PHASE 2: PRO STACK, AI AGENTS, RAG, SYSTEM DESIGN (WEEKS 5-8)

This is the differentiator, what separates a winning hackathon team from a generic one.
Adults learn how production AI software is actually built today: agents with tool calling,
durable workflows, RAG over private data, and the system design choices that scale.

  Week 5: AI APIs & The Vercel AI SDK, Stream, Cache, Cost-Manage
    Topics:
      - Anthropic Claude-class frontier models, OpenAI GPT-class frontier models, Google Gemini-class
        frontier models, tradeoffs
      - Vercel AI SDK fundamentals: generateText, streamText, tools
      - Streaming responses to UI with React Suspense
      - Prompt caching with Anthropic, 90% cost reduction
      - Function/tool calling, turning LLMs into actuators
      - Multimodal: text + image + file inputs
      - Structured outputs with Zod schemas
      - Cost tracking, rate limiting, fallback chains
      - AI Gateway for provider failover
      - Latency budgets and TTFB strategies
    Projects built:
      - Streaming chat app with prompt caching enabled
      - Multi-provider AI gateway with failover
      - Structured-output extraction from PDFs
    Practice: Wire streamText from the Vercel AI SDK into a chat UI with one tool call, and
    measure token cost before and after enabling prompt caching.

  Week 6: AI Agents, Tool Calling & Durable Workflows
    Topics:
      - What is an AI agent? Tools, memory, loop, termination
      - Building agents with Vercel AI SDK + tool calling
      - Multi-step planning and reflection
      - Durable workflows with Vercel Workflow DevKit
      - Pause/resume, retries, crash-safe orchestration
      - Vercel Sandbox for safe code execution by AI
      - Memory: short-term, long-term, semantic memory
      - Evaluation: how do we know an agent is good?
      - MCP (Model Context Protocol) servers, extending agent capabilities
      - Common failure modes: tool loops, prompt injection, runaway costs
    Projects built:
      - Coding agent that writes, runs and tests code in Sandbox
      - Research agent that browses, synthesizes and cites sources
      - Customer support agent with persistent memory + escalation tool
    Practice: Build a two tool agent, for example web lookup plus calculator, with a visible
    step log and a hard termination condition.

  Week 7: RAG Done Right, Embeddings, Vector DBs, Hybrid Search, Eval
    Topics:
      - When NOT to use RAG (fine-tuning vs RAG vs prompt eng)
      - Embedding models: OpenAI text-embed-3, Cohere, Voyage
      - Vector databases: pgvector, Pinecone, Weaviate, Qdrant
      - Chunking strategies: fixed, semantic, hierarchical
      - Hybrid search: BM25 + dense embeddings + reranking
      - Reranking with Cohere Rerank or Voyage Rerank
      - Evaluation: groundedness, context precision, faithfulness
      - RAG observability: trace every retrieval and answer
      - Cost and latency tradeoffs
      - When RAG fails, and how to debug
    Projects built:
      - RAG over your own documents (PDFs + Notion export)
      - Hybrid-search RAG with reranking
      - Evaluation harness with at least 50 test queries
    Practice: Implement a small RAG pipeline over 20 to 50 documents with pgvector, then
    evaluate five queries and record where retrieval failed and why.

  Week 8: System Design + Mock Pro Hackathon (Teams of 2-4)
    Topics:
      - System design fundamentals: load, latency, consistency, partitioning
      - When to add a queue (and which queue)
      - Caching layers: client, CDN, app, database
      - Database scaling: read replicas, sharding, connection pooling
      - Event-driven architecture, webhooks, message queues
      - Observability stack: logs, metrics, traces (OpenTelemetry)
      - Security: OWASP top 10, CSP, secrets management
      - On-call, error budgets, postmortems
      - Pro Mock Hackathon: teams of 2-4, 24-hour build window
      - Live judging panel with senior engineers + founders
    Projects built:

- PHASE 2 CAPSTONE, Pro Mock Hackathon: 24-hour team build with deployed product, agent or RAG component, full pitch + Q&A

Assessment: Pro Mock Hackathon Judges Panel scoring + written feedback letter

---

PHASE 3: PRO HACKATHON SPRINT, CAPSTONE, PITCH LAB & LIVE HACKATHON WEEKEND (WEEKS 9-12)

The final 4 weeks are a real, founder-grade hackathon journey. Adults lock a capstone, get matched with senior mentors (engineers, founders, VCs as needed), build with production discipline, get founder-grade pitch coaching, and compete in the Live Pro Hackathon Weekend with sponsor prizes.

Week 9: Capstone Lock, Spec, Architecture, Cost Model, GTM Sketch

Topics:

- Idea finalists, picking a capstone with both judge-appeal and founder-potential
- Writing a 2-page Product Spec (problem, users, JTBD, MVP, stretch)
- Architecture diagram with picked tech stack and rationale
- Cost model: AI tokens, infra, third-party APIs
- Risk register and mitigation plan
- Mentor matching with senior engineers / founders
- Setting up CI, monitoring, error tracking from day one
- Drafting a 3-minute investor pitch outline
- GTM sketch: who, where, how (even for a hackathon, judges love this)
- Repo, project board, daily commit cadence rules

Projects built:

- Product Spec (2 pages)
- Architecture Diagram with cost model
- First investor-style pitch outline

Practice: Deliver your two page capstone spec with an architecture diagram, a token and infra cost model, and a risk register with mitigations.

Week 10: Heavy Build Sprint, Production Discipline at Hackathon Speed

Topics:

- Daily commits with great messages
- Pair programming with teammates
- AI-assisted coding with Cursor + Claude + Codex
- Mid-sprint mentor reviews and code walkthroughs
- Test critical paths (smoke + at least one E2E)
- Loading / empty / error states across the app
- Mobile and accessibility, judges open on phones
- Performance: Core Web Vitals, bundle size, edge runtime
- Observability: every error visible in Sentry / Vercel logs
- Daily standup logs to mentor

Projects built:

- Capstone build, 70% complete by end of Week 10
- Daily standup logs (3 lines: shipped / shipping / blocked)
- Mid-sprint demo to mentor + 3 peers

Practice: Ship daily for five days: clean commits, one mid sprint mentor review actioned, and one end to end test guarding your demo path.

Week 11: Founder-Grade Pitch Lab, VC Critique, Slides, Demo Polish

Topics:

- Hackathon judging rubric (Innovation 25 / Execution 25 / Design 25 / Pitch 25)
- VC-style judging: 'why now, why you, why this big'
- The 3-minute pro pitch: Hook Problem Solution Demo Architecture Traction (if any) Team Ask
- Slide design, minimal, image-first, 8 slides max
- Live VC-style critique sessions with senior mentors
- Recording a high-quality demo (multiple takes, edited in Loom or DaVinci)
- Voice and pacing tips from professional pitch coaches
- Q&A handling, 'I don't know' done well
- Final README polish, judges read this first
- Final code freeze, deployment health check, mobile/dark mode/edge cases

Projects built:

- Pitch Slides (8 slides, Pitch.com / Tome / Canva)
- Pitch Video (3 minutes)
- Final README with hero image, demo URL, architecture, tech stack, team, GTM sketch

Practice: Rehearse the three minute pitch on camera twice, tighten the deck to eight image first slides and prepare answers to the three hardest judge questions.

Week 12: LIVE PRO HACKATHON WEEKEND, Compete with Founders & Senior Engineers

Topics:

- Friday: opening keynote, sponsor announcements, theme reveal, team check-in
- Saturday: 18-hour final sprint with senior mentor support
- Saturday evening: pitch dress rehearsal with VC-style critique
- Sunday morning: 4-hour final polish + production deploy
- Sunday afternoon: live judging, every team pitches in front of senior judges
- Sponsor categories: Best AI Agent, Best RAG, Best Founder Potential, Best Architecture, Best Pitch, Most Innovative, Audience Favorite
- Live judge Q&A with founders and CTOs

```
        - Awards ceremony with cash prizes, cloud credits, mentor calls and founder intros
        - Hall of Fame inclusion + sponsor follow-up calls
        - Graduation: Pro Hackathon Builder Certification awarded
      Projects built:
        - GRAND CAPSTONE, Live Pro Hackathon Submission: production-deployed product + GitHub repo +
          3-minute investor pitch + 8-slide deck + judge-ready README + live presentation + Q&A
      Assessment: Final Pro Hackathon Score + Founder Feedback Letter

PROJECTS THE STUDENT BUILDS AND KEEPS

  - Phase 1 (Weeks 1-4): 6+ full-stack projects + Solo Pro Mini Hackathon (deployed)
  - Phase 2 (Weeks 5-8): 6+ AI/agent/RAG/system-design projects + Pro Mock Hackathon
  - Phase 3 (Weeks 9-12): Capstone build + investor pitch deck + 3-min demo + LIVE Pro Hackathon
    submission

  Total projects: 12+ deployed projects + Live Pro Hackathon Capstone

SKILLS THE STUDENT WILL HAVE AT THE END

  - Python 3.12 and TypeScript 5
  - Next.js 16 (App Router + Server Actions + Cache Components)
  - Tailwind + shadcn/ui
  - Supabase + Postgres + Redis + pgvector
  - REST + tRPC + edge functions
  - Vercel AI SDK + tool calling + agents
  - Workflow DevKit + Sandbox + durable execution
  - RAG: chunking, embeddings, hybrid search, reranking, eval
  - Multi-vector-DB familiarity (pgvector, Pinecone, Weaviate, Qdrant)
  - System design: queues, caches, sharding, event-driven
  - Observability: Sentry, OpenTelemetry, Vercel logs
  - Security: OWASP top 10, CSP, secrets
  - Performance: Core Web Vitals, edge, ISR, streaming
  - GitHub workflow with PRs and CI
  - Founder-grade pitch decks and 3-minute demos

HOW A TYPICAL WEEK IS SPLIT

  Live classes: 2 sessions (2 hours each, evening or weekend)
  Independent projects: 4 hours
  Weekly pro hack: 1 themed hackathon-style challenge (1-2 hours)
  Total per week: 8-10 hours

SUPPORT INCLUDED

  Live instruction: Senior engineers, ex-CTOs, YC-alumni founders
  Mentor matching: 1-on-1 senior mentor in capstone phase
  Pitch lab: Founder-grade VC-style pitch coaching
  Career support: 1-on-1 LinkedIn + portfolio review for career switchers
  Founder support: Mentor founders matched for capstone if you're building a startup
  Career guidance: Resume and interview preparation, plus portfolio and profile review.

CERTIFICATION DETAIL

  Final certificate: Pro Hackathon Builder, Modern Age Coders Certified
  Capstone required: Live hackathon submission (production-deployed product + investor pitch +
    demo)
  Portfolio: 12+ deployed projects + grand capstone

WHERE THIS CAN LEAD

  - AI Engineer at startups (Rs 15-60 LPA in India, $80k, $200k globally)
  - Full-Stack Engineer at YC / mid-stage startups
  - Product Engineer / Product Manager
  - Indie Hacker / Solo Founder
  - Open-Source Maintainer
  - Career Switcher into tech (first tech role)
  - Founder of a venture-backed startup
  - Hackathon-Champion track (sponsor pipelines, accelerator interviews)

EARNING POTENTIAL (share only if asked, and never promise it)

  Market context: The ranges below are general market salary bands for these roles in India and
    abroad, drawn from public industry data. They are shown for career context only and are not a
    promise or guarantee of income. Actual pay depends on your skills, experience, location, and
    the job market.
  Other roles: Rs 6-18 LPA in first tech role; Rs 20-60 LPA for senior AI / full-stack roles;
    Pre-seed funding range typically $50k, $500k from accelerators or angels; $80k, $200k for AI
    / full-stack engineers from India working remote
```

COMMON QUESTIONS ABOUT THIS COURSE

For anything about cost, use PART 4 and RULE 1. Do not quote two regions.

Q: Is the hackathon really free for adults?
A: Yes, 100% free for anyone aged 18+. No fee. No employer or college endorsement needed. Free certificate. Eligible for all sponsor prizes.

Q: Why is the prep course paid?
A: The prep course is optional. It's for adults who want serious, structured 12-week training in modern engineering, AI agents, RAG, system design and pitching. The hackathon participation stays free regardless.

Q: I'm a non-technical adult, can I still do this?
A: Yes, and you're our favorite kind of student. Many of our top hackathon winners have come from non-technical backgrounds (medicine, law, finance, teaching). Phase 1 starts from absolute zero. AI tools (Cursor, Replit Agent, Bolt.new) close the gap dramatically. Within 4 weeks, you'll be deploying full-stack apps.

Q: I'm a senior engineer, will this be too basic?
A: No. The Phase 2 content (AI agents, RAG done right, durable workflows, system design at hackathon scale, observability) is genuinely current and challenges senior engineers. We also let experienced engineers fast-track Phase 1 in 2 weeks if they pass a placement test.

Q: What's the time commitment?
A: Plan for 8-10 hours weekly: 2 live sessions (2 hours each, evenings or weekends), 4 hours of independent project work, and 1-2 hours for the weekly pro hackathon-style challenge. Small batches make missed classes easy to recover: the mentor recaps in the next session, notes and the week's challenge are shared over WhatsApp, and longer absences get a short free catch-up slot. for working professionals who can't always attend live.

Q: What stack will I learn?
A: The 2026 modern stack: Python 3.12 + TypeScript 5, Next.js 16 (App Router + Cache Components), Tailwind + shadcn/ui, Supabase / Postgres / Redis / pgvector, Vercel AI SDK + Workflow DevKit + Sandbox, Anthropic Claude-class frontier models / OpenAI GPT-class frontier models / Gemini-class frontier models, plus AWS / Cloudflare for production deployment. Cursor and AI agents are first-class throughout.

Q: Will this help me switch careers into tech?
A: Yes, directly. Career switchers are a big part of our cohort. You graduate with a deployed capstone, a public GitHub portfolio, a recorded pitch, a Pro Hackathon Builder certification, and a 1-on-1 LinkedIn and portfolio review. We help you present your work well for applications and interviews, though outcomes depend on your effort and the market.

Q: Can founders use this to validate their startup idea?
A: Absolutely. Many founders use the capstone phase to build their MVP. We pair you with mentor founders if you choose. Several alumni have raised pre-seed funding off their hackathon capstone.

Q: Are there sponsor prizes?
A: Yes. Sponsor lineup announced 2 weeks before each quarterly hackathon.

Q: Do you cover system design and DSA?
A: System design, yes, deeply, at hackathon depth (queues, caches, sharding, event-driven). DSA, to the level you need to write efficient hackathon code. For deep DSA prep (interview-grade), we recommend our Vibe Coding for College / DSA Masterclass program.

To enrol, message Shivam Sir on +91 9123366161 or send the parent this link: https://learn.modernagecoders.com/courses/hackathon-prep-for-adults-professionals-coding-ai-innovation-course
For a demo: the Priority Live Demo (guaranteed, today or tomorrow) is booked at https://learn.modernagecoders.com/priority-demo . The free demo is a waiting list with no fixed date.

==========

COURSE 77 OF 137: HACKATHON FOR KIDS: FREE EVENT + 12-WEEK PREP (AGES 8-12)

==========

Course link: https://learn.modernagecoders.com/courses/hackathon-prep-for-kids-coding-innovation-ai-projects-course
Subject area: Hackathons & Innovation Programs
Designed for: Kids
Who can join: Complete Beginner (Ages 8-12)
Course length: 12 weeks prep + Live Hackathon Weekend
Time needed: 4-6 hours/week
Certificate: Junior Hackathon Builder, Modern Age Coders Certified

PRICE FOR THIS COURSE (quote only the one that applies to the person asking)
In India, per month: group Rs 1,499, mini batch Rs 2,999, one to one Rs 4,999
In Canada, per month: group CAD 140, one to one CAD 210
Anywhere else, per month: group $100, one to one $150

Classes: group and mini batch two live classes a week, eight a month; one to one in India one live class a week, four a month; one to one outside India two live classes a week, eight a month. Each class is one hour.

WHAT THIS COURSE IS

Free hackathon for kids ages 8-12, plus a 12-week prep course in coding, AI, problem-solving and innovation. Build a project, pitch it and win judge prizes.

In one line: Anyone can join. Free to participate. Built to spark India's youngest innovators.

ABOUT THE PROGRAMME

Hackathon for Kids is a free-to-enter hackathon and a 12-week structured prep course at Modern Age Coders, designed for children aged 8 to 12 who want to learn how real innovators build technology. The hackathon participation is 100% free, anyone, from any school or city, can register and compete. The optional 12-week prep course (priced the same as our other coding courses) is for kids who want serious training before they compete. Our only motive is simple: build something great. Build something innovative. Use coding logic, efficient algorithms and AI tools to turn raw ideas into real, working projects in just one weekend. Kids learn how a real hackathon works, how teams form, how ideas get scoped, how problems are decomposed, how AI is used to accelerate building, how you debug under pressure, and how you pitch your project to judges. They use Scratch, Replit, Bolt.new, Google Gemini, Microbit and Canva to build games, AI apps, websites and inventions that solve real problems for kids their age. This is not a normal class. This is a creator's training camp. By the end, every child has a portfolio of 4+ hackathon-ready projects, a 90-second pitch video, a working capstone submission, and the confidence to walk into any school, district or international hackathon and stand on stage.

WHAT MAKES THIS COURSE DIFFERENT

- 100% free hackathon participation, anyone can join, no fees, no gatekeeping
- Hackathon prep priced same as other Modern Age Coders courses, group, mini-batch and 1-on-1 monthly plans
- Designed by mentors who have judged and won 50+ hackathons
- Kids learn the full hackathon arc: ideate plan build debug pitch demo
- AI-assisted building with Replit Agent, Bolt.new and Google Gemini
- Algorithm thinking made playful, sorting, searching, pathfinding through games
- Live mock hackathons every 4 weeks with judge feedback
- Team formation workshops, kids learn collaboration and roles (Builder, Designer, Pitcher)
- Pitch coaching, every child practices a real 90-second demo to camera
- Final hackathon weekend with prizes, judge panel, and Hall of Fame inclusion
- Weekly written progress notes to parents

THE LEARNING PATH, STEP BY STEP

Phase 1: Hackathon Foundations (Weeks 1-4): How hackathons work, coding basics in Scratch, problem-solving, idea generation
Phase 2: Build Skills (Weeks 5-8): AI tools, Replit & Bolt.new, basic algorithms, team-building, design with Canva
Phase 3: Hackathon Sprint (Weeks 9-12): Mock hackathons, capstone build, pitch coaching, demo day, live hackathon weekend

WHAT A STUDENT NEEDS BEFORE STARTING

Age: 8-12 years old
Experience: Absolutely none, beginners welcome
Equipment: A computer or laptop with internet connection
Software: All tools are free and browser-based, nothing to install
Parental support: Encouraged to attend final demo day

WHO THIS COURSE IS FOR

Curious kids: Children aged 8-12 who love building things
Competitive kids: Kids who enjoy challenges, time-limits and judges
Shy kids: Quiet kids who want a safe place to find their voice (pitch coaching changes lives)
Ai curious kids: Kids who want to learn AI tools the right way
School innovation clubs: School coding club members preparing for inter-school hackathons

FULL CURRICULUM, WEEK BY WEEK

This is the complete teaching plan. Parents can ask about any week.

PHASE 1: HACKATHON FOUNDATIONS, HOW HACKATHONS WORK (WEEKS 1-4)

Kids learn what a hackathon is, why it exists, how teams build software in 48 hours, and how to start thinking like an inventor. They build their first 'mini hack' projects in Scratch and learn the language of hackathons: idea, MVP, sprint, demo and pitch.

Week 1: What is a Hackathon?, Welcome to the Builder Mindset
Topics:
- What is a hackathon? Origin story from Silicon Valley to Indian schools
- Famous kids who built real apps in hackathons (case studies)
- The 4 stages of every hackathon: Idea Build Demo Judge
- What is an MVP (Minimum Viable Product)?, explained for kids
- Why anyone can join: free hackathon access at Modern Age Coders
- Setting up your hacker profile: name, team, project board
- Tour of Scratch 3.0, your first build platform
- First mini-hack: build a 'Welcome' interactive card in 60 minutes
- Hackathon vocabulary kids need: bug, ship, push, demo, judge, pitch
- Online safety, kindness in teams, and being a good teammate

Projects built:
- 60-Minute Mini Hack: Animated Welcome Card
- Hacker ID Card (designed in Canva)
- Idea Wall, write 10 things in the world you'd like to fix

Practice: Watch one short hackathon demo video with a parent and write down the problem, the solution and your favorite part of the pitch.

Week 2: Idea Generation, Where Hackathon Ideas Come From
Topics:
- How to spot problems worth solving (kids edition)
- The 'I wish this existed' game, how every great app started
- Idea generation techniques: brainstorming, mind maps, sticky notes
- Good ideas vs. great ideas, judging your own thoughts
- User empathy for kids, designing for a friend, sibling, or grandparent
- Competitor research made fun, what already exists?
- Picking your problem statement and writing it in one sentence
- Sketching your first wireframe by hand and on paper
- Storyboarding your idea, 6 panels, like a comic strip
- Sharing ideas in a group without fear, feedback rules

Projects built:
- My Idea Comic, 6-panel storyboard of your hackathon dream project
- Problem Statement Card (one sentence)
- Empathy Interview, interview a family member about their daily problems

Practice: Keep an 'I wish this existed' notebook all week and bring your three best problem ideas to class.

Week 3: Coding Logic, Loops, Conditions & Variables in Scratch
Topics:
- Loops: how computers repeat tasks, the foundation of efficient code
- If-Then-Else: making computers make decisions
- Variables: storing scores, names, and data
- Why every hackathon project needs these 3 building blocks
- Sequence, selection, repetition, the holy trinity of coding logic
- Building a number guessing game, your first 'algorithm'
- Debugging: finding bugs without crying, printing values to investigate
- Comments and notes, making your code readable to teammates
- Hackathon-style challenges: 30-minute build sprints
- Code reviews with classmates, being kind and helpful

Projects built:
- Number Guessing Game with hints
- Score-Tracking Quiz Game (5 questions)
- Loop Art, generate a star pattern using only loops

Practice: Build a mini Scratch scene that uses one loop, one if then else and one variable, and label each with a comment.

Week 4: First Mini Hackathon (Solo), Build & Pitch in 4 Hours
Topics:
- Hackathon pacing: how to use 4 hours wisely
- The 4-hour template: 30 min ideate, 2.5 hr build, 30 min polish, 30 min pitch
- Choosing scope: what NOT to build is more important than what to build
- Building your project from a problem statement
- Time-boxing: setting timers and sticking to them
- What to do when stuck (the '15-minute rule')
- Recording a 60-second demo video with Loom or screen capture
- Writing your project's README, title, problem, solution, how to use
- Pitching to mentors: how to talk about your build with confidence
- Phase 1 review and Phase 1 capstone presentation

Projects built:
- PHASE 1 CAPSTONE, Solo Mini Hackathon: 4-hour build + 60-second demo + 1-page README. Choose any problem from your Idea Wall.

Assessment: Phase 1 Mini Hackathon Assessment, judged on innovation, execution, clarity

---

PHASE 2: BUILD SKILLS, AI, ALGORITHMS & TEAM HACKING (WEEKS 5-8)

Kids level up to AI tools, learn the basics of algorithms (the secret sauce of efficient

hackathon projects), discover Replit and Bolt.new, and start working in teams of 2-3. By Week 8, they will have built their first AI-powered hackathon project with a partner.

Week 5: Vibe Coding with AI, Build Apps by Talking to Computers
Topics:
- What is AI and how do hackers use it to ship faster?
- Meet Replit Agent, describe an app, watch it appear
- Meet Bolt.new, full apps from a single sentence
- Prompt writing for hackathons: be specific, be visual, be small
- Iterating with AI: 'change the color', 'add a button', 'fix this bug'
- AI vs. human coding: when to use which
- Reading AI-generated code without panicking
- Asking Google Gemini to explain code line-by-line
- Limits of AI, what it gets wrong, why you still need to think
- Ethical AI use in hackathons, credit, originality, transparency

Projects built:
- AI-Built Calculator with custom theme (Replit Agent)
- AI-Built Quiz App on a topic you love (Bolt.new)
- AI-Explained Code Journal, print 3 AI snippets and write what each line does

Practice: Ask Replit Agent or Bolt.new for a one screen app about your hobby, then request two changes: a new color and an extra button.

Week 6: Algorithms for Kids, Sorting, Searching & Pathfinding
Topics:
- What is an algorithm? Simple recipe metaphor
- Why algorithms matter in hackathons (slow apps lose, fast apps win)
- Sorting: bubble sort visualized as kids in a line
- Searching: linear vs. binary, finding the right book on the shelf
- Pathfinding basics, the maze game
- Big O for kids: 'fast', 'slow', 'really slow' (no math symbols yet)
- Choosing the right algorithm for your hackathon idea
- Using AI to suggest algorithms when stuck
- Visualizing algorithms in Scratch with sprites
- Mini-challenge: implement 2 sorts and race them

Projects built:
- Sorting Race, animate bubble sort vs. insertion sort with sprites
- Maze Solver, a sprite that finds the exit using a simple algorithm
- Word Search Game, implement linear search visually

Practice: Explain bubble sort to a family member using playing cards lined up in a row, then repeat it and try to sort faster.

Week 7: Team Hacking, Roles, GitHub Basics & Collaboration
Topics:
- Why hackathons love teams of 2-3
- The 3 hackathon roles: Builder (writes code), Designer (makes it pretty), Pitcher (tells the story)
- Picking a teammate, strengths and personalities
- Communication tools: Google Docs, Figma Jam, voice notes
- Sharing code through Replit Multiplayer (kid-safe)
- Introduction to GitHub, what is a repository?
- Forking, committing and pushing, explained with playground analogies
- Resolving 'who builds what' fights without drama
- Daily 5-minute stand-ups: what I did, what I'm doing, what I need help with
- Sharing credit, every teammate's name on the project

Projects built:
- Team Charter, 1 page on roles, rules, and project goals
- Pair-Built Story App, two kids, one app, built collaboratively in Replit
- Mini GitHub Profile, your first repo with your project README

Practice: Run a 30 minute mini build in Replit Multiplayer with a friend or sibling where one builds and one designs, then swap roles.

Week 8: Mock Hackathon (Teams), 8-Hour Sprint Across Two Days
Topics:
- Forming hackathon teams (2-3 kids, mentor-paired)
- Selecting a problem statement from a curated list
- Day 1: 4-hour build sprint with Replit + Bolt.new + Scratch
- Day 2: 2-hour polish + 1-hour pitch prep + 1-hour live demos
- Time-boxing: how mentors keep teams from over-engineering
- Mid-sprint check-ins with mentors
- Designing a 1-slide pitch deck in Canva
- Recording a 90-second demo video together
- Live presentation to peer judges
- Receiving feedback gracefully, what worked, what to improve

Projects built:
- PHASE 2 CAPSTONE, Team Mock Hackathon: pick a problem, ship an MVP in 8 hours, deliver a 90-second demo with team intro and judge Q&A

Assessment: Mock Hackathon Judges Panel, innovation, technical execution, design, pitch clarity, teamwork

---
PHASE 3: REAL HACKATHON SPRINT, CAPSTONE, PITCH & LIVE HACKATHON WEEKEND (WEEKS 9-12)

The final phase is a real hackathon journey. Kids pick their dream project, get paired with mentors, build their capstone over 4 weeks, get pitch coaching, record final demos, and compete in the official Modern Age Coders Live Hackathon Weekend at the end of Week 12, the same hackathon that's free for the public.

Week 9: Capstone Idea Lock, Mentor Matching & Project Plan
Topics:
- Picking your capstone problem statement (3-5 idea finalists)
- Mentor matching, every team gets a personal hackathon mentor
- Writing the capstone proposal: problem, users, solution, tech stack
- Hackathon judging rubric explained (innovation 25%, execution 25%, design 25%, pitch 25%)
- Designing your project board, Trello-for-kids visual planning
- Stretch goals vs. core MVP
- Risk planning: what could go wrong and how we'll handle it
- First architecture sketch (boxes-and-arrows)
- Setting up your repo, your team channel, your Canva board
- Locking the scope, saying NO to feature creep
Projects built:
- Capstone Proposal Document
- MVP Definition (one paragraph)
- Architecture Sketch (paper or Figma Jam)
Practice: Fill your capstone project board with To Do, Doing and Done columns and at least eight task cards.

Week 10: Build Sprint, Code, AI, Iterate, Repeat
Topics:
- Day-by-day build plan (kids learn to plan their week)
- Working with AI tools at high speed
- Debugging strategies: rubber duck debugging, AI-assisted debugging
- Component thinking, break big projects into small reusable parts
- Asset creation in Canva, backgrounds, sprites, icons
- Sound and music for projects (free libraries)
- Mid-week mentor reviews: what's done, what's blocked
- Pair programming with your teammate
- Quality bar: what 'good enough' looks like for a kids hackathon
- Daily commits, writing kind, clear messages
Projects built:
- Capstone build, 70% complete by end of Week 10
- Daily standup logs (5 lines per day)
- Mid-sprint demo to mentor
Practice: Finish two build tasks from your project board and note one bug you found plus how you or the AI fixed it.

Week 11: Pitch Coaching & Demo Polish, Tell the Story
Topics:
- What judges actually look for: clarity, impact, energy, originality
- The 90-second pitch formula: Hook Problem Solution Demo Ask
- Practicing in front of a mirror, then a parent, then your team
- Recording your pitch on camera (5+ takes)
- Slide design in Canva, title, problem, solution, tech, team, thank you
- Demo recording with Loom, show, don't tell
- Voice tips for kids: pace, pauses, smiles
- Handling Q&A, what to say when you don't know the answer
- Making your project README judge-ready (problem, demo link, screenshots, team)
- Final polish on your build: bugs, edge cases, mobile view
Projects built:
- Pitch Slides (5 slides, Canva)
- Pitch Video (90 seconds, recorded)
- Final README (judge-ready)
Practice: Record your 90 second pitch on camera at least three times and pick the take where your hook sounds most exciting.

Week 12: LIVE HACKATHON WEEKEND, Compete, Demo & Get Crowned
Topics:
- Friday evening: kickoff ceremony, theme announcement, team check-in
- Saturday all-day: 8-hour final sprint with mentor support
- Saturday evening: pitch dress rehearsal
- Sunday morning: final 2-hour polish + submission upload
- Sunday afternoon: live judging, every team presents
- Categories: Most Innovative, Best Built, Best Designed, Best Pitch, Audience Favorite
- Live judge Q&A, handled with grace and confidence
- Awards ceremony, certificates, badges and Hall of Fame inclusion
- Reflection circle: what I learned about myself
- Graduation: Junior Hackathon Builder Certification awarded
Projects built:
- GRAND CAPSTONE, Live Hackathon Submission: working project + 90-second demo video + 5-slide

pitch deck + judge-ready README + live presentation
Assessment: Final Hackathon Scoring + Judge Feedback Letter

PROJECTS THE STUDENT BUILDS AND KEEPS

- Phase 1 (Weeks 1-4): 6+ Scratch mini-hacks + Solo Mini Hackathon
- Phase 2 (Weeks 5-8): 6+ AI/algorithm projects + Team Mock Hackathon
- Phase 3 (Weeks 9-12): Capstone build + Pitch deck + Demo video + LIVE Hackathon submission

Total projects: 12+ projects + Grand Live Hackathon Capstone

SKILLS THE STUDENT WILL HAVE AT THE END

- Hackathon Mindset & MVP scoping
- Scratch 3.0 programming logic
- Vibe Coding with Replit Agent and Bolt.new
- AI Tools: Google Gemini, Teachable Machine
- Algorithm fundamentals: sorting, searching, pathfinding
- Team collaboration with Builder/Designer/Pitcher roles
- Canva pitch deck design
- Loom demo video recording
- Public speaking and 90-second pitches
- Project documentation: README, problem, solution

HOW A TYPICAL WEEK IS SPLIT

Live classes: 2 sessions (1.5 hours each)
Independent projects: 1-3 hours
Vibe challenge: 1 themed weekly hack
Total per week: 4-6 hours

SUPPORT INCLUDED

Live instruction: Expert hackathon mentors with judging experience
Age appropriate: Designed exclusively for ages 8-12
Safe environment: Moderated, kind, bully-free classroom
Community: Junior Hackathon Builders Hall of Fame
Progress updates: Weekly written progress notes to parents

CERTIFICATION DETAIL

Final certificate: Junior Hackathon Builder, Modern Age Coders Certified
Capstone required: Live hackathon submission with demo and pitch
Portfolio: 12+ projects + grand capstone

WHERE THIS CAN LEAD

- Junior Hackathon Builder
- Future Coding Olympiad Participant
- School Innovation Club Leader
- Ready for Hackathon for Teens program
- Foundation for science fairs, robotics leagues and pitch competitions

COMMON QUESTIONS ABOUT THIS COURSE

For anything about cost, use PART 4 and RULE 1. Do not quote two regions.

Q: Is the hackathon really free for kids?
A: Yes, 100% free. Any child aged 8-12 can register and compete in the Modern Age Coders Live Hackathon at zero cost. No fees, no hidden charges, no payment required to participate, get judged, or receive a certificate.

Q: Then why is there a paid prep course?
A: The prep course is optional. It's for parents and kids who want serious, structured training before the hackathon, coding skills, AI tools, algorithm thinking, team practice and pitch coaching. Many kids do the prep, many compete without it. Both are valid paths.

Q: Does my child need any prior coding experience?
A: Absolutely not. The prep course starts from zero. Kids learn Scratch, basic logic, AI tools, and team-building from scratch. Even kids who have never touched a computer in coding mode are welcomed.

Q: What is the age range?
A: Ages 8-12. The content, pace, projects and pitch coaching are all designed for this age group. We have separate Hackathon programs for Teens (13-17) and Adults (18+).

Q: How much time will the prep course take per week?
A: Plan for 4-6 hours weekly: 2 live classes (1.5 hours each) plus 1-3 hours of independent project work. Small batches make missed classes easy to recover: the mentor recaps in the

next session, notes and the week's challenge are shared over WhatsApp, and longer absences get a short free catch-up slot. so your child never falls behind if they miss one.

Q: What does my child build in the prep course?
A: Over 12 weeks, your child will build at least 4 mini-hackathon projects, 1 team project, and 1 grand capstone, all judge-ready with demo videos, README documentation, and Canva pitch decks. Plus they compete in the live free hackathon at the end.

Q: Do they really learn algorithms at age 8?
A: Yes, visually and playfully. We teach sorting, searching and pathfinding through Scratch animations, mazes and games. No math heavy notation. The goal is to build algorithm intuition, not memorize Big O. This intuition compounds for years.

Q: What do they get at the end?
A: A Junior Hackathon Builder certificate (Modern Age Coders Certified), a public portfolio of 5+ projects, a 90-second pitch video, a Hall of Fame listing if they place top-10, and direct admission preference to our Hackathon for Teens program.

Q: Are there refunds if my child doesn't enjoy it?
A: Yes. If you are not satisfied within the first 2 weeks of the prep course, we offer a full refund, no questions asked. The free hackathon participation is, of course, free.

To enrol, message Shivam Sir on +91 9123366161 or send the parent this link: https://learn.modernagecoders.com/courses/hackathon-prep-for-kids-coding-innovation-ai-projects-course
For a demo: the Priority Live Demo (guaranteed, today or tomorrow) is booked at https://learn.modernagecoders.com/priority-demo . The free demo is a waiting list with no fixed date.

==========

COURSE 78 OF 137: HACKATHON FOR TEENS: FREE EVENT + 12-WEEK PREP (AGES 13-17)

==========

Course link: https://learn.modernagecoders.com/courses/hackathon-prep-for-teens-coding-ai-build-innovate-win-course
Subject area: Hackathons & Innovation Programs
Designed for: Teens
Who can join: Beginner-Friendly to Intermediate (Ages 13-17)
Course length: 12 weeks prep + Live Hackathon Weekend
Time needed: 6-8 hours/week
Certificate: Teen Hackathon Builder, Modern Age Coders Certified

PRICE FOR THIS COURSE (quote only the one that applies to the person asking)
In India, per month: group Rs 1,499, mini batch Rs 2,999, one to one Rs 4,999
In Canada, per month: group CAD 140, one to one CAD 210
Anywhere else, per month: group $100, one to one $150
Classes: group and mini batch two live classes a week, eight a month; one to one in India one live class a week, four a month; one to one outside India two live classes a week, eight a month. Each class is one hour.

WHAT THIS COURSE IS

Free hackathon for teens 13-17, plus a 12-week prep course in Python, JavaScript, AI APIs, algorithms and pitching. Build apps and win judge prizes.

In one line: Free hackathon for everyone. Serious prep for those who want to win.

ABOUT THE PROGRAMME

Hackathon for Teens is a free-to-enter hackathon and a 12-week structured prep course at Modern Age Coders for students aged 13 to 17. The hackathon participation is 100% free for everyone, no fees, no school filtering. The prep course is for teens who want to walk into a hackathon with real coding skills, AI fluency, and a proven pitch playbook. Our only motive is simple: build something great. Build something innovative. Use coding logic, efficient algorithms, AI APIs, and modern dev workflows to ship real software in 48 hours. We don't teach kids to copy templates. We teach them how engineers actually build. Teens go deep, Python and JavaScript fundamentals, REST API design, algorithm complexity (Big O), data structures (arrays, hash maps, trees, graphs), AI APIs (OpenAI, Gemini, Claude), GitHub-based collaboration, system design lite, and end-to-end deployment on Vercel. They build hackathon-ready apps using the same stack used by professional engineers in 2026, React, Next.js, Tailwind, Supabase, Replit Agent, Bolt.new, Cursor and Vercel. By Week 12, every teen has a polished GitHub portfolio of 6+ projects, a public capstone deployed live on the internet, a 2-minute pitch video, and a placement on the Modern Age Coders Hackathon Hall of Fame. They graduate hackathon-ready, for school events, MLH-style competitions, Smart India Hackathon, and global online hackathons.

WHAT MAKES THIS COURSE DIFFERENT

- Free hackathon participation, anyone aged 13-17 can register at zero cost
- Prep priced the same as our other teen courses, monthly or 6 months at once: see Fees and enrolment at the top of this page

- Curriculum designed by hackathon winners and senior engineers
- Real production stack: React, Next.js, Tailwind, Supabase, Vercel
- AI-first dev workflow with Cursor, Replit Agent, Bolt.new
- Algorithms taught for hackathons, practical, not academic
- GitHub-native: every project committed, branched, deployed
- Live deployments, every project gets a real URL judges can click
- 1-on-1 mentor matching for capstone phase
- Pitch deck lab with senior pitch coaches
- Mock hackathons every 4 weeks with judge feedback
- Final hackathon weekend, live judges, prizes, Hall of Fame

THE LEARNING PATH, STEP BY STEP

Phase 1: Foundations (Weeks 1-4): Python + JavaScript essentials, Git/GitHub, problem-solving
Phase 2: Build Stack (Weeks 5-8): React + Tailwind + Supabase, AI APIs, algorithms & data structures, system design lite
Phase 3: Hackathon Sprint (Weeks 9-12): Capstone build, mentor coaching, pitch lab, Live Hackathon Weekend

WHAT A STUDENT NEEDS BEFORE STARTING

Age: 13-17 years old
Experience: Zero coding experience welcome, strong fit for self-starters
Equipment: Laptop or desktop with stable internet (8GB RAM recommended)
Software: All free / open source (VS Code, Cursor free tier, Vercel hobby tier)
Mindset: Willingness to ship rough, ugly first versions

WHO THIS COURSE IS FOR

Ambitious teens: Teens aiming for top colleges and want a real portfolio
Competitive teens: Teens who love coding contests, MLH, SIH, Olympiad
Founder curious: Teens who want to learn how startups actually build
Ai native teens: Teens who want AI fluency at the API level (not just ChatGPT chat)
Career planners: Teens planning a tech career with strong GitHub from day one

FULL CURRICULUM, WEEK BY WEEK

This is the complete teaching plan. Parents can ask about any week.

PHASE 1: FOUNDATIONS, PYTHON, JAVASCRIPT & GIT FOR HACKERS (WEEKS 1-4)

Teens build serious coding fluency. We cover Python (logic + scripting), JavaScript (the universal language of the web), and Git/GitHub workflow that every hackathon team uses. By Week 4, every student can ship a small web app to a real URL.

Week 1: Hackathon Culture, Python Basics & The Hacker Mindset
Topics:
- What is a hackathon really? MLH, SIH, NASA Space Apps, internal startup hacks
- Famous teen hackathon winners (cases studies from India and globally)
- The hackathon arc: idea MVP demo pitch judge
- Python install + setup (with VS Code)
- Variables, types, operators, strings, lists, dicts
- Conditionals (if/elif/else), loops (for/while)
- Functions, return values, default args
- Reading inputs, printing outputs, basic file IO
- Your first Python mini-tool: a CLI to-do list
- Hacker etiquette: be kind, be curious, ship over perfect
Projects built:
- CLI To-Do List in Python
- Number guessing game with hints + difficulty levels
- Data formatter: read a CSV, print summary stats
Practice: Set up Python and VS Code, then write a script that stores five hackathon ideas in a list of dicts and prints them ranked by excitement.

Week 2: JavaScript Essentials & DOM, The Universal Hackathon Language
Topics:
- Why JavaScript runs the modern web (and most hackathons)
- let / const, types, functions, arrow functions
- Arrays, objects, destructuring, spread / rest
- Async/await, promises, fetch, calling APIs
- DOM manipulation, event listeners
- ES Modules and modern JS structure
- TypeScript intro, types make hackathon code safer
- Building a client-side mini app
- Browser DevTools for debugging
- Common JS gotchas (== vs ===, hoisting, this)
Projects built:
- Weather App calling a public weather API

- Markdown live preview editor
- GitHub user profile fetcher

Practice: Build a small webpage that fetches from a public API with async await and updates the DOM when a button is clicked.

Week 3: Git, GitHub & Team Coding, Professional Workflow

Topics:
- Git fundamentals: init, add, commit, log, diff
- Branches, merging, conflicts and how to resolve them
- GitHub: repos, README, issues, pull requests
- Forking and cloning open-source projects
- Pull request reviews and team etiquette
- GitHub Actions intro, automated CI
- GitHub Pages deployment
- Hackathon team workflow: feature branches, PR per feature
- Daily standups: what I did, what I'm doing, blockers
- Hackathon-grade README structure (problem, demo, screenshots, setup, team)

Projects built:
- Personal Portfolio site deployed via GitHub Pages
- Open-source contribution: file 1 PR to a public repo
- Team-built mini app with branches and PRs

Practice: Create a repo with a proper README, make five meaningful commits on a branch, then open and merge your own pull request.

Week 4: First Mini Hackathon (Solo), Ship to a Live URL in 8 Hours

Topics:
- 8-hour hackathon template: 1 hr ideate, 5 hr build, 1 hr polish, 1 hr pitch
- Picking a problem statement that's small, clear, and demo-able
- Building solo with Replit Agent + Cursor for speed
- Deployment to Vercel, live URL judges can click
- Recording a 90-second demo with Loom
- Writing your README so judges understand in 60 seconds
- First pitch attempt, to camera, then to mentors
- Self-grading with the official rubric
- Code reviews from senior mentors
- Phase 1 retrospective and feedback letter

Projects built:
- PHASE 1 CAPSTONE, Solo Mini Hackathon: 8-hour build, deployed to Vercel, 90-second demo, judge-ready README

Assessment: Phase 1 Mini Hackathon Score Card, innovation, execution, design, pitch

---

PHASE 2: BUILD STACK, REACT, AI APIS, ALGORITHMS & SYSTEM DESIGN (WEEKS 5-8)

Teens learn the full modern hackathon stack. By Week 8, they can build a deployable React + Tailwind + Supabase app with an AI feature in under 24 hours.

Week 5: React + Tailwind, The Hackathon UI Stack

Topics:
- React fundamentals: components, props, state, hooks
- useState, useEffect, useRef in real projects
- Tailwind CSS, design without writing CSS files
- Building responsive layouts in minutes
- shadcn/ui components, copy/paste production-grade UI
- Forms, validation, controlled components
- Routing with Next.js App Router
- Server Components vs Client Components
- Iconography, dark mode, accessibility basics
- Building UI from a Figma mock in under 30 min

Projects built:
- Personal landing page with React + Tailwind
- Recipe finder calling an external API
- Interactive dashboard with charts (Recharts)

Practice: Rebuild your week 2 page in React with Tailwind and one shadcn/ui component, keeping it responsive at phone width.

Week 6: Backend with Supabase + REST APIs, Build a Real Product

Topics:
- Supabase setup, database, auth, storage in 5 minutes
- Postgres tables, schema design for hackathons
- Row-Level Security basics (auth that doesn't leak)
- Building REST APIs with Next.js Route Handlers
- CRUD apps end-to-end
- Email + magic link authentication
- File uploads to Supabase Storage
- Webhooks and realtime subscriptions
- Postman / Thunder Client for testing APIs
- Connecting frontend backend smoothly

Projects built:

- Notes app with auth + Supabase database
- Image gallery with uploads + storage
- Realtime chat (single-room) with Supabase Realtime

Practice: Stand up a Supabase project with one table protected by Row Level Security and wire a working CRUD form to it from Next.js.

Week 7: AI APIs, Build AI-Powered Hackathon Projects

Topics:
- OpenAI API: chat completions, function calling
- Google Gemini API: multimodal inputs (text + image)
- Anthropic Claude API: long-context, tool use, prompt caching
- Streaming responses to your UI
- RAG (Retrieval Augmented Generation) basics
- Embeddings + vector search with Supabase pgvector
- Image generation APIs (DALL·E, Imagen, Stable Diffusion)
- Speech-to-text and text-to-speech
- Cost-aware design, token counting and caching
- AI ethics: hallucinations, bias, attribution

Projects built:
- AI study buddy that quizzes you on uploaded notes
- AI image caption generator (Gemini multimodal)
- Voice-to-text journal with summarization

Practice: Ship a one prompt AI feature, like a study tip generator, that calls the OpenAI, Gemini or Claude API and streams the response into your UI.

Week 8: Algorithms, DSA & System Design Lite + Mock Hackathon (Teams)

Topics:
- Big O notation for hackathon thinking
- Arrays, hash maps, sets, stacks, queues
- Trees, graphs, BFS/DFS, pathfinding apps
- Sorting (merge, quick) and searching (binary)
- Top 10 hackathon-style algorithm problems
- System Design Lite: when to use which database
- Caching, rate limiting, queues at hackathon scale
- Picking architecture in 5 minutes
- Team mock hackathon (2 days, 12 hours total)
- Live judging panel with feedback letter

Projects built:
- PHASE 2 CAPSTONE, Team Mock Hackathon: pick a problem, ship an MVP in 12 hours, deploy to Vercel, deliver pitch

Assessment: Mock Hackathon Judges Panel scoring + written feedback

---

PHASE 3: REAL HACKATHON SPRINT, CAPSTONE, PITCH LAB & LIVE HACKATHON (WEEKS 9-12)

The final 4 weeks are a real hackathon journey. Teens lock a capstone idea, get matched with a senior mentor, build, polish, get pitch coached and compete in the Live Modern Age Coders Hackathon Weekend.

Week 9: Capstone Lock, Mentor Matching, Spec & Architecture

Topics:
- Idea finalists, picking the right capstone (3 ideas 1)
- Writing a 1-page spec: problem, users, solution, MVP scope, stretch
- Mentor matching with senior engineers
- Architecture diagram (whiteboard or Excalidraw)
- Tech stack lock: React/Next.js + Tailwind + Supabase + AI API
- Risk register: top 3 risks and mitigations
- Project board on GitHub Projects or Linear
- Daily commit cadence rules
- Stretch goals vs. MVP scope (MVP wins, always)
- Repo setup, CI, and Vercel preview deployments

Projects built:
- Capstone Spec (1 page)
- Architecture Diagram
- Project Board with weekly milestones

Practice: Write your one page capstone spec covering problem, users, MVP scope and stretch goals, and sketch the architecture in Excalidraw.

Week 10: Heavy Build Sprint, Code, Test, Iterate

Topics:
- Daily commits with kind, clear messages
- Pair programming with teammates
- AI-assisted coding via Cursor + Replit Agent
- Mid-sprint mentor reviews
- Testing critical paths (smoke tests minimum)
- Loading states, empty states, error states (judges notice these)
- Mobile responsiveness, judges open on phones
- Performance basics: bundle size, image optimization, caching
- Accessibility minimums (alt text, focus rings, color contrast)

- Daily standup logs to mentor
Projects built:
- Capstone build, 70% complete by end of Week 10
- Daily standup logs
- Mid-sprint mentor demo
Practice: Ship one committed feature each day for five days, with clear commit messages and at least one smoke test on the critical path.

Week 11: Pitch Lab, Storytelling, Slides & Demo Polish
Topics:
- Hackathon judging rubric in detail (Innovation 25 / Execution 25 / Design 25 / Pitch 25)
- The 2-minute pitch formula: Hook Problem Solution Demo Tech Team Ask
- Slide design, 7 slides max, big text, no walls of words
- Practicing on camera with daily review
- Recording a high-quality demo video
- Voice and pacing tips from professional pitch coaches
- Q&A handling, what to say when stumped
- Final README polish, judges read this first
- Final code freeze rules
- Deployment health check: SSL, mobile, dark mode, edge cases
Projects built:
- Pitch Slides (7 slides, Pitch.com or Canva)
- Pitch Video (2 minutes)
- Final README with hero image, demo link, tech stack, team
Practice: Cut your pitch to exactly two minutes, build a seven slide deck and record a demo video you would be proud to submit.

Week 12: LIVE HACKATHON WEEKEND, Compete with the World
Topics:
- Friday: opening ceremony, theme reveal, team check-in
- Saturday: 12-hour final sprint with senior mentor support
- Saturday evening: pitch dress rehearsal
- Sunday morning: 3-hour final polish + submission
- Sunday afternoon: live judging, every team pitches
- Categories: Most Innovative, Best Built, Best AI Use, Best Pitch, Best Design, Audience Favorite
- Live judge Q&A, handled with calm and clarity
- Awards ceremony, certificates, badges, Hall of Fame
- Reflection circle and feedback letters from judges
- Graduation: Teen Hackathon Builder Certification awarded
Projects built:
- GRAND CAPSTONE, Live Hackathon Submission: working product deployed to Vercel + GitHub repo + 2-minute demo + 7-slide pitch + judge-ready README + live presentation
Assessment: Final Hackathon Score + Judge Feedback Letter

PROJECTS THE STUDENT BUILDS AND KEEPS

- Phase 1 (Weeks 1-4): 6+ Python/JS projects + Solo Mini Hackathon (deployed)
- Phase 2 (Weeks 5-8): 6+ React/Supabase/AI projects + Team Mock Hackathon
- Phase 3 (Weeks 9-12): Capstone + Pitch Deck + Demo + LIVE Hackathon submission

Total projects: 12+ deployed projects + Live Hackathon Capstone

SKILLS THE STUDENT WILL HAVE AT THE END

- Python and JavaScript fluency
- React + Next.js + Tailwind + shadcn/ui
- Supabase backend + auth + storage + realtime
- AI APIs: OpenAI, Gemini, Claude, chat, streaming, RAG
- Algorithms & DSA at hackathon depth
- Big O analysis
- GitHub workflow with branches and PRs
- System Design Lite for hackathons
- Vercel deployment and CI
- Pitch decks and demo videos
- README and project documentation
- Public speaking and Q&A handling

HOW A TYPICAL WEEK IS SPLIT

Live classes: 2 sessions (1.5-2 hours each)
Independent projects: 3-4 hours
Weekly hack: 1 themed hackathon-style challenge
Total per week: 6-8 hours

SUPPORT INCLUDED

Live instruction: Senior engineers and ex-startup CTOs
Mentor matching: 1-on-1 capstone mentor in Phase 3

  Pitch lab: Dedicated pitch coaches in Week 11
  Community: Teen Hackathon Builders Hall of Fame + alumni network
  Career guidance: Resume and interview preparation, plus portfolio and profile review.

CERTIFICATION DETAIL

  Final certificate: Teen Hackathon Builder, Modern Age Coders Certified
  Capstone required: Live hackathon submission (deployed app + pitch + demo)
  Portfolio: 12+ deployed projects + grand capstone

WHERE THIS CAN LEAD

  - School & Inter-school Hackathon Champion
  - Smart India Hackathon Finalist
  - MLH Global Hackathon Participant
  - Open-Source Contributor
  - Strong College Application Profile (IIT/IIIT/BITS/Stanford/MIT)
  - Internship-Ready (startups, mid-stage companies)
  - Ready for Vibe Coding for College / DSA Masterclass

COMMON QUESTIONS ABOUT THIS COURSE

  For anything about cost, use PART 4 and RULE 1. Do not quote two regions.

  Q: Is the hackathon really free for teens?
  A: Yes, 100% free. Any teen aged 13-17 can register and compete in the Modern Age Coders Live Hackathon at zero cost. No entry fee. No school endorsement required. Free certificate. Free judging.

  Q: Why is the prep course paid then?
  A: The prep course is optional but highly recommended. It gives teens 12 weeks of structured training in coding, AI, algorithms, system design, and pitching. The hackathon itself stays free regardless.

  Q: Does my teen need prior coding experience?
  A: No. The prep course starts from absolute basics in Python and JavaScript. Teens with some experience will move faster, but beginners catch up by Week 4. We have placement check-ins to ensure no one is left behind.

  Q: What is the time commitment per week?
  A: 6-8 hours weekly: 2 live classes (1.5-2 hours each), 3-4 hours of independent project work, plus 1 hour for the weekly hackathon-style challenge. Small batches make missed classes easy to recover: the mentor recaps in the next session, notes and the week's challenge are shared over WhatsApp, and longer absences get a short free catch-up slot.

  Q: What does my teen build by the end?
  A: A GitHub portfolio of 6+ deployed projects, including a live capstone hosted on Vercel, a 2-minute pitch video, and submission to the live hackathon. Strong enough to impress college admissions and internship recruiters.

  Q: Will this help with college applications?
  A: Significantly. A real GitHub portfolio with deployed projects, hackathon wins, and demo videos is one of the strongest signals for tech-leaning college applications (US, Singapore, India IITs/IIITs/BITS). We also write recommendation letters for top performers.

  Q: What stack do you teach?
  A: The same stack used at YC startups in 2026: Python, JavaScript/TypeScript, React, Next.js (App Router), Tailwind CSS, shadcn/ui, Supabase, Vercel, GitHub, plus AI APIs from OpenAI, Google Gemini, and Anthropic Claude. We also use Cursor, Replit Agent, and Bolt.new as AI-assisted dev tools.

  Q: Can my teen compete in MLH or Smart India Hackathon after this?
  A: Yes, and many do. Our curriculum directly maps to MLH (Major League Hacking), Smart India Hackathon, NASA Space Apps, and most college-level hackathons. The skills are universal.

  Q: Do you cover algorithms and DSA?
  A: Yes, at hackathon depth. Big O, arrays, hash maps, trees, graphs, BFS/DFS, sorting, searching. We don't go to LeetCode Hard depth; that's our Vibe Coding for College program. But we go deep enough to write efficient hackathon code that doesn't crash with real data.

  To enrol, message Shivam Sir on +91 9123366161 or send the parent this link: https://learn.modernagecoders.com/courses/hackathon-prep-for-teens-coding-ai-build-innovate-win-course
  For a demo: the Priority Live Demo (guaranteed, today or tomorrow) is booked at https://learn.modernagecoders.com/priority-demo . The free demo is a waiting list with no fixed date.

==
COURSE 79 OF 137: HIGH SCHOOL MATHEMATICS: ALGEBRA TO CALCULUS (GRADE 9-12)
==

Course link: https://learn.modernagecoders.com/courses/complete-high-school-mathematics-mastery
Subject area: Mathematics Education
Designed for: Girls only batches, High school
Who can join: Complete Beginner to Advanced High School
Course length: 12-14 months (52-60 weeks)
Time needed: 2 live classes/week + 3-5 hours practice
Certificate: Certificate from Modern Age Coders, awarded on passing the final exam

PRICE FOR THIS COURSE (quote only the one that applies to the person asking)
  In India, per month: group Rs 1,499, mini batch Rs 2,999, one to one Rs 4,999
  In Canada, per month: group CAD 140, one to one CAD 210
  Anywhere else, per month: group $100, one to one $150
  Classes: group and mini batch two live classes a week, eight a month; one to one in India one live class a week, four a month; one to one outside India two live classes a week, eight a month. Each class is one hour.

WHAT THIS COURSE IS

  Live online high school maths course for Grade 9-12: algebra, geometry, trigonometry, pre-calculus, calculus and statistics, built for university readiness.

  In one line: From Basic Arithmetic to Advanced Calculus in 12 Months

ABOUT THE PROGRAMME

  This accelerated program condenses 4 years of high school mathematics into an intensive 12-month journey. Whether you're a student seeking to excel, an adult learner filling gaps, or preparing for competitive exams, this comprehensive program covers every essential mathematical concept from grades 9-12. You'll master algebraic thinking, geometric reasoning, trigonometric applications, and calculus fundamentals. Each concept is taught through interactive lessons, real-world applications, and extensive problem-solving practice. By completion, you'll be fully prepared for university-level mathematics and standardized tests.

WHAT MAKES THIS COURSE DIFFERENT

  - Accelerated 4-year curriculum in 12 months
  - Visual and interactive learning approach
  - Real-world applications for every concept
  - Adaptive practice problems with instant feedback
  - Preparation for SAT, ACT, and competitive exams
  - Step-by-step solution explanations
  - Weekly assessments and progress tracking
  - Personalized learning paths based on strengths/weaknesses

THE LEARNING PATH, STEP BY STEP

  Phase 1: Foundation (Months 1-3): Algebra I, Linear Equations, Polynomials, Basic Geometry
  Phase 2: Intermediate (Months 4-6): Algebra II, Quadratics, Functions, Coordinate Geometry
  Phase 3: Advanced (Months 7-9): Trigonometry, Pre-Calculus, Sequences, Complex Numbers
  Phase 4: Mastery (Months 10-12): Calculus, Statistics, Probability, Advanced Problem Solving

WHAT A STUDENT NEEDS BEFORE STARTING

  Education: Basic arithmetic and elementary math
  Coding experience: None required - math focus
  Equipment: Computer/tablet, internet, calculator
  Time commitment: 2 live classes plus 3 to 5 hours of practice a week
  English: Basic comprehension
  Motivation: Desire to master mathematics

WHO THIS COURSE IS FOR

  Students: High school students (grades 9-12)
  Working professionals: Adults needing math skills
  Entrepreneurs: Business owners needing quantitative skills
  Freelancers: Tutors and educators
  Kids: Advanced middle schoolers ready for challenge
  Anyone: Anyone wanting strong mathematical foundation

FULL CURRICULUM, WEEK BY WEEK

  This is the complete teaching plan. Parents can ask about any week.

  PHASE 1: ALGEBRAIC FOUNDATIONS AND BASIC GEOMETRY (WEEKS 1-13)

  Build strong foundations in algebraic thinking, equation solving, and geometric reasoning.
  Master the core concepts that form the basis of all advanced mathematics.

Months 1-2: Algebra I Fundamentals (Weeks 1-8)
  Number Systems & Algebraic Expressions
    Topics:
      - Real number system: natural, whole, integers, rational, irrational
      - Number line and absolute value
      - Properties of real numbers: commutative, associative, distributive
      - Order of operations (PEMDAS/BODMAS)
      - Exponents and exponent laws
      - Scientific notation and significant figures
      - Square roots and cube roots
      - Simplifying radical expressions
      - Variables and algebraic expressions
      - Evaluating expressions for given values
      - Combining like terms
      - Translating word problems to algebraic expressions
    Projects built:
      - Create a number system classification chart
      - Real-world scientific notation problems
      - Algebraic expression calculator design
    Practice: Daily: 50 problems on simplification and evaluation
  Linear Equations & Inequalities
    Topics:
      - Solving one-step equations
      - Solving two-step equations
      - Multi-step equations with distribution
      - Equations with variables on both sides
      - Equations with fractions and decimals
      - Literal equations and formulas
      - Linear inequalities in one variable
      - Compound inequalities (AND/OR)
      - Absolute value equations
      - Absolute value inequalities
      - Graphing inequalities on number line
      - Word problems leading to linear equations
    Projects built:
      - Budget planning with linear equations
      - Distance-rate-time problem solver
      - Inequality graphing tool
    Practice: Solve 100 equations and 50 inequalities with varying complexity
  Polynomials & Operations
    Topics:
      - Polynomial terminology: degree, coefficient, constant
      - Standard form of polynomials
      - Adding and subtracting polynomials
      - Multiplying monomials
      - Multiplying polynomials (FOIL method)
      - Multiplying binomials and trinomials
      - Special products: $(a+b)^2$, $(a-b)^2$, $(a+b)(a-b)$
      - Dividing polynomials by monomials
      - Long division of polynomials
      - Synthetic division introduction
      - Pascal's triangle and binomial expansion
      - Applications of polynomial operations
    Projects built:
      - Polynomial calculator implementation
      - Area and volume problems with polynomials
      - Pascal's triangle pattern explorer
    Practice: Complete 150 polynomial operation problems
  Factoring Techniques
    Topics:
      - Greatest Common Factor (GCF)
      - Factoring by grouping
      - Factoring trinomials (a=1)
      - Factoring trinomials (a≠1)
      - Difference of squares
      - Sum and difference of cubes
      - Perfect square trinomials
      - Complete factoring strategies
      - Solving equations by factoring
      - Zero product property
      - Factor theorem introduction
      - Applications in area and optimization
    Projects built:
      - Factoring flowchart creation
      - Projectile motion problems
      - Optimization problem solver
    Practice: Factor 200 expressions of varying types

Month 3: Systems & Basic Geometry (Weeks 9-13)
Systems of Linear Equations
Topics:
- Graphing linear equations in two variables
- Slope and y-intercept
- Point-slope form and slope-intercept form
- Standard form and intercepts
- Parallel and perpendicular lines
- Systems of linear equations: graphical method
- Substitution method
- Elimination method
- Systems with no solution or infinite solutions
- Three-variable systems introduction
- Matrix representation of systems
- Word problems with systems
Projects built:
- Supply and demand economic model
- Mixture problem solver
- Linear programming introduction
Practice: Solve 100 systems using different methods
Introduction to Geometry
Topics:
- Points, lines, and planes
- Angles: acute, right, obtuse, straight, reflex
- Angle relationships: complementary, supplementary, vertical
- Parallel lines and transversals
- Triangles: classification by sides and angles
- Triangle sum theorem
- Exterior angle theorem
- Congruent triangles: SSS, SAS, ASA, AAS, HL
- Similar triangles and proportions
- Pythagorean theorem and its converse
- Special right triangles (45-45-90, 30-60-90)
- Triangle inequalities
Projects built:
- Triangle solver application
- Architectural design with triangles
- Distance calculator using Pythagorean theorem
Practice: Complete 150 geometry problems
Phase 1 Review & Assessment
Topics:
- Comprehensive review of algebraic concepts
- Review of equation solving techniques
- Polynomial and factoring review
- Systems of equations review
- Geometry fundamentals review
- Problem-solving strategies
- Test-taking techniques
Projects built:
- Create comprehensive formula sheet
- Design practice test for peers
- Real-world application portfolio
Assessment: Phase 1 cumulative exam: a written paper mixing this phase with everything before it, plus targeted revision for anything shaky

---
PHASE 2: ADVANCED ALGEBRA AND FUNCTIONS (WEEKS 14-26)

Master quadratic functions, advanced algebraic concepts, coordinate geometry, and function theory. Build strong analytical and graphing skills.

Months 4-5: Quadratics & Functions (Weeks 14-21)
Quadratic Functions & Equations
Topics:
- Quadratic functions: $f(x) = ax^2 + bx + c$
- Graphing parabolas: vertex, axis of symmetry
- Maximum and minimum values
- Vertex form: $f(x) = a(x-h)^2 + k$
- Converting between standard and vertex form
- Completing the square method
- Quadratic formula derivation and application
- Discriminant and nature of roots
- Complex solutions introduction
- Sum and product of roots
- Quadratic inequalities
- Applications: projectile motion, optimization
Projects built:
- Projectile motion simulator
- Profit maximization calculator

- Parabola art generator
  Practice: Solve 200 quadratic problems
Exponential & Logarithmic Functions
  Topics:
    - Exponential functions: f(x) = a^x
    - Properties of exponential functions
    - Exponential growth and decay
    - The number e and natural exponential
    - Compound interest formula
    - Introduction to logarithms
    - Common and natural logarithms
    - Logarithm properties and laws
    - Change of base formula
    - Solving exponential equations
    - Solving logarithmic equations
    - Applications: population growth, radioactive decay
  Projects built:
    - Compound interest calculator
    - Population growth model
    - pH scale explorer
  Practice: Master 150 exponential and logarithmic problems
Rational Functions & Expressions
  Topics:
    - Rational expressions: simplification
    - Multiplying and dividing rational expressions
    - Adding and subtracting rational expressions
    - Complex fractions
    - Rational equations
    - Extraneous solutions
    - Rational functions and graphs
    - Vertical and horizontal asymptotes
    - Holes in rational functions
    - Inverse variation
    - Joint and combined variation
    - Applications in physics and engineering
  Projects built:
    - Lens equation calculator
    - Rate problem solver
    - Asymptote visualizer
  Practice: Complete 150 rational expression problems
Function Theory & Transformations
  Topics:
    - Function definition and notation
    - Domain and range
    - Function operations: addition, subtraction, multiplication, division
    - Composite functions
    - Inverse functions
    - One-to-one functions
    - Function transformations: translations
    - Reflections and stretches
    - Combining transformations
    - Even and odd functions
    - Piecewise functions
    - Greatest integer function
  Projects built:
    - Function transformation visualizer
    - Composite function calculator
    - Inverse function finder
  Practice: Work through 200 function problems
Conic Sections
  Topics:
    - Circle equation: center-radius form
    - General form of circle equation
    - Ellipse: standard form and properties
    - Hyperbola: standard form and properties
    - Parabola review in conic context
    - Identifying conic sections
    - Translations of conics
    - Systems involving conics
    - Applications in astronomy and physics
  Projects built:
    - Conic section grapher
    - Orbital mechanics simulator
    - Architectural design with conics
  Practice: Graph and analyze 100 conic sections

Month 6: Coordinate Geometry & Vectors (Weeks 22-26)
Advanced Coordinate Geometry
  Topics:

    - Distance formula in 2D and 3D
    - Midpoint formula
    - Section formula
    - Area of triangle using coordinates
    - Collinearity of points
    - Equation of line: various forms
    - Angle between two lines
    - Distance from point to line
    - Concurrent lines
    - Locus problems
    - Transformation geometry: rotation, reflection
    - Coordinate proofs
  Projects built:
    - Geometry solver application
    - GPS distance calculator
    - Computer graphics transformer
  Practice: Solve 150 coordinate geometry problems
Introduction to Vectors
  Topics:
    - Vector vs scalar quantities
    - Vector notation and representation
    - Vector addition and subtraction
    - Scalar multiplication
    - Magnitude of a vector
    - Unit vectors
    - Component form of vectors
    - Dot product
    - Angle between vectors
    - Vector projections
    - Applications in physics
    - Cross product introduction (3D)
  Projects built:
    - Force vector calculator
    - Navigation system simulator
    - Vector graphics editor
  Practice: Complete 100 vector problems
Sequences and Series
  Topics:
    - Arithmetic sequences
    - Arithmetic series and sum formula
    - Geometric sequences
    - Geometric series and sum formula
    - Infinite geometric series
    - Convergence and divergence
    - Sigma notation
    - Recursive sequences
    - Fibonacci sequence
    - Mathematical induction
    - Binomial theorem
    - Applications in finance and nature
  Projects built:
    - Loan amortization calculator
    - Fibonacci pattern generator
    - Series convergence tester
  Practice: Work through 150 sequence and series problems
Complex Numbers
  Topics:
    - Imaginary unit i
    - Complex number form: a + bi
    - Operations with complex numbers
    - Complex conjugates
    - Absolute value of complex numbers
    - Complex plane (Argand diagram)
    - Polar form of complex numbers
    - De Moivre's theorem
    - Roots of complex numbers
    - Euler's formula introduction
    - Applications in engineering
    - Solving polynomial equations
  Projects built:
    - Complex number calculator
    - Mandelbrot set visualizer
    - AC circuit analyzer
  Practice: Master 100 complex number problems
Phase 2 Capstone Assessment
  Topics:
    - Comprehensive function review
    - Advanced algebra synthesis
    - Coordinate geometry mastery check

- Vector applications
- Complex problem solving
- Mathematical modeling

Projects built:
- Design a complete function analysis tool
- Create mathematical model for real phenomenon
- Build comprehensive problem set with solutions

Assessment: Phase 2 cumulative exam: a written paper mixing this phase with everything before it, plus targeted revision for anything shaky

---

PHASE 3: TRIGONOMETRY AND PRE-CALCULUS (WEEKS 27-39)

Master trigonometric functions, identities, and applications. Prepare for calculus with limits, advanced functions, and analytical geometry.

Months 7-8: Trigonometry Mastery (Weeks 27-34)

Trigonometric Ratios & Functions

Topics:
- Angle measurement: degrees and radians
- Arc length and sector area
- Right triangle trigonometry
- Six trigonometric ratios: sin, cos, tan, csc, sec, cot
- Trigonometric ratios of special angles
- Reference angles and coterminal angles
- Unit circle and circular functions
- Trigonometric functions of any angle
- Signs of trigonometric functions in quadrants
- Exact values using unit circle
- Inverse trigonometric functions
- Principal values and general solutions

Projects built:
- Unit circle interactive tool
- Height and distance calculator
- Trigonometric table generator

Practice: Solve 200 basic trigonometry problems

Graphing Trigonometric Functions

Topics:
- Graphing sine and cosine functions
- Amplitude, period, and frequency
- Phase shift and vertical shift
- Graphing tangent and cotangent
- Graphing secant and cosecant
- Transformations of trigonometric graphs
- Combining trigonometric functions
- Damped oscillations
- Trigonometric modeling
- Applications: sound waves, tides
- Harmonic motion
- Fourier series introduction

Projects built:
- Wave generator and analyzer
- Music synthesizer using trig functions
- Tidal prediction model

Practice: Graph 150 trigonometric functions

Trigonometric Identities

Topics:
- Fundamental identities: Pythagorean, reciprocal, quotient
- Cofunction identities
- Even-odd identities
- Sum and difference formulas
- Double angle formulas
- Half angle formulas
- Product-to-sum formulas
- Sum-to-product formulas
- Proving trigonometric identities
- Simplifying trigonometric expressions
- Conditional identities
- Applications in physics and engineering

Projects built:
- Identity prover application
- Trigonometric simplifier
- Physics formula derivation tool

Practice: Prove 100 trigonometric identities

Trigonometric Equations & Applications

Topics:
- Solving basic trigonometric equations
- Equations involving multiple angles
- Equations with trigonometric identities

- Parametric equations
- Eliminating parameters
- Polar coordinates
- Converting between polar and rectangular
- Graphing in polar coordinates
- Rose curves and limacons
- Complex numbers in polar form
- Applications in navigation
- Spherical trigonometry basics

Projects built:

- Parametric curve plotter
- Polar graphing calculator
- Navigation system using trigonometry

Practice: Solve 150 trigonometric equations

Law of Sines and Cosines

Topics:

- Law of sines derivation
- Solving triangles with law of sines
- Ambiguous case (SSA)
- Law of cosines derivation
- Solving triangles with law of cosines
- Area of triangle formulas
- Heron's formula
- Applications in surveying
- Navigation problems
- Vector applications
- 3D trigonometry introduction

Projects built:

- Triangle solver (all cases)
- Surveying application
- GPS triangulation simulator

Practice: Solve 100 triangle problems

Month 9: Pre-Calculus & Limits (Weeks 35-39)

Limits and Continuity

Topics:

- Introduction to limits
- Limit notation and terminology
- Evaluating limits graphically
- Evaluating limits numerically
- Evaluating limits algebraically
- One-sided limits
- Limits at infinity
- Infinite limits and vertical asymptotes
- Limit laws and properties
- Squeeze theorem
- Continuity at a point
- Types of discontinuities

Projects built:

- Limit calculator and visualizer
- Continuity checker
- Asymptote analyzer

Practice: Evaluate 200 limits

Introduction to Derivatives

Topics:

- Rate of change and slope
- Average rate of change
- Instantaneous rate of change
- Definition of derivative
- Derivative as a limit
- Differentiability and continuity
- Basic differentiation rules
- Power rule
- Product rule introduction
- Quotient rule introduction
- Chain rule introduction
- Applications: velocity and acceleration

Projects built:

- Derivative calculator
- Motion analyzer
- Tangent line grapher

Practice: Find 150 derivatives

Mathematical Reasoning & Proofs

Topics:

- Logic and statements
- Truth tables
- Conditional statements
- Biconditional statements
- Logical equivalence

- Methods of proof: direct, indirect
- Proof by contradiction
- Proof by induction (detailed)
- Counter examples
- Set theory basics
- Relations and functions
- Mathematical writing

Projects built:
- Proof validator
- Logic puzzle solver
- Set operation calculator

Practice: Write 50 mathematical proofs

Matrices and Determinants

Topics:
- Matrix notation and terminology
- Types of matrices
- Matrix operations: addition, subtraction
- Scalar multiplication
- Matrix multiplication
- Properties of matrix operations
- Identity and inverse matrices
- Determinants (2x2 and 3x3)
- Properties of determinants
- Cramer's rule
- Matrix equations
- Applications in transformations

Projects built:
- Matrix calculator
- Linear system solver using matrices
- Transformation visualizer

Practice: Complete 100 matrix problems

Phase 3 Review & Assessment

Topics:
- Trigonometry comprehensive review
- Pre-calculus concepts review
- Limits and continuity review
- Mathematical reasoning review
- Problem-solving strategies
- Exam preparation techniques

Projects built:
- Create trigonometry reference guide
- Design pre-calculus problem bank
- Build interactive review tool

Assessment: Phase 3 cumulative exam: a written paper mixing this phase with everything before it, plus targeted revision for anything shaky

---

PHASE 4: CALCULUS, STATISTICS AND FINAL REVISION (WEEKS 40-52)

Master differential and integral calculus, statistics, probability, and advanced problem-solving techniques for university readiness.

Month 10: Calculus (Weeks 40-44)

Differential Calculus

Topics:
- Review of derivative concept
- Differentiation rules (complete)
- Derivatives of trigonometric functions
- Derivatives of exponential functions
- Derivatives of logarithmic functions
- Implicit differentiation
- Logarithmic differentiation
- Higher-order derivatives
- Related rates problems
- Linear approximation
- Differentials
- Error estimation

Projects built:
- Complete derivative calculator
- Related rates problem solver
- Error analysis tool

Practice: Solve 300 differentiation problems

Applications of Derivatives

Topics:
- Critical points and extrema
- First derivative test
- Second derivative test
- Concavity and inflection points
- Curve sketching (complete process)

- Optimization problems
- Maximum and minimum word problems
- Mean Value Theorem
- Rolle's Theorem
- L'Hôpital's Rule
- Newton's method
- Applications in economics and physics

Projects built:
- Function analyzer (complete)
- Optimization problem solver
- Economic model calculator

Practice: Complete 200 application problems

Integral Calculus

Topics:
- Antiderivatives and indefinite integrals
- Basic integration rules
- Integration by substitution
- Definite integrals
- Fundamental Theorem of Calculus
- Properties of definite integrals
- Integration by parts
- Trigonometric integrals
- Trigonometric substitution
- Partial fractions
- Improper integrals
- Numerical integration: trapezoid, Simpson's rule

Projects built:
- Integration calculator
- Area calculator using integrals
- Numerical integration tool

Practice: Evaluate 300 integrals

Applications of Integration

Topics:
- Area between curves
- Volume by disks and washers
- Volume by cylindrical shells
- Arc length
- Surface area of revolution
- Work and energy problems
- Center of mass
- Probability density functions
- Average value of a function
- Applications in physics
- Applications in economics
- Differential equations introduction

Projects built:
- Volume calculator for solids
- Physics application solver
- Probability distribution analyzer

Practice: Solve 150 application problems

Series and Sequences (Calculus)

Topics:
- Infinite sequences
- Convergence of sequences
- Infinite series
- Geometric series (calculus perspective)
- Test for divergence
- Integral test
- Comparison tests
- Ratio and root tests
- Alternating series
- Power series
- Taylor and Maclaurin series
- Applications of series

Projects built:
- Series convergence tester
- Taylor series calculator
- Function approximator

Practice: Analyze 100 series

Month 11: Statistics & Probability (Weeks 45-49)

Descriptive Statistics

Topics:
- Types of data: categorical, numerical
- Measures of central tendency: mean, median, mode
- Measures of spread: range, variance, standard deviation
- Quartiles and box plots
- Percentiles and percentile rank
- Frequency distributions and histograms

    - Stem-and-leaf plots
    - Scatter plots and correlation
    - Linear regression
    - Coefficient of determination (R^2)
    - Outliers and their effects
    - Data transformation
  Projects built:
    - Statistical calculator suite
    - Data visualization dashboard
    - Regression analysis tool
  Practice: Analyze 50 data sets
Probability Theory
  Topics:
    - Sample spaces and events
    - Classical probability
    - Empirical probability
    - Probability axioms
    - Addition rule of probability
    - Multiplication rule
    - Conditional probability
    - Independent and dependent events
    - Bayes' theorem
    - Permutations and combinations
    - Binomial probability
    - Expected value and variance
  Projects built:
    - Probability calculator
    - Monte Carlo simulator
    - Game theory analyzer
  Practice: Solve 150 probability problems
Probability Distributions
  Topics:
    - Random variables: discrete and continuous
    - Probability mass functions
    - Probability density functions
    - Cumulative distribution functions
    - Binomial distribution
    - Poisson distribution
    - Geometric distribution
    - Normal distribution
    - Standard normal distribution (Z-scores)
    - Central Limit Theorem
    - Sampling distributions
    - Chi-square distribution introduction
  Projects built:
    - Distribution visualizer
    - Normal probability calculator
    - Sampling distribution simulator
  Practice: Work with 100 distribution problems
Statistical Inference
  Topics:
    - Point estimation
    - Confidence intervals for means
    - Confidence intervals for proportions
    - Hypothesis testing framework
    - Type I and Type II errors
    - Z-tests for means
    - T-tests: one-sample, two-sample, paired
    - Tests for proportions
    - Chi-square test for independence
    - ANOVA basics
    - P-values and significance levels
    - Power of a test
  Projects built:
    - Hypothesis testing calculator
    - Confidence interval generator
    - Statistical test selector
  Practice: Conduct 75 hypothesis tests
Advanced Problem Solving
  Topics:
    - Competition mathematics strategies
    - Number theory problems
    - Combinatorics advanced
    - Graph theory basics
    - Game theory introduction
    - Optimization techniques
    - Mathematical modeling
    - Cross-topic problem solving
    - SAT/ACT preparation

```
          - University entrance exam prep
          - Mathematical competitions prep
        Projects built:
          - Competition problem solver
          - Mathematical game creator
          - Exam preparation guide
        Practice: Solve 100 competition-level problems

    Month 12: Final Review & Applications (Week 50)
      University Preparation
        Topics:
          - University mathematics preview
          - Study skills for higher math
          - Mathematical maturity
          - Abstract thinking development
          - Proof-writing skills
          - Advanced calculus preview
          - Linear algebra introduction
          - Discrete mathematics preview
          - Mathematical career paths
          - Further learning resources
        Projects built:
          - University readiness portfolio
          - Advanced topic exploration
          - Learning plan for next level
        Practice: Complete university-level problem sets

    Month 13: Final Assessments & Certification (Weeks 51-52)
      Comprehensive Review - Part 1
        Topics:
          - Algebra complete review
          - Geometry complete review
          - Trigonometry complete review
          - Functions and graphs review
          - Calculus essentials review
          - Statistics and probability review
          - Problem-solving strategies review
          - Formula compilation
        Projects built:
          - Create comprehensive study guide
          - Build formula reference app
          - Design review problem sets
      Comprehensive Review - Part 2 & Mock Exams
        Topics:
          - Cross-topic problem solving
          - Time management strategies
          - Error analysis and correction
          - Mock exam practice
          - SAT/ACT math practice
          - AP Calculus practice
          - Competition math practice
          - Peer tutoring exercises
        Deliverables:
          - Complete practice exam portfolio
          - Error analysis report
          - Personal progress documentation
          - Achievement portfolio
        Assessment: FINAL EXAM: a comprehensive written paper covering every phase of the
        course. Passing earns the certificate; falling short earns a focused revision plan and
        a free retest

PROJECTS THE STUDENT BUILDS AND KEEPS

  - Phase 1: Algebraic calculator, Equation solver, Geometry tool, Pattern generator
  - Phase 2: Function analyzer, Graphing calculator, Vector simulator, Complex number visualizer
  - Phase 3: Trigonometry suite, Proof assistant, Matrix calculator, Limit explorer
  - Phase 4: Calculus toolkit, Statistics dashboard, Probability simulator, Research project
  - Final: Comprehensive mathematics portfolio with 50+ solved problems

  Total projects: 100+ mathematical tools, visualizers, and problem-solving applications

SKILLS THE STUDENT WILL HAVE AT THE END

  - Algebra: Linear, quadratic, polynomial, rational, exponential, logarithmic
  - Geometry: Euclidean, coordinate, transformational, vectors
  - Trigonometry: Functions, identities, equations, applications
  - Pre-Calculus: Limits, sequences, series, matrices
  - Calculus: Differential, integral, applications
  - Statistics: Descriptive, inferential, regression
```

- Probability: Theory, distributions, inference
- Problem Solving: Analytical thinking, proof writing, modeling
- Technology: Calculators, software, programming for math

HOW A TYPICAL WEEK IS SPLIT

Live classes: 2 live one-hour classes per week with a real teacher, working problems together
Homework: A problem set after every class, and a mixed-review assignment at the end of every month that deliberately folds in earlier topics
Practice: 3-5 hours of problem-solving between classes
Review: Every set reviewed with written feedback; recurring mistakes reopened in class until they are gone

SUPPORT INCLUDED

Doubt support: WhatsApp doubt support between classes
Progress updates: Honest monthly progress reviews: which topics are solid, which are wobbly, and the plan for the wobble

CERTIFICATION DETAIL

Completion: Certificate from Modern Age Coders, awarded on passing the final exam. Fall short and there is focused revision and a free retest: the certificate certifies mastery, not attendance

WHERE THIS CAN LEAD

- Engineering (all disciplines)
- Data Science and Analytics
- Actuarial Science
- Financial Analysis
- Research Scientist
- Mathematics Teacher/Professor
- Quantitative Trading
- Operations Research
- Software Development (algorithms)
- Economics and Econometrics

COMMON QUESTIONS ABOUT THIS COURSE

For anything about cost, use PART 4 and RULE 1. Do not quote two regions.

Q: What topics does the High School Mathematics Mastery Program cover?
A: In 12 months it moves through four phases: Algebra I foundations and basic geometry; Algebra II with quadratics, functions and coordinate geometry; trigonometry and pre-calculus including sequences and complex numbers; and finally introductory calculus, statistics and probability. It is the full grade 9 to 12 arc taught as one connected story.

Q: Does this course follow CBSE, ICSE or another school board?
A: The course is deliberately board agnostic: it teaches the mathematics underneath every board, so it works alongside CBSE, ICSE, IGCSE, IB or state syllabi rather than replacing them. Your teacher aligns examples and pacing with what school is covering whenever that helps.

Q: My child is in grade 9, or already in grade 11. Is the level right?
A: Yes. The program starts from basic arithmetic and algebra, so a grade 9 student begins comfortably, while an older student uses it to close gaps quickly and then accelerate into pre-calculus and calculus. A diagnostic in the first week sets the entry point, so nobody sits through material they already own.

Q: What are the prerequisites?
A: Only basic arithmetic and elementary school mathematics. No coding is involved, and the equipment list is simple: a computer or tablet, internet and a calculator. Everything else, including the thinking habits, is built inside the course.

Q: How do we know it is working? How is progress measured?
A: Every phase ends with an assessment that must be secure before moving on, and weekly problem work is reviewed for reasoning, not just answers. Parents get a clear picture from the running record of mastered topics, and school test performance is the natural external check along the way.

Q: How is my child assessed, and is the certificate just for attending?
A: No. A problem set follows every class with written feedback, monthly reviews deliberately mix new material with earlier topics so nothing is forgotten, each phase ends with a cumulative exam, and the course ends with a final exam covering the whole syllabus. Passing earns the certificate; falling short earns focused revision and a free retest. We measure understanding, not attendance.

Q: Is there a free trial?

A: Yes. Book a free demo class at learn.modernagecoders.com/contact with no commitment; it is a real lesson plus an honest read on where your child stands. Questions first? Message us on WhatsApp at +91 91233 66161. (Agent note: the free demo is a waiting list with no fixed date. The Priority Live Demo is a guaranteed class today or tomorrow, booked at https://learn.modernagecoders.com/priority-demo . Offer both, as RULE 3 says.)

Q: Are these live classes or videos?
A: Live, always. Each session is a full one hour class with a real teacher in a small group, never pre-recorded content, so the teacher can catch the exact step where your child's method breaks and fix it on the spot.

Q: Is there a certificate at the end of the program?
A: Students receive the High School Mathematics Completion Certificate along with a documented record of the topics, problem sets and projects they worked through. We are rated 4.9 stars across 547+ Google reviews, largely by parents of students in programs like this one.

To enrol, message Shivam Sir on +91 9123366161 or send the parent this link: https://learn.modernagecoders.com/courses/complete-high-school-mathematics-mastery
For a demo: the Priority Live Demo (guaranteed, today or tomorrow) is booked at https://learn.modernagecoders.com/priority-demo . The free demo is a waiting list with no fixed date.

==========
COURSE 80 OF 137: HTML & CSS FOR BEGINNERS: BUILD REAL RESPONSIVE WEBSITES
==========

Course link: https://learn.modernagecoders.com/courses/html-css-course-for-beginners-build-real-websites
Subject area: Web Development
Designed for: Teens
Who can join: Absolute beginner, ages 10 to adult
Course length: 4 months (16 weeks)
Time needed: 2 live classes/week + 2-3 hours practice
Certificate: Certificate from Modern Age Coders, awarded on passing the final assessment

PRICE FOR THIS COURSE (quote only the one that applies to the person asking)
In India, per month: group Rs 1,499, mini batch Rs 2,999, one to one Rs 4,999
In Canada, per month: group CAD 140, one to one CAD 210
Anywhere else, per month: group $100, one to one $150
Classes: group and mini batch two live classes a week, eight a month; one to one in India one live class a week, four a month; one to one outside India two live classes a week, eight a month. Each class is one hour.

WHAT THIS COURSE IS

HTML and CSS course for beginners: live online classes from your first tag to a published multi-page website, with flexbox, grid, and responsive design.

In one line: Every website you have ever visited is built on these two languages. Four months from a blank file to your own published site.

ABOUT THE PROGRAMME

HTML and CSS are where the web actually starts. Frameworks come and go, but every page on the internet is, underneath, structure written in HTML and appearance written in CSS, and people who skip this layer pay for it later. This 4-month live course takes complete beginners from an empty folder to a multi-page personal website they design, build, test on a phone, and publish to a real URL. The first two months build the two languages properly: semantic page structure, then selectors, the box model, and typography, so students understand why a page looks the way it does instead of copying snippets and hoping. The second half is where pages become layouts: flexbox and grid, responsive design that survives a phone screen, working forms, and a capstone month spent building and shipping the personal site. Classes are live and small, and every student leaves with a site that is genuinely theirs, structure, design decisions, and all.

WHAT MAKES THIS COURSE DIFFERENT

- Structure before decoration: semantic HTML is taught properly in month 1, the habit that separates clean sites from tag soup
- Layout is taught as a system, not a bag of tricks: flexbox and grid each get real time, including when to use which
- Students recreate real designs from screenshots, the same exercise working developers use to train their eye
- Every page built in class is tested on a phone, because most visitors arrive on one
- The capstone is published to a real URL on free hosting, not left on a laptop
- Works for ages 10 to adult: batches are grouped by age so examples and pace fit the room

THE LEARNING PATH, STEP BY STEP

Phase 1: The two languages: semantic HTML structure first, then CSS selectors, the box model, and typography, applied to real pages every week
Phase 2: Layout and shipping: flexbox, grid, responsive design, and forms, finishing with a multi-page personal site built, tested, and published

WHAT A STUDENT NEEDS BEFORE STARTING

Coding experience: None. This is the true starting point of web development
Computer skills: Comfortable typing and managing files and folders
Equipment: A computer with a modern browser and a stable internet connection
Age: 10 to adult. Batches are grouped by age so pace and examples fit the room

WHO THIS COURSE IS FOR

Absolute beginners: Anyone starting web development from zero who wants to build the real foundation, not skip it
Kids and teens: Students aged 10+ who want to make actual websites they can show, not just follow tutorials
Adults switching tracks: Working adults testing whether web development suits them, with a real published site as the outcome
Small business owners: People who want to understand, fix, and eventually build their own web presence
Future javascript students: Learners who plan to take JavaScript next and want their HTML and CSS solid first

FULL CURRICULUM, WEEK BY WEEK

This is the complete teaching plan. Parents can ask about any week.

PHASE 1: THE TWO LANGUAGES (MONTHS 1-2, WEEKS 1-8)

HTML gives a page its structure and meaning; CSS gives it appearance. Both are learned by building real pages from the first week.

Month 1: HTML, the Structure of Every Page (Weeks 1-4)
Your First Page
Topics:
- How a website actually works: files, browsers, and servers in plain language
- Setting up VS Code and a tidy project folder
- The skeleton of every page: doctype, head, and body
- Headings, paragraphs, and line breaks
- Ordered and unordered lists
- Saving, refreshing, and reading your page the way the browser does
Projects built:
- A real first page: an introduction page with headings, paragraphs, and a list, opened in the browser by the end of class one
Practice: Build a second page about a hobby using every element from class, plus one you look up yourself
Links, Images, and Paths
Topics:
- Anchor tags: linking to other sites and to your own pages
- Images: src, alt text, and why alt text matters for real people
- Relative vs absolute paths, and the broken-image bug everyone hits
- Organizing a project: an images folder that stays tidy
- Attributes in general: the pattern behind href, src, and the rest
- Opening links in new tabs, used sparingly
Projects built:
- Two-page mini site: an about page and a favorites page, linked both ways, with images that actually load
Practice: Fix a provided page with six broken links and images, then explain what was wrong with each
Semantic Structure
Topics:
- header, nav, main, section, article, and footer: naming the parts of a page
- Why structure matters: screen readers, search engines, and future-you
- div and span, and why they are the last resort, not the first
- Nesting elements correctly and indenting so you can see the structure
- Block vs inline elements, previewed before CSS makes it matter
- Reading the structure of real websites with dev tools
Projects built:
- Restructure week 2's site with proper semantic tags, then sketch the structure of a favorite real website on paper
Practice: Mark up a printed newspaper-style article into clean semantic HTML
Tables, Media, and Clean Code
Topics:
- Tables for actual tabular data: rows, headers, and captions
- Embedding video and maps with iframes
- Character entities and special symbols

- Validating your HTML with the W3C validator and reading its complaints
- Commenting and formatting habits that keep pages readable
- A structure checklist to run before calling any page done

Projects built:
- A results or schedule page with a real data table plus an embedded video or map

Practice: Run all your pages through the validator and clear every error

Assessment: Month 1 check: build a clean semantic page live from a hand-drawn sketch, validator-clean

Month 2: CSS, the Appearance Layer (Weeks 5-8)

First Styles

Topics:
- What CSS is and the three ways to add it, and why external stylesheets win
- Selectors: element, class, and id, and when each is appropriate
- Colors: names, hex, and rgb
- The cascade in plain terms: what wins when rules collide
- Grouping selectors and keeping a stylesheet organized
- Dev tools as a CSS laboratory: change styles live, then copy them back

Projects built:
- Style the month 1 introduction page: a real color scheme, applied through classes, no inline styles

Practice: Given an unstyled page and a screenshot, write the selectors and colors to match it

Typography

Topics:
- font-family and font stacks: what happens when a font is missing
- Loading Google Fonts properly
- Size, weight, and line-height: the three dials that change everything
- Spacing text so it breathes: letter-spacing and text alignment
- Units: px, em, rem, and percent, explained with examples
- Pairing two fonts without the page looking like a ransom note

Projects built:
- Typography makeover: the same article styled two ways, one serious, one playful, with a note on the choices

Practice: Recreate the text styling of a well-designed real site as closely as you can

The Box Model

Topics:
- Every element is a box: content, padding, border, margin
- Reading the box model diagram in dev tools
- box-sizing: border-box and why we set it everywhere
- Backgrounds: colors, images, and gradients
- Borders, rounded corners, and shadows used with restraint
- Margin collapse, the classic surprise, demonstrated live

Projects built:
- Profile card: photo, name, description, and a button, spaced and shadowed like a real component

Practice: Ten box-model puzzles: match the target spacing exactly using padding and margin

Display and Simple Layout

Topics:
- display: block, inline, and inline-block in practice
- Width, height, and max-width: making content behave
- Centering things: the honest tour of the classic problem
- Building a content column that sits nicely on any screen
- Hover states: the first taste of interactivity in pure CSS
- Putting a full page together: structure from month 1, styles from month 2

Projects built:
- A styled article page: centered content column, styled headings, hover-styled links, and a card or two

Practice: Recreate a provided card design from a screenshot, pixel-close

Assessment: Month 2 check: recreate a small component design from a screenshot live, explaining each CSS choice

---

PHASE 2: LAYOUT, RESPONSIVENESS, AND SHIPPING (MONTHS 3-4, WEEKS 9-16)

Flexbox and grid turn styled pages into real layouts. Then responsive design, forms, and a capstone month: build, test, and publish a multi-page personal site.

Month 3: Real Layout with Flexbox and Grid (Weeks 9-12)

Flexbox Fundamentals

Topics:
- The flex container and its children: a mental model that sticks
- Main axis and cross axis, drawn before coded
- justify-content and align-items: the six arrangements you use daily
- gap: spacing items without margin hacks
- flex-direction: rows becoming columns
- The navigation bar: flexbox's most famous job

Projects built:

- A proper navigation bar: logo left, links right, evenly spaced, with hover states
Practice: Flexbox Froggy through the core levels, plus three layout snippets built from description alone
Flexbox in the Real World
Topics:
- flex-wrap: rows that break gracefully
- flex-grow and flex-shrink: who gets the spare space
- Building a card row that becomes a card grid
- Aligning odd items: the last-item problem and clean solutions
- Nested flex containers without confusion
- Reading a real site's layout and spotting the flex containers
Projects built:
- Photo gallery row and a three-card feature section, both wrapping cleanly as the window narrows
Practice: Recreate two sections of a real landing page using only flexbox
CSS Grid
Topics:
- grid-template-columns and rows: designing in two dimensions
- The fr unit and repeat()
- Placing items: spanning columns and rows
- grid-template-areas: layouts you can read like a map
- Grid vs flexbox: a working rule for choosing
- Gaps, alignment, and auto-fit for self-arranging grids
Projects built:
- Magazine-style layout: a featured story spanning two columns above a grid of smaller pieces
Practice: Build the same page layout twice, once in flexbox, once in grid, and write three sentences on which felt right
Responsive Design
Topics:
- Why mobile-first is the sane default
- Media queries: syntax, breakpoints, and where breakpoints actually come from
- The viewport meta tag, the line everyone forgets
- Flexible images: max-width 100% and object-fit
- Testing with the dev tools device toolbar and on a real phone
- Responsive navigation: what stacks, what hides, what stays
Projects built:
- Make the month's layouts fully responsive: gallery, cards, and magazine layout all working from phone to desktop
Practice: Audit two favorite websites at three screen widths and note what changes at each
Assessment: Layout check: build a responsive two-breakpoint layout live from a wireframe

Month 4: Forms, Polish, and the Capstone Site (Weeks 13-16)
Forms
Topics:
- form, input, label, and why every input needs its label
- Input types: text, email, number, date, and what the browser gives you free
- Textareas, selects, checkboxes, and radio buttons
- Styling form controls so they match the site
- Built-in validation: required, min, max, and helpful error states
- What happens on submit, honestly: where the backend would take over
Projects built:
- A styled contact form: name, email, subject dropdown, message, and a submit button that validates
Practice: Build a sign-up form for an imaginary club, labels and validation included
Polish and Performance
Topics:
- Transitions: hover effects that feel smooth instead of sudden
- Simple keyframe animations, used with restraint
- Favicons and page titles: the details visitors notice
- Image weight: resizing and compressing before uploading
- A consistent spacing scale: the quiet secret of pages that look professional
- Accessibility pass: contrast, alt text, and keyboard-reachable links
Projects built:
- Polish pass on your best existing page: transitions, favicon, compressed images, and an accessibility check
Practice: Run a contrast checker on your color scheme and fix anything that fails
Capstone Build
Topics:
- Scoping the personal site: home, about, gallery or projects, and contact
- A shared header and footer across pages, kept consistent by hand
- Wireframing each page before building it
- Reusing your components: cards, navigation, and forms from past weeks
- Working from a checklist: structure, styles, responsive, polish
- Mid-build review with the instructor and a course correction if needed
Projects built:
- The capstone: a multi-page personal site, four pages, shared navigation, responsive throughout

Practice: Complete two pages between classes to keep the build on schedule
Test, Publish, Present
Topics:
- Cross-device testing: phone, tablet width, and a second browser
- The pre-launch checklist: links, images, validator, spelling
- Publishing to free hosting so the site has a real address
- Sharing the link and what to say when you do
- Presenting design decisions: why it looks the way it looks
- Where this leads: JavaScript to make pages interactive
Projects built:
- The published site: live at a real URL, presented to the class with a walkthrough of one design decision per page
Practice: Send the live link to three people and collect one piece of feedback from each
Assessment: Capstone presentation: live site walkthrough plus questions on structure and CSS choices

PROJECTS THE STUDENT BUILDS AND KEEPS

- Two-page mini site with working links and images
- Semantic restructure of a real article into clean HTML
- Typography makeover: one article styled two different ways
- Profile card component, spaced and shadowed like a real design
- Navigation bar with logo, links, and hover states
- Responsive photo gallery and three-card feature section
- Magazine-style CSS grid layout
- Styled contact form with built-in validation
- The capstone: a published multi-page personal website

Total projects: 10+ real pages and components, ending with a published multi-page website

SKILLS THE STUDENT WILL HAVE AT THE END

- Semantic HTML: structuring any page correctly, from articles to forms to tables
- CSS fundamentals: selectors, the cascade, the box model, and typography that reads well
- Layout: flexbox and grid used deliberately, with a working rule for choosing between them
- Responsive design: mobile-first pages that hold up from phone to desktop
- Shipping: validating, testing across devices, compressing images, and publishing to free hosting
- Design judgment: spacing, contrast, and restraint, trained by recreating real designs

HOW A TYPICAL WEEK IS SPLIT

Live classes: 2 live one-hour classes per week, building pages along with the instructor
Practice: 2-3 hours of building and recreation exercises between classes
Review: Every submitted page reviewed with written feedback; recurring issues reopened in class
Homework: A task or problem set after every class, and a monthly mixed-review assignment that deliberately folds in earlier topics

SUPPORT INCLUDED

Doubt support: WhatsApp doubt support between classes for stuck layouts and broken pages
Progress updates: Regular progress notes to parents of younger students; adults get direct feedback on every build

CERTIFICATION DETAIL

Completion: Certificate from Modern Age Coders, awarded on passing the final assessment. Fall short and there is focused revision and a free retest: the certificate certifies real learning, not attendance

WHERE THIS CAN LEAD

- JavaScript next: our JavaScript courses turn these static pages into interactive apps
- The full front-end track: React and modern tooling once both layers are solid
- Freelance-style small projects: simple sites for family, clubs, and local groups
- Design-side paths: UI design tools make far more sense once you know what CSS can do
- WordPress and site-builder work with the rare ability to fix what the builder gets wrong

COMMON QUESTIONS ABOUT THIS COURSE

For anything about cost, use PART 4 and RULE 1. Do not quote two regions.

Q: Is HTML a programming language?
A: Strictly speaking, no: HTML is a markup language that describes structure, and CSS describes appearance; neither has loops or logic. That does not make them lesser skills. Every website ever made rests on them, layout in CSS is genuine engineering thinking, and developers who never learned this layer properly struggle with it for years. This course is

the foundation programming languages get built on top of.

Q: What age is this course right for?
A: The course runs from age 10 up to adults, and batches are grouped by age, so a 10-year-old is not sharing a class with a 40-year-old career switcher. The material is the same because HTML and CSS are the same; the pace, examples, and project themes are adjusted to the room. For children under 10 we recommend our kids courses, which build the same instincts through friendlier tools.

Q: Do I need this before learning JavaScript?
A: It helps a great deal. JavaScript's whole job in the browser is manipulating HTML and CSS, so students who know both layers learn it noticeably faster and debug with far less pain. Our JavaScript course does teach the markup each project needs along the way, so either order works, but HTML and CSS first is the smoother road.

Q: What will I have built by the end?
A: Ten or more real pages and components: a semantic article page, styled cards, a navigation bar, a responsive photo gallery, a magazine-style grid layout, and a working contact form. The final month is a capstone: a multi-page personal website, responsive from phone to desktop, published to a real URL you can send to anyone.

Q: How are the classes run?
A: Live one-hour online classes, twice a week, with a real instructor and at most 20 students in a group batch. Students build during class, not just watch, and everything submitted between classes comes back with written feedback. Mini-batch (up to 6 students) and 1-on-1 options are available for learners who want closer attention.

Q: How am I assessed, and is the certificate just for showing up?
A: No. A task follows every class with feedback, monthly reviews deliberately mix new material with earlier topics so nothing is forgotten, and the course ends with a final project defended live, plus a written assessment. Passing earns the certificate; falling short earns focused revision and a free retest. We measure real learning, not attendance.

Q: Is there a free trial class?
A: Yes, the first demo class is free with no commitment. Book at learn.modernagecoders.com/contact or message us on WhatsApp at +91 91233 66161. It is a real class, not a sales pitch: you or your child will build something small in it.

Q: Do I need to buy any software?
A: No. Everything used in the course is free: the VS Code editor, a modern browser like Chrome, Google Fonts, and free hosting for publishing the capstone. Any reasonably recent laptop or desktop is enough; HTML and CSS are the lightest possible workload for a computer.

Q: Can this course lead to real work?
A: On its own, HTML and CSS get you to simple static sites, which is genuinely enough for personal pages, clubs, and small local projects. For paid front-end work you will also want JavaScript, which is exactly the next course in our track. What this course guarantees is the layer beneath all of that, learned properly instead of patched together later.

To enrol, message Shivam Sir on +91 9123366161 or send the parent this link: https://learn.modernagecoders.com/courses/html-css-course-for-beginners-build-real-websites
For a demo: the Priority Live Demo (guaranteed, today or tomorrow) is booked at https://learn.modernagecoders.com/priority-demo . The free demo is a waiting list with no fixed date.

==========
COURSE 81 OF 137: IB DP COMPUTER SCIENCE (NEW GUIDE, FIRST ASSESSMENT 2027)
==========

Course link: https://learn.modernagecoders.com/courses/ib-diploma-computer-science-course
Subject area: IB Diploma Computer Science
Designed for: Teens
Who can join: IB Diploma Programme students taking Computer Science at SL or HL
Course length: Ongoing DP support, joinable any month
Time needed: 2 live classes/week + coursework and IA support
Certificate: Certificate from Modern Age Coders, awarded on passing the final assessment

PRICE FOR THIS COURSE (quote only the one that applies to the person asking)
In India, per month: group Rs 1,499, mini batch Rs 2,999, one to one Rs 4,999
In Canada, per month: group CAD 140, one to one CAD 210
Anywhere else, per month: group $100, one to one $150
Classes: group and mini batch two live classes a week, eight a month; one to one in India one live class a week, four a month; one to one outside India two live classes a week, eight a month. Each class is one hour.

WHAT THIS COURSE IS

Live online IB Diploma Computer Science classes for the new guide: both themes, the case study in Paper 1, algorithmic thinking in Paper 2 (Python or Java), and full support on the

internal assessment.

In one line: Taught to the new guide, first assessed May 2027, with the internal assessment supported properly instead of left to the last term.

ABOUT THE PROGRAMME

IB Computer Science changed. The new Diploma Programme guide was launched in February 2025 for first teaching in August 2025, with first assessment in May 2027, and the differences are not cosmetic. Paper 3 has been removed entirely at both SL and HL. The options are gone. The case study is now covered by both SL and HL students and is assessed within Paper 1. Databases and object-oriented programming are now studied at both levels, not just HL. Any course still built around the old structure is preparing students for an examination that no longer exists. This course follows the new guide as it stands. The syllabus is organised around two themes: concepts in computer science, and computational thinking and problem-solving. Theme A covers computer fundamentals, networks, databases and machine learning. Theme B is where students learn to actually solve problems with code, which is what Paper 2 tests. The programme is built for how the Diploma actually runs. Theory is taught in the syllabus's own order so it lines up with school teaching, the case study is worked properly rather than skimmed the term before the exam, and the internal assessment, the computational solution, is supported from planning through to documentation, with the new emphasis on evidencing the computational thinking process. For Paper 2 we teach Python by default and support Java, since the new guide runs two separate versions of that paper and schools choose one at department level.

WHAT MAKES THIS COURSE DIFFERENT

- Taught to the NEW guide (first teaching 2025, first assessment May 2027): Paper 3 removed, options gone, case study inside Paper 1, databases and OOP at both SL and HL
- The internal assessment is supported from the start, not rescued at the end, including the new emphasis on documenting the computational thinking process
- The case study is worked in depth, because it now applies to SL students too and is assessed in Paper 1
- Paper 2 taught in the language your school chose: Python by default, Java supported, since the guide runs two separate versions of the paper
- Real programming, not slideware: students write and run code every week, which is the only thing that makes Paper 2 tractable
- Live, small batches with work reviewed on the spot, and SL and HL students taught to their own level

THE LEARNING PATH, STEP BY STEP

Phase 1: Theme A part one: computer fundamentals, system architecture and networks, with the ethical issues woven through
Phase 2: Theme A part two: databases and SQL, then machine learning and AI, plus the annual case study
Phase 3: Theme B: computational thinking, algorithms and OOP in Python or Java, the internal assessment, then full exam practice

WHAT A STUDENT NEEDS BEFORE STARTING

Title: What Your Child Needs to Start

WHO THIS COURSE IS FOR

Title: Who This Course Is For

FULL CURRICULUM, WEEK BY WEEK

This is the complete teaching plan. Parents can ask about any week.

PHASE 1: THEME A, COMPUTER FUNDAMENTALS AND NETWORKS

How computing systems actually work, taught so the Paper 1 answers come from understanding rather than recall.

Month 1: Computer Fundamentals and System Architecture (Weeks 1-4)
Hardware, Software and the System
Topics:
- The components of a computer system and how they interact
- Primary and secondary memory, and why the distinction matters
- System software versus application software
- The role of the operating system as a resource manager
- Reading a system description and identifying what each part contributes
Projects built:
- Map a described real system end to end, labelling every hardware and software component
Practice: 10 structured questions in IB command-term style
System Architecture and the Processor

```
      Topics:
        - CPU architecture, registers and buses
        - The machine instruction cycle, step by step
        - Cache and how it affects real performance
        - Binary representation and why everything reduces to it
        - Comparing architectures on evidence rather than assertion
      Projects built:
        - Trace a full instruction cycle and explain each stage in your own words
      Practice: 10 architecture questions including compare and evaluate commands
    Data Representation and Abstraction
      Topics:
        - Representing numbers, text, images and sound in binary
        - Abstraction as the central idea of the whole course
        - Why abstraction makes large systems possible
        - Identifying the level of abstraction in a described system
        - Using precise language, which the IB rewards heavily
      Projects built:
        - Describe one everyday system at three different levels of abstraction
      Practice: 10 representation and abstraction questions
      Assessment: A timed check on computer fundamentals, marked against IB command terms
    Ethical and Social Issues in Computing
      Topics:
        - The ethical dimension the guide expects you to weave through every topic
        - Privacy, surveillance, data ownership and digital divide
        - Building a balanced argument with real stakeholders named
        - Why one-sided answers cap your marks on evaluate questions
        - Linking ethics to the specific technology in the question
      Projects built:
        - Write a balanced evaluation of one real computing controversy, naming stakeholders on both
          sides
      Practice: 6 extended-response ethics questions, peer reviewed

  Month 2: Networks, Security and the Cloud (Weeks 5-8)
    Network Structures and Types
      Topics:
        - LAN, WAN and the topologies that matter
        - Client-server and peer-to-peer models compared
        - Network hardware and what each device is responsible for
        - Bandwidth, latency and what actually limits real performance
        - Choosing and justifying a network design for a scenario
      Projects built:
        - Design a network for a described organisation and justify every choice
      Practice: 10 network-design questions with justification marks
    Protocols and Data Transmission
      Topics:
        - Why protocols exist and what would happen without them
        - Layers, packets and packet switching
        - TCP/IP and HTTP at the depth the guide requires
        - Error handling and flow control in plain terms
        - Tracing a request across a network
      Projects built:
        - Trace a single web request across the layers, naming the protocol at each step
      Practice: 10 protocol questions at exam standard
    Cybersecurity
      Topics:
        - Threats: malware, phishing, denial of service, interception, social engineering
        - Encryption, symmetric and asymmetric, explained precisely
        - Authentication, access control and firewalls
        - Matching a defence to a specific threat, which is where the marks are
        - The human factor, usually the real vulnerability
      Projects built:
        - Produce a security assessment for a described system with prioritised, justified
          recommendations
      Practice: 10 threat-and-mitigation scenarios
      Assessment: End-of-phase test on networks and security
    Cloud Computing
      Topics:
        - What cloud computing actually is, beyond the marketing
        - Service and deployment models at guide depth
        - The genuine advantages and the genuine risks
        - Data sovereignty and the ethical questions it raises
        - Evaluating whether cloud is right for a described organisation
      Projects built:
        - Write a balanced recommendation on moving a described organisation to the cloud
      Practice: 8 evaluation questions on cloud adoption

----------------------------------------------------------------
PHASE 2: DATABASES, MACHINE LEARNING AND THE CASE STUDY
----------------------------------------------------------------
```

The two Theme A areas that are new or expanded for both SL and HL, plus the case study that is now assessed inside Paper 1.

- Month 3: Databases and SQL (Weeks 9-12)
  - The Relational Model
    - Topics:
      - Tables, records, fields, primary and foreign keys
      - Relationships and why they prevent duplicated data
      - Normalisation at the level the guide expects
      - Reading and drawing an entity relationship diagram
      - Why databases are now examined at SL as well as HL
    - Projects built:
      - Design a normalised relational schema for a described scenario and draw its ER diagram
    - Practice: 8 schema-design tasks with keys and relationships identified
  - SQL in Practice
    - Topics:
      - SELECT, FROM, WHERE, ORDER BY
      - Aggregate functions and GROUP BY
      - Joining tables to answer a real question
      - INSERT, UPDATE and DELETE
      - Turning a written requirement into the query that satisfies it
    - Projects built:
      - Build a working database and write the queries that answer real questions about it
    - Practice: 12 SQL problems building from single conditions to joins and aggregation
  - Data Storage, Integrity and Ethics
    - Topics:
      - Data integrity, validation and consistency
      - Transactions and why they matter
      - Backup, recovery and redundancy
      - Data protection and the ethics of holding personal data
      - Connecting database design to the privacy questions from Phase 1
    - Projects built:
      - Audit a described database for integrity and privacy risks and recommend fixes
    - Practice: 8 integrity and ethics questions
    - Assessment: A timed check on databases and SQL
  - Machine Learning and AI
    - Topics:
      - What machine learning is, and how it differs from ordinary programming
      - Supervised and unsupervised learning at guide depth
      - Training data, features and why data quality decides outcomes
      - Bias in data and its real consequences
      - Where AI is genuinely appropriate and where it is not
    - Projects built:
      - Explain how a described ML system reaches a decision, then identify where bias could enter
    - Practice: 10 machine-learning questions including an ethics evaluation

- Month 4: The Case Study and Computational Thinking (Weeks 13-16)
  - Working the Annual Case Study
    - Topics:
      - How the case study now sits inside Paper 1 for both SL and HL
      - Reading the case study actively rather than passively
      - Building a glossary of its specific terminology
      - Researching the underlying technology properly
      - Anticipating the question types the case study invites
    - Projects built:
      - Produce a full annotated summary and terminology glossary for the current case study
    - Practice: Structured questions drawn directly from the case study material
  - Case Study Depth and Application
    - Topics:
      - Linking case study technology back to Theme A concepts
      - Preparing evidence-based extended answers
      - Handling unfamiliar terminology under exam pressure
      - Evaluating solutions proposed within the case study
      - Practising the specific command terms it attracts
    - Projects built:
      - Write two full extended responses on the case study and mark them against the criteria
    - Practice: Timed case-study responses with feedback
    - Assessment: A timed case-study section under Paper 1 conditions
  - Computational Thinking
    - Topics:
      - Decomposition, pattern recognition, abstraction and algorithm design
      - Thinking through a problem before writing any code
      - Representing a solution as pseudocode and as a flowchart
      - Tracing an algorithm accurately with a trace table
      - Why this thinking is now explicitly assessed in the IA
    - Projects built:
      - Take one problem from analysis through to a fully traced algorithm, documenting each thinking step
    - Practice: 10 algorithm-design and trace-table tasks

```
    Algorithms and Efficiency
      Topics:
        - Standard algorithms: searching and sorting
        - Comparing algorithms on efficiency rather than preference
        - Arrays and collections and when each is right
        - Recursion at the depth the guide expects
        - Explaining why one algorithm beats another for a given case
      Projects built:
        - Implement and compare two searching or sorting algorithms on the same data and report the
          difference
      Practice: 10 algorithm and efficiency questions

----------------------------------------------------------------
PHASE 3: PROGRAMMING, THE INTERNAL ASSESSMENT AND EXAM MASTERY
----------------------------------------------------------------
Theme B in code, the computational solution built properly, and both papers drilled under
timed conditions.

  Month 5: Programming and Object-Oriented Programming (Weeks 17-20)
    Programming Fundamentals in Your Paper 2 Language
      Topics:
        - Variables, data types, input and output
        - Selection and iteration, and nesting them cleanly
        - Writing readable code that a marker can follow
        - Python by default, Java supported, matching the version of Paper 2 your school chose
        - Debugging as a method rather than guesswork
      Projects built:
        - Write and run a complete program that solves a described problem end to end
      Practice: 12 short programs, each tested with your own test data
    Data Structures and File Handling
      Topics:
        - Arrays, lists and dictionaries or maps
        - Two-dimensional structures and traversing them
        - Reading from and writing to files
        - Choosing the right structure for the problem
        - Handling errors and unexpected input
      Projects built:
        - Build a program that loads data from a file, processes it and writes a result
      Practice: 10 data-structure and file-handling programs
    Object-Oriented Programming (SL and HL)
      Topics:
        - Classes and objects, and why OOP exists
        - Encapsulation with private fields and accessor methods
        - Inheritance and polymorphism at guide depth
        - Designing a small class hierarchy for a real problem
        - Why OOP is now studied at both SL and HL under the new guide
      Projects built:
        - Design and implement a small object-oriented solution with at least two related classes
      Practice: 8 OOP design-and-implement tasks
      Assessment: A timed programming assessment covering structures and OOP
    Starting the Internal Assessment
      Topics:
        - What the computational solution actually requires
        - Choosing a problem with a real client and genuine scope
        - Planning: success criteria, record of tasks, design
        - The new emphasis on evidencing the computational thinking process
        - Common IA mistakes that cost marks before a line of code is written
      Projects built:
        - Agree an IA problem with a real client and complete the planning and design documentation
      Practice: Draft planning documents reviewed against the assessment criteria

  Month 6: Completing the IA and Full Exam Practice (Weeks 21-24)
    Building and Documenting the Solution
      Topics:
        - Developing the solution in stages against the success criteria
        - Documenting techniques used, with justification
        - Evidencing the computational thinking process as the new guide expects
        - Testing with real data and recording the outcomes
        - Keeping the record of tasks honest and current
      Projects built:
        - Build the working solution and complete the development documentation
      Practice: Weekly IA checkpoints against the published criteria
    Finishing the IA and the Video
      Topics:
        - Evaluating the solution against every success criterion
        - Client feedback and honest recommendations for improvement
        - Producing the required video demonstration
        - Final checks on structure, evidence and word limits
        - Academic honesty and correct referencing
```

Projects built:
- Complete and submit the full internal assessment package

Practice: Final IA review against every criterion

Assessment: Full IA marked against the official criteria with written feedback

Paper 1 Technique

Topics:
- How Paper 1 is structured under the new assessment model
- IB command terms: state, describe, explain, compare, evaluate, and what each is worth
- Structuring an extended response so every mark is reachable
- Handling the case study section confidently
- Managing time so the long questions are not rushed

Projects built:
- A full timed Paper 1, reviewed question by question with every miss tagged by cause

Practice: Two timed Paper 1 attempts, fully reviewed

Paper 2 and Full Mocks

Topics:
- How Paper 2 tests algorithmic thinking rather than recall
- Writing correct code by hand under time
- Reading the problem properly before starting to write
- Full timed mocks on both papers under real conditions
- Turning the error log into a final revision plan

Projects built:
- Two complete mock examinations across both papers, each fully reviewed

Practice: Repeated full mocks until pacing and accuracy are consistent

Assessment: Final full mock on both papers, benchmarked against the target grade

HOW A TYPICAL WEEK IS SPLIT

Homework: A task or problem set after every class, and a monthly mixed-review assignment that deliberately folds in earlier topics

CERTIFICATION DETAIL

Completion: Certificate from Modern Age Coders, awarded on passing the final assessment. Fall short and there is focused revision and a free retest: the certificate certifies real learning, not attendance

WHERE THIS CAN LEAD

- Strong SL or HL Computer Science grades under the new assessment model
- A completed internal assessment that is genuinely the student's own work
- Real programming ability in Python or Java
- A credible foundation for a computer science or engineering degree application
- Computational thinking that transfers across the whole Diploma

COMMON QUESTIONS ABOUT THIS COURSE

For anything about cost, use PART 4 and RULE 1. Do not quote two regions.

Q: Is this course taught to the new IB Computer Science guide?
A: Yes. The new DP Computer Science guide was launched in February 2025 for first teaching in August 2025, with first assessment in May 2027. We teach that structure: Paper 3 removed at both SL and HL, options no longer available, the case study covered by SL and HL students and assessed within Paper 1, and databases and object-oriented programming studied at both levels.

Q: What actually changed from the old syllabus?
A: The biggest changes are that Paper 3 has been removed entirely at both SL and HL, the options are gone, the case study now applies to SL students too and is assessed inside Paper 1, and databases and OOP are now studied at both SL and HL rather than being HL territory. The internal assessment remains a computational solution but with a new emphasis on documenting the computational thinking process.

Q: Do you teach Python or Java for Paper 2?
A: Both are supported. The new guide runs two separate versions of Paper 2, one in Python and one in Java, and schools choose which at department level. We teach Python by default because most students find it clearer, and we teach Java for students whose school selected that version. Tell us which your school chose and we place your child accordingly.

Q: Can you help with the internal assessment?
A: Yes, and we start it early rather than rescuing it at the end. We support choosing a problem with a real client, writing the success criteria, the design and record of tasks, building and documenting the solution, testing, the evaluation, and the video. The new guide puts more weight on evidencing the computational thinking process, so we build that documentation as the work happens. The solution must be the student's own work, and we keep it that way.

Q: My child is taking SL. Is this course still right?
A: Yes. Under the new guide SL students cover the case study, databases and object-oriented

programming too, so the content overlap with HL is larger than it used to be. We teach SL and HL students within the same live batch but to their own required depth, and HL-only extension work is handled separately.

Q: How am I assessed, and is the certificate just for showing up?
A: No. A task follows every class with feedback, monthly reviews deliberately mix new material with earlier topics so nothing is forgotten, and the course ends with a full mock paper as the final assessment. Passing earns the certificate; falling short earns focused revision and a free retest. We measure real learning, not attendance.

To enrol, message Shivam Sir on +91 9123366161 or send the parent this link: https://learn.modernagecoders.com/courses/ib-diploma-computer-science-course
For a demo: the Priority Live Demo (guaranteed, today or tomorrow) is booked at https://learn.modernagecoders.com/priority-demo . The free demo is a waiting list with no fixed date.

==========
COURSE 82 OF 137: IB MATHS AA & AI: SL & HL, LIVE ONLINE WITH IA COACHING
==========

Course link: https://learn.modernagecoders.com/courses/ib-mathematics-aa-ai-masterclass
Subject area: Exam Board Mathematics
Designed for: High school
Who can join: IB DP students (AA & AI, SL & HL) and MYP students heading to the DP
Course length: 24 months (the full Diploma Programme arc)
Time needed: 2 live one-hour classes per week + weekly past-paper work
Certificate: Certificate from Modern Age Coders, awarded on passing the final assessment

PRICE FOR THIS COURSE (quote only the one that applies to the person asking)
In India, per month: group Rs 1,499, mini batch Rs 2,999, one to one Rs 4,999
In Canada, per month: group CAD 140, one to one CAD 210
Anywhere else, per month: group $100, one to one $150
Classes: group and mini batch two live classes a week, eight a month; one to one in India one live class a week, four a month; one to one outside India two live classes a week, eight a month. Each class is one hour.

WHAT THIS COURSE IS

Live online IB Maths course for AA and AI, SL and HL: syllabus-exact teaching, paper-specific technique, GDC fluency and honest IA coaching. Free demo first.

In one line: Your exact course, your exact level, taught to a 7.

ABOUT THE PROGRAMME

A full-Diploma live program matched to the student's actual IB course: Analysis & Approaches or Applications & Interpretation, at SL or HL. IB maths punishes generic tutoring, the two courses examine different things, AA runs a strictly non-calculator paper while AI assumes the GDC everywhere, HL adds an extended problem-solving paper, and the Internal Assessment is worth a fifth of the grade. This masterclass teaches the syllabus for genuine ownership, trains paper-specific technique on real past questions and mark schemes, builds GDC fluency as a scored skill, and coaches the Mathematical Exploration honestly, structure, criteria and critique, with the work staying the student's own under IB academic integrity rules.

WHAT MAKES THIS COURSE DIFFERENT

- Course-exact teaching: AA and AI are different subjects here, as they are on exam day
- Non-calculator craft for AA Paper 1 and GDC power-workflows for AI, each trained deliberately
- The IA coached properly: topic selection against the actual criteria, milestones, mathematical depth and honest draft critique, never ghost-writing
- HL Paper 3 stamina built through olympiad-flavoured problem work
- Predicted-grade awareness: the arc aims at internal assessments too, because those set the number universities see
- MYP-era gaps repaired inline instead of ignored
- One dedicated mentor across the whole two-year arc
- Honest course-fit advice, including 'stay at SL' when that is the truth

THE LEARNING PATH, STEP BY STEP

Phase 1: The shared core built to DP strength: algebra, functions and the toolkit both courses stand on, with MYP debt repaired
Phase 2: Course-specific depth: calculus and proof for AA, statistics, modelling and technology for AI, plus IA season, shepherded
Phase 3: Syllabus completion, paper craft by course and level, HL Paper 3 training and full past-paper cycles into the exam session

WHAT A STUDENT NEEDS BEFORE STARTING

Education: IB DP students (either course, either level) or MYP years 4-5 students heading to

the DP
Math background: Any, the diagnostic finds the real base and MYP-era gaps are repaired inline
Equipment: Computer with stable internet; an IB-approved GDC (we advise on models)
Time commitment: 2 live hours plus 2-3 hours of past-paper and IA work weekly
English: Course taught in English
Motivation: The Diploma provides it; we supply the method and the calm

WHO THIS COURSE IS FOR

Aa students: AA SL/HL students who want the ideas owned and Paper 1 made routine
Ai students: AI SL/HL students who need modelling depth and real GDC fluency
Ia season: Students whose Exploration is drifting and needs structure and honest critique
Hl ambition: HL students building the Paper 3 stamina regular homework never builds
Myp runway: MYP students buying the cheapest IB insurance: a real algebra base

FULL CURRICULUM, WEEK BY WEEK

This is the complete teaching plan. Parents can ask about any week.

PHASE 1: THE SHARED CORE AT DP STRENGTH (MONTHS 1-8)

Both IB courses stand on the same five topic areas. This phase builds number & algebra and functions to Diploma strength, repairs MYP-era gaps inline, and establishes the retrieval and paper habits that a two-year syllabus demands.

Months 1-2: Diagnostic, Course Fit and Algebra at DP Pace (Weeks 1-8)
Diagnostic and Course Fit (AA vs AI, SL vs HL)
Topics:
- Full syllabus-position diagnostic across the five IB topic areas
- Locating MYP-era gaps in algebra and number
- Current GDC habits and calculator setup review
- Evidence-based AA vs AI course comparison
- SL vs HL demand and workload honesty
- Baseline record set up for later progress tracking
Practice: Complete a short mixed diagnostic set and log every gap it exposes into a personal error log.
Detail: Full diagnostic: syllabus position, MYP-era gaps, GDC habits, and an honest course-fit read (AA vs AI, SL vs HL) with evidence
Exponents and Logarithms to DP Fluency
Topics:
- Laws of exponents from first meaning
- Rational and negative indices
- Logarithms as the inverse of exponentials
- Laws of logarithms and change of base
- Solving exponential and logarithmic equations
- Fluency drills that both courses assume
Practice: Work a fluency set converting between exponential and logarithmic form and solving equations without hesitation.
Detail: Exponents, logarithms and the laws that both courses assume, taught from meaning, drilled to fluency
Sequences, Series and Financial Applications
Topics:
- Arithmetic sequences and series
- Geometric sequences and series
- Sigma notation fluency
- Sum to infinity and the idea of convergence
- Compound interest and annuities (an AI favourite)
- Financial modelling contexts on the GDC
Practice: Solve a mixed set that pairs pure sequence questions with a compound-interest financial application.
Detail: Sequences and series: arithmetic, geometric, sigma notation and financial applications (an AI favourite)
Proof and Mathematical Writing Foundations
Topics:
- Direct proof structure
- Clear mathematical writing and notation
- Logical connectives and reasoning
- Counterexamples and disproof
- Deeper proof demands for AA HL
- Setting the standard for written working
Practice: Write out two short direct proofs with full justification and correct notation.
Detail: Proof and reasoning foundations: direct proof and mathematical writing habits (deeper for AA HL)

Months 3-5: Functions, the DP's Load-Bearing Topic (Weeks 9-20)
Function Anatomy: Domain, Range, Composition, Inverses
Topics:

- Domain and range from meaning
- Function notation and evaluation
- Composite functions
- Inverse functions and their graphs
- One-to-one functions and the horizontal-line idea
- Why the whole DP silently assumes this fluency

Practice: Build a reference sheet of domain, range and inverse for a set of standard functions.

Detail: Function anatomy: domain, range, composition and inverses, the material the whole DP silently assumes

Transformations, Quadratics and Polynomials

Topics:
- Translations, stretches and reflections of graphs
- Reading graphs fluently
- Quadratics in vertex, root and factored forms
- The discriminant as an idea, not just a formula
- Polynomial behaviour and the factor theorem
- Sketching to DP depth

Practice: Sketch a family of transformed graphs by hand, then confirm each on the GDC.

Detail: Transformations and graph literacy; quadratics and polynomials to DP depth; the discriminant as an idea

Exponential, Log and Rational Functions with the GDC

Topics:
- Exponential growth and decay models
- Logarithmic functions and scales
- Rational functions and asymptotes
- Modelling contexts drawn from data
- GDC graphing workflow set up properly
- Interpreting features straight from a graph

Practice: Model a given real context with an exponential or rational function and justify the fit on the GDC.

Detail: Exponential, logarithmic and rational functions with modelling contexts; GDC graphing workflows introduced properly

Months 6-8: Geometry, Trigonometry and First Paper Craft (Weeks 21-32)

Trigonometry: Unit Circle to Applied Bearings

Topics:
- Unit circle and exact values (AA depth)
- Trigonometric identities
- Solving trigonometric equations (AA)
- Right-triangle trigonometry (AI emphasis)
- Applied trig with bearings and angles of elevation
- Radian measure introduced

Practice: Complete a split set: AA exact-value and identity work, AI applied bearings problems.

Detail: Trigonometry rebuilt: unit circle, identities and equations (AA depth) / right-triangle and applied trig with bearings (AI emphasis)

Vectors, 3D Geometry and the Sine and Cosine Rules

Topics:
- Vectors and vector operations (AA HL)
- 3D coordinate geometry
- The sine rule in non-right triangles
- The cosine rule and the ambiguous case
- Area of a triangle formula
- Applied problems combining the rules

Practice: Solve a set of non-right-triangle problems, choosing the sine or cosine rule deliberately.

Detail: Vectors (AA HL) and 3D geometry; sine and cosine rules in applied problems

First Past-Paper Season and the Review Ritual

Topics:
- Anatomy of an IB exam question
- Command terms and what they demand
- Reading and applying mark schemes
- Method marks versus answer marks
- The review ritual used for the next eighteen months
- Building the error-log habit

Practice: Sit one short past-paper section under time, then self-mark it against the real mark scheme.

Assessment: End-of-phase checkpoint: a timed past-paper section marked against the official scheme sets the Phase 1 baseline.

Detail: First past-paper season: question anatomy, mark-scheme logic, and the review ritual used for the next eighteen months

---

PHASE 2: COURSE-SPECIFIC DEPTH + THE IA (MONTHS 9-16)

The AA and AI tracks now genuinely diverge: calculus and proof depth for AA, statistics and modelling with full GDC fluency for AI. In the middle of this phase sits IA season, the Mathematical Exploration, coached against the real criteria while remaining the student's own

work.

  Months 9-11: The AA Track / The AI Track (Weeks 33-44)
    AA Differentiation from First Principles / AI Statistics and Regression
      Topics:
        - AA: limits and the idea of a derivative
        - AA: differentiation from first principles
        - AA: derivative toolkit and chain rule mastery
        - AI: descriptive statistics measures
        - AI: correlation and Pearson r
        - AI: linear regression on the GDC
      Practice: AA students differentiate a mixed set including chain-rule cases; AI students run a regression on a dataset and interpret it.
      Detail: AA: limits and differentiation from first principles; the derivative toolkit including chain rule mastery. AI: descriptive statistics, correlation and regression on the GDC
    AA Applications and Integration / AI Probability Distributions
      Topics:
        - AA: tangents and normals
        - AA: optimisation problems
        - AA: kinematics with calculus
        - AA: introduction to integration
        - AI: probability rules and diagrams
        - AI: binomial and normal distributions with interpretation
      Practice: AA students solve an optimisation and a kinematics problem; AI students compute and interpret binomial and normal probabilities.
      Detail: AA: applications, tangents, optimisation, kinematics; introduction to integration. AI: probability, distributions (binomial, normal) and interpretation craft
    AA Integration and Areas / AI Modelling Cycle and Networks
      Topics:
        - AA: integration techniques
        - AA: definite integrals and area under a curve
        - AA: volumes of revolution
        - AI: the modelling cycle, choose, fit, critique, improve
        - AI: matrices and their operations (HL)
        - AI: networks and graph theory (HL)
      Practice: AA students find an area and a volume by integration; AI students fit and critique a model for a given dataset.
      Detail: AA: integration techniques and areas/volumes. AI: modelling cycle, choose, fit, critique and improve a model; matrices and networks (HL)

  Months 12-14: IA Season, the Exploration, Shepherded (Weeks 45-56)
    IA Topic Selection and Proposal
      Topics:
        - The five IA assessment criteria explained
        - Genuine personal engagement
        - Mathematics chosen so it can actually score
        - Scoping a workable exploration question
        - A milestone plan for the IA
        - Academic integrity expectations set from the start
      Practice: Draft three candidate IA questions and test each honestly against the five criteria.
      Assessment: IA milestone: the exploration proposal is locked with a dated milestone plan.
      Detail: Topic selection against the five criteria: personal engagement that is real, mathematics that can score; proposal locked with milestones
    Deepening the IA Mathematics
      Topics:
        - Pushing mathematical rigour in the exploration
        - Meeting the aim criterion
        - Communication and structure standards
        - Correct notation throughout
        - Student-led work with mentor questioning
        - Keeping the exploration honestly the student's own
      Practice: Develop the core mathematics of your exploration and annotate where each criterion is being met.
      Detail: The mathematics deepened: the mentor pushes rigour and aim while the student drives; communication and notation standards set
    IA Draft Critique and Final Polish Plan
      Topics:
        - Honest critique against each criterion
        - Strengthening the reflection
        - Improving communication and presentation
        - The final polish plan
        - Academic integrity kept throughout
        - Self-checking before submission
      Practice: Revise your IA draft against criterion-by-criterion feedback and record the changes you make.
      Assessment: IA milestone: a full draft is reviewed against all five criteria before the

      final polish.
      Detail: Draft critique rounds: honest feedback against each criterion, reflection strengthened, and the final polish plan, the work staying the student's own throughout, per IB academic integrity rules

  Months 15-16: Syllabus Depth Continues (Weeks 57-64)
    AA Further Calculus / AI Hypothesis Testing
      Topics:
        - AA: further integration and differentiation
        - AA HL: deeper techniques and Maclaurin ideas
        - AI: the logic of hypothesis testing
        - AI: chi-squared tests for independence
        - AI: t-tests and interpretation
        - Reading statistical output critically
      Practice: AA students tackle a further-calculus set; AI students run and interpret a chi-squared or t-test.
      Detail: AA: further calculus (HL: deeper techniques, Maclaurin ideas); AI: hypothesis testing, chi-squared and t-tests with interpretation
    HL Paper 3 Investigations Introduced / SL Consolidation
      Topics:
        - HL: the structure of Paper 3 extended investigations
        - HL: harvesting earlier parts of a problem
        - HL: sustaining an unfamiliar investigation
        - SL: consolidation by error-log priority
        - SL: targeted retrieval of weak topics
        - Both: connecting topics across the syllabus
      Practice: HL students attempt one extended investigation; SL students clear their top three error-log items.
      Assessment: End-of-phase checkpoint: HL students are marked on a Paper 3 style investigation and SL students on a targeted consolidation set.
      Detail: HL students of both courses: Paper 3-style extended investigations introduced; SL students: consolidation cycles by error-log priority

---
PHASE 3: SYLLABUS CLOSE + PAPER CRAFT TO EXAM SESSION (MONTHS 17-24)

The remaining syllabus is closed with margin, then the program becomes exam craft: papers by course and level, calculator and non-calculator discipline, HL Paper 3 stamina, and full timed cycles that peak in the exam session, with predicted-grade checkpoints along the way.

  Months 17-19: Closing the Syllabus with Margin (Weeks 65-76)
    Closing the Final Syllabus Topics
      Topics:
        - Remaining probability and statistics (AA)
        - Remaining calculus for AI HL
        - Kinematics and applied problems
        - Any outstanding course-specific topics
        - Topics taught early enough to settle
        - Linking new topics back to earlier work
      Practice: Complete a set on the last new topics for your exact course and level.
      Detail: Final syllabus topics per course and level, taught early enough to settle: remaining probability/statistics (AA), remaining calculus for AI HL, kinematics and applications
    Full-Syllabus Connection Map and Spaced Retrieval
      Topics:
        - Building a personal syllabus connection map
        - Linking the five topic areas
        - Scheduling spaced retrieval
        - Interleaving topics in practice
        - Identifying weak links to revisit
        - Preparing for full paper cycles
      Practice: Build a one-page connection map of the whole syllabus and schedule your spaced retrieval.
      Detail: Full-syllabus connection map built by the student; spaced retrieval cycles across all five topic areas

  Months 20-22: Paper Craft by Course and Level (Weeks 77-88)
    AA Paper 1 Non-Calculator Craft / AI GDC Speed
      Topics:
        - AA: exact-value fluency
        - AA: structure recognition inside questions
        - AA: clean written working for method marks
        - AI: GDC speed workflows
        - AI: efficient graphing, solving and regression
        - Acceptable use of technology
      Practice: AA students complete a non-calculator set; AI students time their GDC workflows on typical questions.
      Detail: AA Paper 1 non-calculator craft: exact values, structure recognition and clean written working. AI: GDC speed workflows for every paper

Paper 2 Technique and Time Allocation
Topics:
- Strategy for extended structured questions
- Method-mark discipline
- Time allocation from personal data
- Recovering from a stuck part
- Presentation that earns follow-through marks
- GDC use within Paper 2
Practice: Sit a Paper 2 section and log your time per question to set personal pacing targets.
Detail: Paper 2 technique: extended structured questions, method-mark discipline and time allocation from personal data
HL Paper 3 Stamina and Investigation Craft
Topics:
- Long unfamiliar investigations
- Harvesting earlier parts to reach later ones
- Keeping momentum through difficulty
- Managing time across a long problem
- The calm that stamina training buys
- Reviewing Paper 3 against the scheme
Practice: Complete a full HL Paper 3 style investigation under time and review it against the mark scheme.
Detail: HL Paper 3: long unfamiliar investigations, harvesting earlier parts, keeping momentum, and the calm that stamina training buys

Months 23-24: Full Cycles and the Exam Session (Weeks 89-96)
Full Timed Past-Paper Cycles
Topics:
- Full timed past-paper cycles
- Papers for the exact course and level
- Marking against real mark schemes
- Error-log closure
- Spotting patterns across mistakes
- Refining exam-day strategy
Practice: Sit a full timed paper, self-mark it, and close the error-log items it reveals.
Assessment: Mock checkpoint: full timed papers are marked against official schemes and score progression is recorded.
Detail: Full timed past-paper cycles by exact course and level, reviewed against real mark schemes; error-log closure
Peak Plan and the Exam Session
Topics:
- Final targeted consolidations
- Rest and recovery discipline
- Exam-day routines
- GDC and materials checklist
- Managing nerves through rehearsal
- Meeting the session as a rehearsed place
Practice: Run a final light consolidation and rehearse your full exam-day routine.
Assessment: The IB examination session: papers are sat for the student's exact course and level.
Detail: Peak plan: final consolidations, rest discipline, exam-day routines, and the session met as a rehearsed place

PROJECTS THE STUDENT BUILDS AND KEEPS

- Two-year error log and syllabus map, maintained by the student
- The Mathematical Exploration (IA), coached against the real criteria
- GDC workflow library (AI) / exact-value fluency system (AA)
- Self-graded past-paper portfolio against real mark schemes
- Full timed paper cycles with documented score progression

Total projects: The IA plus 5+ exam artifacts

SKILLS THE STUDENT WILL HAVE AT THE END

- Algebra, functions and trigonometry at DP strength
- AA: calculus, proof and non-calculator craft
- AI: statistics, modelling and GDC power-workflows
- Mark-scheme literacy and method-mark discipline
- HL Paper 3 stamina and investigation technique
- IA construction against the five criteria
- Predicted-grade exam readiness
- Two-year retrieval and revision systems

HOW A TYPICAL WEEK IS SPLIT

Live classes: 2 one-hour live classes with your mentor
Past paper work: Weekly question sets from your exact course and level

Ia season: Milestone check-ins during Exploration months
Total per week: About 4-5 focused hours
Homework: A problem set after every class, and a monthly mixed-review assignment that deliberately folds in earlier topics

SUPPORT INCLUDED

Live sessions: 8 live one-hour classes every month, 2 per week
Mentorship: One dedicated mentor across the whole Diploma
Recordings: Every class recorded for revision
Progress tracking: Paper-score progression + IA milestones shared with parents
Flexibility: Intensity adjusts around mocks, IA deadlines and the exam session

CERTIFICATION DETAIL

Completion: Certificate from Modern Age Coders, awarded on passing the final assessment. Fall short and there is focused revision and a free retest: the certificate certifies mastery, not attendance

WHERE THIS CAN LEAD

- An IB maths grade that holds predicted grades and university offers
- AA route: engineering, mathematics, physics and CS degree readiness
- AI route: business, economics and social-science quantitative literacy
- Ready for College Mathematics Masterclass or competition mathematics

COMMON QUESTIONS ABOUT THIS COURSE

For anything about cost, use PART 4 and RULE 1. Do not quote two regions.

Q: Do you teach both AA and AI, at both SL and HL?
A: Yes, and separately, because they are genuinely different courses. The mentor teaches your student's exact registration: AA's algebraic, proof-flavoured, calculus-heavy road or AI's modelling, statistics and technology-first road, at the right level. The free demo doubles as a course-fit consult if the choice is still open. (Agent note: the free demo is a waiting list with no fixed date. The Priority Live Demo is a guaranteed class today or tomorrow, booked at https://learn.modernagecoders.com/priority-demo . Offer both, as RULE 3 says.)

Q: How does the IA coaching work, and how far is too far?
A: We coach the Mathematical Exploration properly: topic selection against the actual criteria, structure, pushing the mathematics deep enough to score, and honest critique of drafts. Done right, it is the most coachable 20% of the grade.

Q: My AA student falls apart on the non-calculator paper. Fixable?
A: Very. Paper 1 skill is mostly exact-value fluency plus structure recognition, seeing the quadratic inside the exponential equation. Both are trained, not innate, and every AA class includes non-calculator work so Paper 1 becomes routine long before the exam.

Q: Do you teach GDC (graphing calculator) skills?
A: As a first-class skill, because AI examines it and AA's Paper 2 rewards it: efficient graphing, solving and regression workflows, and knowing what counts as acceptable use of technology. AI students who underuse the GDC leave marks and minutes on the table.

Q: Can you help before predicted grades are set?
A: That is the highest-leverage timing in the IB, predictions ride on school assessments, so a focused arc aimed at the next internal exams moves the number universities actually see. Start earlier than feels necessary; predictions harden sooner than most families expect.

Q: My child is in the MYP. Is this course relevant yet?
A: Yes, MYP students join the Phase 1 material aimed at arriving in the DP with the algebra and functions base both courses silently assume. It is the cheapest IB maths insurance there is.

Q: How am I assessed, and is the certificate just for showing up?
A: No. A problem set follows every class with written feedback, monthly reviews deliberately mix new material with earlier topics so nothing is forgotten, and the course ends with full mock papers as the final assessment. Passing earns the certificate; falling short earns focused revision and a free retest. We measure real understanding, not attendance.

Q: Can we try it before paying?
A: Yes. Every student starts with a free live demo class that doubles as the diagnostic and course-fit consult, no card details, no obligation.

To enrol, message Shivam Sir on +91 9123366161 or send the parent this link: https://learn.modernagecoders.com/courses/ib-mathematics-aa-ai-masterclass
For a demo: the Priority Live Demo (guaranteed, today or tomorrow) is booked at https://learn.modernagecoders.com/priority-demo . The free demo is a waiting list with no fixed date.

==========

COURSE 83 OF 137: ICSE COMPUTER APPLICATIONS (CLASS 9-10): JAVA WITH BLUEJ

==========

Course link: https://learn.modernagecoders.com/courses/icse-computer-applications-java-bluej-course
Subject area: ICSE Computer Applications
Designed for: Teens
Who can join: ICSE Class 9 and 10 students taking Computer Applications; taught from the basics, no prior coding required
Course length: Class 9 and 10 board program, monthly enrolment
Time needed: 2 live classes/week + weekly BlueJ practice
Certificate: Certificate from Modern Age Coders, awarded on passing the final assessment

PRICE FOR THIS COURSE (quote only the one that applies to the person asking)
  In India, per month: group Rs 1,499, mini batch Rs 2,999, one to one Rs 4,999
  In Canada, per month: group CAD 140, one to one CAD 210
  Anywhere else, per month: group $100, one to one $150
  Classes: group and mini batch two live classes a week, eight a month; one to one in India one live class a week, four a month; one to one outside India two live classes a week, eight a month. Each class is one hour.

WHAT THIS COURSE IS

  Live online ICSE Computer Applications classes for Class 9 and 10, taught in Java with BlueJ and aligned to the current CISCE 100+100 scheme, so students write their own programs and score in both the theory paper and the internal assessment.

  In one line: A real Java course, taught in BlueJ and aligned to the current CISCE scheme, that ends in top marks in both the theory paper and the internal assessment, because your child can actually write programs, not just reproduce them.

ABOUT THE PROGRAMME

  ICSE Computer Applications is taught in Java using the BlueJ environment, and it is the subject where students who genuinely understand code pull away from the ones who memorise programs. This course treats it as a real first programming course, because that is exactly what it is: your child leaves able to write Java, read an error, and solve a problem they have not seen before, which is what the board paper actually asks for. It is also taught to the scheme as it stands now. CISCE marks Computer Applications on a 100 plus 100 basis, unlike the usual 80 plus 20: a 100-mark external theory paper and a 100-mark internal assessment made up of practical lab work and a written project on Disruptive Technologies. Many students lose easy marks on the internal assessment simply because nobody prepared them for it, so we treat both halves seriously from day one. The programme follows the ICSE Class 9 and 10 Computer Applications syllabus in order. It begins with object-oriented thinking and Java from nothing, moves through conditionals, loops and nested loops, then into the Class 10 core: classes as the basis of computation, user-defined methods, constructors, the library and wrapper classes, encapsulation, single and double dimensional arrays, and string handling. Alongside the theory, every student builds a proper practical file of at least fifteen BlueJ assignments and the Disruptive Technologies project, and drills the two-section board paper until earning marks is a habit. Every class is live and small, and every concept is practised by writing code in BlueJ, because that is the only way this subject is ever actually learned.

WHAT MAKES THIS COURSE DIFFERENT

  - Aligned to the current CISCE 100 plus 100 scheme: a 100-mark theory paper and a 100-mark internal assessment, so we prepare your child for both halves, not just the written exam most classes stop at
  - Taught in BlueJ (version 5.4.2 or higher on JDK 11 or higher), the exact environment used in school and the board practical exam, so nothing on exam day is unfamiliar
  - The internal assessment is taken seriously: your child builds a real practical file of at least fifteen lab assignments plus the written project on Disruptive Technologies, worth a full 100 marks
  - A real Java course, not rote learning: students stop memorising programs and start writing their own, which is exactly what Section B of the paper rewards
  - Board paper technique drilled directly: the compulsory Section A short answers and the answer-any-four programs of Section B, practised against real board-style questions
  - Live, small batches where your child writes code during class and gets it reviewed, not lecture videos watched alone

THE LEARNING PATH, STEP BY STEP

  Phase 1: Java and OOP from scratch in BlueJ, the Class 9 core: objects and classes, data types, operators, input, the Math library, conditionals, and loops including nested loops
  Phase 2: The Class 10 core: the class as the basis of computation, user-defined methods, constructors, library and wrapper classes, and encapsulation
  Phase 3: Arrays and string handling, the full practical file and Disruptive Technologies project, and complete board theory and BlueJ practical exam mastery

WHAT A STUDENT NEEDS BEFORE STARTING

  Title: What Your Child Needs to Start

WHO THIS COURSE IS FOR

  Title: Who This Course Is For

FULL CURRICULUM, WEEK BY WEEK

  This is the complete teaching plan. Parents can ask about any week.

  PHASE 1: JAVA AND OOP FOUNDATIONS, THE CLASS 9 CORE (IN BLUEJ)

  Object-oriented thinking and Java built from nothing in BlueJ, then the Class 9 Computer
  Applications syllabus in order: the base everything in Class 10 stands on.

    Month 1: Object-Oriented Thinking and Java Basics (Weeks 1-4)
      Introduction to OOP and the BlueJ Environment
        Topics:
          - What object-oriented programming means: objects, classes, and why Java is built around them
          - The principles behind OOP the syllabus names: abstraction, encapsulation, inheritance and
            polymorphism, explained in plain language
          - Setting up BlueJ (version 5.4.2 or higher on JDK 11 or higher), the exact tool used in school
            and the board practical
          - The anatomy of a Java program: class, main method, statements and semicolons
          - The compile-and-run cycle in BlueJ, and reading your first error messages without fear
        Projects built:
          - First BlueJ program: create a class, compile it, and run a method that prints a short
            formatted output
        Practice: 8 short exercises creating and running simple classes in BlueJ, reading each
        error message and fixing it
      Elementary Concept of Objects and Classes, Values and Data Types
        Topics:
          - Objects as instances of a class, and the class as a blueprint, with real everyday analogies
          - Java's primitive data types: int, double, char, boolean and the rest, and when each is used
          - Literals, identifiers, keywords and the rules for naming, exactly as the paper expects
          - Type size, range and the difference between primitive and reference types
          - Variables, initialisation, and Unicode and ASCII as the syllabus requires
        Projects built:
          - A class that stores and prints details using the correct data type for each field
        Practice: 10 questions classifying data types and choosing the right type for a given
        value, board-question style
        Assessment: A short written check on OOP terms and data types, marked in the board's
        short-answer style
      Operators in Java and Expressions
        Topics:
          - Arithmetic, relational, logical and assignment operators, and operator precedence
          - Increment and decrement, prefix versus postfix, a classic board trap
          - Type conversion: implicit widening and explicit casting, and integer versus real division
          - The conditional (ternary) operator and evaluating mixed expressions by hand
          - Tracing expressions on paper the way Section A questions demand
        Projects built:
          - A simple calculator class that applies each operator and prints the result
        Practice: 12 expression-evaluation questions, predicted on paper then checked in BlueJ
      Input in Java and Mathematical Library Methods
        Topics:
          - Taking input with the Scanner class, the standard the syllabus uses
          - Reading int, double, char and String input cleanly
          - The Math library: pow, sqrt, abs, max, min, round, ceil, floor and random
          - Combining input and Math methods to solve real formulae
          - Common Math-method questions exactly as they appear in the paper
        Projects built:
          - A program that reads values and computes results such as area, simple interest and the roots
            of a quadratic using Math methods
        Practice: 10 input-and-compute programs, each written and run in BlueJ
        Assessment: A timed set on operators, expressions and Math methods, scored in the
        board's style

    Month 2: Conditional and Iterative Constructs (Weeks 5-8)
      Conditional Constructs: if, if-else, if-else-if
        Topics:
          - The if, if-else and if-else-if ladder, and choosing the right form
          - Nested if statements and how to keep them readable
          - Boolean conditions built from relational and logical operators
          - Dry-running a decision program by hand to predict its output
          - Menu-style decision problems as the paper frames them
        Projects built:
          - A program that classifies input, for example grade from marks or category from a value, using
            an if-else-if ladder

Practice: 10 decision programs, each dry-run on paper first then verified in BlueJ
The switch-case Construct
Topics:
- The switch-case statement and when it beats an if-else-if ladder
- The role of break, and the fall-through behaviour when it is missing, a favourite board trap
- The default case and valid switch expression types
- Converting between switch and if-else forms both ways
- Menu-driven programs using switch, exactly as asked in Section B
Projects built:
- A menu-driven program, for example a units converter or a simple arithmetic menu, built with switch-case
Practice: 8 switch-case programs including deliberate missing-break tracing questions
Assessment: A timed check on conditionals covering both if-else and switch, board style
Iteration: for, while and do-while Loops
Topics:
- The for, while and do-while loops and how to convert one into another
- Loop control: initialisation, condition and update, and off-by-one errors
- The entry-controlled versus exit-controlled distinction the paper asks about
- Classic loop programs: sum of a series, factorial, counting digits, reversing a number
- Predicting how many times a loop runs, a common Section A question
Projects built:
- A program producing a series result, for example the sum of a series, factorial, or checking a number for a property
Practice: 12 loop programs, each written three ways with for, while and do-while to build fluency
Nested Loops and Patterns
Topics:
- Nested for loops and how the inner loop runs fully for each outer step
- Number and star pattern programs, a guaranteed source of Section B marks
- Prime, palindrome, Armstrong and similar number-property programs
- Tracing nested loops on paper to predict the exact output
- Structuring a longer program cleanly so it earns full marks
Projects built:
- A pattern-printing program and a number-property checker, both built with nested loops
Practice: 10 nested-loop and pattern programs at board difficulty
Assessment: End-of-phase test: a Section-A-style short-answer set plus two Section-B-style programs, scored on the board rubric

---
PHASE 2: THE CLASS 10 CORE, CLASSES, METHODS AND ENCAPSULATION

The heart of the Class 10 syllabus: writing your own classes, methods and constructors, and using the library and wrapper classes the paper depends on.

Month 3: Classes, User-Defined Methods and Constructors (Weeks 9-12)
The Class as the Basis of All Computation
Topics:
- Revisiting objects and classes as the foundation of everything in Class 10
- Instance variables and methods, and the state and behaviour of an object
- Access specifiers: private, public and protected, and why they matter
- Creating objects and calling methods, and the role of the main method
- Reading a full class definition the way a Section B question presents it
Projects built:
- A complete class, for example a Student or BankAccount, with fields and methods, created and used from main
Practice: 8 exercises writing and using small classes in BlueJ
User-Defined Methods
Topics:
- Declaring methods: return type, name, parameters and body
- Parameters and arguments, and returning a value versus void
- Pure and impure methods, and call by value as the syllabus frames it
- Method overloading and how the compiler picks a version
- The static keyword and the difference between static and instance methods
Projects built:
- A class with several overloaded and value-returning methods, each tested from main
Practice: 10 method-writing questions, including overloading and pure-versus-impure identification
Constructors
Topics:
- What a constructor is and how it differs from a method
- Default, parameterised and copy constructors
- Constructor overloading and choosing the right one at object creation
- How constructors initialise object state cleanly
- Constructor questions exactly as the board asks them
Projects built:
- A class with default, parameterised and copy constructors, demonstrated by creating objects several ways
Practice: 8 constructor programs and a set of spot-the-difference method-versus-constructor questions

Assessment: A timed check on classes, methods and constructors, marked on the board rubric

Encapsulation and Clean Class Design

Topics:

- Encapsulation: private fields with public accessor and mutator methods
- Why data hiding protects an object and earns design marks
- Designing a class so its methods fully control its state
- Reading and completing a partially written class, a common Section B format
- Good naming and structure that make a program easy to mark

Projects built:

- An encapsulated class with private fields and get and set methods, used safely from outside

Practice: 8 class-completion questions in the board's fill-in-the-method style

Month 4: Library Classes, Wrapper Classes and Characters (Weeks 13-16)

Library Classes and Wrapper Classes

Topics:

- What the Java library provides and why we do not reinvent it
- Wrapper classes: Integer, Double, Character and the rest, and why they exist
- Autoboxing and unboxing in plain terms
- Converting between primitive types and their wrapper objects
- Parsing a String to a number with parseInt and parseDouble

Projects built:

- A program that reads numeric text input, parses it with wrapper methods, and computes a result

Practice: 8 wrapper-class and parsing questions in board format

Character and Case Handling

Topics:

- The char type, and ASCII and Unicode values
- Character methods: isDigit, isLetter, isUpperCase, isLowerCase, toUpperCase, toLowerCase
- Converting characters to and from their integer codes
- Counting vowels, consonants, digits and spaces, a classic program
- Character-based Section A questions and how to answer them precisely

Projects built:

- A program that scans text and reports counts of vowels, consonants, digits and other characters

Practice: 10 character-method programs and code-value tracing questions

Assessment: A timed set on library, wrapper and character methods, board style

Building the Practical File, Part One

Topics:

- The internal assessment: how the 100 practical marks are actually earned
- What makes a good lab assignment: clear design, correct implementation and testing
- Writing assignments that each demonstrate a theory concept, as CISCE requires
- Documenting a program properly: purpose, variable description and output
- Starting the required set of at least fifteen assignments for the year

Projects built:

- The first several formal BlueJ lab assignments, written up to internal-assessment standard

Practice: Assignment write-ups reviewed and corrected to the standard a school and CISCE expect

The Disruptive Technologies Project

Topics:

- The written project on Disruptive Technologies that carries part of the internal assessment
- Choosing a genuine topic, for example AI, blockchain, IoT or robotics
- Structuring the project: what it is, how it works, and its real-world impact
- Writing in the student's own words, honestly and clearly, not copied
- Presenting the project so it earns full internal-assessment marks

Projects built:

- A complete, well-structured written project on a chosen disruptive technology

Practice: Draft, review and finalise the project to internal-assessment standard

Assessment: End-of-phase test: a mixed Section-A and Section-B paper plus a practical-file review

---

PHASE 3: ARRAYS, STRINGS AND FULL BOARD AND PRACTICAL MASTERY

The last major syllabus topics, then the whole subject brought together: the two-section theory paper and the BlueJ practical exam, drilled until top marks are a habit.

Month 5: Arrays and String Handling (Weeks 17-20)

Single Dimensional Arrays

Topics:

- Declaring, creating and initialising a single dimensional array
- Traversing an array with a loop, and reading and printing elements
- Finding the sum, maximum, minimum and average of an array
- Linear search and simple frequency counting
- Array questions exactly as Section B presents them

Projects built:

- A program that reads a set of values into an array and reports statistics and a searched value

Practice: 10 single-dimensional-array programs at board difficulty

Sorting and Searching in Arrays
Topics:
- Bubble sort and selection sort, the two the syllabus expects, step by step
- Binary search on a sorted array and why order matters
- Tracing a sort or search pass by pass, a common Section A question
- Choosing the right technique for a given problem
- Writing a full sort-or-search program cleanly for maximum marks

Projects built:
- A program that sorts an array with bubble or selection sort, then binary-searches it

Practice: 8 sorting and searching programs, plus pass-by-pass tracing questions

Double Dimensional Arrays
Topics:
- Declaring and using a two dimensional array as rows and columns
- Nested loops to fill, read and print a matrix
- Row sums, column sums, and the diagonal of a square matrix
- Common matrix programs the paper sets
- Keeping a two-dimensional program readable so it earns full marks

Projects built:
- A matrix program that fills a two dimensional array and reports row, column and diagonal totals

Practice: 8 double-dimensional-array programs

String Handling
Topics:
- The String class and common methods: length, charAt, substring, indexOf, equals and compareTo
- toUpperCase, toLowerCase, trim, replace and concatenation
- Reversing a string, checking a palindrome, and counting words
- Comparing strings correctly, equals versus the double-equals trap
- String programs exactly as Section B frames them

Projects built:
- A text program that reverses input, checks for a palindrome, and counts words and characters

Practice: 10 string-handling programs at board difficulty
Assessment: A timed set covering arrays and strings, scored on the board rubric

Month 6: Board Theory and BlueJ Practical Exam Mastery (Weeks 21-24)
The Theory Paper: Section A Technique
Topics:
- How the 100-mark theory paper is structured across its two sections
- Section A: the compulsory short-answer questions and how to earn every mark
- Precise definitions, output prediction and one-line answers the way examiners want them
- Common Section A traps: operator precedence, missing break, loop counts and casting
- Timing Section A so Section B gets the minutes it needs

Projects built:
- A full Section A attempt under time, then a question-by-question review

Practice: Two timed Section A sets, each fully reviewed with every miss tagged by cause

The Theory Paper: Section B Programs
Topics:
- Section B: answering any four of the program questions, and choosing the right four
- Structuring a full program answer so partial marks are never lost
- Writing clean, commented code by hand under exam conditions
- Handling the class-design, array and string programs that recur every year
- Checking a written program for the small errors that cost marks

Projects built:
- A full Section B attempt of four hand-written programs, marked on the official rubric

Practice: Timed Section B sets across class, array and string program types

The BlueJ Practical Exam and the Internal Assessment
Topics:
- How the school and board practical works in BlueJ, and what is expected
- Writing, compiling, testing and correcting a program under time in BlueJ
- Finalising the practical file of at least fifteen assignments and the project
- Reading a practical problem correctly and planning before coding
- Debugging calmly when a program does not compile the first time

Projects built:
- A full mock practical: solve an unseen problem end to end in BlueJ under exam time

Practice: Repeated timed BlueJ practicals on unseen problems, each reviewed
Assessment: A complete mock practical scored like the real one, with the practical file signed off

Full Mock Board Exams and Final Polishing
Topics:
- Full-length timed mock theory papers under real conditions
- Turning the error log from every mock into a focused revision plan
- Locking in the recurring high-mark programs so they are automatic
- A calm, tested routine for both the theory paper and the practical
- A clear, honest read on the target grade and the final push to reach it

Projects built:
- Two full mock board papers, each fully reviewed and converted into a revision list

Practice: Repeated full mocks until pacing and accuracy are consistent
Assessment: Final full mock board paper, scored and benchmarked against the target grade

HOW A TYPICAL WEEK IS SPLIT

  Homework: A task or problem set after every class, and a monthly mixed-review assignment that deliberately folds in earlier topics

CERTIFICATION DETAIL

  Completion: Certificate from Modern Age Coders, awarded on passing the final assessment. Fall short and there is focused revision and a free retest: the certificate certifies real learning, not attendance

WHERE THIS CAN LEAD

  - A strong ICSE Computer Applications result in both the theory paper and the 100-mark internal assessment
  - A confident move into ISC Computer Science in Class 11 and 12, continuing in Java
  - A genuine foundation for a computer science stream and, later, an engineering or CS degree
  - Transferable problem-solving and logical-thinking skills that help across every subject
  - An early, real head start in programming that compounds for years

COMMON QUESTIONS ABOUT THIS COURSE

  For anything about cost, use PART 4 and RULE 1. Do not quote two regions.

  Q: Is this course aligned to the current ICSE Computer Applications syllabus?
  A: Yes. It follows the CISCE Class 9 and 10 Computer Applications syllabus, taught in Java with BlueJ, and it is built around the current 100 plus 100 scheme: a 100-mark external theory paper and a 100-mark internal assessment made up of practical lab work and a written project on Disruptive Technologies. We prepare your child for both halves, which is where many classes stop short.

  Q: Do you teach in BlueJ, the environment used in school?
  A: Yes. We teach Java in BlueJ, version 5.4.2 or higher on JDK 11 or higher, which is the same environment used in school and in the board practical exam. Your child writes, compiles and tests real programs in it from the first class, so nothing on exam day is unfamiliar.

  Q: How does the 100-mark internal assessment work, and do you prepare for it?
  A: Computer Applications is marked out of 200: a 100-mark theory paper and a 100-mark internal assessment. The internal assessment comes from practical lab work, at least fifteen assignments across the year, plus a written project on Disruptive Technologies. We build the practical file and the project properly with your child, so the full 100 internal marks are genuinely earned, not left to chance.

  Q: My child finds Computer Applications confusing at school. Can this help?
  A: This is exactly who the course is for. Most confusion comes from memorising programs without understanding them, so the moment the logic changes, a student is stuck. We teach the concepts from the basics, in a small live batch, until your child can write their own programs. That understanding shows up directly in both the paper and the practical.

  Q: Can a Class 9 student join, or is it only for Class 10?
  A: Both. A Class 9 student builds the foundations in order, which makes Class 10 far easier. A Class 10 student joins with a quick, solid revision of the Class 9 core and then moves into the Class 10 topics and full board preparation. We place your child at the right point after the demo class.

  Q: How am I assessed, and is the certificate just for showing up?
  A: No. A task follows every class with feedback, monthly reviews deliberately mix new material with earlier topics so nothing is forgotten, and the course ends with a full mock paper as the final assessment. Passing earns the certificate; falling short earns focused revision and a free retest. We measure real learning, not attendance.

  Q: Will this help with ISC Computer Science later?
  A: Yes. ISC Computer Science in Class 11 and 12 continues in Java and builds directly on the Class 9 and 10 foundation, adding topics like recursion, interfaces and exception handling. A student who genuinely understands Computer Applications is set up to do well in ISC, rather than starting from behind.

  To enrol, message Shivam Sir on +91 9123366161 or send the parent this link: https://learn.modernagecoders.com/courses/icse-computer-applications-java-bluej-course
  For a demo: the Priority Live Demo (guaranteed, today or tomorrow) is booked at https://learn.modernagecoders.com/priority-demo . The free demo is a waiting list with no fixed date.

==========
COURSE 84 OF 137: IGCSE COMPUTER SCIENCE (0478): FULL SYLLABUS AND EXAM PREP
==========

Course link: https://learn.modernagecoders.com/courses/igcse-computer-science-0478-course
Subject area: IGCSE Computer Science

Designed for: Teens
Who can join: IGCSE students taking Computer Science 0478; taught from the basics, no prior coding required
Course length: 6 months (24 weeks), joinable any month
Time needed: 2 live classes/week + weekly programming practice
Certificate: Certificate from Modern Age Coders, awarded on passing the final assessment

PRICE FOR THIS COURSE (quote only the one that applies to the person asking)
  In India, per month: group Rs 1,499, mini batch Rs 2,999, one to one Rs 4,999
  In Canada, per month: group CAD 140, one to one CAD 210
  Anywhere else, per month: group $100, one to one $150
  Classes: group and mini batch two live classes a week, eight a month; one to one in India one live class a week, four a month; one to one outside India two live classes a week, eight a month. Each class is one hour.

WHAT THIS COURSE IS

  Live online Cambridge IGCSE Computer Science 0478 classes covering both papers in full: computer systems, algorithms, programming in Python, databases and Boolean logic, with real exam technique.

  In one line: Both papers taught in full, with real programming in Python, so your child understands the subject instead of memorising it.

ABOUT THE PROGRAMME

  Cambridge IGCSE Computer Science is two subjects wearing one name. Half of it is how computers actually work, from binary and data transmission to hardware, networks and emerging technologies. The other half is thinking like a programmer: designing algorithms, writing and correcting real code, querying a database, and reasoning through logic circuits. Students who treat it as a memory subject stall on the second half, because you cannot memorise your way through writing a program you have never seen. This course teaches both halves properly. It follows the current 0478 syllabus (version 5, for examination in 2026, 2027 and 2028) topic by topic, and it is built around the fact that the qualification is assessed by two written papers of equal weight, with no coursework. Paper 1 covers computer systems. Paper 2 covers algorithms, programming and logic. Neither can be neglected, because each is worth exactly half the grade. The six-month structure moves in the syllabus's own order. Months 1 and 2 build computer systems from the ground up: data representation, data transmission and hardware. Months 3 and 4 finish the theory with software, the internet and its uses, and automated and emerging technologies, then add Boolean logic. Months 5 and 6 turn to the programming half: algorithm design, pseudocode, real Python, file handling, databases and SQL, and then full timed exam practice on both papers. Every class is live and small, and every programming concept is practised by actually writing code, because that is the only part of this subject that cannot be faked.

WHAT MAKES THIS COURSE DIFFERENT

  - Both papers taught in full and to equal depth, because each is worth exactly 50 percent of the grade and most students quietly neglect one of them
  - Taught to the current syllabus (0478 version 5, for examination in 2026, 2027 and 2028), so nothing covered is out of date
  - Real programming, not just pseudocode on paper: students write and run genuine Python, which is what makes Paper 2 straightforward instead of frightening
  - The scenario question is prepared for directly: candidates may answer in pseudocode or in Python, Visual Basic or Java, and we drill the choice your child is strongest in
  - Exam technique built in from the start: trace tables, dry runs, test data, and the difference between the marks for stating, applying and evaluating
  - Live, small batches where your child writes code during class and gets it reviewed on the spot, not recorded lectures watched alone

THE LEARNING PATH, STEP BY STEP

  Phase 1: Computer systems foundations: data representation, data transmission and hardware, built from binary upward
  Phase 2: Software, the internet and its uses, automated and emerging technologies, then Boolean logic and logic circuits
  Phase 3: Algorithm design, programming in Python, databases and SQL, then full timed practice on both papers

WHAT A STUDENT NEEDS BEFORE STARTING

  Title: What Your Child Needs to Start

WHO THIS COURSE IS FOR

  Title: Who This Course Is For

FULL CURRICULUM, WEEK BY WEEK

  This is the complete teaching plan. Parents can ask about any week.

PHASE 1: COMPUTER SYSTEMS FOUNDATIONS (PAPER 1 CORE, MONTHS 1-2)

How a computer actually represents, moves and processes information, built from binary upward
so nothing later has to be taken on faith.

  Month 1: Data Representation and Data Transmission (Weeks 1-4)
    Binary, Denary and Hexadecimal
      Topics:
        - Why computers use binary, and what a bit and a byte actually are
        - Converting between denary, binary and hexadecimal in both directions
        - Binary addition, and what overflow means and when it happens
        - Logical binary shifts and their effect on a value
        - Where hexadecimal shows up in practice: error codes, MAC addresses, colour codes
      Projects built:
        - A conversion drill sheet worked by hand, then a short Python script that checks your answers
      Practice: 20 conversion and binary-addition questions at exam difficulty, self-marked
      against worked solutions
    Representing Text, Images and Sound
      Topics:
        - Character sets: ASCII and Unicode, and why Unicode exists
        - How an image is stored: pixels, resolution, colour depth, and the file-size calculation
        - How sound is stored: sampling rate, sample resolution, and the trade-off with quality
        - Calculating file sizes, a guaranteed source of marks
        - Measurements of storage from bit up to terabyte
      Projects built:
        - Calculate the true file size of a given image and sound clip, then verify against a real file
      Practice: 12 file-size and representation calculations, shown with full working
      Assessment: A short written check on number systems and data representation, marked in
      exam style
    Compression and Data Transmission
      Topics:
        - Lossy and lossless compression, and when each is appropriate
        - How run-length encoding works, step by step
        - Data packets: structure, packet switching, and why packets can arrive out of order
        - Serial and parallel transmission, simplex, half-duplex and duplex
        - Universal Serial Bus and where it fits
      Projects built:
        - Compress a sample string by run-length encoding by hand, then reverse it
      Practice: 10 questions on compression and transmission methods, including a
      packet-structure diagram
    Error Detection and Encryption
      Topics:
        - Why errors occur in transmission, and what that means for the receiver
        - Parity checks (odd and even), checksums, echo check and check digits
        - Automatic Repeat reQuest and how acknowledgement works
        - Symmetric and asymmetric encryption explained plainly
        - Why encryption protects data but does not prevent interception
      Projects built:
        - Work a parity check and a check-digit calculation by hand, then break a deliberately
          corrupted example
      Practice: 12 error-detection questions including trace-style parity problems
      Assessment: End-of-month test on data representation and transmission, scored on the
      exam mark scheme

  Month 2: Hardware and Computer Architecture (Weeks 5-8)
    The CPU and the Fetch-Decode-Execute Cycle
      Topics:
        - The von Neumann model and the role of the processor
        - Registers, buses and their purpose in plain language
        - The fetch, decode, execute cycle in order
        - What actually affects CPU performance: clock speed, cores, cache
        - Embedded systems and where they are used
      Projects built:
        - Trace one full fetch-decode-execute cycle for a simple instruction and explain each step in
          your own words
      Practice: 10 architecture questions, including performance-comparison scenarios
    Input, Output and Sensors
      Topics:
        - Common input devices and where each is genuinely appropriate
        - Output devices, including printers and their differences
        - Sensors, what each measures, and their use in monitoring and control systems
        - Choosing the right device for a described scenario, which is how the exam asks it
        - Justifying a choice, since the marks are for the reason, not the name
      Projects built:
        - Specify the input and output devices for a described real system and justify every choice
      Practice: 10 scenario questions where the marks come from justification
    Memory and Storage

      Topics:
        - RAM and ROM, and the difference that actually matters
        - Virtual memory: what it is and why it is used
        - Magnetic, optical and solid state storage, and how each physically works
        - Comparing storage types on capacity, speed, portability and durability
        - Cloud storage, with its genuine advantages and real drawbacks
      Projects built:
        - Build a comparison table of storage types and defend a recommendation for a given user
      Practice: 10 memory and storage questions including comparison and justification
    Network Hardware and the Internet Backbone
      Topics:
        - Network interface card, MAC address and IP address, and how they differ
        - Routers and what they actually do
        - IPv4 and IPv6, and why IPv6 exists
        - Public and private IP addresses
        - How this connects to data transmission from Month 1
      Projects built:
        - Map how a request travels from a home device to a web server and back, labelling each
          component
      Practice: 10 networking questions at exam difficulty
      Assessment: End-of-phase test covering all of hardware, scored on the mark scheme

---
PHASE 2: SOFTWARE, THE INTERNET, EMERGING TECHNOLOGIES AND LOGIC (MONTHS 3-4)

The rest of the Paper 1 theory, then Boolean logic, which is the bridge into the programming
half of the course.

  Month 3: Software and the Internet (Weeks 9-12)
    System Software and the Operating System
      Topics:
        - System software versus application software, with clear examples
        - What an operating system actually manages
        - Interrupts: what triggers them and how they are handled
        - The role of the bootstrap on start-up
        - Utility software and what each utility is for
      Projects built:
        - Explain, in your own words, exactly what happens between pressing power and seeing the
          desktop
      Practice: 10 software questions including interrupt scenarios
    Programming Languages, Translators and the IDE
      Topics:
        - High-level and low-level languages, and the real trade-off
        - Assembly language and why it still exists
        - Compilers and interpreters, and the difference in how each reports errors
        - What an Integrated Development Environment gives you
        - Common IDE features and how they help you debug
      Projects built:
        - Run the same short program through an interpreter and observe how errors surface
      Practice: 10 questions comparing translators, with justification marks
      Assessment: A timed check on software, translators and the operating system
    The Internet and Its Uses
      Topics:
        - The internet and the World Wide Web are not the same thing, and the exam tests this
        - URLs, HTTP and HTTPS, and what the S actually secures
        - Web browsers, cookies (session and persistent) and how pages are retrieved and displayed
        - Digital currency and the idea of blockchain, at syllabus depth
        - Why any of this matters for security
      Projects built:
        - Trace what happens from typing a URL to the page rendering, naming every step
      Practice: 10 questions on web technologies and cookies
    Cyber Security
      Topics:
        - The threats named in the syllabus: brute force, data interception, DDoS, hacking, malware,
          phishing, pharming, social engineering
        - How each threat actually works, so the definitions stop blurring together
        - The solutions: access levels, anti-malware, authentication, firewalls, privacy settings,
          proxy servers, SSL
        - Matching the right solution to the right threat, which is how marks are awarded
        - Two-factor and biometric authentication
      Projects built:
        - Build a threat-and-solution table, then answer a scenario recommending and justifying
          protections
      Practice: 12 threat-matching and justification questions
      Assessment: End-of-month test on the internet and cyber security

  Month 4: Automated Systems, Emerging Technologies and Boolean Logic (Weeks 13-16)
    Automated Systems and Robotics
      Topics:

- How sensors, microprocessors and actuators work together in an automated system
- Worked examples across transport, agriculture, weather and lighting
- What characterises a robot, and where robotics is genuinely used
- The real advantages and drawbacks of automation
- Answering these as scenario questions rather than definitions

Projects built:
- Design an automated system for a described situation, naming every sensor and the microprocessor logic

Practice: 8 automated-system scenarios with full explanations

Artificial Intelligence at Syllabus Depth

Topics:
- What artificial intelligence means in this syllabus, precisely
- Narrow, general and strong AI as the syllabus frames them
- The basic characteristics of expert systems and their components
- Machine learning at the level the exam requires, without overreach
- The genuine limitations, so answers stay accurate

Projects built:
- Explain how an expert system reaches a conclusion, using its rule base and inference engine

Practice: 8 questions on AI and expert systems

Logic Gates and Truth Tables

Topics:
- The six gates: NOT, AND, OR, NAND, NOR and XOR
- The symbol, the function and the truth table for each
- Building a truth table correctly and completely, row by row
- Reading a logic statement and identifying the gates involved
- Why this topic is pure marks once the method is automatic

Projects built:
- Produce complete truth tables for all six gates from memory, then verify them

Practice: 12 truth-table exercises building to three-input problems

Logic Circuits and Logic Expressions

Topics:
- Drawing a logic circuit from a written scenario
- Writing the logic expression for a given circuit
- Completing a truth table for a multi-gate circuit without losing rows
- Working backwards from a truth table to the expression
- The common slips that cost marks in this topic

Projects built:
- Take a described safety system, draw its logic circuit, write the expression and complete the truth table

Practice: 10 full logic-circuit problems at exam standard

Assessment: End-of-phase test on emerging technologies and Boolean logic

---

PHASE 3: ALGORITHMS, PROGRAMMING, DATABASES AND EXAM MASTERY (PAPER 2, MONTHS 5-6)

The programming half of the qualification, taught by actually writing code, then both papers drilled under timed conditions.

Month 5: Algorithm Design and Programming (Weeks 17-20)

Algorithm Design, Pseudocode and Flowcharts

Topics:
- The program development life cycle: analysis, design, coding, testing
- Decomposition and abstraction, and structure diagrams
- Writing pseudocode in the style the syllabus expects
- Drawing flowcharts with the correct symbols
- Converting freely between pseudocode and a flowchart

Projects built:
- Take one described problem and express its solution as a structure diagram, pseudocode and a flowchart

Practice: 10 algorithm-design tasks in both pseudocode and flowchart form

Programming Fundamentals in Python

Topics:
- Data types, variables and constants, and declaring them properly
- Input and output, and basic string handling
- Sequence, selection (IF and CASE) and iteration (FOR, WHILE, REPEAT)
- Nested statements and keeping them readable
- Totalling and counting, the two patterns that appear constantly

Projects built:
- Write a working Python program using selection and iteration to solve a real described task

Practice: 12 short programs written and run, each tested with your own test data

Arrays, Procedures, Functions and File Handling

Topics:
- One-dimensional and two-dimensional arrays, and traversing them with loops
- Standard methods: linear search, bubble sort, finding totals, maximum, minimum and average
- Procedures and functions, parameters, and why they matter
- Local and global variables
- Reading from and writing to a text file

Projects built:
- Build a program that reads records from a file into an array, searches and sorts it, and

writes results back
Practice: 10 array and file-handling programs at exam difficulty
Validation, Verification, Test Data and Trace Tables
Topics:
- Validation checks: range, length, type, presence, format, check digit
- Verification, and how it differs from validation
- Choosing normal, abnormal and boundary test data deliberately
- Completing a trace table accurately, a classic source of marks
- Finding the error in someone else's code, which the exam asks directly
Projects built:
- Add full validation to an earlier program, then produce a trace table proving it works
Practice: 10 trace-table and test-data questions, plus 5 find-the-error tasks
Assessment: Timed programming assessment: write, validate and trace a full solution

Month 6: Databases, SQL and Full Exam Practice (Weeks 21-24)
Databases and SQL
Topics:
- Single-table databases: records, fields and the primary key
- Choosing appropriate data types for fields
- SQL: SELECT, FROM, WHERE, ORDER BY
- SUM and COUNT, and when each is wanted
- Reading a described scenario and writing the query it asks for
Projects built:
- Design a single-table database for a described scenario and write the queries that answer real questions about it
Practice: 12 SQL questions building from single conditions to sorted, aggregated queries
Paper 1 Technique
Topics:
- How the theory paper is structured and how the marks are distributed
- Reading the command word: state, describe, explain, compare, justify
- Why a one-word answer loses marks on an explain question
- Managing time so the longer questions are not rushed
- The topics that recur every single year
Projects built:
- A full timed Paper 1 attempt, then a question-by-question review with every miss tagged by cause
Practice: Two timed Paper 1 sets, fully reviewed
Paper 2 Technique and the Scenario Question
Topics:
- How the programming paper is structured, including the extended scenario question
- Choosing your answer language deliberately: pseudocode, Python, Visual Basic or Java
- Structuring a long program answer so partial marks are never lost
- Writing readable code by hand, under time, with comments that earn credit
- Checking a written program for the small errors that cost marks
Projects built:
- A full timed Paper 2 attempt including the extended scenario question, marked on the official scheme
Practice: Timed Paper 2 sets across algorithm, array, file and database question types
Full Mock Exams and Final Polishing
Topics:
- Full-length timed mocks on both papers under real conditions
- Turning the error log from every mock into a focused revision plan
- Locking in the recurring high-mark topics so they are automatic
- A calm, tested routine for both exam days
- An honest read on the target grade and the final push to reach it
Projects built:
- Two complete mock examinations, both papers, each fully reviewed and converted into a revision list
Practice: Repeated full mocks until pacing and accuracy are consistent
Assessment: Final full mock on both papers, scored and benchmarked against the target grade

HOW A TYPICAL WEEK IS SPLIT

Homework: A task or problem set after every class, and a monthly mixed-review assignment that deliberately folds in earlier topics

CERTIFICATION DETAIL

Completion: Certificate from Modern Age Coders, awarded on passing the final assessment. Fall short and there is focused revision and a free retest: the certificate certifies real learning, not attendance

WHERE THIS CAN LEAD

- A strong IGCSE Computer Science grade across both papers
- A confident move into A Level Computer Science or IB Computer Science
- Genuine Python ability, the most transferable skill in the syllabus

  - A real foundation for a computer science degree later
  - Computational thinking that transfers into maths, physics and engineering

COMMON QUESTIONS ABOUT THIS COURSE

  For anything about cost, use PART 4 and RULE 1. Do not quote two regions.

  Q: Is this course aligned to the current IGCSE Computer Science syllabus?
  A: Yes. It follows Cambridge IGCSE Computer Science 0478, version 5, for examination in 2026, 2027 and 2028. It covers both assessed components in full: Paper 1 on computer systems, and Paper 2 on algorithms, programming and logic. There is no coursework in this qualification, so the two papers are the entire grade.

  Q: Which programming language do you teach for Paper 2?
  A: We teach Python, because it is the clearest to read and the most widely used beyond the exam. In the extended scenario question candidates may answer in pseudocode or in Python, Visual Basic or Java, so we make sure your child is fluent in pseudocode too and confident in whichever form they choose to answer in.

  Q: My child is fine at the theory but panics on the programming paper. Can this help?
  A: That is the single most common pattern in this subject, and it is exactly what the course is built to fix. Paper 2 is worth half the grade and cannot be memorised. We teach programming by having your child write and run real code every week, then drill trace tables, test data and the extended scenario question until writing a solution under time feels ordinary.

  Q: Do you cover Boolean logic and databases properly?
  A: Yes, both in full. Boolean logic gets two dedicated weeks covering all six gates, truth tables, drawing circuits from a scenario and writing logic expressions. Databases get a full week on single-table design and SQL, including SELECT, FROM, WHERE, ORDER BY, SUM and COUNT. Both are reliable marks once the method is automatic.

  Q: How long is the course and when can we join?
  A: It runs six months across 24 weeks, with two live classes a week, and you can join in any month. Students already partway through their IGCSE course are placed at the right point after the free demo class, and we fill any gaps from the earlier topics as we go. (Agent note: the free demo is a waiting list with no fixed date. The Priority Live Demo is a guaranteed class today or tomorrow, booked at https://learn.modernagecoders.com/priority-demo . Offer both, as RULE 3 says.)

  Q: How am I assessed, and is the certificate just for showing up?
  A: No. A task follows every class with feedback, monthly reviews deliberately mix new material with earlier topics so nothing is forgotten, and the course ends with a full mock paper as the final assessment. Passing earns the certificate; falling short earns focused revision and a free retest. We measure real learning, not attendance.

  Q: Will this prepare my child for A Level or IB Computer Science?
  A: Yes. The programming, algorithm design and computer-systems foundations here are exactly what A Level Computer Science and IB Computer Science build on. A student who genuinely understands 0478, rather than having memorised it, starts the next qualification ahead instead of behind.

  To enrol, message Shivam Sir on +91 9123366161 or send the parent this link: https://learn.modernagecoders.com/courses/igcse-computer-science-0478-course
  For a demo: the Priority Live Demo (guaranteed, today or tomorrow) is booked at https://learn.modernagecoders.com/priority-demo . The free demo is a waiting list with no fixed date.

==========
COURSE 85 OF 137: IGCSE MATHS: CORE, EXTENDED & ADDITIONAL MATHEMATICS ONLINE
==========

Course link: https://learn.modernagecoders.com/courses/igcse-mathematics-mastery
Subject area: Exam Board Mathematics
Designed for: High school
Who can join: IGCSE students, years 9-11: Core, Extended and Additional Maths
Course length: 18 months (72 weeks), joinable any month
Time needed: 2 live one-hour classes per week + weekly past-paper work
Certificate: Course completion certificate + documented paper-score progression

PRICE FOR THIS COURSE (quote only the one that applies to the person asking)
  In India, per month: group Rs 1,499, mini batch Rs 2,999, one to one Rs 4,999
  In Canada, per month: group CAD 140, one to one CAD 210
  Anywhere else, per month: group $100, one to one $150
  Classes: group and mini batch two live classes a week, eight a month; one to one in India one live class a week, four a month; one to one outside India two live classes a week, eight a month. Each class is one hour.

WHAT THIS COURSE IS

Live online IGCSE Maths course for Cambridge Core, Extended and Additional Mathematics: non-calculator fluency and past-paper technique on real mark schemes.

In one line: Core, Extended or Additional, taught to the top grade, syllabus-exact.

ABOUT THE PROGRAMME

An 18-month live program for IGCSE mathematics, matched to the student's exact board and entry: Cambridge 0580/0980 at Core or Extended tier, Edexcel International GCSE, and Additional Mathematics 0606 for strong students. The tier decision caps or opens grades before a single answer is written, and Cambridge's updated syllabus put a non-calculator paper in front of every candidate, so this course trains bare-hands fluency deliberately, teaches the Extended reach early enough to settle, and converts understanding into marks through past-paper cycles against real mark schemes.

WHAT MAKES THIS COURSE DIFFERENT

- Syllabus-exact: the mentor confirms your school's board and codes first, and teaches to them, 0580/0980, Edexcel 4MA1, or 0606
- Non-calculator fluency trained in every class, because the newer papers examine it and calculator-raised students get caught
- Tier-honest: evidence for the Core-vs-Extended decision, and a real runway from Core-risk to Extended-comfortable
- Additional Maths 0606 taught as the serious second subject it is, the best A-Level preparation on the syllabus list
- Mark-scheme literacy: method marks, follow-through and working discipline taught explicitly
- Understanding-first teaching so mocks stop sliding as content deepens
- One dedicated mentor across the whole IGCSE run
- One full interactive hour per class, twice a week

THE LEARNING PATH, STEP BY STEP

Phase 1: The Core foundation built properly: number, algebra as a language, and calculator-free fluency as a habit
Phase 2: The Extended reach with settling time: functions, trigonometry, vectors and probability at full depth
Phase 3: Additional Maths 0606 for the strong (or Extended consolidation), then past-paper craft into the exam series

WHAT A STUDENT NEEDS BEFORE STARTING

Education: Years 9-11 at an IGCSE school (Cambridge or Edexcel), or equivalent homeschool candidates
Math background: Any, the diagnostic finds the real base; Core-level gaps are repaired before Extended reach
Equipment: Computer with stable internet; a scientific calculator for the calculator papers
Time commitment: 2 live hours plus 1-2 practice hours weekly
English: Course taught in English
Motivation: An exam series on the calendar; we supply the method

WHO THIS COURSE IS FOR

Extended aimers: Students who need the move from Core-risk to Extended-comfortable made real
Top grade hunters: Extended students converting understanding into A*-level marks through paper craft
Add maths: Strong students taking 0606 as their A-Level insurance
Non calc worriers: Calculator-raised students facing the newer bare-hands papers
International families: Families who move countries and need maths that moves with them

FULL CURRICULUM, WEEK BY WEEK

This is the complete teaching plan. Parents can ask about any week.

PHASE 1: THE CORE FOUNDATION, BUILT PROPERLY (MONTHS 1-6)

Everything on the Extended papers stands on Core material owned deeply: number fluency without a calculator, algebra as a language rather than ritual, and the geometry and data basics. The diagnostic finds the real starting point; this phase makes it solid.

Months 1-2: Diagnostic + Number, Bare-Handed (Weeks 1-8)

Diagnostic, Syllabus Code and Tier Fit

Topics:

- Board and syllabus code confirmed: 0580, 0980 or 4MA1
- Core versus Extended tier fit assessed honestly
- Non-calculator fluency screen
- Algebra base measured
- Number and ratio accuracy audit

- Honest starting-grade picture
Practice: A mixed non-calculator and algebra diagnostic set matched to the suspected tier.
Assessment: Baseline grade estimate with a written Core-or-Extended recommendation and a topic-priority map.
Detail: Full diagnostic: board and syllabus code confirmed, tier fit assessed honestly, non-calculator fluency and algebra base measured

Number Fluency Rebuilt
Topics:
- The four operations with fractions
- Decimal calculations without a calculator
- Percentage of, increase, decrease and reverse
- Converting between fractions, decimals and percentages
- Estimation and rounding as a check
- Non-calculator paper territory
Practice: A non-calculator number set with estimation checks on every answer.
Detail: Number fluency rebuilt: fractions, decimals, percentages and estimation as a checking habit, the non-calculator paper's exact territory

Ratio, Proportion and Standard Form
Topics:
- Sharing in a given ratio
- Direct and inverse proportion
- Rates of change in context
- Standard form and its arithmetic
- Standard form at real scale
- Unit conversions
Practice: Ratio, proportion and standard-form questions in applied contexts.
Detail: Ratio, proportion and rates of change; standard form with real scale

Indices, Surds, Bounds and Accuracy
Topics:
- Index laws with negative and fractional powers
- Surds and simplifying (Extended)
- Rationalising and surd arithmetic
- Upper and lower bounds
- Accuracy and significant figures
- Bounds applied in calculations
Practice: An indices, surds and bounds set including accuracy questions.
Detail: Indices and surds from meaning; bounds and accuracy, the quietly examined skills

Months 3-4: Algebra as a Language (Weeks 9-16)
Expressions, Expansion and Factorisation
Topics:
- Simplifying and collecting like terms
- Expanding single and double brackets
- The area model behind expansion
- Factorising into brackets
- Common-factor extraction
- Algebraic notation discipline
Practice: An expand-and-factorise set anchored by area-model diagrams.
Detail: Expressions, expansion and factorisation with the area model underneath

Linear Equations, Inequalities and Formulae
Topics:
- Solving linear equations step by step
- Equations with brackets and fractions
- Solving and representing inequalities
- Number-line representation of solutions
- Changing the subject of a formula
- Reading an equation as a sentence
Practice: Linear equation, inequality and rearrangement questions with worded contexts.
Detail: Linear equations and inequalities read as sentences; changing the subject of formulae

Straight-Line Graphs as One Story
Topics:
- Plotting straight-line graphs
- Gradient understood as a rate
- Intercepts as starting values
- Equation, table and graph as one story
- Finding the equation of a line
- Parallel and perpendicular lines
Practice: Straight-line graph questions linking equation, table and graph.
Detail: Straight-line graphs: gradient as rate, intercepts as starting values, equation, table and graph as one story

Simultaneous Equations and Sequences
Topics:
- Simultaneous equations by elimination
- Simultaneous equations by substitution
- Choosing a method by structure
- Linear and simple non-linear sequences

- Finding and using the nth term rule
- Pattern recognition

Practice: A simultaneous-equations and nth-term set graded by structure.

Detail: Simultaneous equations by structure; sequences and the nth term

Months 5-6: Shape, Space and Data Foundations (Weeks 17-24)

Angle Reasoning and Justification

Topics:

- Angles on lines and around points
- Parallel-line angle rules
- Interior and exterior angles of polygons
- Basic circle angle facts
- Stating a reason for every step
- Multi-step angle chains

Practice: Angle problems requiring a named reason for each step.

Detail: Angle reasoning: parallel lines, polygons and circle basics with justification language

Perimeter, Area, Volume and Pythagoras

Topics:

- Perimeter and area of standard shapes
- Compound and composite shapes
- Volume and surface area of solids
- Pythagoras derived from a picture
- Applying Pythagoras in context
- Units for length, area and volume

Practice: A mensuration set combining compound shapes and Pythagoras problems.

Detail: Perimeter, area and volume including compound shapes; Pythagoras from a picture

Statistics Foundations

Topics:

- Mean, median, mode and range
- Averages from frequency tables
- Bar charts, pie charts and pictograms
- Scatter diagrams and correlation
- Lines of best fit
- Reading data critically

Practice: A statistics set interpreting charts and a scatter diagram.

Detail: Statistics foundations: averages, charts and scatter diagrams read critically

Phase 1 Core-Tier Checkpoint

Topics:

- Full Core-tier paper under timing
- Mark-scheme review of every question
- The review ritual established
- Method-mark awareness introduced
- Error log started from the checkpoint
- Timing across a full paper

Practice: A complete Core-tier paper sat to time, then reviewed against the mark scheme.

Assessment: Core-tier checkpoint paper marked to the mark scheme, establishing the review ritual and the error log.

Detail: Phase checkpoint: a full Core-tier paper under timing, reviewed against the mark scheme, the review ritual for the rest of the course

---

PHASE 2: THE EXTENDED REACH, WITH SETTLING TIME (MONTHS 7-12)

The topics that separate Extended from Core, and top grades from safe passes, taught months before the exam so they are owned, not crammed: functions, trigonometry beyond right angles, vectors, and probability at full depth.

Months 7-8: Quadratics and Functions (Weeks 25-32)

Solving Quadratics Three Ways

Topics:

- Solving by factorising
- Completing the square
- The quadratic formula
- Choosing the method by structure
- Roots and their meaning
- Extended-tier quadratic manipulation

Practice: A quadratics set requiring choice of factorising, completing the square or the formula.

Detail: Quadratic equations by factorising, completing the square and the formula, chosen by structure

Quadratic Graphs and Linear-Quadratic Systems

Topics:

- Sketching quadratic graphs
- Roots, intercepts and symmetry
- Quadratics in real contexts
- Simultaneous linear-quadratic systems
- Solving graphically and algebraically

- Interpreting the parabola
    Practice: Quadratic-graph questions plus simultaneous linear-quadratic systems.
    Detail: Quadratic graphs and real contexts; simultaneous linear-quadratic systems
  Functions: Composite and Inverse
    Topics:
      - Function notation and evaluation
      - Composite functions and order
      - Inverse functions and how to find them
      - Domain and range awareness
      - Common function-mark traps
      - Functions read as meaning
    Practice: A functions set focused on composite and inverse questions.
    Detail: Function notation, composite and inverse functions, read as meaning, where half of all function marks are lost
  Graph Transformations and Graph Literacy
    Topics:
      - Translations and reflections of graphs
      - Recognising graphs from equations
      - Cubic, reciprocal and exponential shapes
      - Reading features from a graph
      - Graph literacy the top questions assume
      - Sketching from key points
    Practice: Graph-transformation and graph-reading questions at Extended standard.
    Detail: Graph transformations and the graph-literacy the top questions assume

Months 9-10: Trigonometry and Vectors at Full Depth (Weeks 33-40)
  Trigonometry: Right Triangles to Sine and Cosine Rules
    Topics:
      - Sine, cosine and tangent ratios
      - Finding sides and angles in right triangles
      - The sine rule
      - The cosine rule
      - Area of a triangle with the sine formula
      - Bearings and applications
    Practice: A trig set moving from right triangles to sine and cosine rule problems.
    Detail: Right-triangle trig consolidated, then the sine and cosine rules with bearing and area applications
  Trig Graphs and Equations
    Topics:
      - Sine, cosine and tangent graphs
      - Features and periodicity of trig graphs
      - Solving simple trig equations
      - Reading solutions from a graph
      - Extended-reach trig contexts
      - Exact values where required
    Practice: Trig-graph and simple trig-equation questions at Extended reach.
    Detail: Trig graphs and solving simple trig equations (Extended reach)
  Vectors and Geometric Proof
    Topics:
      - Vector notation and column vectors
      - Adding and scaling vectors
      - Position vectors and paths
      - Geometry proofs with vectors
      - The classic Extended vector question
      - Proving collinear or parallel points
    Practice: Vector questions building to the classic Extended vector proof.
    Detail: Vectors: notation, geometry proofs and the classic Extended vector question, defanged
  Circle Theorems
    Topics:
      - The main circle theorems
      - Angle at the centre and at the circumference
      - Cyclic quadrilaterals and tangents
      - The alternate segment theorem
      - Proof-quality justification language
      - Multi-theorem angle chains
    Practice: Circle-theorem problems requiring a named theorem for each step.
    Detail: Circle theorems completed with proof-quality justification

Months 11-12: Probability, Data and the Extended Checkpoint (Weeks 41-48)
  Probability and Tree Diagrams
    Topics:
      - Probability of single and combined events
      - Tree diagrams for dependent events
      - Conditional reasoning
      - With and without replacement
      - Set notation and Venn diagrams
      - Avoiding formula-panic
    Practice: A probability set using tree diagrams and conditional reasoning.

Detail: Probability with tree diagrams and conditional reasoning; combined events without formula-panic

Cumulative Frequency and Histograms

Topics:
- Cumulative frequency curves
- Median, quartiles and interquartile range
- Histograms with unequal class widths
- Frequency density
- Box plots and comparing distributions
- Interpreting data like a statistician

Practice: A set drawing and reading cumulative frequency curves and histograms.

Detail: Cumulative frequency, histograms and comparing distributions like a statistician

Introductory Differentiation (Extended)

Topics:
- Differentiation as the gradient of a curve
- Differentiating simple polynomials
- Gradient at a point
- Turning points from the derivative
- The 0580 Extended calculus taste
- Interpreting a rate of change

Practice: Introductory differentiation questions finding gradients and turning points.

Detail: Differentiation introduced (0580 Extended's calculus taste): gradients of curves and turning points

Phase 2 Extended-Tier Checkpoint

Topics:
- Full Extended-tier past-paper cycle
- Mark-scheme review of long questions
- Method-mark and follow-through practice
- Error-log update from the cycle
- Timing across an Extended paper
- Weak-topic list refreshed

Practice: A full Extended-tier past paper sat to time and reviewed against the mark scheme.

Assessment: Extended-tier past-paper cycle marked to the mark scheme, updating the error log and weak-topic list.

Detail: Phase checkpoint: full Extended-tier past paper cycle with mark-scheme review and error-log update

---

PHASE 3: ADDITIONAL MATHS 0606 + EXAM CRAFT (MONTHS 13-18)

Strong students extend into Additional Mathematics, functions, identities, vectors and introductory calculus taught properly. All students then enter the exam machine: past-paper cycles by exact board and series, non-calculator discipline, and mark-scheme craft that peaks in the exam window.

Months 13-15: Additional Mathematics 0606 (or Extended Consolidation) (Weeks 49-60)

0606 Functions and Algebra Foundations

Topics:
- 0606 functions at depth
- Quadratics revisited with rigour
- Indices and surds
- Simultaneous equations for 0606
- The A-Level trailer begins
- Parallel Extended consolidation by error-log priority

Practice: 0606 function and algebra problems, with Extended students on a parallel consolidation set.

Detail: 0606: functions at depth, quadratics revisited with rigour, indices and surds, simultaneous equations, the A-Level trailer begins. (Parallel track: Extended students consolidate by error-log priority)

0606 Binomial, Trig Identities and Logs

Topics:
- Binomial expansion
- Trigonometric identities
- Solving trigonometric equations
- Logarithmic functions and laws
- Exponential functions
- Modelling with exponentials and logs

Practice: A 0606 set on binomial expansion, trig identities and log-exponential functions.

Detail: 0606: binomial expansion, trigonometric identities and equations, logarithmic and exponential functions

0606 Calculus, Vectors and Kinematics

Topics:
- Differentiation rules and applications
- Integration as the reverse of differentiation
- Areas and definite integrals
- Applications to rates and optimisation

          - Vectors at 0606 depth
          - Kinematics of motion
        Practice: A 0606 calculus set with differentiation, integration and a kinematics problem.
        Detail: 0606: introductory calculus, differentiation and integration with applications; vectors and kinematics

    Months 16-17: Past-Paper Craft by Board and Series (Weeks 61-68)
      Board-Exact Paper Cycles
        Topics:
          - Paper cycles from the exact board and series
          - Non-calculator papers under bare-hands discipline
          - Calculator papers with method-mark craft
          - Tier-correct paper selection
          - Presenting working for marks
          - Board-specific command words
        Practice: Board-exact non-calculator and calculator papers sat to time and reviewed.
        Detail: Paper cycles from your exact board: non-calculator papers under bare-hands discipline, calculator papers with method-mark craft
      Timing Plans and Point-Leak Habits
        Topics:
          - Personal timing plans from paper data
          - Per-question time budgets
          - Multi-step question chains rehearsed
          - The plus-minus sign habit
          - Units and final-answer discipline
          - Stopping avoidable point leaks
        Practice: Timed multi-step question sets drilling the plus-minus and units habits.
        Detail: Timing plans from personal data; multi-step question chains rehearsed; the plus-minus and units habits that stop point leaks

    Month 18: The Exam Series, Met Calmly (Weeks 69-72)
      Final Cycles and Error-Log Closure
        Topics:
          - Final full paper cycles
          - Documented score progression
          - Error-log closure
          - Re-testing previously fixed errors
          - Confidence on weak topics
          - Consistency across papers
        Practice: Final full paper cycles with progression charted and closed errors re-tested.
        Detail: Final full cycles with documented score progression; error-log closure
      Peak-Week Plan and Exam-Day Routines
        Topics:
          - Light consolidation in the peak week
          - Rest before the series
          - Exam-day routines rehearsed
          - Calm pacing under real conditions
          - Final confidence work
          - The series met as a known place
        Practice: Light consolidation tasks and a rehearsed exam-day routine before the series.
        Assessment: Final full-cycle rehearsal with documented score progression before the exam series.
        Detail: Peak-week plan: light consolidations, rest, and exam-day routines rehearsed, the series met as a known place

PROJECTS THE STUDENT BUILDS AND KEEPS

  - Personal error log and syllabus map across all 18 months
  - Non-calculator fluency system, built through daily-dose drills
  - Self-graded past-paper portfolio against real mark schemes
  - 0606 formula-and-technique handbook (Additional Maths students)
  - Full timed paper cycles with documented score progression

  Total projects: 5+ exam artifacts plus the student's own handbooks

SKILLS THE STUDENT WILL HAVE AT THE END

  - Calculator-free number fluency
  - Algebra as a language: equations, formulae, graphs
  - Extended-tier functions, trigonometry and vectors
  - Probability and statistics at exam depth
  - Introductory calculus (Extended and 0606)
  - Mark-scheme literacy and working discipline
  - Past-paper timing craft
  - 0606 pre-A-Level maturity (strong students)

HOW A TYPICAL WEEK IS SPLIT

  Live classes: 2 one-hour live classes with your mentor
  Past paper work: Weekly question sets from your exact board
  Fluency: Non-calculator warm-up in every class
  Total per week: About 4 focused hours

SUPPORT INCLUDED

  Live sessions: 8 live one-hour classes every month, 2 per week
  Mentorship: One dedicated mentor across the whole IGCSE run
  Recordings: Every class recorded for revision
  Progress tracking: Paper-score progression shared with parents
  Flexibility: Intensity adjusts around school mocks and the exam series

CERTIFICATION DETAIL

  Final certificate: Course completion certificate from Modern Age Coders
  Score record: Documented paper-score progression
  Portfolio projects: Past-paper portfolio and personal handbooks

WHERE THIS CAN LEAD

  - An IGCSE grade that opens sixth-form and A-Level doors
  - A-Level Mathematics readiness, especially via 0606
  - IB Diploma readiness for students switching systems
  - Ready for the IB Mathematics Masterclass or competition mathematics

COMMON QUESTIONS ABOUT THIS COURSE

  For anything about cost, use PART 4 and RULE 1. Do not quote two regions.

  Q: Which boards and syllabuses does this course cover?
  A: The first thing the mentor confirms is the exact code and tier your school uses, and all
  past-paper work comes from that board and series.

  Q: Core or Extended, how should we decide?
  A: By destination, then evidence. Core caps the achievable grade, so if A-Level maths,
  sciences or a competitive sixth form is even possible, Extended is the default. Whether the
  gaps blocking Extended are repairable in the time available is a diagnostic question, and the
  free demo answers it with evidence you can take to school. (Agent note: the free demo is a
  waiting list with no fixed date. The Priority Live Demo is a guaranteed class today or
  tomorrow, booked at https://learn.modernagecoders.com/priority-demo . Offer both, as RULE 3
  says.)

  Q: What about the non-calculator papers?
  A: Cambridge's updated 0580/0980 syllabus put a non-calculator paper in front of every
  candidate at both tiers. We train that fluency deliberately, fractions, percentages and
  estimation drills open every class, and verify current paper structures against your school's
  syllabus code and series.

  Q: Should my child take Additional Maths 0606?
  A: If they are comfortable in Extended and A-Level maths is likely: strongly consider it.
  0606 is the best A-Level preparation on the syllabus list, functions, identities, vectors and
  introductory calculus taught properly. It is a genuine second subject that rewards starting
  early, which is exactly how this course sequences it.

  Q: My child does endless past papers but the score is stuck. Will more classes help?
  A: More papers will not, practice repeats what the student already does, errors included. A
  stuck score almost always means an understanding gap upstream, usually algebra as memorized
  rules. We find the gap, fix it at the root, and then past papers start converting effort into
  marks again.

  Q: Can this course rescue a threatened Core entry?
  A: Often, yes. Schools respond to evidence, and entry deadlines usually leave more room than
  parents fear. A focused term of understanding-first teaching plus improving test scores is
  the argument that works, and we are honest in both directions when Core genuinely is the kind
  choice.

  Q: Can we try it before paying?
  A: Yes. Every student starts with a free live demo class that doubles as the diagnostic,
  board, tier, fluency and algebra base, with no card details required.

  To enrol, message Shivam Sir on +91 9123366161 or send the parent this link: https://learn.modernagecoders.com/courses/igcse-mathematics-mastery
  For a demo: the Priority Live Demo (guaranteed, today or tomorrow) is booked at
  https://learn.modernagecoders.com/priority-demo . The free demo is a waiting list with no fixed date.

==========
COURSE 86 OF 137: INFORMATICS PRACTICES (IP) CLASS 11-12: CBSE PYTHON & SQL

==========

Course link: https://learn.modernagecoders.com/courses/cbse-informatics-practices-ip-class-11-12-python-pandas-sql-complete-course
Subject area: School Board Exam Preparation - Informatics Practices
Designed for: Teens
Who can join: Class 11 Beginner to Class 12 Board Exam Ready
Course length: 24 months (Class 11 + Class 12, the full 2-year board cycle), joinable any month
Time needed: 6-8 hours/week (3-4 classes + self-practice)
Certificate: Certificate from Modern Age Coders plus a documented mock-exam progression toward the board exam

PRICE FOR THIS COURSE (quote only the one that applies to the person asking)
  In India, per month: group Rs 1,499, mini batch Rs 2,999, one to one Rs 4,999
  In Canada, per month: group CAD 140, one to one CAD 210
  Anywhere else, per month: group $100, one to one $150
  Classes: group and mini batch two live classes a week, eight a month; one to one in India one
  live class a week, four a month; one to one outside India two live classes a week, eight a
  month. Each class is one hour.

WHAT THIS COURSE IS

  CBSE Informatics Practices course for Class 11 & 12: master Python, Pandas, NumPy, Matplotlib
  and MySQL, with practical file and viva preparation.

  In one line: 100% CBSE IP Syllabus · Pandas & Matplotlib Mastery · SQL Expert · Board Topper Strategy · Live Mentoring

ABOUT THE PROGRAMME

  Informatics Practices (IP, Code 065) is the perfect subject for students interested in data
  science, business analytics, and technology applications. Unlike Computer Science (Code 083)
  which dives deep into programming logic and data structures, IP focuses on practical data
  handling using Python's Pandas library, stunning data visualization with Matplotlib, and
  powerful SQL database querying. This 2-year course covers the complete CBSE IP syllabus for
  Class 11 and Class 12, from the very basics of Python programming and SQL to advanced
  DataFrame operations, pivot tables, data visualization charts, GROUP BY/HAVING queries, table
  joins, computer networks, and societal impacts of technology. Our IP batch is completely
  separate from CS (083) and ICSE batches. Every class, assignment, test, and mock exam is
  specifically designed for the IP syllabus and CBSE exam pattern. We follow Preeti Arora (most
  popular IP textbook), Sumita Arora, and NCERT Informatics Practices textbooks
  chapter-by-chapter. Students get complete practical file preparation (15+ Pandas programs, 4+
  Matplotlib visualizations, 15+ SQL queries), guided project work, viva preparation, and
  intensive board exam revision with 10+ mock papers. Our goal: every student scores 90+ in IP
  board exams.

WHAT MAKES THIS COURSE DIFFERENT

  - Dedicated CBSE IP batch, not mixed with CS or ICSE students
  - 100% CBSE Code 065 syllabus coverage, latest 2026-27 curriculum
  - Chapter-wise teaching matching Preeti Arora, Sumita Arora & NCERT IP textbooks
  - Hands-on Pandas practice with real datasets, not just theory
  - Matplotlib visualization projects with real-world data
  - Live MySQL database for SQL practice, write and execute queries in class
  - Complete practical file: 15+ Pandas programs + 4+ Matplotlib charts + 15+ SQL queries
  - Board exam project guidance with documentation template
  - Weekly chapter tests + monthly unit tests + 10+ full mock board exams
  - Previous 10 years solved papers with marking scheme analysis
  - Dedicated doubt-clearing sessions before exams
  - Assertion-Reason, Case Study, and MCQ-specific preparation
  - Data science career orientation, understand where IP skills lead

THE LEARNING PATH, STEP BY STEP

  Phase 1: Class 11, Semester 1 (Months 1-5): Computer fundamentals, Python basics (variables,
  operators, control flow, lists, dictionaries), SQL fundamentals
  Phase 2: Class 11, Semester 2 (Months 6-10): Advanced SQL (DQL), Emerging Trends (AI, IoT,
  Cloud), practical file, Class 11 exam prep
  Phase 3: Class 12, Semester 1 (Months 11-17): Pandas Series & DataFrame, data visualization
  with Matplotlib, CSV import/export
  Phase 4: Class 12, Semester 2 (Months 18-24): Advanced SQL (functions, GROUP BY, joins),
  computer networks, societal impacts, board exam prep

WHAT A STUDENT NEEDS BEFORE STARTING

  Class level: Students entering Class 11 or Class 12 with Informatics Practices (CBSE code
    065); Class 10 students who have chosen IP can join early
  Prior knowledge: No programming or database experience required - Class 11 starts from zero;
    Class 12 joiners get a bridge revision of Class 11 Python and SQL
  Equipment: A laptop or desktop with a stable internet connection; we guide installation of
    Python, Pandas, Matplotlib, and MySQL in the first sessions
  Time commitment: 6-8 hours per week including live classes and self-practice

Textbooks: Preeti Arora, Sumita Arora, or NCERT IP - classes align with whichever textbook the student's school follows

WHO THIS COURSE IS FOR

- Class 11 ip students: Students starting IP in Class 11 who want clear fundamentals in Python and SQL from the first chapter
- Class 12 board aspirants: Students facing boards in the 2026-27 session who need complete Code 065 coverage plus intensive exam practice
- Students confused by pandas: Students who find Series, DataFrames, loc and iloc, and Boolean indexing confusing and want them taught step by step with real data
- Sql strugglers: Students who can read queries but cannot yet independently write GROUP BY, HAVING, or join queries
- Practical file and project help: Students who need structured help completing the Pandas, Matplotlib, and SQL practical file and board project on time
- Future data analysts: Students interested in data science, analytics, or commerce-plus-technology careers after school

FULL CURRICULUM, WEEK BY WEEK

This is the complete teaching plan. Parents can ask about any week.

PHASE 1: CLASS 11 SEMESTER 1, COMPUTER BASICS, PYTHON PROGRAMMING & SQL INTRODUCTION (MONTHS 1-5)

Build your foundation in computer science concepts, learn Python programming from scratch, and start with SQL database queries. By the end of this phase, you'll write Python programs confidently and run basic SQL queries on MySQL.

Month 1: Introduction to Computer Systems (Week 1-4)

Evolution of Computing & Computer Hardware

Topics:

- Evolution of computing devices, from Abacus to modern AI-powered computers
- Generations of computers: First (vacuum tubes) to Fifth (AI)
- Computer system components: Input Unit, CPU, Memory, Output Unit
- Block diagram of a computer, data flow from input to output
- CPU components: ALU (Arithmetic Logic Unit), Control Unit (CU), Registers
- Types of processors: single core, dual core, quad core, octa core
- Clock speed and its effect on processing: GHz explained
- Input devices: keyboard, mouse, scanner, webcam, microphone, touchscreen, stylus
- Biometric devices: fingerprint scanner, iris scanner, face recognition
- Output devices: monitor (CRT, LCD, LED, OLED, AMOLED), printer (inkjet, laser, 3D), speaker, projector, plotter
- Combined devices: touchscreen (both input and output)
- How a computer processes data: Input Process Output cycle

Projects built:

- Computer system diagram with all components labeled
- Input-output devices classification chart with 20+ devices
- Research project: Latest processor technologies in 2026-27

Practice: NCERT IP Chapter 1 questions, Preeti Arora exercises, 30 MCQs on computer fundamentals

Memory, Storage & Software

Topics:

- Computer memory: why it's needed, role in processing
- Primary memory (volatile): RAM, SRAM vs DRAM, speed, cost
- ROM, PROM, EPROM, EEPROM, non-volatile, stores firmware
- Cache memory: L1, L2, L3, speeds up CPU access to frequently used data
- Memory hierarchy: Registers Cache RAM SSD HDD (speed vs capacity trade-off)
- Units of memory: bit, nibble (4 bits), byte (8 bits), KB, MB, GB, TB, PB, EB
- Secondary storage: HDD (magnetic), SSD (flash), USB drive, memory card
- Optical storage: CD (700MB), DVD (4.7GB), Blu-ray (25-50GB)
- Cloud storage: Google Drive, OneDrive, iCloud, advantages and concerns
- Data deletion and recovery: when you delete, data isn't immediately gone
- Data security concerns: unauthorized access, data corruption, backup importance
- Software: definition, need for software, software vs hardware
- System software: OS, language processors, device drivers, utility programs
- Application software: general purpose (MS Office, browser) vs specific purpose (Tally, AutoCAD)
- Open source software: Linux, LibreOffice, GIMP, Python, MySQL
- Proprietary software: Windows, MS Office, Adobe Photoshop
- Operating system: functions, process management, memory management, file management, device management, user interface
- Types of user interface: CLI (Command Line) vs GUI (Graphical)

Projects built:

- Memory hierarchy pyramid diagram with specifications
- Software classification chart, 15+ examples each category
- Compare 5 open-source vs proprietary software alternatives

Practice: Preeti Arora Chapter 1 exercises, 50 MCQs, fill-in-the-blanks, true/false questions

Months 2-3: Introduction to Python Programming (Week 5-12)
  Getting Started with Python, Setup & First Programs
    Topics:
      - Why Python for IP?, simple syntax, data analysis libraries, industry standard
      - Python in the real world: Instagram, YouTube, Spotify, Netflix use Python
      - Installing Python 3.12+ on Windows, downloading from python.org
      - Python IDLE: Interactive mode (>>> prompt) vs Script mode (.py files)
      - Difference between Interactive and Script mode, when to use which
      - Setting up VS Code with Python extension (optional, IDLE is sufficient for IP)
      - First program: print('Hello, World!'), both in interactive and script mode
      - Saving and running .py files
      - Python tokens: keywords, identifiers, literals, operators, punctuators/delimiters
      - Python keywords: 35 reserved words, False, True, None, and, or, not, if, else, elif, for, while, def, return, import, etc.
      - Identifiers: rules, must start with letter or underscore, case-sensitive, no keywords, no spaces
      - Valid vs invalid identifiers, practice exercises
    Projects built:
      - 10 print() variations, different data types, multiple arguments
      - Interactive mode exploration, test 20 expressions
      - Valid/invalid identifier quiz, 30 examples
    Practice: Preeti Arora Python introduction exercises, 20 MCQs, output prediction for print statements
  Variables, Data Types & Input/Output
    Topics:
      - Variables: named storage locations in memory
      - Variable assignment: x = 10, name = 'Riya'
      - Dynamic typing: Python infers data type automatically
      - Multiple assignment: a, b, c = 1, 2, 3 and a = b = c = 0
      - Data types in Python:
      - int, integers: 10, -5, 0, 1000000 (unlimited precision)
      - float, decimal numbers: 3.14, -0.5, 2.0
      - complex, complex numbers: 3+4j (not in board exams but good to know)
      - str, strings: 'hello', "world", '''multi-line'''
      - bool, boolean: True, False (capital T and F!)
      - None, absence of value: x = None
      - type() function: checking data type of any variable
      - Mutable vs Immutable types: lists are mutable, strings/tuples/int/float are immutable, IMPORTANT CONCEPT
      - Type conversion (casting): int(), float(), str(), bool()
      - Implicit type conversion: int + float float (automatic)
      - Explicit type conversion: int('25'), float('3.14'), str(100)
      - Input function: input(), ALWAYS returns a string
      - Converting input: int(input()), float(input())
      - print() function: sep parameter, end parameter
      - Formatted output: f-strings, f'Hello {name}, age {age}'
      - Comments: # single line, '''multi-line docstrings'''
      - Debugging basics: reading error messages, common beginner mistakes
    Projects built:
      - Student information collector, input name, age, class, marks, display formatted
      - Simple interest calculator, P, R, T as input
      - BMI calculator with formatted output
      - Swap two variables, 3 methods: temp, arithmetic, Pythonic a,b = b,a
    Practice: 40 output prediction MCQs, 15 type conversion exercises, Preeti Arora data handling exercises
  Operators & Expressions
    Topics:
      - Arithmetic operators: + (add), - (subtract), * (multiply), / (true division), // (floor division), % (modulus), ** (exponent)
      - / vs //, 7/2 gives 3.5 (float), 7//2 gives 3 (integer), EXAM FAVORITE
      - Modulus operator: 17%5 = 2 (remainder), -17%5 = 3 (Python's floor modulus!)
      - Exponent: 2**10 = 1024, 9**0.5 = 3.0 (square root)
      - Relational/comparison operators: == (equals), != (not equals), <, >, <=, >=
      - Comparing strings: lexicographic order based on ASCII/Unicode values
      - Logical operators: and, or, not
      - Truth tables for and, or, not
      - Short-circuit evaluation: False and X False (X not evaluated), True or X True
      - Assignment operators: =, +=, -=, *=, /=, //=, %=, **=
      - Identity operators: is, is not, checks if same object in memory (not just equal)
      - Membership operators: in, not in, checks presence in sequence
      - 'a' in 'apple' True, 5 in [1,2,3,4,5] True
      - Operator precedence (PEMDAS for Python):
      - ** unary +x -x ~x * / // % + - == != < > <= >= not and or
      - Associativity: most operators left-to-right, ** is right-to-left
      - Expression evaluation: step-by-step breakdown practice
      - Common exam traps: precedence gotchas, integer vs float division
    Projects built:
      - Expression evaluator worksheet, 30 complex expressions with step-by-step solutions

- Electricity bill calculator with slab rates
- Operator precedence quiz, 20 tricky questions
- Truth table generator for and, or, not combinations

Practice: 50 expression evaluation problems, 30 operator MCQs, Preeti Arora operator exercises

Control Flow, Conditional Statements & Loops

Topics:

- Program flow types: sequential, selection (conditional), iteration (loops)
- if statement: if condition: (note the colon and indentation!)
- if-else statement: two-way decision making
- if-elif-else ladder: multi-way branching, checking multiple conditions
- Nested if: if inside if, complex decision trees
- Ternary expression: result = 'Pass' if marks >= 40 else 'Fail'
- Common programs: largest of 2/3 numbers, even/odd, positive/negative/zero
- Grade calculator, leap year checker, vowel/consonant detector
- for loop: for variable in sequence:, iterating over range, string, list
- range() function: range(stop), range(start, stop), range(start, stop, step)
- range(5) 0,1,2,3,4; range(2,8) 2,3,4,5,6,7; range(10,0,-1) 10,9,...,1
- while loop: while condition:, repeat until condition becomes False
- while loop with counter, controlled repetition
- Infinite loop: while True, use with break for exit
- Loop control: break (exit loop immediately), continue (skip to next iteration)
- Nested loops: outer loop controls rows, inner loop controls columns
- Pattern printing: *, numbers, alphabets, basic patterns
- Accumulator patterns: sum of n numbers, factorial, counting
- Common programs: sum of digits, reverse number, palindrome check, Fibonacci
- Board exam focus: tracing loop output, counting iterations, break/continue effects

Projects built:

- Menu-driven calculator with if-elif-else
- Number guessing game using while loop
- Pattern printer, 10 basic star and number patterns
- Prime number checker and Fibonacci generator
- Multiplication table generator

Practice: 40 conditional logic problems, 30 loop tracing exercises, 15 pattern programs, Preeti Arora exercises

Lists in Python, IP Perspective

Topics:

- What are lists?, ordered, mutable, indexed collection of items
- List creation: [] empty list, [1,2,3], list() constructor, list('hello')
- Lists can contain mixed types: [1, 'hello', 3.14, True, None]
- Indexing: positive (0-based) and negative (-1 for last element)
- Slicing: list[start:stop:step], extracting sublists
- List is MUTABLE, elements can be changed: list[0] = 'new_value'
- List operations: + (concatenation), * (repetition), in (membership)
- List traversal: for item in list:, for i in range(len(list)):
- List methods, MUST KNOW for exams:
- append(x), add x to end
- insert(i, x), add x at position i
- extend(iterable), add all items from another list
- remove(x), remove first occurrence of x (ValueError if not found)
- pop(), remove and return last item, pop(i), remove at position i
- clear(), remove all items
- index(x), return position of first occurrence
- count(x), count occurrences of x
- sort(), sort in ascending order, sort(reverse=True), descending
- reverse(), reverse the list in place
- copy(), create shallow copy
- Built-in functions: len(), min(), max(), sum(), sorted(), list()
- del statement: del list[i], del list[start:stop]
- List comprehension basics: [x*2 for x in range(5)] [0, 2, 4, 6, 8]
- Common programs: linear search, finding max/min without built-in, removing duplicates
- Board exam: output prediction with list operations and methods

Projects built:

- Student marks manager, add, remove, sort, find topper, average
- Shopping list application with all list operations
- List-based number analyzer, even/odd count, sum, average, max, min
- Duplicate remover, remove duplicate elements from a list

Practice: Preeti Arora list chapter exercises, 50 list MCQs, 20 list programs

Dictionaries in Python, IP Perspective

Topics:

- What are dictionaries?, unordered collection of key-value pairs
- Dictionary creation: {} empty, {'name': 'Riya', 'age': 16}, dict()
- Keys must be immutable (string, int, tuple), lists cannot be keys
- Values can be any type, including lists, other dictionaries
- Accessing values: d['key'] (raises KeyError if not found), d.get('key', default)
- Adding/updating: d['new_key'] = value (adds if new, updates if exists)
- Removing: del d['key'], d.pop('key'), d.popitem() (removes last), d.clear()
- Dictionary methods:
- dict(), constructor

- len(d), number of key-value pairs
- d.keys(), view of all keys
- d.values(), view of all values
- d.items(), view of all (key, value) tuples
- d.get(key, default), safe access with default
- d.update(other_dict), merge/update from another dictionary
- d.copy(), shallow copy
- d.clear(), remove all items
- Traversing dictionaries: for key in d:, for key, value in d.items():
- Nested dictionaries: student records with multiple attributes
- in operator with dictionaries: checks keys (not values)
- Dictionary comprehension basics: {x: x**2 for x in range(5)}
- Common programs: character frequency, word counter, student database
- Board exam focus: output prediction with dictionary operations

Projects built:
- Phone book application, add, search, update, delete contacts
- Character frequency counter for a string
- Student report card using nested dictionaries
- Word frequency analyzer, count each word in a paragraph

Practice: Preeti Arora dictionary exercises, 40 MCQs, 15 dictionary programs

Months 4-5: SQL Fundamentals, Database Concepts & Basic Queries (Week 13-20)

Database Concepts & Relational Model

Topics:
- What is data?, raw facts and figures vs information (processed data)
- What is a database?, organized collection of related data
- Need for databases: data redundancy reduction, data integrity, data security
- File system vs DBMS: why databases replaced flat files
- DBMS examples: MySQL, PostgreSQL, Oracle, MongoDB, SQL Server
- Relational Database Model: data stored in tables (relations)
- RDBMS terminology:
- Relation = Table (collection of rows and columns)
- Attribute = Column = Field (a property of the entity)
- Tuple = Row = Record (a single entry in the table)
- Domain = Set of valid values for an attribute
- Degree = Number of attributes (columns) in a relation
- Cardinality = Number of tuples (rows) in a relation
- Keys, identifying rows uniquely:
- Candidate Key: attribute(s) that can uniquely identify each tuple, there can be multiple
- Primary Key: the chosen candidate key, only ONE per table, no NULL values
- Alternate Key: candidate keys that were not chosen as primary key
- Example: Student table, RollNo and AdmissionNo are both candidate keys; if RollNo is primary key, AdmissionNo is alternate key
- Referential integrity concept basics

Projects built:
- Design database schema for: school, library, hospital, e-commerce, identify all keys
- Key identification worksheet, 15 scenarios
- Draw 5 sample tables with proper attributes, data types, and keys

Practice: Preeti Arora database concepts chapter, 40 MCQs on RDBMS terminology, key identification exercises

SQL Introduction, DDL & DML Commands

Topics:
- What is SQL?, Structured Query Language, communicating with databases
- SQL is NOT a programming language, it's a query language
- MySQL: free, open-source RDBMS, used in CBSE IP
- Installing MySQL on Windows, MySQL Community Server + MySQL Workbench
- Accessing MySQL: command line client, MySQL Workbench GUI
- SQL command categories: DDL, DML, DQL
- SQL data types:
- CHAR(n), fixed-length string (padded with spaces), VARCHAR(n), variable-length
- INT, integer, SMALLINT, smaller range, BIGINT, larger range
- FLOAT, decimal with approximate precision, DOUBLE, higher precision
- DATE, format 'YYYY-MM-DD', DATETIME, 'YYYY-MM-DD HH:MM:SS'
- DDL (Data Definition Language), structure commands:
- CREATE DATABASE db_name;, create new database
- USE db_name;, select active database
- SHOW DATABASES;, list all databases
- SHOW TABLES;, list all tables in current database
- CREATE TABLE table_name (col1 datatype constraint, col2 datatype, ...);
- Constraints: NOT NULL, UNIQUE, PRIMARY KEY, DEFAULT
- DESCRIBE table_name; / DESC table_name;, show table structure
- ALTER TABLE: ADD column, MODIFY column, DROP column
- DROP TABLE table_name;, delete entire table (structure + data)
- DROP DATABASE db_name;, delete entire database
- DML (Data Manipulation Language), data commands:
- INSERT INTO table VALUES (val1, val2, ...);, insert all columns
- INSERT INTO table (col1, col2) VALUES (val1, val2);, insert specific columns
- INSERT multiple rows in one command
- UPDATE table SET col1=val1 WHERE condition;, modify data

- DELETE FROM table WHERE condition;, remove specific rows
- WARNING: UPDATE/DELETE without WHERE affects ALL rows!

Projects built:
- Create School database with Student, Teacher, Subject tables
- Insert 15+ records in each table
- Practice ALTER TABLE, add, modify, drop columns
- UPDATE and DELETE with various conditions

Practice: 30 DDL/DML queries, Preeti Arora SQL chapter exercises, create-insert-update-delete practice

SQL DQL, SELECT Queries with WHERE, Operators & Sorting

Topics:
- SELECT, the most important SQL command for IP exams
- SELECT * FROM table;, retrieve all columns, all rows
- SELECT col1, col2 FROM table;, specific columns only
- SELECT DISTINCT col FROM table;, remove duplicate values
- Column aliases: SELECT col AS alias_name
- WHERE clause, filtering rows based on conditions:
- Comparison operators: = <> (or !=) < > <= >=
- Logical operators: AND, OR, NOT
- Operator precedence: NOT > AND > OR (use parentheses for clarity)
- BETWEEN operator: WHERE marks BETWEEN 60 AND 90 (inclusive!)
- NOT BETWEEN: marks NOT BETWEEN 60 AND 90
- IN operator: WHERE city IN ('Delhi', 'Mumbai', 'Kolkata')
- NOT IN: WHERE city NOT IN ('Delhi', 'Mumbai')
- LIKE operator, pattern matching:
- %, matches zero or more characters: 'A%' (starts with A), '%ing' (ends with ing)
- _, matches exactly one character: '_a%' (second letter is a), '___' (exactly 3 chars)
- LIKE patterns: '%an%' (contains 'an'), 'S____' (S followed by exactly 4 chars)
- IS NULL: WHERE commission IS NULL, checking for missing values
- IS NOT NULL: WHERE phone IS NOT NULL
- NULL arithmetic: anything + NULL = NULL, NULL = NULL is UNKNOWN (use IS NULL!)
- ORDER BY clause, sorting results:
- ORDER BY col ASC, ascending (default, A-Z, 0-9)
- ORDER BY col DESC, descending (Z-A, 9-0)
- ORDER BY col1 ASC, col2 DESC, multi-column sorting
- NULL values in ORDER BY, appear first in ASC, last in DESC

Projects built:
- 40-query challenge on Student table, various SELECT queries
- Employee database queries, salary filtering, department queries
- Pattern matching challenge, 15 LIKE queries
- Multi-condition queries combining AND, OR, NOT, BETWEEN, IN, LIKE

Practice: 60 SELECT queries, Preeti Arora DQL exercises, 30 output prediction MCQs for SQL

SQL Aggregate Functions & Class 11 SQL Revision

Topics:
- Aggregate functions, operating on groups of rows:
- COUNT(*), count all rows (including NULLs)
- COUNT(column), count non-NULL values in column
- COUNT(DISTINCT column), count unique non-NULL values
- SUM(column), total of numeric column (ignores NULLs)
- AVG(column), average of numeric column (ignores NULLs)
- MAX(column), maximum value (works with numbers, strings, dates)
- MIN(column), minimum value
- Aggregate functions IGNORE NULL values (except COUNT(*))
- Using aggregate functions with WHERE: SELECT AVG(marks) FROM student WHERE class=12;
- Aliases with aggregates: SELECT COUNT(*) AS total_students FROM student;
- GROUP BY clause: grouping rows for aggregate calculations
- SELECT city, COUNT(*) FROM student GROUP BY city;
- GROUP BY with multiple columns
- HAVING clause: filtering groups after GROUP BY
- WHERE vs HAVING, WHERE filters rows BEFORE grouping, HAVING filters AFTER grouping
- Complete query with all clauses: SELECT ... FROM ... WHERE ... GROUP BY ... HAVING ... ORDER BY ...
- Class 11 SQL complete revision, all DDL, DML, DQL commands
- SQL query writing strategy for exams
- Common mistakes in SQL and how to avoid them

Projects built:
- Sales database analysis, total, average, max, min by category, region
- Student performance report, class-wise, section-wise statistics
- SQL revision worksheet, 80 queries covering all topics
- SQL error correction, find and fix errors in 20 queries

Practice: 50 aggregate/GROUP BY/HAVING queries, Preeti Arora exercises, previous year SQL questions

---

PHASE 2: CLASS 11 SEMESTER 2, EMERGING TRENDS, PRACTICALS & EXAM PREP (MONTHS 6-10)

Complete remaining Class 11 topics: Emerging Trends in Technology. Prepare practical file with Python programs and SQL queries. Get ready for Class 11 final examination.

Months 6-7: Emerging Trends & Revision (Week 21-28)
Introduction to Emerging Trends (CBSE IP Unit 4-5 marks)
Topics:
- Artificial Intelligence (AI): machines that simulate human intelligence
- Types of AI: Narrow AI (Siri, Alexa), General AI (future), Super AI (theoretical)
- Applications of AI: healthcare, education, autonomous vehicles, chatbots (ChatGPT)
- Machine Learning (ML): subset of AI, computers learn from data without explicit programming
- Types of ML: supervised, unsupervised, reinforcement learning
- Natural Language Processing (NLP): AI understanding human language, Google Translate, voice assistants
- Augmented Reality (AR): digital content overlaid on real world, Pokémon Go, Instagram filters
- Virtual Reality (VR): fully immersive digital environment, Oculus, VR gaming
- Mixed Reality (MR): combination of AR and VR
- Robotics: programmable machines performing tasks, manufacturing, surgery, exploration
- Types of robots: industrial, service, humanoid, drone
- Internet of Things (IoT): everyday objects connected to internet, smart home, wearables
- IoT architecture: sensors connectivity data processing user interface
- IoT examples: smart thermostat, fitness tracker, smart fridge, traffic management
- Smart Cities: technology-driven urban management, traffic, waste, energy, safety
- Big Data: extremely large datasets requiring special tools to process
- Big Data characteristics: 5 V's, Volume, Velocity, Variety, Veracity, Value
- Cloud Computing: accessing computing resources over internet instead of local machines
- Cloud service models: SaaS (Gmail), PaaS (Google App Engine), IaaS (AWS EC2)
- Cloud deployment: public, private, hybrid, community cloud
- Grid Computing: distributed computing, combining many computers for complex tasks
- Blockchain technology: decentralized, immutable digital ledger, cryptocurrency, supply chain
- How blockchain works: blocks, hashing, consensus mechanism

Projects built:
- Emerging technology presentation, choose one topic and present for 10 minutes
- IoT application design, design a smart home system on paper
- AI in daily life report, identify 15 AI applications you use daily
- Cloud vs traditional computing comparison chart

Practice: Preeti Arora emerging trends chapter, NCERT IP textbook, 50 MCQs on emerging trends

Practical File, Project & Class 11 Exam Preparation
Topics:
- Practical file requirements for Class 11 IP:
- Minimum 14 Python programs covering all topics
- Minimum 14 SQL queries covering DDL, DML, DQL
- Python programs for practical file:
- P1: Input two numbers, perform all arithmetic operations
- P2: Find largest of three numbers
- P3: Check if number is even/odd, positive/negative
- P4: Grade calculator using if-elif-else
- P5: Print multiplication table using for loop
- P6: Print patterns using nested loops (3 patterns)
- P7: Check prime number, palindrome, Armstrong number
- P8: Calculate factorial using while loop
- P9: List operations, create, append, insert, remove, sort, search
- P10: Find max, min, sum, average from a list
- P11: Count vowels, consonants in a string
- P12: Dictionary operations, create, add, update, delete, traverse
- P13: Character/word frequency counter using dictionary
- P14: Menu-driven program combining multiple concepts
- SQL queries for practical file:
- Q1-Q3: CREATE TABLE, INSERT INTO, DDL and DML
- Q4-Q6: SELECT with WHERE, BETWEEN, IN, LIKE
- Q7-Q9: UPDATE, DELETE with conditions
- Q10-Q11: Aggregate functions, COUNT, SUM, AVG, MAX, MIN
- Q12-Q14: GROUP BY, HAVING, ORDER BY
- Class 11 final exam revision, unit-wise important questions
- Sample paper solving, 3 complete papers with solutions
- Viva voce preparation, 30 Q&A

Deliverables:
- Complete practical file: 14+ Python programs + 14+ SQL queries
- 3 solved sample papers
- Viva preparation notes
- Ready for Class 11 final exam

PHASE 3: CLASS 12 SEMESTER 1, PANDAS, DATA VISUALIZATION & ADVANCED DATA HANDLING (MONTHS 11-17)

This is the CORE of Class 12 IP, mastering Pandas for data handling and Matplotlib for data visualization. Unit 1 carries 25 marks in the board exam. Every concept here is board exam critical.

Months 11-12: Python Pandas, Series (Week 41-48)
Introduction to Python Libraries & Pandas Series Basics

Topics:
- What are Python libraries?, pre-written code modules for specific tasks
- NumPy: Numerical Python, arrays, mathematical operations (foundation for Pandas)
- Pandas: Python Data Analysis Library, data manipulation and analysis
- Matplotlib: plotting and visualization library
- Installing libraries: pip install pandas numpy matplotlib
- Importing: import pandas as pd, import numpy as np
- Pandas data structures: Series (1D) and DataFrame (2D)
- Series: one-dimensional labeled array, like a column in a table
- Creating Series from a list: pd.Series([10, 20, 30, 40])
- Default index: 0, 1, 2, 3... (RangeIndex)
- Custom index: pd.Series([10, 20, 30], index=['a', 'b', 'c'])
- Creating Series from a dictionary: pd.Series({'Maths': 90, 'Science': 85})
- Creating Series from a scalar value: pd.Series(5, index=['a', 'b', 'c']) all values are 5
- Creating Series from NumPy ndarray: pd.Series(np.array([1, 2, 3]))
- Series attributes: dtype, shape, size, nbytes, ndim, index, values, name
- Checking data type: s.dtype returns data type of elements
- Series is like a fixed-size dictionary, index acts as keys

Projects built:
- Create 10 different Series, from list, dict, scalar, ndarray
- Student marks Series with subject names as index
- Temperature data Series for a week with day names as index

Practice: Preeti Arora Pandas chapter exercises, 20 Series creation MCQs

Pandas Series, Operations, Indexing & Methods

Topics:
- Accessing elements: s[0] (positional), s['a'] (label-based)
- Slicing Series: s[1:4] (positional), s['b':'d'] (label, inclusive on both ends!)
- s.head(n), first n elements (default 5), s.tail(n), last n elements
- Mathematical operations on Series, element-wise:
- s + 10 adds 10 to each element
- s1 + s2 adds corresponding elements (NaN for unmatched indices)
- s * 2, s / 3, s ** 2, all element-wise operations
- Comparison operations: s > 50, s == 100 returns Boolean Series
- Boolean indexing / filtering: s[s > 50] elements greater than 50
- NaN (Not a Number): result of mismatched index operations
- Handling NaN: s.isnull(), s.notnull(), s.dropna(), s.fillna(value)
- Series methods for board exams:
- s.sum(), s.mean(), s.median(), s.mode(), s.std(), s.var()
- s.min(), s.max(), s.count() (non-NaN count)
- s.describe(), summary statistics (count, mean, std, min, 25%, 50%, 75%, max)
- s.value_counts(), frequency count of each unique value
- s.unique(), array of unique values, s.nunique(), count of unique values
- s.sort_values(ascending=True/False), sort by values
- s.sort_index(), sort by index labels
- Vectorized string operations: s.str.upper(), s.str.lower(), s.str.len()
- Board exam focus: output prediction with Series operations, NaN handling

Projects built:
- Sales data analysis using Series, total, average, max, min, filtering
- Temperature analysis, find hottest/coldest day, above average days
- Student marks comparison, Series arithmetic with NaN handling
- Statistical summary report using describe()

Practice: 40 Series operation MCQs, 20 output prediction problems, Preeti Arora exercises

Pandas DataFrame, Creation & Basic Operations

Topics:
- DataFrame: 2-dimensional labeled data structure, like a spreadsheet/SQL table
- DataFrame = collection of Series sharing the same index
- Creating DataFrame from dictionary of lists:
- pd.DataFrame({'Name': ['A', 'B'], 'Marks': [90, 85]})
- Creating DataFrame from dictionary of Series
- Creating DataFrame from list of dictionaries
- Creating DataFrame from 2D list/array with columns parameter
- Creating DataFrame from CSV file: pd.read_csv('file.csv'), VERY IMPORTANT
- Custom index: pd.DataFrame(data, index=['row1', 'row2', ...])
- DataFrame attributes: shape, size, ndim, dtypes, columns, index, values, T (transpose)
- Selecting columns: df['column'], df[['col1', 'col2']] (single vs multiple)
- Adding a new column: df['new_col'] = values
- Deleting a column: del df['col'], df.drop('col', axis=1), df.pop('col')
- Renaming columns: df.rename(columns={'old': 'new'})
- Selecting rows by label: df.loc['row_label'], df.loc['r1':'r3']
- Selecting rows by position: df.iloc[0], df.iloc[0:3]
- loc vs iloc, label-based vs integer position-based, EXAM CRITICAL
- Selecting specific cell: df.loc['row', 'col'], df.iloc[row_idx, col_idx]
- df.at['row', 'col'], fast scalar access by label
- df.iat[row_idx, col_idx], fast scalar access by position
- df.head(n), df.tail(n), view first/last n rows

Projects built:
- Student database DataFrame, create from dictionary, CSV, and list of dicts
- Employee records with adding, renaming, and deleting columns

- Accessing data challenge, loc vs iloc practice with 20 examples
- CSV data loader, read real-world dataset and explore

Practice: Preeti Arora DataFrame chapter exercises, 30 creation MCQs, 20 loc/iloc problems

Pandas DataFrame, Advanced Operations & Data Manipulation

Topics:

- Adding a new row: df.loc['new_index'] = [values], pd.concat()
- Deleting rows: df.drop('row_label'), df.drop([indices])
- Boolean indexing with DataFrame: df[df['Marks'] > 80]
- Multiple conditions: df[(df['Marks'] > 80) & (df['City'] == 'Delhi')]
- Note: use & instead of 'and', | instead of 'or' for DataFrame filtering
- Sorting: df.sort_values('column'), df.sort_values(['col1', 'col2'])
- df.sort_values('column', ascending=False), descending sort
- df.sort_index(), sort by index
- DataFrame iteration: df.iterrows(), iterate row by row
- Aggregate operations: df['col'].sum(), .mean(), .max(), .min(), .count()
- df.describe(), statistical summary for all numeric columns
- df.info(), overview of DataFrame structure
- df.isnull(), check for NaN values, df.notnull()
- df.dropna(), remove rows with NaN, df.fillna(value), fill NaN
- df.drop_duplicates(), remove duplicate rows
- Exporting DataFrame to CSV: df.to_csv('output.csv', index=False)
- DataFrame arithmetic: df1 + df2, df * scalar, element-wise operations
- Pivot tables basics: df.pivot_table(values, index, aggfunc)
- Groupby basics: df.groupby('column').mean()
- Board exam focus: complete DataFrame operation chains, output prediction

Projects built:

- Complete student report card system using DataFrame
- Sales data analysis, filtering, sorting, grouping, statistics
- CSV data processing pipeline, read clean analyze export
- Covid/weather/population dataset analysis (real-world data)

Practice: 50 DataFrame operation problems, 30 output prediction MCQs, Preeti Arora advanced exercises

Months 13-14: Data Visualization with Matplotlib (Week 49-56)

Introduction to Matplotlib, Line Charts & Bar Graphs

Topics:

- What is data visualization?, representing data graphically for insights
- Why visualize?, patterns, trends, comparisons are easier to see in charts
- Matplotlib library: most popular Python plotting library
- Importing: import matplotlib.pyplot as plt
- Basic plot workflow: create figure plot data customize show/save
- Line Chart / Line Plot: plt.plot(x, y)
- plt.plot() with just y values, x defaults to 0, 1, 2, ...
- Multiple lines on same plot: call plt.plot() multiple times
- Line customization:
- color: plt.plot(x, y, color='red') or color='r' or color='#FF0000'
- Line style: linestyle='-' (solid), '--' (dashed), '-.' (dash-dot), ':' (dotted)
- Line width: linewidth=2 or lw=2
- Markers: marker='o' (circle), 's' (square), '^' (triangle), 'D' (diamond), '*' (star)
- Marker size: markersize=10 or ms=10
- Combined format string: plt.plot(x, y, 'r--o') red dashed line with circles
- Chart elements, MUST add for full marks:
- plt.title('Chart Title'), chart title
- plt.xlabel('X-Axis Label'), plt.ylabel('Y-Axis Label'), axis labels
- plt.legend(['Line 1', 'Line 2']) or label='name' in plot + plt.legend()
- plt.grid(True), add grid lines
- plt.xticks(rotation=45), rotate x-axis labels
- plt.show(), display the chart
- plt.savefig('chart.png'), save chart as image
- Bar Graph: plt.bar(x, height), vertical bars
- Horizontal bar: plt.barh(x, width)
- Bar customization: color, width, edgecolor, align
- Multiple bar groups: side-by-side bars using width offset
- Stacked bars: plt.bar(x, y1); plt.bar(x, y2, bottom=y1)

Projects built:

- Monthly temperature line chart, 12 months with customization
- Student marks comparison, line chart for 5 subjects across 3 students
- Product sales bar graph, quarterly sales for 4 products
- Population comparison, horizontal bar chart for 10 cities

Practice: 15 line chart programs, 10 bar chart programs, Preeti Arora visualization exercises

Histograms, Advanced Customization & Combining Charts

Topics:

- Histogram: plt.histogram(data, bins), frequency distribution chart
- Histogram vs Bar graph: histogram for continuous data, bar for categorical
- Histogram parameters: bins (number of intervals), range, edgecolor, color, alpha
- bins parameter: bins=10 (10 equal intervals), bins=[0,20,40,60,80,100] (custom)
- alpha parameter: transparency, alpha=0.7 (0=invisible, 1=opaque)

- Using histograms: exam marks distribution, age distribution, salary distribution
- Advanced customization for all chart types:
- Figure size: plt.figure(figsize=(10, 6))
- Font sizes: fontsize parameter in title, xlabel, ylabel, legend
- Font weight: fontweight='bold'
- Color options: named colors, hex codes, RGB tuples
- Grid customization: plt.grid(axis='y', linestyle='--', alpha=0.7)
- Setting axis limits: plt.xlim(0, 100), plt.ylim(0, 50)
- Annotations: plt.annotate('text', xy=(x,y), xytext=(tx,ty), arrowprops=dict(arrowstyle='->'))
- Adding text: plt.text(x, y, 'text')
- Subplots: plt.subplot(rows, cols, position), multiple charts in one figure
- plt.tight_layout(), avoid overlapping in subplots
- Complete chart for board exam: title + labels + legend + grid + colors + markers
- Board exam pattern: write code to create a specific chart from given data
- Chart type selection: when to use line vs bar vs histogram
- Practical exam: creating charts from Pandas DataFrame data

Projects built:
- Student marks histogram, frequency distribution across score ranges
- Dashboard with subplots, line, bar, and histogram in one figure
- Complete data story: Pandas analysis Matplotlib visualization
- 4 Matplotlib programs for practical file, fully customized charts

Practice: 10 histogram programs, 5 subplot programs, complete visualization exercises, board exam chart questions

Months 15-16: Pandas + Matplotlib Integration & CSV Data Workflow (Week 57-64)

Pandas DataFrame Visualization & CSV Import/Export

Topics:
- Plotting directly from DataFrame: df.plot(), integrates Pandas with Matplotlib
- df.plot(kind='line'), line chart from DataFrame columns
- df.plot(kind='bar'), bar chart, df.plot(kind='barh'), horizontal bar
- df.plot(kind='hist'), histogram from DataFrame data
- df['column'].plot(), plot a single column as Series
- Complete CSV workflow:
- Step 1: pd.read_csv('data.csv'), import data into DataFrame
- read_csv parameters: sep, header, index_col, usecols, nrows, na_values
- Step 2: df.head(), df.info(), df.describe(), explore the data
- Step 3: df[condition], filter and clean data
- Step 4: df.groupby().agg(), aggregate and summarize
- Step 5: df.plot() or plt.plot(), visualize insights
- Step 6: df.to_csv('output.csv', index=False), export results
- Real-world data analysis workflow using CSV files
- Handling large CSV files: chunking, selecting columns
- Common Pandas + Matplotlib patterns for board exams

Projects built:
- Weather data analysis: CSV import filtering visualization
- Student performance dashboard: CSV DataFrame charts
- Sales trend analysis: monthly/quarterly charts from CSV data
- Complete data analysis project for practical file

Practice: 15 integrated Pandas-Matplotlib programs, CSV workflow exercises

Pandas & Matplotlib Revision + Practical Programs

Topics:
- Complete Pandas revision: Series creation, operations, methods
- DataFrame revision: creation, selection, filtering, sorting, groupby
- CSV read/write revision
- Matplotlib revision: line, bar, histogram with full customization
- 15 Pandas programs for practical file:
- P1: Create Series from list, dict, ndarray, display attributes
- P2: Series arithmetic operations and NaN handling
- P3: Series statistical functions, mean, median, mode, std
- P4: Create DataFrame from dict, list of dicts, CSV
- P5: DataFrame column operations, add, delete, rename
- P6: DataFrame row selection with loc and iloc
- P7: Boolean indexing, filter DataFrame rows by condition
- P8: Sorting DataFrame by column values
- P9: DataFrame aggregate functions, sum, mean, count
- P10: GroupBy operations, group by category and aggregate
- P11: Handling missing data, isnull, dropna, fillna
- P12: Import CSV into DataFrame and display statistics
- P13: Export DataFrame to CSV file
- P14: DataFrame describe() and info(), data exploration
- P15: Integrated program, CSV filter aggregate export
- 4+ Matplotlib programs for practical file:
- M1: Line chart with title, labels, legend, grid, colors
- M2: Bar graph (vertical/horizontal) with customization
- M3: Histogram with bins, color, edgecolor
- M4: Multiple charts comparison using subplots

Deliverables:
- 15 Pandas programs written and tested
- 4+ Matplotlib programs with saved chart images

- Complete understanding of Pandas-Matplotlib for board exam

PHASE 4: CLASS 12 SEMESTER 2, ADVANCED SQL, NETWORKS, SOCIETY & BOARD EXAM MASTERY (MONTHS 18-24)

Complete remaining Class 12 syllabus: advanced SQL with functions, joins, GROUP BY/HAVING, computer networks, and societal impacts. Then intensive board exam preparation with mock tests.

Months 18-19: Advanced SQL, Functions, GROUP BY, HAVING & Joins (Week 69-76)

SQL Single Row Functions, Math, String & Date Functions

Topics:

- Revision of Class 11 SQL: CREATE, INSERT, SELECT, WHERE, operators
- SQL Functions: two categories, single row functions & aggregate functions
- Single row functions work on each row individually
- Mathematical functions:
- POWER(base, exponent), POWER(2, 3) = 8
- ROUND(number, decimals), ROUND(15.678, 1) = 15.7, ROUND(15.678, 0) = 16
- ROUND(1256, -2) = 1300, rounding to nearest hundred
- MOD(dividend, divisor), MOD(17, 5) = 2 (remainder)
- TRUNCATE(number, decimals), TRUNCATE(15.678, 1) = 15.6 (no rounding!)
- ABS(number), absolute value
- CEIL(number) / CEILING(number), smallest integer >= number
- FLOOR(number), largest integer <= number
- String/Text functions:
- UCASE(str) / UPPER(str), convert to uppercase
- LCASE(str) / LOWER(str), convert to lowercase
- MID(str, start, length) / SUBSTRING(str, start, length) / SUBSTR(str, start, length)
- Note: MySQL string positions start from 1 (not 0 like Python!)
- LENGTH(str), number of characters including spaces
- LEFT(str, n), first n characters, RIGHT(str, n), last n characters
- INSTR(str, substr), position of first occurrence of substr (returns 0 if not found)
- LTRIM(str), remove leading spaces, RTRIM(str), remove trailing spaces
- TRIM(str), remove both leading and trailing spaces
- CONCAT(str1, str2), join strings together
- REPLACE(str, old, new), replace occurrences
- Date functions:
- NOW(), current date and time
- DATE(datetime), extract date portion
- MONTH(date), month number (1-12)
- MONTHNAME(date), month name ('January', 'February', ...)
- YEAR(date), year number
- DAY(date), day of month (1-31)
- DAYNAME(date), day name ('Monday', 'Tuesday', ...)
- DAYOFWEEK(date), 1=Sunday, 2=Monday, ... 7=Saturday
- Using functions in SELECT and WHERE clauses
- Nested functions: UPPER(LEFT(name, 3)), combine functions

Projects built:

- SQL function explorer, test all functions on sample data
- Employee name formatting, UPPER, LOWER, CONCAT, SUBSTRING
- Date-based queries, find employees hired in specific month/year
- Mathematical query set, ROUND, MOD, POWER calculations on salary data

Practice: 40 function-based SQL queries, output prediction MCQs, Preeti Arora SQL function exercises

SQL Aggregate Functions, GROUP BY & HAVING, Deep Dive

Topics:

- Aggregate functions (revision and deep dive):
- COUNT(*), total rows, COUNT(column), non-NULL count
- SUM(column), total, AVG(column), average
- MAX(column), maximum, MIN(column), minimum
- COUNT(DISTINCT column), unique value count
- All aggregates ignore NULL except COUNT(*)
- GROUP BY clause, advanced usage:
- Grouping by single column: SELECT city, COUNT(*) FROM student GROUP BY city;
- Grouping by multiple columns: GROUP BY class, section
- GROUP BY with all aggregate functions
- Rules: columns in SELECT must be in GROUP BY or inside aggregate functions
- HAVING clause, filtering groups:
- HAVING COUNT(*) > 5, show only groups with more than 5 members
- HAVING AVG(marks) >= 80, show groups with average marks >= 80
- WHERE vs HAVING, the definitive comparison (EXAM CRITICAL):
- WHERE: filters ROWS before grouping, cannot use aggregate functions
- HAVING: filters GROUPS after grouping, CAN use aggregate functions
- WHERE is for conditions on individual rows
- HAVING is for conditions on grouped results
- Complete query with all clauses:
- SELECT col, AGG(col) FROM table WHERE condition GROUP BY col HAVING agg_condition ORDER BY col;
- Execution order: FROM WHERE GROUP BY HAVING SELECT ORDER BY

- Complex queries combining WHERE + GROUP BY + HAVING + ORDER BY
- Board exam: write query for given output, find errors, output prediction

Projects built:
- Sales analysis: total/average sales by region, category, with filtering
- Student database: section-wise, class-wise statistics with HAVING
- Employee analysis: department-wise salary stats, count, conditions
- 30-query challenge: all GROUP BY + HAVING combinations

Practice: 50 GROUP BY/HAVING queries, WHERE vs HAVING comparison exercises, board exam SQL from last 10 years

SQL Joins, Equi-Join on Two Tables

Topics:
- Why joins?, real databases have multiple related tables
- Foreign key: column in one table referencing primary key of another
- Example: Student(RollNo, Name, ClassID) and Class(ClassID, ClassName, Teacher)
- Cartesian Product / Cross Join: every row of Table1 × every row of Table2
- If Table1 has 5 rows and Table2 has 3 rows result has 15 rows
- Cartesian product is rarely useful, need to filter with conditions
- Equi-Join: Cartesian product + WHERE condition matching common columns
- SELECT s.Name, c.ClassName FROM student s, class c WHERE s.ClassID = c.ClassID;
- Table aliases: student s, class c, shorter names for readability
- Using dot notation: s.Name, c.ClassName, specify which table's column
- Why aliases are needed: when both tables have same column name
- Natural Join: automatically joins on columns with same name
- SELECT * FROM student NATURAL JOIN class;, auto-matches ClassID
- Natural join removes duplicate columns in result
- Equi-join vs Natural Join: equi-join gives you control, natural join is automatic
- Join with additional conditions: WHERE s.ClassID = c.ClassID AND s.Marks > 80
- Joining with aggregate functions: SELECT c.ClassName, AVG(s.Marks) FROM student s, class c WHERE s.ClassID = c.ClassID GROUP BY c.ClassName;
- Board exam join patterns: 2-table queries with conditions, aggregates, sorting
- Practice: identifying which tables to join and on which columns

Projects built:
- Student-Marks-Subject multi-table query project
- Employee-Department join queries, 20 questions
- Product-Order-Customer join queries
- Complete SQL revision: single table + multi-table + functions + aggregates

Practice: 30 join queries, Preeti Arora join exercises, board exam join questions from last 10 years

SQL Complete Revision + 15 SQL Queries for Practical File

Topics:
- Complete SQL revision, all commands:
- DDL: CREATE DATABASE/TABLE, ALTER TABLE, DROP TABLE/DATABASE
- DML: INSERT INTO, UPDATE, DELETE
- DQL: SELECT with WHERE, BETWEEN, IN, LIKE, IS NULL/IS NOT NULL
- Functions: Math (POWER, ROUND, MOD), String (UPPER, LOWER, MID, LENGTH, LEFT, RIGHT, INSTR, TRIM, CONCAT), Date (NOW, DATE, MONTH, MONTHNAME, YEAR, DAY, DAYNAME)
- Aggregates: COUNT, SUM, AVG, MAX, MIN
- Clauses: GROUP BY, HAVING, ORDER BY, DISTINCT
- Joins: Cartesian product, Equi-join, Natural join
- 15+ SQL queries for practical file:
- Q1: CREATE TABLE with constraints (PRIMARY KEY, NOT NULL)
- Q2: INSERT INTO, multiple rows
- Q3: SELECT with WHERE using comparison operators
- Q4: SELECT with BETWEEN and IN
- Q5: SELECT with LIKE and wildcards
- Q6: SELECT with IS NULL / IS NOT NULL
- Q7: SELECT with ORDER BY (ASC and DESC)
- Q8: UPDATE records with WHERE condition
- Q9: DELETE records with WHERE condition
- Q10: ALTER TABLE, add and modify column
- Q11: Aggregate functions, COUNT, SUM, AVG, MAX, MIN
- Q12: GROUP BY with aggregate functions
- Q13: GROUP BY with HAVING clause
- Q14: SQL functions, UPPER, LOWER, MID, LENGTH, ROUND, MOD
- Q15: Equi-join on two tables with conditions

Deliverables:
- 15+ SQL queries for practical file
- Complete SQL command reference sheet
- All queries tested and verified on MySQL

Months 20-21: Computer Networks & Societal Impacts (Week 77-84)

Introduction to Computer Networks (CBSE IP Unit 3-10 marks)

Topics:
- What is a computer network?, interconnected devices sharing resources
- Types of networks based on geographical area:
- PAN (Personal Area Network): Bluetooth headset, smartwatch, within 10 meters
- LAN (Local Area Network): within a building, school lab, office, home WiFi
- MAN (Metropolitan Area Network): across a city, cable TV network, city WiFi
- WAN (Wide Area Network): across countries/continents, Internet is the largest WAN

- Networking devices:
- Modem: MOdulator-DEModulator, converts digital to analog and vice versa
- Hub: broadcasts data to ALL connected devices, dumb device, creates traffic
- Switch: intelligent hub, sends data ONLY to intended device using MAC addresses
- Repeater: amplifies/regenerates weak signals, extends cable distance
- Router: connects different networks, directs traffic using IP addresses
- Gateway: connects networks with DIFFERENT protocols, translates between them
- NIC (Network Interface Card): hardware for network connectivity, has MAC address
- WiFi adapter: wireless NIC for WiFi connectivity
- Network topologies:
- Star topology: all devices connect to central hub/switch
- Advantages: easy to add/remove, failure of one device doesn't affect others
- Disadvantage: central hub failure takes down entire network
- Bus topology: all devices on single backbone cable with terminators
- Advantages: cheap, easy to install
- Disadvantages: cable failure affects all, difficult troubleshooting
- Tree/Hierarchical topology: combination of star and bus, like a tree structure
- Mesh topology: every device connected to every other device
- Advantage: maximum redundancy, Disadvantage: very expensive

Projects built:

- Network diagram for a school, choose topology, devices, media
- Networking device comparison chart with functions and use cases
- Topology pros-cons table with real-world examples

Practice: Preeti Arora network chapter, 40 MCQs on network types, devices, topologies

Internet, Web Technologies & Protocols

Topics:

- Internet: global network of networks, largest WAN
- How internet works: ISP, DNS, routers, data packets
- Internet services:
- WWW (World Wide Web): system of interlinked hypertext documents, uses HTTP
- Email: electronic mail, SMTP (sending), POP3/IMAP (receiving)
- Chat/Instant Messaging: WhatsApp, Telegram, Slack
- VoIP (Voice over IP): voice calls over internet, Zoom, Google Meet, Skype
- Video conferencing: audio + video communication over internet
- URL (Uniform Resource Locator): address of a web resource
- URL structure: protocol://domain_name:port/path/page?query#fragment
- Domain name: human-readable website address (google.com, example.org)
- DNS (Domain Name System): translates domain names to IP addresses
- Domain extensions: .com, .org, .edu, .gov, .in, .co.in
- Websites: collection of related web pages
- Static web pages: fixed content, created with HTML/CSS, same for all users
- Dynamic web pages: content changes based on user, time, interaction, uses server-side processing
- Web server: computer that hosts websites and serves web pages
- Web hosting: storing website on a server for internet access
- Types of hosting: shared, VPS, dedicated, cloud hosting
- Web browser: software to access websites, Chrome, Firefox, Edge, Safari
- Browser features: tabs, bookmarks, history, extensions/add-ons, plug-ins
- Cookies: small data files stored by websites on your browser
- First-party cookies: set by the website you visit
- Third-party cookies: set by advertisers/trackers, privacy concern

Projects built:

- URL anatomy exercise, break down 10 URLs into components
- Static vs dynamic website comparison, 10 examples each
- Web technology glossary, define 30 web-related terms
- Browser feature exploration report

Practice: Preeti Arora web chapter, 50 MCQs on internet, web, protocols, cookies

Societal Impacts of Technology (CBSE IP Unit 4-10 marks)

Topics:

- Digital footprint: trail of data you leave on the internet
- Active digital footprint: intentional, social media posts, emails, comments
- Passive digital footprint: unintentional, browsing history, cookies, IP logs
- Managing your digital footprint: privacy settings, thinking before posting
- Communication etiquette (netiquette): proper online behavior
- Email etiquette: professional subject lines, proper greeting, no ALL CAPS
- Social media etiquette: respect others, verify before sharing, no cyberbullying
- Data protection: safeguarding personal and organizational data
- Personal data: name, address, phone, email, financial info, biometric data
- Consent: permission before collecting/using personal data
- Intellectual Property Rights (IPR):
- Copyright: legal right over creative works, books, music, software, art
- Patent: protection for inventions, machines, processes, formulas
- Trademark: protection for brand identity, logos, names, slogans
- Plagiarism: using someone else's work without proper credit, academic dishonesty
- How to avoid plagiarism: cite sources, paraphrase properly, use quotation marks
- Software licensing:
- Proprietary: paid, closed source, Windows, Adobe, MS Office
- Free and Open Source Software (FOSS): free to use, modify, distribute
- FOSS examples: Linux, Firefox, LibreOffice, Python, MySQL, Android, WordPress

- Creative Commons: flexible copyright licenses, CC-BY, CC-BY-SA, CC-BY-NC
- GPL (GNU General Public License): must keep derivatives open source
- Cybercrime: criminal activities using computers/internet
- Hacking: unauthorized access to computer systems
- Phishing: fraudulent emails/websites to steal login credentials
- Cyberbullying: harassment, threats, humiliation online
- Identity theft: stealing personal information for fraud
- Ransomware: malware that encrypts data and demands payment
- Indian Information Technology Act 2000 (amended 2008):
- Section 43: penalty for unauthorized access, data theft
- Section 66: computer-related offences, hacking, identity theft
- Section 67: publishing obscene material electronically
- Section 72: breach of confidentiality and privacy
- E-waste: discarded electronic devices, hazards and management
- E-waste hazards: toxic materials (lead, mercury, cadmium), soil/water pollution
- E-waste management: reduce, reuse, recycle, proper disposal at certified centers
- Health concerns from technology: digital eye strain, back/neck pain, carpal tunnel syndrome
- Ergonomics: proper posture, screen distance, break intervals (20-20-20 rule)
- Technology addiction: social media addiction, gaming disorder, awareness and balance

Projects built:
- Digital citizenship poster, 15 dos and don'ts for online behavior
- Cybercrime awareness infographic, types, prevention, reporting
- E-waste management plan for school/home
- IPR case study, analyze 3 real-world copyright/patent cases

Practice: Preeti Arora societal impacts chapter, NCERT exercises, 60 MCQs, case study questions, IT Act scenario-based questions

Months 22-24: Board Exam Preparation, Intensive Revision & Mock Tests (Week 85-96)

Practical File Completion & Project Submission

Topics:
- Complete practical file requirements verification:
- 15+ Pandas programs, Series and DataFrame operations
- 4+ Matplotlib programs, line chart, bar graph, histogram with customization
- 15+ SQL queries, DDL, DML, DQL, functions, aggregates, joins
- Project work (5 marks): data analysis project using Pandas + Matplotlib
- Suggested projects:
- COVID-19 data analysis, cases, recoveries, deaths by country/state
- Weather data analysis, temperature, rainfall trends over years
- Student performance analyzer, class-wise, subject-wise analysis with charts
- IPL/cricket statistics analysis, batting, bowling averages with visualization
- E-commerce sales analysis, product category wise, monthly trends
- Project documentation: cover page, certificate, acknowledgement, introduction, source code, output, bibliography
- Viva voce preparation, 50 most-asked questions:
- What is Pandas? What is a DataFrame? What is a Series?
- Difference between loc and iloc?
- What is matplotlib? How to create a bar chart?
- What is GROUP BY? What is HAVING?
- Difference between WHERE and HAVING?
- What is a primary key? What is a foreign key?
- What is an equi-join?
- What is a digital footprint?

Deliverables:
- Complete practical file, all programs tested and documented
- Project with full documentation
- Viva voce preparation notes, 50 Q&A

Chapter-Wise Revision, Pandas & Matplotlib

Topics:
- Pandas Series revision: creation, indexing, slicing, operations, methods, NaN handling
- Pandas DataFrame revision: creation, selection, filtering, sorting, groupby, CSV operations
- DataFrame vs Series, comparison table
- loc vs iloc, 20 practice problems
- Boolean indexing revision, complex condition filtering
- Aggregate functions on DataFrame: sum, mean, max, min, count, describe
- Matplotlib revision: line chart, bar graph, histogram
- Chart customization checklist: title, xlabel, ylabel, legend, grid, color, marker, linestyle
- Format strings revision: 'r--o', 'b-s', 'g:^'
- Common Pandas output prediction patterns
- Quick reference card for Pandas methods and Matplotlib functions

Practice: 40 Pandas MCQs, 20 output prediction, 15 Matplotlib code-writing questions

Chapter-Wise Revision, SQL, Networks & Societal Impacts

Topics:
- SQL complete revision: DDL, DML, DQL
- SQL functions revision: POWER, ROUND, MOD, UPPER, LOWER, MID, LENGTH, LEFT, RIGHT, INSTR, TRIM, CONCAT, NOW, DATE, MONTH, YEAR, DAY, MONTHNAME, DAYNAME
- Aggregate functions revision: COUNT, SUM, AVG, MAX, MIN
- GROUP BY + HAVING revision, 20 practice queries
- Joins revision: Cartesian product, equi-join, natural join
- Complete SQL query writing, from WHERE to JOIN

- Computer networks revision: PAN, LAN, MAN, WAN, devices, topologies
- Internet and web concepts revision: URL, DNS, HTTP/HTTPS, static/dynamic, cookies
- Societal impacts revision: digital footprint, IPR, cybercrime, IT Act, e-waste
- Case study practice, network design scenarios (CBSE board favorite)

Practice: 50 SQL revision queries, 40 network MCQs, 30 societal impact MCQs, case study practice

Mock Board Exams, Set 1 & 2

Topics:

- Full-length Mock Exam 1: 70 marks, 3 hours, strict exam conditions
- CBSE IP paper structure:
- Section A: 21 questions × 1 mark = 21 marks (MCQ, True/False, Fill-in-blanks)
- Section B: 7 questions × 2 marks = 14 marks (Very Short Answer)
- Section C: 4 questions × 3 marks = 12 marks (Short Answer)
- Section D: 2 questions × 4 marks = 8 marks (Case Study based)
- Section E: 3 questions × 5 marks = 15 marks (Long Answer)
- Detailed solution discussion with CBSE marking scheme
- Full-length Mock Exam 2: different question set, same structure
- Common mistakes analysis and correction
- Time management strategy:
- Section A (21 marks): 30-35 minutes
- Section B (14 marks): 20 minutes
- Section C (12 marks): 20 minutes
- Section D (8 marks): 15 minutes
- Section E (15 marks): 25 minutes
- Review time: 10-15 minutes
- How to write Pandas/Matplotlib code in board exams
- How to write SQL queries in board exams, formatting tips

Deliverables:

- 2 complete mock papers solved and reviewed
- Weak areas identified with improvement plan
- Exam writing technique refined

Mock Board Exams, Set 3, 4, 5 + Previous Year Paper Solving

Topics:

- 3 more full-length mock exams (Set 3, 4, 5)
- CBSE IP Previous Year Papers solved:
- 2020, 2021, 2022, 2023, 2024, 2025, complete solutions with marking scheme
- CBSE IP Sample Paper 2026-27, official sample paper solved
- Frequently repeated question analysis, top 30 topics that appear every year
- Most important Pandas questions: Series operations, DataFrame creation, loc/iloc, groupby
- Most important SQL questions: GROUP BY + HAVING, aggregate functions, joins, functions
- Most important theory questions: network devices, topologies, cybercrime, IPR, IT Act
- Case study question patterns, how to approach and answer
- Assertion-Reason question strategy, understanding the format
- Partial marks strategy, how to get step marks even if you don't know complete answer

Practice: 5 mock papers + 6 previous year papers = 11 full papers solved

Final Revision & Last-Minute Board Exam Preparation

Topics:

- One-shot revision: entire IP syllabus in 2 days, key points only
- Pandas cheat sheet: all methods, attributes, operations on one page
- Matplotlib cheat sheet: plot types, customization options, format strings
- SQL command reference: all DDL, DML, DQL, functions on 2 pages
- Network concepts summary: devices, topologies, protocols on 1 page
- Societal impacts summary: key terms, IT Act sections on 1 page
- Top 30 most important Pandas output prediction problems
- Top 20 SQL queries you must know by heart
- Top 15 theory questions with model answers
- Board exam day strategy: reading time, question selection, presentation
- How to handle unfamiliar questions, partial answer strategies
- Confidence building: you've practiced more than 95% of students
- Practical exam preparation: Pandas program + SQL queries + project viva

Deliverables:

- Quick revision notes, entire syllabus on 8-10 pages
- Pandas + Matplotlib reference sheet, 2 pages
- SQL reference sheet, 2 pages
- Theory revision sheet, 2 pages
- 11+ solved papers in practice
- READY FOR BOARD EXAM, 90+ score target

PROJECTS THE STUDENT BUILDS AND KEEPS

- Phase 1 (Class 11 Sem 1): Python console programs - calculators, grade tools, list and dictionary applications - plus a full school database built and queried in MySQL
- Phase 2 (Class 11 Sem 2): the complete Class 11 practical file with 14+ Python programs and 14+ SQL queries, plus an emerging trends presentation project
- Phase 3 (Class 12 Sem 1): real-dataset analysis with Pandas Series and DataFrames, a CSV import-analyze-export pipeline, and 4+ fully customized Matplotlib charts (line, bar, histogram)
- Phase 4 (Class 12 Sem 2): advanced SQL query sets (single-row functions, GROUP BY, HAVING, joins) and the final board project combining Pandas, Matplotlib, and CSV data with

documentation
- Total: 2 board-ready practical files, 2 submission projects, and dozens of graded programs and query sets

Total projects: 35+ graded programs across both years, including 2 complete board practical files (Pandas, Matplotlib, and SQL) and 2 board-submission projects

SKILLS THE STUDENT WILL HAVE AT THE END

- Python Basics: variables, operators, control flow, lists, dictionaries, and menu-driven programs
- Pandas: creating Series and DataFrames, loc and iloc selection, Boolean filtering, sorting, and aggregation
- Data Visualization: line charts, bar graphs, and histograms in Matplotlib with titles, labels, legends, and grids
- CSV Workflow: importing data with read_csv, cleaning and analyzing it, and exporting results with to_csv
- SQL on MySQL: DDL, DML, single-row and aggregate functions, GROUP BY, HAVING, ORDER BY, and joins
- Computer Networks: network types, devices, topologies, and internet basics as per the IP syllabus
- Societal Impacts: digital footprint, cyber safety, IPR, plagiarism, e-waste, and the IT Act
- Exam Technique: output prediction, query writing, and marking-scheme based answer writing

HOW A TYPICAL WEEK IS SPLIT

Live classes: 3-4 live classes per week, 1 hour each, in sync with the school's chapter sequence
Practical work: 2-3 hours of hands-on work: Pandas programs, Matplotlib charts, and SQL queries executed on a live MySQL database
Board style practice: Weekly chapter tests, output-prediction drills, query-writing practice, and answer writing trained on the CBSE marking scheme
Doubt support: Dedicated doubt-clearing sessions, with extra slots before school exams, pre-boards, and board exams

SUPPORT INCLUDED

Small batches: Small group batches so every student gets individual attention and screen time
Dedicated ip batch: An IP-only (code 065) batch - never mixed with CS (083) or ICSE students
Exam season support: Extra revision classes and doubt sessions before pre-boards and board exams
Practical and project help: Step-by-step help with every practical file entry and the board project until they are submission-ready
Progress tracking: Regular test results and progress updates shared with parents

CERTIFICATION DETAIL

Course certificate: Modern Age Coders Course Completion Certificate at the end of each academic year
Board exam readiness: Previous year papers, the official CBSE sample paper, and full mock exams on the current IP (065) pattern: 70 marks theory plus 30 marks practical
Practical file support: Complete guidance on the required practical file entries (15+ Pandas programs, 4+ Matplotlib charts, 15+ SQL queries), the board project, and viva preparation for the 30-mark practical exam

WHERE THIS CAN LEAD

- BCA, B.Sc IT, and B.Sc Data Science admissions with working Python and SQL skills
- BBA, B.Com, and economics programs where data analysis skills stand out
- Data analytics and business analytics degree specializations
- Data analyst internships that expect Pandas and SQL basics
- Business intelligence and reporting work later on - the SQL taught here transfers directly
- Statistics, journalism, and social science programs that increasingly use Python for data work
- A smooth upgrade path into full data science courses after Class 12

COMMON QUESTIONS ABOUT THIS COURSE

For anything about cost, use PART 4 and RULE 1. Do not quote two regions.

Q: What is Informatics Practices (IP)? Is it different from Computer Science (CS)?
A: Yes, IP (Code 065) and CS (Code 083) are different CBSE subjects. IP focuses on data handling with Pandas, data visualization with Matplotlib, and SQL, it's application-oriented and considered easier. CS focuses on deep Python programming, data structures (stacks), sorting/searching algorithms, and Python-MySQL connectivity, it's more programming-intensive. We run separate batches for IP and CS students.

Q: Is IP easier than CS? Should I choose IP?
A: IP is generally considered easier because it focuses on using Python libraries (Pandas,

Matplotlib) for data analysis rather than building algorithms from scratch. If you're interested in data science, business analytics, or want a higher-scoring subject, IP is a great choice. If you want to pursue software engineering or competitive programming, CS is better. We can help you decide based on your goals.

Q: Do you have separate batches for IP and CS?
A: Absolutely. IP and CS have completely different syllabi, different units, different topics, different exam patterns. Our IP batch only teaches IP content (Pandas, Matplotlib, SQL, networks, societal impacts). No mixing with CS topics like file handling, data structures, or Python-MySQL connectivity.

Q: Which textbook do you follow for IP?
A: We primarily follow Preeti Arora (Informatics Practices with Python), the most popular IP textbook, supplemented by NCERT IP textbook and Sumita Arora. Our teaching covers every chapter from these books.

Q: Do I need to install anything on my computer?
A: Yes, you'll need Python 3.12+ (with Pandas, NumPy, Matplotlib, installed via pip) and MySQL Community Server. We guide you through the complete installation process in the first few classes.

Q: Will you help with the practical file and project?
A: Yes, completely. We prepare your entire practical file (15+ Pandas programs, 4+ Matplotlib charts, 15+ SQL queries), guide you through a data analysis project with full documentation, and prepare you for the viva voce examination. You submit a polished, complete practical file.

Q: Can this course help me score 90+ in IP board exam?
A: IP has a more predictable question pattern than CS, making high scores very achievable with proper preparation.

Q: Is there an ICSE equivalent of IP?
A: No, ICSE/ISC does not have an Informatics Practices subject. ISC offers Computer Science (Java-based) which is more similar to CBSE CS. If you're an ICSE student interested in data analysis, you can join our IP batch to learn Pandas/Matplotlib skills alongside your board preparation, these are valuable skills regardless of your board.

Q: What career options does IP open up?
A: IP gives you a strong foundation for Data Analyst, Business Analyst, SQL Developer, Data Scientist, BI Developer, IT Manager, Digital Marketing Analyst, and Financial Analyst roles. The Python + SQL + data visualization skills you learn are directly used in industry. Many BCA, B.Sc IT, BBA, and MBA programs value these skills.

To enrol, message Shivam Sir on +91 9123366161 or send the parent this link: https://learn.modernagecoders.com/courses/cbse-informatics-practices-ip-class-11-12-python-pandas-sql-complete-course
For a demo: the Priority Live Demo (guaranteed, today or tomorrow) is booked at https://learn.modernagecoders.com/priority-demo . The free demo is a waiting list with no fixed date.

==========
COURSE 87 OF 137: JAVA COURSE FOR COLLEGE: CORE JAVA TO SPRING BOOT
==========

Course link: https://learn.modernagecoders.com/courses/complete-java-programming-masterclass-college
Subject area: Programming
Designed for: College students
Who can join: Complete beginner (18+); college students, graduates and working professionals
Course length: 10-12 months (44-52 weeks)
Time needed: 2 live classes/week + 4-6 hours practice
Certificate: Certificate from Modern Age Coders, awarded on passing the final exam

PRICE FOR THIS COURSE (quote only the one that applies to the person asking)
In India, per month: group Rs 1,499, mini batch Rs 2,999, one to one Rs 4,999
In Canada, per month: group CAD 140, one to one CAD 210
Anywhere else, per month: group $100, one to one $150
Classes: group and mini batch two live classes a week, eight a month; one to one in India one live class a week, four a month; one to one outside India two live classes a week, eight a month. Each class is one hour.

WHAT THIS COURSE IS

Java course for college students and professionals: core Java, collections and concurrency, then Spring Boot APIs with security and tests, in 10-12 months.

In one line: The language enterprises run on and placements test: core Java to real depth, then Spring Boot the way backend teams actually use it.

ABOUT THE PROGRAMME

Java is still the backbone of enterprise software and the single most-tested language in Indian placements, and the difference between knowing Java syntax and owning Java depth, collections, concurrency, the memory model, decides both interviews and real work. This live online masterclass builds that depth in order: core Java and object-oriented thinking done properly, then the engine room, collections in depth, exceptions, multithreading and modern Java features, design patterns and JDBC with real testing habits, then the job stack: Spring Boot, Spring Data JPA, security, REST APIs designed and tested like a professional. A finale month ships a Spring Boot capstone and sits the final exam. The pace is honest: ten teaching months at two live classes a week plus four to six hours of practice, with two more in hand. Problem sets, monthly mixed reviews, phase exams, and a final exam that decides the certificate with a free retest.

WHAT MAKES THIS COURSE DIFFERENT

- Placement-grade core: collections, concurrency and OOP at the depth interviews probe
- Modern Java throughout: streams, lambdas and current LTS features, not textbook Java
- Spring Boot as teams use it: REST APIs, JPA, security and tests, not hello-world
- Design patterns and JDBC before the framework, so Spring is understood, not incanted
- An honest 10-month arc with 2 months in hand
- Real assessment: weekly problem sets, monthly mixed reviews, phase exams and a final exam with a free retest

THE LEARNING PATH, STEP BY STEP

Phase 1: Foundations (Months 1-3): core Java and object-oriented programming properly
Phase 2: The engine room (Months 4-6): collections, concurrency, modern Java, patterns and testing
Phase 3: The job stack (Months 7-9): Spring Boot, JPA, security and production habits
Phase 4: The finale (Month 10): a Spring Boot capstone and the final exam

WHAT A STUDENT NEEDS BEFORE STARTING

Coding experience: None. Everything is taught from the first line
Equipment: Any computer with a stable internet connection; every tool used is free
Age: 18+; college students, graduates and working professionals
Time commitment: 2 live classes plus 4-6 hours of practice a week

WHO THIS COURSE IS FOR

College students: Students whose placements will test Java, which is most of them
Career switchers: Professionals entering backend development on the enterprise stack
Self taught: Learners with syntax knowledge but not the depth interviews reach for
Backend bound: Developers who want the Spring ecosystem opened properly
Android curious: Future Android developers who want the Java foundation Kotlin assumes

FULL CURRICULUM, WEEK BY WEEK

This is the complete teaching plan. Parents can ask about any week.

PHASE 1: FOUNDATION & CORE JAVA SKILLS (MONTHS 1-3, WEEKS 1-13)

Build rock-solid Java fundamentals. Learn programming logic, master Java syntax, OOP principles, and create your first applications.

Months 1-2: Java Fundamentals & Programming Basics (Weeks 1-7)

Introduction to Java & Development Environment Setup

Topics:

- What is Java? History, features, and platform independence
- Java ecosystem: JDK, JRE, JVM explained
- Write Once Run Anywhere (WORA) concept
- Java applications: Desktop, Web, Mobile (Android), Enterprise
- Installing JDK (Java 17 LTS or latest)
- Setting up development environment: IntelliJ IDEA, Eclipse, VS Code
- Understanding IDE features and shortcuts
- Your first Java program: Hello World
- Java program structure: class, main method
- Compiling and running Java programs
- Understanding bytecode and JVM
- Comments: single-line (//), multi-line (/* */), Javadoc (/** */)
- Java coding conventions and naming standards

Projects built:

- Hello World variations with personalized messages
- Simple output programs using System.out.println
- Personal information display program
- ASCII art generator in Java

Practice: Daily: 30 min Java syntax practice, write 5-10 simple programs

Variables, Data Types & Operators

Topics:

- Variables: declaration, initialization, naming rules
- Primitive data types: byte, short, int, long, float, double, char, boolean
- Understanding type sizes and ranges
- Type casting: implicit (widening) and explicit (narrowing)
- Wrapper classes: Integer, Double, Character, Boolean, etc.
- Autoboxing and unboxing
- Literals: integer, floating-point, character, string, boolean
- Operators: arithmetic (+, -, *, /, %, ++, --)
- Relational operators: ==, !=, >, <, >=, <=
- Logical operators: &&, ||, !
- Assignment operators: =, +=, -=, *=, /=, %=
- Bitwise operators: &, |, ^, ~, <<, >>, >>>
- Ternary operator: ? :
- Operator precedence and associativity
- String basics: creation, concatenation, immutability

Projects built:

- Simple calculator (four basic operations)
- Temperature converter (Celsius, Fahrenheit, Kelvin)
- Age calculator with detailed output
- BMI calculator with health categories
- Currency converter
- Area and perimeter calculator for shapes
- Compound interest calculator

Practice: Solve 30 problems on variables, data types, and operators

Control Flow Statements

Topics:

- Boolean expressions and conditions
- If statement: single condition execution
- If-else statement: two-way branching
- If-else-if ladder: multiple conditions
- Nested if statements
- Switch statement: multi-way branching
- Switch with fall-through and break
- Enhanced switch (Java 12+): arrow syntax, yield
- While loop: pre-tested loop
- Do-while loop: post-tested loop
- For loop: counter-based iteration
- Enhanced for loop (for-each): iterating arrays/collections
- Break statement: exit loop
- Continue statement: skip iteration
- Labeled break and continue
- Nested loops and loop patterns

Projects built:

- Number guessing game with attempts limit
- Grade calculator with letter grades
- Even/odd checker and list generator
- Prime number checker and generator
- Multiplication table generator
- Factorial calculator (iterative)
- Fibonacci series generator
- Pattern printing (stars, numbers, pyramids, diamonds)
- FizzBuzz challenge
- Menu-driven calculator with switch
- Simple ATM simulation

Practice: Solve 40 control flow and loop problems

Methods & Arrays

Topics:

- Methods: definition, purpose, and structure
- Method declaration: return type, name, parameters
- Method invocation and calling
- Parameters vs arguments
- Return statement and return values
- Method overloading: same name, different parameters
- Variable scope: local vs instance vs class
- Static methods vs instance methods
- Recursion: base case and recursive case
- Arrays: declaration, creation, initialization
- Array indexing and accessing elements
- Array length property
- Iterating arrays: for loop, enhanced for loop
- Multi-dimensional arrays (2D, 3D)
- Jagged arrays
- Arrays class utility methods
- Variable arguments (varargs)

Projects built:

- Method library for mathematical operations
- Array statistics calculator (sum, average, min, max)
- Linear search and binary search implementation
- Sorting algorithms: bubble sort, selection sort

- Matrix operations (addition, multiplication)
- Tic-tac-toe game with 2D array
- Student grade management system
- Factorial using recursion
- Tower of Hanoi recursive solution
- Palindrome checker (string/number)
- Prime number generator in range

Practice: Create 25 methods for various functionalities, solve 30 array problems

Month 3: Object-Oriented Programming Fundamentals (Weeks 8-13)

Classes, Objects & OOP Basics

Topics:

- Object-Oriented Programming paradigm
- Classes: blueprint for objects
- Objects: instances of classes
- Class declaration and structure
- Instance variables (attributes/fields)
- Instance methods (behaviors)
- Creating objects with 'new' keyword
- Constructors: default and parameterized
- Constructor overloading
- this keyword: referencing current object
- Access modifiers: private, public, protected, default
- Encapsulation: data hiding principle
- Getters and setters (accessor and mutator methods)
- toString() method for object representation
- Object initialization blocks
- Static variables (class variables)
- Static methods and static blocks
- Static import

Projects built:

- Student class with attributes and methods
- Bank Account class with deposit/withdraw
- Book class for library management
- Employee class with salary calculations
- Rectangle/Circle classes with area/perimeter
- Car class with properties and behaviors
- Calculator class with static methods
- Product class for inventory system
- Person class with constructor overloading
- Date class implementation

Practice: Create 20 different classes modeling real-world entities

Inheritance & Polymorphism

Topics:

- Inheritance: IS-A relationship
- Extends keyword for inheritance
- Parent class (superclass) and child class (subclass)
- Inheriting fields and methods
- Method overriding: redefining parent methods
- @Override annotation
- super keyword: accessing parent class members
- super() for calling parent constructor
- Constructor chaining in inheritance
- Types of inheritance: single, multilevel, hierarchical
- Multiple inheritance limitation in Java
- Final keyword: final variables, methods, classes
- Polymorphism: compile-time and runtime
- Method overloading (compile-time polymorphism)
- Method overriding (runtime polymorphism)
- Dynamic method dispatch
- Upcasting and downcasting
- instanceof operator

Projects built:

- Animal hierarchy (Animal -> Dog, Cat, Bird)
- Shape hierarchy with area calculation
- Vehicle system (Vehicle -> Car, Bike, Truck)
- Employee hierarchy (Employee -> Manager, Developer, Designer)
- Bank account types (Account -> Savings, Current, Fixed)
- School management (Person -> Student, Teacher)
- E-commerce product categories
- Payment system with different payment types

Practice: Build 15 inheritance hierarchies, solve 25 polymorphism problems

Abstraction & Interfaces

Topics:

- Abstraction: hiding implementation details
- Abstract classes with 'abstract' keyword
- Abstract methods: methods without body
- Concrete methods in abstract classes
- When to use abstract classes

- Interfaces: 100% abstraction (pre-Java 8)
- Interface declaration with 'interface' keyword
- Implementing interfaces with 'implements'
- Multiple interface implementation
- Interface variables: public static final
- Interface methods: public abstract
- Default methods in interfaces (Java 8+)
- Static methods in interfaces (Java 8+)
- Private methods in interfaces (Java 9+)
- Functional interfaces and @FunctionalInterface
- Marker interfaces
- Interface vs abstract class comparison
- Real-world abstraction examples

Projects built:
- Shape calculator with abstract classes
- Payment gateway with interfaces
- Database connection abstraction
- Notification system (Email, SMS, Push)
- Remote control interface for devices
- Sorting algorithms with Comparable/Comparator
- Plugin architecture using interfaces
- PHASE 1 MINI CAPSTONE: Library Management System (Console-based)
- Features: Books, members, issue/return, search, OOP principles

Practice: Solve 30 abstraction and interface problems
Assessment: Phase 1 exam: a practical build defended live, plus a written paper mixing this phase with everything before it

---

PHASE 2: INTERMEDIATE JAVA & ADVANCED CONCEPTS (MONTHS 4-6, WEEKS 14-26)

Master advanced Java features, Collections Framework, exception handling, file I/O, multithreading, and design patterns.

Month 4: Advanced Java Features & Collections (Weeks 14-18)

String Handling & Regular Expressions

Topics:
- String class: immutability and string pool
- String methods: length, charAt, substring, indexOf
- String comparison: equals, equalsIgnoreCase, compareTo
- String manipulation: concat, replace, trim, split
- String case methods: toUpperCase, toLowerCase
- StringBuilder class: mutable strings
- StringBuffer class: thread-safe mutable strings
- StringBuilder vs StringBuffer vs String
- String formatting: format(), printf()
- StringTokenizer class
- Regular expressions (regex) in Java
- Pattern and Matcher classes
- Regex patterns: character classes, quantifiers, groups
- Common regex operations: validation, search, replace
- Regex for email, phone, URL validation

Projects built:
- Text analyzer (word count, character count, frequency)
- String manipulation utility library
- Email validator using regex
- Phone number formatter
- Password strength validator
- URL extractor from text
- CSV parser using String methods
- Palindrome and anagram checker
- Caesar cipher encryption/decryption
- Log file parser

Practice: Solve 35 string manipulation and regex problems

Exception Handling & Error Management

Topics:
- What are exceptions? Error vs Exception
- Exception hierarchy: Throwable, Error, Exception
- Checked exceptions vs unchecked exceptions
- Try-catch block for exception handling
- Multiple catch blocks
- Catch block order: specific to general
- Finally block: cleanup code
- Try-with-resources (Java 7+): automatic resource management
- Throw keyword: throwing exceptions manually
- Throws keyword: declaring exceptions
- Creating custom exceptions
- Custom checked and unchecked exceptions
- Exception chaining and cause
- Best practices for exception handling

- Common exceptions: NullPointerException, ArrayIndexOutOfBoundsException, etc.
- Rethrowing exceptions
- Multi-catch (Java 7+)

Projects built:

- Robust calculator with exception handling
- File reader with proper error handling
- Custom banking exception system
- Input validation with custom exceptions
- Safe array operations utility
- Age validator with custom exceptions
- Division calculator with exception handling
- User registration with validation exceptions

Practice: Solve 25 exception handling scenarios

Collections Framework - Part 1

Topics:

- Collections Framework overview and architecture
- Collection interface hierarchy
- List interface and implementations
- ArrayList: dynamic array implementation
- ArrayList methods: add, remove, get, set, size, clear
- LinkedList: doubly-linked list implementation
- ArrayList vs LinkedList performance comparison
- Vector and Stack (legacy classes)
- Set interface: unique elements
- HashSet: hash table implementation
- LinkedHashSet: insertion order maintenance
- TreeSet: sorted set using Red-Black tree
- Set operations and methods
- Iterator and ListIterator interfaces
- Enhanced for loop with collections
- Collections class utility methods

Projects built:

- Todo list application with ArrayList
- Student management system with List
- Phonebook with ArrayList and search
- Unique word counter with HashSet
- Sorted student list with TreeSet
- Remove duplicates from list
- Collection operations library
- Inventory management with collections

Practice: Solve 40 List and Set problems

Collections Framework - Part 2

Topics:

- Map interface: key-value pairs
- HashMap: hash table based map
- HashMap methods: put, get, remove, containsKey, keySet, values
- LinkedHashMap: insertion order maintenance
- TreeMap: sorted map using Red-Black tree
- Hashtable: legacy synchronized map
- HashMap vs Hashtable vs ConcurrentHashMap
- Queue interface: FIFO structure
- PriorityQueue: heap-based priority queue
- Deque interface: double-ended queue
- ArrayDeque implementation
- Comparable interface for natural ordering
- Comparator interface for custom ordering
- Sorting collections: Collections.sort()
- Searching collections: Collections.binarySearch()
- Generics in collections
- Type safety with generics

Projects built:

- Word frequency counter with HashMap
- Contact management with Map
- Student grade book with TreeMap
- Priority task manager with PriorityQueue
- Cache implementation with LinkedHashMap
- Custom sorting with Comparator
- Leaderboard system with TreeSet
- Configuration manager with Properties

Practice: Solve 40 Map and Queue problems

Generics & Advanced Collections

Topics:

- Introduction to generics: type parameters
- Generic classes and interfaces
- Generic methods
- Bounded type parameters: extends, super
- Wildcards: ?, ? extends T, ? super T
- Generic constructors
- Type erasure in generics

- Restrictions on generics
- Generic collections usage
- Creating custom generic classes
- EnumSet and EnumMap
- Immutable collections (Java 9+)
- List.of(), Set.of(), Map.of()
- Collections performance comparison
- Time and space complexity of operations

Projects built:
- Generic stack and queue implementation
- Generic pair and tuple classes
- Type-safe database repository
- Generic utility library
- Custom generic collection class
- Generic algorithm implementations

Practice: Create 15 generic classes, solve 25 generics problems

Month 5: File I/O, Multithreading & Modern Java (Weeks 19-22)

File I/O & Serialization

Topics:
- File handling in Java: File class
- Creating, deleting, renaming files and directories
- File properties: exists, length, canRead, canWrite
- Byte streams: InputStream, OutputStream
- FileInputStream and FileOutputStream
- Character streams: Reader, Writer
- FileReader and FileWriter
- Buffered streams: BufferedReader, BufferedWriter
- PrintWriter for formatted output
- Scanner for reading input
- NIO (New I/O) package: Path, Paths, Files
- Reading and writing with NIO
- Serialization: converting objects to bytes
- Serializable interface
- ObjectInputStream and ObjectOutputStream
- Transient keyword
- Externalizable interface for custom serialization

Projects built:
- File-based note-taking application
- File copy and move utility
- Text file analyzer (line count, word count)
- CSV file reader and writer
- Contact manager with file persistence
- Student records with serialization
- Configuration file manager
- Log file generator and reader
- File encryption/decryption utility
- Directory tree viewer

Practice: Build 15 file handling applications

Multithreading & Concurrency - Part 1

Topics:
- Multithreading concepts: process vs thread
- Thread lifecycle: new, runnable, running, blocked, terminated
- Creating threads: extending Thread class
- Creating threads: implementing Runnable interface
- Thread class methods: start, run, sleep, join
- Thread priorities: setPriority, getPriority
- Daemon threads
- Thread synchronization: race condition problem
- Synchronized keyword: synchronized methods
- Synchronized blocks
- Inter-thread communication: wait, notify, notifyAll
- Deadlock and its prevention
- Thread safety and immutability
- ThreadLocal class
- Thread groups

Projects built:
- Multi-threaded counter application
- Producer-consumer problem solution
- Bank account with synchronized withdrawal
- Print even-odd numbers using two threads
- Multi-threaded file downloader
- Thread pool executor example
- Dining philosophers problem
- Ticket booking system with synchronization

Practice: Solve 30 multithreading problems

Multithreading & Concurrency - Part 2

Topics:
- Executor framework: ExecutorService

- Thread pools: FixedThreadPool, CachedThreadPool
- Callable and Future interfaces
- CompletableFuture for async programming
- Concurrent collections: ConcurrentHashMap
- CopyOnWriteArrayList
- BlockingQueue and its implementations
- Atomic variables: AtomicInteger, AtomicLong
- Lock interface and ReentrantLock
- ReadWriteLock for read-write operations
- Semaphore for resource control
- CountDownLatch and CyclicBarrier
- Fork/Join framework
- Parallel streams (Java 8+)
- Best practices for concurrent programming

Projects built:
- Parallel file processor
- Concurrent web crawler
- Multi-threaded image processor
- Task scheduler with ExecutorService
- Parallel array sum calculation
- Thread-safe cache implementation
- Concurrent download manager
- Real-time data processor

Practice: Build 12 concurrent applications

Java 8+ Modern Features

Topics:
- Lambda expressions: syntax and usage
- Functional interfaces: Predicate, Function, Consumer, Supplier
- Method references: static, instance, constructor
- Streams API: creating streams
- Intermediate operations: filter, map, flatMap, sorted
- Terminal operations: collect, forEach, reduce
- Collectors class: toList, toSet, toMap, groupingBy
- Optional class: handling null values
- Date and Time API (java.time package)
- LocalDate, LocalTime, LocalDateTime
- ZonedDateTime and time zones
- Period and Duration
- Default and static methods in interfaces
- forEach method with lambda
- New features in Java 9-17: modules, var keyword, records, sealed classes

Projects built:
- Stream operations on collections
- Employee filtering and sorting with streams
- Data transformation pipeline
- Optional handling in applications
- Date-time calculations and formatting
- File processing with streams
- Custom collectors implementation
- Functional programming utilities

Practice: Solve 40 lambda and streams problems

Month 6: Design Patterns, JDBC & Testing (Weeks 23-26)

Design Patterns - Part 1 (Creational)

Topics:
- Design patterns introduction and importance
- Gang of Four (GoF) patterns
- Pattern categories: creational, structural, behavioral
- Singleton pattern: one instance
- Factory pattern: object creation
- Abstract Factory pattern
- Builder pattern: complex object construction
- Prototype pattern: cloning objects
- When to use each creational pattern
- Anti-patterns to avoid
- Real-world pattern applications

Projects built:
- Database connection pool (Singleton)
- Shape factory implementation
- Document builder with Builder pattern
- GUI component factory
- Configuration manager (Singleton)
- Clone-based object creation

Practice: Implement all 5 creational patterns in different scenarios

Design Patterns - Part 2 (Structural & Behavioral)

Topics:
- Adapter pattern: interface adaptation
- Decorator pattern: adding functionality
- Proxy pattern: placeholder object

- Facade pattern: simplified interface
- Composite pattern: tree structure
- Observer pattern: event handling
- Strategy pattern: algorithm selection
- Command pattern: encapsulating requests
- Template Method pattern
- State pattern: state-based behavior
- Chain of Responsibility pattern
- Iterator pattern (already in Collections)
- MVC pattern for applications

Projects built:
- Notification system (Observer pattern)
- Payment strategy implementation
- Logging framework (Decorator + Singleton)
- UI component library (Composite)
- Request processing chain
- State machine implementation
- Command-based calculator

Practice: Implement 15+ design patterns with real examples

JDBC & Database Programming

Topics:
- Introduction to JDBC (Java Database Connectivity)
- JDBC architecture and drivers
- Driver types: Type 1, 2, 3, 4
- Loading JDBC driver
- Establishing database connection
- Connection interface and methods
- Statement interface for SQL execution
- PreparedStatement: parameterized queries
- CallableStatement: stored procedures
- ResultSet: processing query results
- CRUD operations with JDBC
- Transaction management: commit, rollback
- Batch processing
- Connection pooling
- Database metadata
- Handling SQL exceptions

Projects built:
- Student database management (CRUD)
- Employee records system with MySQL
- Product catalog with database
- User authentication with database
- Transaction-based banking system
- Prepared statement utility library
- Database backup and restore utility
- Report generation from database

Practice: Build 10 database-driven applications

Unit Testing with JUnit

Topics:
- Introduction to testing: why test?
- Types of testing: unit, integration, system
- JUnit framework introduction
- JUnit 5 (Jupiter) architecture
- Test annotations: @Test, @BeforeEach, @AfterEach
- @BeforeAll, @AfterAll
- Assertions: assertEquals, assertTrue, assertNotNull
- assertThrows for exception testing
- Test lifecycle
- Parameterized tests
- Test suites
- Mocking with Mockito
- Test-Driven Development (TDD)
- Code coverage with JaCoCo
- Best practices for unit testing

Projects built:
- Unit tests for calculator class
- Testing collections utilities
- TDD implementation of stack
- Testing database operations with mocks
- Test suite for banking system
- Parameterized tests for validators
- Integration tests for application

Practice: Write tests for all previous projects, achieve 80%+ coverage

Assessment: Phase 2 exam: a practical build defended live, plus a written paper mixing this phase with everything before it

---

PHASE 3: ENTERPRISE JAVA & WEB DEVELOPMENT (MONTHS 7-9, WEEKS 27-39)

Master enterprise Java development with Servlets, JSP, Spring Framework, Spring Boot,
Hibernate, and RESTful APIs.

  Month 7: Web Development & Spring Framework (Weeks 27-30)
    Servlets & JSP Fundamentals
      Topics:
        - Web application architecture: client-server
        - HTTP protocol: request-response cycle
        - HTTP methods: GET, POST, PUT, DELETE
        - Web servers vs application servers
        - Apache Tomcat setup and configuration
        - Servlets: server-side Java programs
        - Servlet lifecycle: init, service, destroy
        - HttpServlet class and methods
        - doGet() and doPost() methods
        - HttpServletRequest and HttpServletResponse
        - Request parameters and headers
        - Session management: HttpSession
        - Cookies in servlets
        - Request dispatcher: forward and include
        - Servlet configuration: web.xml, annotations
        - JSP (JavaServer Pages) introduction
        - JSP lifecycle and implicit objects
        - JSP directives, declarations, scriptlets, expressions
      Projects built:
        - Hello World servlet
        - Login servlet with session
        - User registration form processing
        - Simple calculator servlet
        - Shopping cart with session
        - File upload servlet
        - JSP-based dynamic web pages
        - Servlet-JSP MVC pattern application
      Practice: Build 10 servlet-based web applications
    Spring Framework Core
      Topics:
        - Introduction to Spring Framework
        - Spring modules and architecture
        - Dependency Injection (DI) concept
        - Inversion of Control (IoC) principle
        - Spring IoC container: BeanFactory, ApplicationContext
        - Bean definition and configuration
        - XML-based configuration
        - Annotation-based configuration: @Component, @Autowired
        - Java-based configuration: @Configuration, @Bean
        - Bean scopes: singleton, prototype, request, session
        - Bean lifecycle: init and destroy methods
        - Autowiring: byName, byType, constructor
        - @Qualifier for disambiguation
        - Dependency injection: constructor, setter, field
        - ApplicationContext events
        - Spring Expression Language (SpEL)
      Projects built:
        - Simple Spring application setup
        - Dependency injection examples
        - Bean configuration practice
        - Spring-based calculator
        - User service with DI
        - Multiple bean configurations
        - Layered architecture with Spring
      Practice: Create 15 Spring DI scenarios
    Spring Boot Fundamentals
      Topics:
        - Introduction to Spring Boot
        - Spring Boot advantages: convention over configuration
        - Spring Initializr: project generation
        - Spring Boot starters
        - Auto-configuration mechanism
        - Application.properties and application.yml
        - Spring Boot main application class
        - @SpringBootApplication annotation
        - Component scanning
        - Spring Boot DevTools
        - Creating REST controllers with @RestController
        - @RequestMapping, @GetMapping, @PostMapping
        - Path variables and request parameters
        - Request body with @RequestBody
        - Response entity and HTTP status codes
        - Exception handling with @ControllerAdvice

- Custom error responses
    Projects built:
      - Hello World REST API with Spring Boot
      - CRUD REST API for products
      - User management REST API
      - Todo application backend
      - Blog post API
      - Student records API
      - Exception handling in APIs
      - API documentation with Swagger/OpenAPI
    Practice: Build 10 REST APIs with Spring Boot
  Spring Data JPA & Hibernate
    Topics:
      - JPA (Java Persistence API) introduction
      - ORM (Object-Relational Mapping) concept
      - Hibernate as JPA implementation
      - Entity classes with @Entity annotation
      - Primary keys: @Id, @GeneratedValue
      - Column mapping: @Column annotation
      - Table mapping: @Table annotation
      - Entity relationships: @OneToOne, @OneToMany, @ManyToOne, @ManyToMany
      - Cascade types and fetch types (LAZY, EAGER)
      - Spring Data JPA repositories
      - JpaRepository interface
      - CRUD operations with repositories
      - Query methods: findBy, findAll, save, delete
      - Custom queries with @Query
      - JPQL (Java Persistence Query Language)
      - Native SQL queries
      - Pagination and sorting
    Projects built:
      - Student database with JPA entities
      - Product catalog with Spring Data JPA
      - Blog with posts and comments (relationships)
      - E-commerce with products and categories
      - User and roles management
      - Library system with JPA
      - Custom query implementations
      - Pagination and sorting examples
    Practice: Build 10 database applications with Spring Data JPA

Month 8: Advanced Spring Boot & Microservices Basics (Weeks 31-35)
  Spring Security & Authentication
    Topics:
      - Spring Security introduction
      - Security filter chain
      - Authentication vs authorization
      - In-memory authentication
      - JDBC authentication
      - UserDetailsService for custom authentication
      - Password encoding: BCryptPasswordEncoder
      - Method-level security: @PreAuthorize, @Secured
      - Role-based access control (RBAC)
      - JWT (JSON Web Token) authentication
      - Creating and validating JWT tokens
      - Stateless authentication
      - OAuth 2.0 basics
      - Social login integration
      - CORS configuration in Spring Boot
      - CSRF protection
    Projects built:
      - User registration and login API
      - JWT-based authentication system
      - Role-based authorization API
      - Secured REST API endpoints
      - Social login with OAuth
      - Password reset functionality
      - User profile management with security
      - Multi-role application
    Practice: Secure all REST APIs with authentication
  Spring Boot Advanced Features
    Topics:
      - Spring Boot Actuator: production-ready features
      - Health checks and metrics
      - Custom actuator endpoints
      - Application monitoring
      - Logging in Spring Boot: Logback, Log4j2
      - Logging levels and configuration
      - Aspect-Oriented Programming (AOP) in Spring

    - @Aspect, @Before, @After, @Around
    - Cross-cutting concerns: logging, transaction
    - Transaction management: @Transactional
    - Declarative vs programmatic transactions
    - Caching with Spring: @Cacheable, @CacheEvict
    - Redis integration for caching
    - Scheduling tasks: @Scheduled
    - Async processing: @Async
    - Event handling in Spring
    - Profiles for different environments
  Projects built:
    - Application with health monitoring
    - Custom metrics endpoint
    - AOP-based logging system
    - Transaction management in banking app
    - Caching layer implementation
    - Scheduled task executor
    - Async email notification system
    - Multi-environment configuration
  Practice: Add production features to all Spring Boot apps
RESTful API Best Practices & Microservices Intro
  Topics:
    - REST API design principles
    - Resource naming conventions
    - HTTP status codes usage
    - HATEOAS (Hypermedia as the Engine of Application State)
    - API versioning strategies
    - Request validation with @Valid
    - Bean validation annotations
    - API documentation with SpringDoc OpenAPI
    - Swagger UI integration
    - Rate limiting and throttling
    - API security best practices
    - Microservices architecture introduction
    - Monolithic vs microservices
    - Service discovery concept
    - Inter-service communication
    - Introduction to Spring Cloud
  Projects built:
    - RESTful API with HATEOAS
    - Validated REST endpoints
    - Complete API with Swagger docs
    - Versioned API implementation
    - Rate-limited public API
    - Basic microservice setup
    - Service-to-service communication
    - API gateway pattern example
  Practice: Design and document 5 production-ready APIs
Spring Boot with External Services
  Topics:
    - RestTemplate for HTTP clients
    - WebClient for reactive HTTP calls
    - Consuming third-party APIs
    - Feign client for declarative REST
    - Email integration: JavaMailSender
    - Sending HTML emails
    - File upload and storage
    - AWS S3 integration
    - Message queues: RabbitMQ basics
    - Apache Kafka introduction
    - Event-driven architecture
    - WebSocket support in Spring Boot
    - Real-time communication
    - Payment gateway integration (Stripe, Razorpay)
    - SMS integration
    - Push notifications
  Projects built:
    - Weather API consumer
    - Email notification service
    - File upload to cloud storage
    - Message queue producer-consumer
    - Real-time chat application
    - Payment processing system
    - SMS alert service
    - Event-driven order processing
  Practice: Integrate 8 external services in applications
Testing Spring Boot Applications
  Topics:
    - Spring Boot testing overview

- @SpringBootTest annotation
- Test slicing: @WebMvcTest, @DataJpaTest
- MockMvc for testing controllers
- Mocking with @MockBean
- Testing REST APIs
- Integration testing with database
- TestContainers for database testing
- Testing security configurations
- Testing with different profiles
- JUnit 5 with Spring Boot
- AssertJ for fluent assertions
- Test coverage with JaCoCo
- Performance testing basics
- Contract testing introduction

Projects built:

- Complete test suite for REST API
- Controller layer tests
- Service layer tests with mocks
- Repository layer tests
- Integration tests for application
- Security tests
- End-to-end testing
- Test-driven development practice

Practice: Write comprehensive tests for all Spring Boot projects

Month 9: Production Java: Deployment, Monitoring & Security (Weeks 36-39)

Database Design & Optimization

Topics:

- Relational database design principles
- Normalization: 1NF, 2NF, 3NF, BCNF
- Entity-Relationship diagrams
- Database schema design
- Index optimization in JPA
- Query optimization techniques
- N+1 query problem and solutions
- Database connection pooling: HikariCP
- Transaction isolation levels
- Optimistic vs pessimistic locking
- Database migration with Flyway/Liquibase
- NoSQL with Spring Boot: MongoDB
- Spring Data MongoDB
- Choosing SQL vs NoSQL
- Multi-database applications

Projects built:

- Optimized database schema design
- Migration scripts with Flyway
- Performance-tuned JPA queries
- MongoDB integration
- Connection pool configuration
- Database performance monitoring
- Multi-database Spring Boot app

Practice: Optimize databases for all projects

Application Deployment & DevOps

Topics:

- Packaging Spring Boot applications
- JAR vs WAR deployment
- Application properties for production
- Externalized configuration
- Environment-specific configurations
- Deploying to Tomcat server
- Docker basics review
- Dockerizing Spring Boot applications
- Docker Compose for multi-container
- Docker best practices for Java
- Cloud platforms: AWS, Azure, GCP
- Deploying to AWS Elastic Beanstalk
- Deploying to Render
- CI/CD for Spring Boot with Jenkins
- GitHub Actions for Java projects

Projects built:

- Production-ready application configuration
- Dockerized Spring Boot app
- Multi-container deployment
- Cloud deployment practice
- CI/CD pipeline setup
- Automated deployment workflow
- Blue-green deployment example

Practice: Deploy all applications to production environments

Monitoring, Logging & Performance

```
      Topics:
        - Application monitoring strategies
        - Spring Boot Actuator deep dive
        - Micrometer metrics
        - Prometheus integration
        - Grafana dashboards
        - Distributed tracing with Sleuth and Zipkin
        - Centralized logging with ELK stack
        - Log aggregation strategies
        - Performance profiling tools
        - JVM monitoring and tuning
        - Garbage collection optimization
        - Memory leak detection
        - Load testing with JMeter
        - API performance optimization
        - Database query profiling
      Projects built:
        - Monitoring dashboard setup
        - Metrics collection and visualization
        - Distributed tracing implementation
        - Centralized logging system
        - Performance optimization project
        - Load testing suite
        - JVM tuning exercise
      Practice: Add monitoring to all production applications
    Security Best Practices & API Standards
      Topics:
        - OWASP Top 10 for Java applications
        - SQL injection prevention in JPA
        - XSS (Cross-Site Scripting) prevention
        - CSRF protection implementation
        - Secure password handling
        - Secrets management
        - API key management
        - Rate limiting implementation
        - Input validation best practices
        - Secure communication: HTTPS/TLS
        - Security headers configuration
        - Dependency vulnerability scanning
        - Static code analysis: SonarQube
        - Security testing
        - Compliance: GDPR, PCI-DSS basics
      Projects built:
        - Security-hardened application
        - Vulnerability assessment tool
        - Secure API implementation
        - Security testing suite
        - Code quality dashboard
      Practice: Security audit all projects
      Assessment: Phase 3 exam: a practical build defended live, plus a written paper mixing
      this phase with everything before it

----------------------------------------------------------------
PHASE 4: THE FINALE (MONTH 10, WEEKS 40-44)
----------------------------------------------------------------
The capstone month: spec, build, ship and defend, then the final exam that decides the
certificate.

  Month 10: Capstone and the Final Exam (Weeks 40-44)
    Capstone Spec and Setup
      Topics:
        - Choosing the capstone: a Spring Boot product API: bookings, a commerce backend or a
          real-world service with security and tests
        - A one-page spec: scope, milestones, stack
        - Repository and skeleton ready on day one
        - Instructor sign-off before the build begins
      Projects built:
        - Approved capstone spec plus the running skeleton
      Practice: Pitch the spec to the batch and absorb one hard question
    Capstone Build
      Topics:
        - Two focused weeks in vertical slices
        - Instructor checkpoints and honest scope cuts
        - Using the whole course: core Java depth, collections and concurrency judgment, Spring Boot,
          JPA and security
        - Daily commits and an always-working build
      Projects built:
        - The capstone, feature-complete with version control
      Practice: A working build at the end of every session
```

Ship and Polish
Topics:
- The finishing pass: edge cases, errors, documentation
- Packaged and deployed: a Spring Boot artifact running outside the IDE
- A README worth reading and a demo worth watching
- A full-course spiral review before the exam
Projects built:
- The capstone shipped, documented and rehearsed
Practice: Two mock demos, each tighter than the last
Demo Day and the Final Exam
Topics:
- Presenting the capstone: live demo plus the hardest bug story
- The honest map of next roads: backend engineering, microservices when a system earns them, DSA for placements
- Where our other courses continue the journey
Projects built:
- Demo day presentation delivered to the batch
Assessment: FINAL EXAM: a practical build plus a written paper with questions mixed from every phase. Passing earns the certificate; falling short earns a focused revision plan and a free retest

PROJECTS THE STUDENT BUILDS AND KEEPS

- Phase 1: console programs that prove core Java and OOP
- Phase 2: concurrent, tested builds using collections and patterns for real
- Phase 3: Spring Boot REST APIs with JPA, security and tests
- Phase 4: the Spring Boot capstone, deployed and defended

Total projects: 20+ real builds, crowned by a deployed Spring Boot capstone

SKILLS THE STUDENT WILL HAVE AT THE END

- Core Java at placement depth: OOP, collections, generics, exceptions
- Concurrency understood: threads, the memory model and modern utilities
- Modern Java fluency: streams, lambdas, records and current LTS habits
- Design patterns and JDBC: the thinking under every framework
- Spring Boot in practice: REST APIs, Spring Data JPA, security, testing

HOW A TYPICAL WEEK IS SPLIT

Live classes: 2 live one-hour classes per week, coding along with the instructor
Homework: A problem set after every class, and a mixed-review assignment at the end of every month
Practice: 4-6 hours of building between classes
Review: Every submission reviewed with written feedback; recurring gaps reopened in class

SUPPORT INCLUDED

Doubt support: WhatsApp doubt support between classes
Progress updates: Honest monthly progress reviews: what is solid, what is wobbly, and the plan for the wobble

CERTIFICATION DETAIL

Completion: Certificate from Modern Age Coders, awarded on passing the final exam. Fall short and there is focused revision and a free retest: the certificate certifies knowledge, not attendance

WHERE THIS CAN LEAD

- Backend roles: Java plus Spring Boot remains the enterprise hiring staple
- Our DSA course beside this one is the classic placement combination
- Microservices and cloud depth later, once real systems demand them
- Kotlin and Android: our Kotlin course builds on exactly this foundation

EARNING POTENTIAL (share only if asked, and never promise it)

Market context: The ranges below are general market salary bands for these roles in India and abroad, drawn from public industry data. They are shown for career context only and are not a promise or guarantee of income. Actual pay depends on your skills, experience, location, and the job market.
Early career roles: Rs 3-5 LPA (Junior Java Developer / Fresher)
Growing roles: Rs 5-9 LPA (Java Developer); Rs 8-15 LPA (Senior Java Developer / Spring Boot Developer)
Experienced roles: Rs 12-25 LPA (Senior Java / Microservices Developer / Tech Lead); Rs 18-40 LPA (Lead Developer / Architect)
Freelance: Rs 1,000-5,000/hour based on expertise
International usa: $80k-180k USD (Java Developer to Senior)
International europe: €50k-120k EUR based on country and experience

COMMON QUESTIONS ABOUT THIS COURSE

  For anything about cost, use PART 4 and RULE 1. Do not quote two regions.

  Q: What does this Java course cover?
  A: Core Java to real depth first: object-oriented programming, collections, generics, exceptions, multithreading and modern Java features, plus design patterns, JDBC and JUnit testing. Then the job stack: Spring Boot, Spring Data JPA with Hibernate, Spring Security, REST API design and testing, and production habits like deployment, monitoring and logging. A finale month ships a Spring Boot capstone and sits the final exam.

  Q: How long does it take to learn Java properly?
  A: Ten months of teaching at 2 live classes a week plus 4 to 6 hours of practice, with two more months in hand for learners who need them. The three teaching phases build the skill and its real-world application; the finale month ships a capstone and sits the final exam.

  Q: How am I assessed? Is the certificate just for attending?
  A: No. Problem sets follow every class with written feedback, monthly reviews deliberately mix new material with earlier topics, each phase ends with a cumulative exam, and the course ends with a final exam: a practical build plus written questions from the whole syllabus. Passing earns the certificate; falling short earns focused revision and a free retest.

  Q: Is Java still worth learning in 2026?
  A: Emphatically: banking, e-commerce, telecom and most of enterprise India run on Java, placements test it more than any other language, and modern Java (current LTS releases, streams, records, virtual threads) is a far better language than its reputation. Python took the headlines; Java kept the backends.

  Q: Java or Python first for placements?
  A: Either works for DSA rounds, but Java pays twice: the same language covers your DSA practice and the Spring Boot backend skills that service and product companies actually hire for. If your target is backend or enterprise roles, Java first is the efficient road; our Python courses cover the data and automation roads.

  Q: Can I try a class before enrolling?
  A: Yes, a free demo class with no commitment: book at learn.modernagecoders.com/contact or message us on WhatsApp at +91 91233 66161. (Agent note: the free demo is a waiting list with no fixed date. The Priority Live Demo is a guaranteed class today or tomorrow, booked at https://learn.modernagecoders.com/priority-demo . Offer both, as RULE 3 says.)

  Q: Are classes live or recorded?
  A: Live, always: small groups with a real instructor reading your actual code, never pre-recorded videos.

  To enrol, message Shivam Sir on +91 9123366161 or send the parent this link: https://learn.modernagecoders.com/courses/complete-java-programming-masterclass-college
  For a demo: the Priority Live Demo (guaranteed, today or tomorrow) is booked at https://learn.modernagecoders.com/priority-demo . The free demo is a waiting list with no fixed date.

==========

COURSE 88 OF 137: JAVA FOR TEENS: COMPLETE COURSE FROM BEGINNER TO ADVANCED

==========

Course link: https://learn.modernagecoders.com/courses/java-programming-masterclass-for-teens
Subject area: Java Programming
Designed for: Teens
Who can join: Absolute beginner, ages 13 to 18
Course length: 10-12 months (40-48 weeks)
Time needed: 2 live classes/week + 3-4 hours practice
Certificate: Certificate from Modern Age Coders, awarded on passing the final exam

PRICE FOR THIS COURSE (quote only the one that applies to the person asking)
  In India, per month: group Rs 1,499, mini batch Rs 2,999, one to one Rs 4,999
  In Canada, per month: group CAD 140, one to one CAD 210
  Anywhere else, per month: group $100, one to one $150
  Classes: group and mini batch two live classes a week, eight a month; one to one in India one live class a week, four a month; one to one outside India two live classes a week, eight a month. Each class is one hour.

WHAT THIS COURSE IS

  Java course for teens aged 13-18. Live online classes: core Java, JavaFX apps, games, Minecraft mods, data structures and a Spring Boot intro, in 10-12 months.

  In one line: The language behind Minecraft, Android and the systems banks run on, taught to teenagers properly: strict enough to build discipline, fun enough to keep them building.

ABOUT THE PROGRAMME

Java is the language schools trust and industry runs on: ICSE, ISC and AP Computer Science A all teach it, Minecraft is written in it, and enterprise systems everywhere depend on it. This live online course takes students aged 13 to 18 from their first line of code to genuinely advanced Java, and its strict, typed nature quietly teaches the discipline that makes every later language easier. The first three months build the foundations: variables to loops to methods, then object-oriented programming taught the way Java demands, with classes, inheritance, interfaces and real design decisions. The middle months make Java fun on screen: the collections framework and modern streams, desktop apps with JavaFX, a complete 2D game, and Minecraft modding, the project every Java-learning teen secretly wants. The final months go where serious Java students go: data structures and algorithms built from scratch, a threaded program that does two things at once, a first REST API with Spring Boot, calling modern AI models from Java, and a capstone shipped with Git, tests and a demo. The pace is honest: two live classes a week plus three to four hours of practice fits the syllabus in ten months, and students who need more time take up to twelve, the class adapts instead of rushing ahead. Learning is checked the honest way too: homework after every class, monthly assignments that mix new questions with earlier topics, and a final exam that decides the certificate. Real knowledge, real work, real projects, depth over dopamine.

WHAT MAKES THIS COURSE DIFFERENT

- Aligned with school Java: ICSE, ISC and AP Computer Science A students find class work and school work reinforcing each other
- Minecraft modding is in the syllabus, not a teaser: students build and run their own mods in month 6
- Object-oriented programming taught as design, not syntax: students learn why classes exist, not just how to type them
- Data structures and algorithms built from scratch, the preparation serious CS paths actually require
- An honest 10-month arc with 2 months of margin built in: students who need more practice take up to 12, nobody is rushed
- Real assessment: weekly homework, mixed-review assignments every month, and a final exam that decides the certificate, with focused revision and a free retest for students who fall short

THE LEARNING PATH, STEP BY STEP

Phase 1: Java foundations (Months 1-3): first programs, arrays, methods, strings, files, then object-oriented programming done properly
Phase 2: Java you can see (Months 4-6): collections and streams, JavaFX desktop apps, a complete 2D game, and Minecraft modding
Phase 3: Data structures and algorithms (Months 7-8): the classic structures built by hand, sorting, graphs, recursion and multithreading
Phase 4: The wider world (Months 9-10): a REST API with Spring Boot, AI APIs from Java, Git and JUnit, and the final capstone

WHAT A STUDENT NEEDS BEFORE STARTING

Coding experience: None. The course starts from the very first line of code
Computer skills: Comfortable typing and managing files and folders
Equipment: A computer with a stable internet connection; the JDK, IntelliJ IDEA and every library used are free
Age: 13 to 18. Batches are grouped by age and pace so the room always fits
Time commitment: 2 live classes plus 3-4 hours of practice a week

WHO THIS COURSE IS FOR

School java students: ICSE, ISC and AP Computer Science A students who want to be ahead of the syllabus, not chasing it
Complete beginners: Teens starting from zero who want a strict, structured language that builds real discipline
Minecraft fans: Students who have always wanted to change the game itself, not just play it
Future engineers: Teens eyeing engineering and computer science degrees where Java and DSA are the entry gate
Serious builders: The kind of student who wants to understand how software works underneath, not just make it run once

FULL CURRICULUM, WEEK BY WEEK

This is the complete teaching plan. Parents can ask about any week.

PHASE 1: JAVA FOUNDATIONS AND OOP (MONTHS 1-3, WEEKS 1-12)

From the first program to real object-oriented design. Java's strictness becomes an advantage: every concept is understood, not guessed.

Month 1: First Programs (Weeks 1-4)
Introduction and Setup

  Topics:
    - What is programming? Why Java? Real-world Java applications
    - How computers understand code: compilation and execution
    - Java history: from coffee to code that runs everywhere
    - Installing Java JDK and understanding versions
    - Setting up IntelliJ IDEA (student edition)
    - Your first Java program: Hello World explained
    - Understanding main method and program structure
    - Basic program flow and execution
    - Using the command line to compile and run Java
    - Introduction to debugging and reading error messages
    - Code comments and documentation basics
    - Programming mindset: how to think like a developer
  Projects built:
    - Set up complete Java development environment
    - Create and run Hello World in 3 different ways
    - Build a simple personal introduction program
  Practice: Short daily exercises: 15 small programs in the first week
Variables, Types and Operations
  Topics:
    - Variables: storing information in programs
    - Primitive data types: int, double, boolean, char
    - Declaring and initializing variables
    - Naming conventions and best practices
    - Arithmetic operators: +, -, *, /, %
    - Order of operations (PEMDAS in programming)
    - Type casting and conversion
    - String basics: creating and concatenating
    - Reading user input with Scanner class
    - Formatting output with printf
    - Constants and final keyword
    - Common programming errors and how to fix them
  Projects built:
    - Interactive calculator application
    - Temperature converter (Celsius/Fahrenheit/Kelvin)
    - Simple cashier program with tax calculation
    - Mad Libs story generator
  Practice: Solve 25 problems on variables and operations
Control Flow: Making Decisions
  Topics:
    - Boolean logic: true and false
    - Comparison operators: ==, !=, <, >, <=, >=
    - If statements: making decisions in code
    - If-else chains for multiple conditions
    - Nested if statements
    - Logical operators: && (AND), || (OR), ! (NOT)
    - Switch statements for multiple choices
    - Ternary operator for simple conditions
    - Program flow visualization
    - Debugging conditional logic
    - Common logic errors and edge cases
    - Writing readable conditional code
  Projects built:
    - Grade calculator with letter grades
    - Simple adventure game with choices
    - Rock-Paper-Scissors game
    - Age-appropriate movie recommendation system
  Practice: Build 10 programs using different conditional patterns
Loops: Repetition and Patterns
  Topics:
    - Why loops? Automation and efficiency
    - While loops: repeat while condition is true
    - Do-while loops: execute at least once
    - For loops: counting and iteration
    - Loop control: break and continue
    - Nested loops: loops within loops
    - Common loop patterns
    - Infinite loops and how to avoid them
    - Enhanced for loop (for-each) preview
    - Loop performance considerations
    - Debugging loops effectively
    - Accumulator and counter patterns
  Projects built:
    - Number guessing game with attempts
    - Multiplication table generator
    - Pattern printer (pyramids, diamonds)
    - Simple password validator with retry
    - Prime number checker
  Practice: Solve 25 loop-based programming challenges

```
    Assessment: Month 1 check: build a small menu-driven program live, plus a take-home
    assignment mixing everything from month 1

Month 2: Arrays, Methods, Strings and Files (Weeks 5-8)
  Arrays
    Topics:
      - Introduction to arrays: storing multiple values
      - Declaring and initializing arrays
      - Accessing array elements with indices
      - Array length and bounds checking
      - Iterating through arrays with loops
      - Common array operations: sum, average, max, min
      - Searching arrays: linear search
      - Sorting arrays: bubble sort basics
      - Two-dimensional arrays (matrices)
      - Arrays of strings
      - ArrayIndexOutOfBoundsException
      - Arrays class utility methods
    Projects built:
      - Grade book system for a class
      - Tic-Tac-Toe game board
      - Student roster management
      - Simple playlist manager
      - Basic statistics calculator
    Practice: Master 25 array manipulation problems
  Methods: Reusable Code
    Topics:
      - What are methods? Why use them?
      - Method structure: return type, name, parameters
      - Void methods vs methods with return values
      - Passing arguments to methods
      - Method overloading: same name, different parameters
      - Scope and local variables
      - Pass by value in Java
      - Recursive methods introduction
      - Method documentation with Javadoc
      - Testing methods independently
      - Helper methods and code organization
      - Static vs instance methods preview
    Projects built:
      - Calculator with method for each operation
      - Text analysis toolkit (word count, etc.)
      - Geometry calculator library
      - Simple encryption/decryption program
      - Menu-driven banking application
    Practice: Create 15 useful utility methods
  Strings and Text Processing
    Topics:
      - String class deep dive
      - String immutability concept
      - Common String methods: length, charAt, substring
      - String comparison: equals vs ==
      - Case conversion: toUpperCase, toLowerCase
      - Searching strings: indexOf, contains
      - Replacing and splitting strings
      - StringBuilder for efficient string building
      - Character class utilities
      - Regular expressions basics
      - Parsing strings to numbers
      - Formatting strings for output
    Projects built:
      - Password strength analyzer
      - Palindrome checker
      - Word game (like Wordle)
      - Text-based email validator
      - Simple markdown to HTML converter
    Practice: Complete 20 string manipulation challenges
  Files and Exceptions
    Topics:
      - Reading from text files
      - Writing to text files
      - File class and file operations
      - Scanner for file input
      - PrintWriter for file output
      - Try-catch blocks for error handling
      - Common exceptions: IOException, FileNotFoundException
      - Finally block usage
      - Throwing exceptions
      - Creating custom exceptions preview
```

```
      - Best practices for file handling
      - Resource management basics
    Projects built:
      - Note-taking application with file storage
      - High score system for games
      - Simple database using text files
      - Log file analyzer
      - CSV file reader/writer
    Practice: Add file storage to three earlier projects
    Assessment: Month 2 check: build a program that loads, changes and saves its data, with
    quiz questions reaching back to month 1

Month 3: Object-Oriented Programming (Weeks 9-12)
  Classes and Objects
    Topics:
      - Object-Oriented Programming concepts
      - Real-world objects vs programming objects
      - Creating your first class
      - Instance variables (attributes/fields)
      - Methods (behaviors)
      - Constructors: default and parameterized
      - Creating objects with 'new' keyword
      - The 'this' keyword
      - Getters and setters (accessors/mutators)
      - toString() method
      - Object references vs primitive values
      - Garbage collection basics
    Projects built:
      - Student class with grade management
      - Bank account class with transactions
      - Book library system
      - Simple pet simulator
      - Car dealership inventory
    Practice: Model 10 real-world things as classes
  Encapsulation and Static
    Topics:
      - Information hiding principle
      - Access modifiers: public, private, protected, default
      - Encapsulation best practices
      - Validation in setters
      - Immutable objects
      - Static variables and methods
      - Static vs instance context
      - Class constants with static final
      - Package organization
      - Import statements and classpath
    Projects built:
      - Secure user account system
      - Inventory management with validation
      - Employee management system
      - Game character with stats
      - Shopping cart with product catalog
    Practice: Refactor earlier projects with proper encapsulation
  Inheritance
    Topics:
      - Inheritance concept: is-a relationship
      - Extending classes with 'extends'
      - Super keyword and parent constructors
      - Method overriding
      - @Override annotation
      - Protected access modifier
      - Multi-level inheritance
      - Object class as universal parent
      - equals() and hashCode() methods
      - Abstract classes introduction
      - When to use inheritance vs composition
      - Inheritance best practices
    Projects built:
      - Animal hierarchy with different species
      - Vehicle inheritance system
      - Employee hierarchy (Manager, Developer, etc.)
      - Shape hierarchy for geometry
      - Game entity system
    Practice: Design 5 inheritance hierarchies and defend each design choice
  Polymorphism and Interfaces
    Topics:
      - Polymorphism: many forms
      - Method overriding for polymorphism
      - Dynamic method dispatch
```

- Abstract classes and methods
- Interfaces: contracts for classes
- Implementing multiple interfaces
- Interface default methods (Java 8+)
- Comparable and Comparator interfaces
- Polymorphic arrays and collections
- instanceof operator
- Type casting with objects
- Interface vs abstract class

Projects built:
- Payroll system with different employee types
- Media player for different file types
- Drawing application with shapes
- RPG game with character classes
- Plugin system using interfaces

Practice: Implement 8 interfaces across your own projects
Assessment: Phase 1 exam: build a small OOP system live from requirements and explain the design, with cumulative questions from months 1-3

PHASE 2: COLLECTIONS, APPS, GAMES AND MINECRAFT (MONTHS 4-6, WEEKS 13-24)

Modern Java and things you can see: the collections framework, desktop apps with JavaFX, a complete 2D game, and your own Minecraft mods.

Month 4: Collections and Modern Java (Weeks 13-16)

The Collections Framework

Topics:
- Collections vs arrays: when to use what
- Collection interface hierarchy
- List interface: ArrayList vs LinkedList
- Set interface: HashSet, TreeSet, LinkedHashSet
- Map interface: HashMap, TreeMap, LinkedHashMap
- Queue and Deque interfaces
- Iterator and ListIterator
- Collections utility class
- Sorting collections with Comparable/Comparator
- Searching and shuffling
- Performance characteristics of collections

Projects built:
- Contact management system with HashMap
- Task scheduler with PriorityQueue
- Duplicate finder using Sets
- Student database with sorting
- Cache implementation with LinkedHashMap

Practice: Master 25 collection manipulation problems

Generics

Topics:
- Why generics? Type safety benefits
- Generic classes creation
- Generic methods
- Bounded type parameters
- Wildcards: ?, extends, super
- Generic interfaces
- Multiple type parameters
- Generic collections deep dive
- Best practices with generics
- Common generic patterns

Projects built:
- Generic data structure library
- Type-safe cache implementation
- Generic DAO pattern
- Custom generic collections
- Builder pattern with generics

Practice: Create 10 generic classes and methods

Lambdas and Streams

Topics:
- Functional interfaces concept
- Lambda expression syntax
- Method references
- Built-in functional interfaces
- Stream API introduction
- Creating streams from collections
- Intermediate operations: filter, map, sorted
- Terminal operations: collect, reduce, forEach
- Parallel streams
- Optional class for null safety
- Stream performance considerations
- Functional programming in Java

```
    Projects built:
      - Data processing pipeline
      - Report generator with streams
      - Functional calculator
      - Stream-based file analyzer
      - Employee data analysis system
    Practice: Solve 20 problems using streams and lambdas
  Exceptions and Debugging Like a Professional
    Topics:
      - Exception hierarchy in Java
      - Checked vs unchecked exceptions
      - Try-catch-finally deep dive
      - Multi-catch blocks
      - Try-with-resources statement
      - Creating custom exception classes
      - Exception chaining
      - Best practices for exception handling
      - Logging with java.util.logging
      - Debugging techniques in IDE
      - Using breakpoints effectively
      - Stack traces and error analysis
    Projects built:
      - Robust file processing system
      - Input validation framework
      - Error handling library
      - Retry mechanism implementation
      - Logging system for applications
    Practice: Handle exceptions in 15 different scenarios
    Assessment: Month 4 check: a debugging gauntlet plus a mixed assignment reaching back
    to phase 1

Month 5: Desktop Apps with JavaFX (Weeks 17-20)
  JavaFX Fundamentals
    Topics:
      - JavaFX vs Swing: modern GUI development
      - JavaFX application structure
      - Stage, Scene, and Scene Graph
      - Layouts: VBox, HBox, GridPane, BorderPane
      - Basic controls: Button, Label, TextField
      - Event handling in JavaFX
      - CSS styling for JavaFX
      - FXML for UI design
      - Scene Builder tool
      - Images and media in JavaFX
      - Menus and toolbars
      - Dialogs and alerts
    Projects built:
      - Calculator with GUI
      - Note-taking application
      - Login screen with validation
      - Image viewer application
      - Simple text editor
    Practice: Build 8 different GUI layouts
  Tables, Charts and Real Controls
    Topics:
      - TableView for data display
      - TreeView for hierarchical data
      - ListView and observableList
      - ComboBox and ChoiceBox
      - DatePicker and ColorPicker
      - Charts: PieChart, BarChart, LineChart
      - WebView for HTML content
      - Custom controls creation
      - Binding properties
      - Animations and transitions
      - Drag and drop functionality
      - Keyboard shortcuts
    Projects built:
      - Student database with TableView
      - File explorer with TreeView
      - Data visualization dashboard
      - Media player interface
      - Calendar application
    Practice: Build 3 data-driven screens with tables and charts
  Structuring a Real App with MVC
    Topics:
      - Model-View-Controller pattern
      - Separating concerns in JavaFX
      - Observable pattern in JavaFX
```

- Data binding deep dive
- Application state management
- Navigation between screens
- Application packaging
- Keeping logic out of the UI: the habit that saves every project

Projects built:
- Complete MVC application
- Multi-screen navigation app
- Inventory management system
- Point of Sale (POS) system
- Library management GUI

Practice: Refactor one earlier app into clean MVC

Databases for Desktop Apps

Topics:
- JDBC basics and drivers
- Connecting to databases
- SQL review for Java developers
- PreparedStatement vs Statement
- ResultSet processing
- Transaction management
- DAO pattern with JDBC
- Database design basics
- SQLite for desktop apps

Projects built:
- Database-backed todo application
- Customer management system
- Inventory with database
- Expense tracker with reports
- Student information system

Practice: Add SQLite storage to two of your apps

Assessment: Month 5 check: present a working database-backed desktop app, plus a mixed quiz over months 1-5

Month 6: Games and Minecraft Modding (Weeks 21-24)

Game Development Basics

Topics:
- Game loop concept
- Sprite handling and animation
- Collision detection
- Game physics basics
- Sound effects and music
- Game state management
- Score and lives system
- Level design principles
- 2D graphics with Canvas
- Input handling for games
- Game optimization techniques
- Packaging games for distribution

Projects built:
- Snake game implementation
- Breakout/Brick breaker game
- Simple platformer
- Tower defense game
- Puzzle game like 2048

Practice: Build two tiny game prototypes between classes

Build a Complete 2D Game

Topics:
- Choosing your game: Snake, Breakout or a simple platformer
- Structuring the game with the OOP you now own
- Levels, difficulty and progression
- Sound effects, scoring and lives done cleanly
- Menus, pause and game-over screens
- Saving high scores to a file
- Playtesting: watching someone else play, then fixing what confused them
- Packaging the game so a friend can run it

Projects built:
- A complete, finished 2D game with menus, sound, scoring and a shareable build

Practice: Polish pass driven by two playtesters' honest feedback

Minecraft Modding

Topics:
- Minecraft Forge setup
- Mod structure and basics
- Creating blocks and items
- Crafting recipes
- Custom entities
- World generation
- GUI creation
- Mod configuration
- Testing and debugging

- Forge and Fabric: the two modding worlds, explained
Projects built:
- Your first mod: custom items and blocks that load in your own game
- A crafting-recipe mod with its own logic
- A custom tool or gadget mod
Practice: Design and build one mod idea of your own
Phase 2 Capstone and Review
Topics:
- Choosing your phase capstone: game, desktop app or Minecraft mod, taken further
- Refactoring old code with new skills
- Code review: reading each other's projects kindly and usefully
- A targeted review week shaped by what the batch found hard
- Writing project descriptions people understand
- What phase 3 changes: from building things to building fast things
Projects built:
- Phase capstone: your best build, taken one honest level further
Practice: Publish your top 3 projects in a personal portfolio folder
Assessment: Phase 2 review: capstone walkthrough plus a written mixed review spanning phases 1 and 2

PHASE 3: DATA STRUCTURES AND ALGORITHMS (MONTHS 7-8, WEEKS 25-32)

The serious core of computer science, built by hand in Java: structures, sorting, graphs, recursion, and a first look at threads.

Month 7: Structures Built from Scratch (Weeks 25-28)
Lists, Stacks and Queues by Hand
Topics:
- Abstract Data Types (ADT)
- Implementing dynamic arrays
- Linked Lists: single, double, circular
- Stack implementation and applications
- Queue implementation and variants
- Priority queues and heaps
Projects built:
- Custom ArrayList implementation
- Expression evaluator using stacks
- Task scheduler with a priority queue
Practice: Implement a dynamic array, linked list, stack and queue from scratch
Hash Tables and Trees
Topics:
- Hash tables from scratch
- Collision resolution strategies
- Trees: binary trees basics
- Tree traversal: inorder, preorder, postorder
- Binary search trees
- Balanced trees introduction
Projects built:
- Spell checker with your own hash table
- File system simulator with trees
- Autocomplete with a simple trie
Practice: Implement a hash map and a binary search tree, then test them against Java's
Sorting, Searching and Big O
Topics:
- Linear search and optimizations
- Binary search and variations
- Bubble sort and optimizations
- Selection sort
- Insertion sort
- Merge sort and divide-conquer
- Quick sort and partitioning
- Heap sort
- Counting sort and radix sort
- Sorting stability
- Time complexity analysis
- Space complexity
Projects built:
- Sorting visualizer application
- Search engine for text files
- Music playlist sorter
- Leaderboard system
- Data analysis tool
Practice: Implement and analyze 10 classic algorithms
Problem-Solving Patterns
Topics:
- Reading a problem statement like a solver, not a victim
- Frequency counting with maps: the pattern behind dozens of problems
- Two pointers and sliding windows

```
        - Prefix sums for range questions
        - Choosing the right structure: the decision tree
        - Estimating before coding: will this even run in time?
        - Practicing on HackerRank and LeetCode without drowning
        - Where our dedicated DSA course goes further
      Projects built:
        - A personal patterns notebook with one solved example per pattern
      Practice: Solve 20 problems, tagging each with the pattern it used
      Assessment: Month 7 check: a timed three-problem set, plus mixed questions from earlier
      phases

  Month 8: Graphs, Recursion and Threads (Weeks 29-32)
    Graphs
      Topics:
        - Graph representations: adjacency matrix/list
        - Breadth-first search (BFS)
        - Depth-first search (DFS)
        - Shortest path: Dijkstra's algorithm
        - Minimum spanning tree
        - Topological sorting
        - Modeling real problems as graphs: maps, friendships, prerequisites
      Projects built:
        - Social network analyzer
        - Route finder on a real map grid
        - Course prerequisite checker with topological sort
      Practice: Solve 12 graph problems, drawing each before coding it
    Recursion and Backtracking
      Topics:
        - Recursion re-learned properly: trust the function
        - The call stack, visualized
        - Classic recursion: factorial to file-tree walker
        - Backtracking: exploring choices and undoing them
        - Solving mazes by backtracking
        - Sudoku solver: the famous application
        - Memoization: remembering answers you already computed
        - When recursion is the wrong tool
      Projects built:
        - Maze solver with visualization
        - Sudoku solver
        - Word search puzzle solver
      Practice: Solve 15 recursion and backtracking problems
    Multithreading, the Honest Introduction
      Topics:
        - Thread concept and lifecycle
        - Creating threads: Thread class vs Runnable
        - Thread synchronization basics
        - Synchronized keyword
        - Deadlock and how to avoid it
        - Thread pools introduction
        - Callable and Future
        - Concurrent collections
        - Thread safety principles
        - Common threading problems
      Projects built:
        - Multi-threaded download manager
        - Producer-consumer implementation
        - Concurrent counter application
        - Thread pool executor demo
        - Race condition simulator
      Practice: Build 5 small programs that genuinely need two threads
    DSA Capstone
      Topics:
        - Choosing the capstone: sorting visualizer, pathfinding demo or game leaderboard engine
        - Designing before coding: structures chosen for reasons
        - Benchmarking your structure against Java's built-ins
        - Presenting a technical project to a non-technical audience
        - A cumulative review of the whole DSA phase
      Projects built:
        - DSA capstone: an interactive visualizer or engine that shows an algorithm working
      Practice: Write a one-page explanation of your capstone's core algorithm
      Assessment: Phase 3 exam: implement a chosen structure live plus a written paper mixing
      questions from all three phases

----------------------------------------------------------------
PHASE 4: APIS, AI AND THE CAPSTONE (MONTHS 9-10, WEEKS 33-40)
----------------------------------------------------------------
Where teen Java meets the real world: a REST API with Spring Boot, AI models called from
Java, Git and JUnit, and a final capstone shipped properly.
```

Month 9: APIs and AI (Weeks 33-36)
  How the Web Works, for Java Developers
    Topics:
      - How the web works: HTTP protocol
      - Client-server architecture
      - Request-response cycle
      - HTTP methods: GET, POST, PUT, DELETE
      - Status codes and headers
      - HTML/CSS basics for Java developers
      - JSON and XML data formats
      - RESTful API principles
      - Java's built-in HttpClient: calling real APIs
    Projects built:
      - HTTP client that talks to a public API
      - JSON parser for a real API response
      - Weather or trivia terminal app powered by an API
    Practice: Consume 3 public APIs from plain Java
  Your First REST API with Spring Boot
    Topics:
      - What Spring Boot is, and why the industry runs on it
      - Spring Initializr: a real project in two minutes
      - @RestController: your first endpoints
      - GET and POST: reading and creating data
      - Path variables and request parameters
      - Returning JSON objects from Java classes
      - application.properties and sensible configuration
      - Testing your API with a REST client
      - An honest map of what enterprise Spring adds later
    Projects built:
      - A working REST API for a hobby collection: books, games or trading cards
    Practice: Design and build a small API of your own from scratch
  Saving Data: JPA Without the Jargon
    Topics:
      - JPA and Hibernate basics
      - Entity mapping with annotations
      - @Entity, @Table, @Column
      - Primary keys and generation strategies
      - Relationships: @OneToMany, @ManyToOne
      - Spring Data repositories
      - Query methods
      - H2: a database that lives inside your app while you learn
    Projects built:
      - Your hobby API upgraded: data survives restarts
      - A two-entity model with a real relationship
    Practice: Model and persist 3 small domains end to end
  Calling AI Models from Java
    Topics:
      - Calling a modern AI model from Java (accounts set up with a parent where required)
      - Structured output: making the model return real objects
      - Function calling and tool use in a typed language
      - Retrieval over enterprise data
      - Concurrency: many AI calls without melting the server
      - Guardrails and validating model output
      - Cost, caching and quotas
      - Where Java is actually used for AI (and where Python wins)
      - Testing non-deterministic systems
      - Ethics and accountability in automated decisions
    Projects built:
      - AI-powered study helper API endpoint
      - Structured-output parser that turns model text into Java objects
      - A small tool-using AI assistant
    Practice: Build 3 AI-powered features and note where each one is confidently wrong
    Assessment: Month 9 check: a mixed assignment spanning APIs, persistence and AI, with
    questions revisiting earlier phases

Month 10: Quality, Capstone and Demo Day (Weeks 37-40)
  Git, GitHub and JUnit
    Topics:
      - Version control: why every developer uses it
      - The core Git loop: status, add, commit, log
      - Branches: experimenting without fear
      - GitHub: publishing your portfolio
      - READMEs that make a project understandable in a minute
      - JUnit 5: your first real test suite
      - Writing testable methods: the design pressure tests create
      - Debugger over print statements: breakpoints as a way of thinking
      - Where our full Git and GitHub course goes further
    Projects built:
      - Course portfolio pushed to GitHub with clean READMEs

- JUnit test suite for your API's core logic
Practice: Commit daily for two weeks; write 20 tests across your best projects
Final Capstone Build
Topics:
- Choosing the capstone: a polished game, a JavaFX product, a Minecraft mod pack with real logic, or an API-backed app
- Writing a one-page spec before any code
- Milestones: working core by day 4, feature-complete by day 10
- Instructor checkpoints and course corrections
- Using everything: OOP, collections, DSA judgment, tests, Git
- Cutting scope without cutting quality
- Preparing the demo: story, not feature list
Projects built:
- The final capstone, built over two weeks with version control, JUnit tests on core logic, and a README worth reading
Practice: Daily commits; a working build at the end of every session
Demo Day and What Comes Next
Topics:
- Presenting the capstone: live demo plus the hardest bug story
- Portfolio final pass: GitHub profile, project pages, screenshots
- An honest skills inventory: strong, shaky, next
- Where each path leads: DSA deep-dive, Android via Kotlin, full-stack web, or school board excellence
- How ICSE, ISC and AP Computer Science A map to what you now know
- Staying sharp: projects, communities and healthy practice habits
Projects built:
- Demo day presentation delivered to the batch and parents
Assessment: FINAL EXAM: a practical build plus a written paper with questions mixed from every phase. Passing earns the certificate; a student who falls short gets a focused revision plan and a free retest

PROJECTS THE STUDENT BUILDS AND KEEPS

- Phase 1: calculators, text games, a grade book, file-backed apps, a full OOP system built from requirements
- Phase 2: JavaFX desktop apps with tables and charts, a complete 2D game, and working Minecraft mods
- Phase 3: hand-built data structures, a sorting or pathfinding visualizer, and threaded programs
- Phase 4: a REST API with persistence, AI-powered features, and a final capstone with tests and version control

Total projects: 30+ real projects, ending with working Minecraft mods, a REST API and a tested final capstone

SKILLS THE STUDENT WILL HAVE AT THE END

- Core Java: syntax, arrays, methods, strings, files, exceptions and genuine OOP fluency
- Modern Java: collections, generics, lambdas and streams used the way current codebases use them
- Desktop apps: JavaFX interfaces with real data, structured as MVC
- Games and mods: a finished 2D game and Minecraft mods built on Forge
- Data structures and algorithms: built from scratch, analyzed with Big O, applied to real problems
- Web APIs: a first REST API with Spring Boot and JPA persistence
- AI foundations: calling modern AI models from Java with structured output and guardrails
- Developer habits: Git and GitHub, JUnit, debugging and code review

HOW A TYPICAL WEEK IS SPLIT

Live classes: 2 live one-hour classes per week, coding along with the instructor
Homework: Homework after every class, and a mixed-review assignment at the end of every month so earlier skills stay sharp
Practice: 3-4 hours of projects and challenges between classes
Review: Every submitted project reviewed with written feedback; recurring issues reopened in class

SUPPORT INCLUDED

Doubt support: WhatsApp doubt support between classes, so nobody stays stuck on a compiler error for days
Progress updates: Regular progress notes to parents: what was built, what comes next, and where encouragement at home helps

CERTIFICATION DETAIL

Completion: Certificate from Modern Age Coders, awarded on passing the final exam. Fall short and there is focused revision and a free retest: the certificate certifies knowledge, not attendance

WHERE THIS CAN LEAD

- Data Structures and Algorithms: the dedicated course for competitive programming and interviews
- Android development: our Kotlin and app development tracks continue where Java leaves off
- Full-stack web development: deepen Spring Boot into real backend engineering
- School exams: ICSE Computer Applications, ISC Computer Science and AP Computer Science A all examine in Java
- Real small projects: tools, mods and apps for family, school clubs and friends

COMMON QUESTIONS ABOUT THIS COURSE

For anything about cost, use PART 4 and RULE 1. Do not quote two regions.

Q: What will my teen build in this Java course?
A: More than 30 real projects across ten months: text games and file-backed tools in the foundations, JavaFX desktop apps with tables and charts, a complete 2D game, working Minecraft mods built on Forge, hand-built data structures with a visualizer capstone, a REST API with Spring Boot, and a final capstone shipped with Git and JUnit tests. Every project is built by the student and reviewed with written feedback.

Q: How long does it take a teenager to learn Java properly?
A: Most students reach a genuinely advanced level in 10 months at 2 live classes a week plus 3 to 4 hours of practice. The syllabus deliberately keeps 2 months of margin in hand: students who need more repetition take up to 12 months, with no rushing and no penalty. Java rewards patience early, and the course is paced for exactly that.

Q: How is my teen assessed? Is the certificate just for attending?
A: No. Classwork runs inside every session, homework follows every class, and each month ends with an assignment that deliberately mixes new questions with earlier topics so knowledge compounds instead of fading. Every phase closes with a cumulative check, and the course ends with a final exam: a practical build plus written questions drawn from the whole syllabus. Passing earns the certificate; falling short earns a focused revision plan and a free retest. We optimize for real knowledge and real depth, not a stream of feel-good badges.

Q: Should my teen learn Java or Python first?
A: Both are excellent first languages, and we teach both. Java is the better start when the school board examines in it, ICSE, ISC and AP Computer Science A all do, when Minecraft modding is the dream, or when a student thrives on structure: Java's strictness catches mistakes early and builds habits every later language benefits from. Python is the better start for a teen pulled toward AI and data. Either way nothing has to be unlearned later.

Q: Does this course help with ICSE, ISC or AP Computer Science?
A: Directly. Those boards examine in Java, and the first two phases cover the language and object-oriented concepts their papers test, at greater depth than the school syllabus. Students taking those exams find school work becoming revision. For focused board preparation we also run dedicated ICSE Computer Applications and AP Computer Science A courses.

Q: Is Minecraft modding really part of the syllabus?
A: Yes, in month 6, and it is taught seriously: students set up a real Forge development environment, write mods with custom items, blocks and recipes in Java, and load them into their own game. It is the single best motivation device in teen Java, and it quietly exercises classes, inheritance and events, the exact concepts from earlier months.

Q: Does this course cover Android app development?
A: It builds the exact foundation Android rests on, and the final phase includes REST APIs, the backend half of every serious app. Modern Android itself is Kotlin-first, so rather than squeeze an outdated Android unit into this course, we teach it properly in our app development and Kotlin tracks, which pick up exactly where this course ends.

Q: Is any paid software required?
A: No. The Java Development Kit, the IntelliJ IDEA editor used in class, JavaFX, Spring Boot and the Minecraft modding toolchain are all free. A standard computer with a stable internet connection handles the entire course. Where an AI service needs an account in month 9, it is set up together with a parent.

Q: Can we book a demo class?
A: Yes, demo classes are free and carry no commitment; reserve one at learn.modernagecoders.com/contact or message us on WhatsApp at +91 91233 66161. Parents can sit in, and we hold a 4.9 rating across 547 Google reviews if you would like to read what other families say first.

Q: Is the teaching live or recorded?
A: Every class is live: a 1-hour online session where a real teacher works with a small group, never a pre-recorded video. Students code along in class and get corrections on the spot, which matters most in Java's early weeks when one missing semicolon can feel like a wall.

Q: Is there a certificate on completion?

A: Yes, and it is earned, not handed out: the certificate is awarded on passing the final exam, with a free retest after revision if the first attempt falls short. Alongside it stands the portfolio, a finished game, Minecraft mods, a REST API and the capstone, which shows exactly what your teen can build.

To enrol, message Shivam Sir on +91 9123366161 or send the parent this link: https://learn.modernagecoders.com/courses/java-programming-masterclass-for-teens
For a demo: the Priority Live Demo (guaranteed, today or tomorrow) is booked at https://learn.modernagecoders.com/priority-demo . The free demo is a waiting list with no fixed date.

==========
COURSE 89 OF 137: JAVASCRIPT FOR TEENS: INTERACTIVE WEBSITES & BROWSER GAMES
==========

Course link: https://learn.modernagecoders.com/courses/javascript-course-for-teens-beginners-interactive-web
Subject area: Web Development
Designed for: Teens
Who can join: Beginner, ages 13 to 18
Course length: 6 months (24 weeks)
Time needed: 2 live classes/week + 2-3 hours practice
Certificate: Certificate from Modern Age Coders, awarded on passing the final assessment

PRICE FOR THIS COURSE (quote only the one that applies to the person asking)
In India, per month: group Rs 1,499, mini batch Rs 2,999, one to one Rs 4,999
In Canada, per month: group CAD 140, one to one CAD 210
Anywhere else, per month: group $100, one to one $150
Classes: group and mini batch two live classes a week, eight a month; one to one in India one live class a week, four a month; one to one outside India two live classes a week, eight a month. Each class is one hour.

WHAT THIS COURSE IS

JavaScript course for teens ages 13-18: live online classes from first variables to interactive pages, canvas games, real APIs, and a deployed capstone site.

In one line: The language every browser runs, taught from the first variable to a game your friends can actually play.

ABOUT THE PROGRAMME

JavaScript is the only programming language every web browser understands, which makes it the most immediate language a teenager can learn: write a line, refresh the page, and something on screen changes. This 6-month live course starts at zero and builds in one direction, toward work worth showing. Months 1 and 2 cover the language core and the DOM, so pages respond to clicks and typing within weeks. Months 3 and 4 add real data: arrays, objects, JSON, saving with localStorage, and fetching from public APIs such as live weather. Month 5 is games on the HTML canvas, with a proper game loop, keyboard control, and collision detection. Month 6 is the capstone: each student scopes, builds, and deploys an interactive site of their own, then presents it. Classes are live and small. Students write code in every session while an instructor watches them work, and homework gets reviewed, not just collected.

WHAT MAKES THIS COURSE DIFFERENT

- Everything runs in the browser students already have, so the write-refresh-see loop takes seconds and motivation stays high
- The DOM arrives in month 2, not month 5: pages react to clicks within the first weeks, long before the theory runs out
- Real public APIs instead of toy data: weather, dictionaries, and services students choose themselves
- A full month of canvas games, because a game you built yourself is the project teens actually show their friends
- The capstone is deployed to a real URL, so the finished site can sit on a school application or be sent to relatives
- No prior HTML needed: the markup and CSS each project requires is taught in class, exactly when it is needed

THE LEARNING PATH, STEP BY STEP

Phase 1: The language and the page: variables, decisions, loops, and functions, then the DOM and events so pages respond to users
Phase 2: Data and the network: arrays, objects, JSON, and localStorage, then fetch and public APIs for pages built on live data
Phase 3: Canvas games with a real game loop, then a scoped, deployed capstone site presented to the class

WHAT A STUDENT NEEDS BEFORE STARTING

Coding experience: None. The course starts from the first line of code

Html knowledge: Not required. The HTML and CSS each project needs is taught in class
Equipment: A computer with a modern browser and a stable internet connection
Age: 13 to 18. Younger children are better served by our kids coding courses

WHO THIS COURSE IS FOR

Complete beginners: Teens who have never written code and want a language where results show up on screen immediately
Scratch graduates: Students who outgrew block coding and want to type real programs that do real things
Future web developers: Teens aiming at websites and apps, for whom JavaScript is the non-negotiable first step
Game curious: Students who want to build playable browser games, not just read about them
Portfolio builders: Teens who want deployed, working projects to point to on school and college applications

FULL CURRICULUM, WEEK BY WEEK

This is the complete teaching plan. Parents can ask about any week.

PHASE 1: THE LANGUAGE AND THE PAGE (MONTHS 1-2, WEEKS 1-8)

JavaScript from the first line: values, decisions, loops, and functions, then the DOM and events so real pages respond to real users.

Month 1: JavaScript from the First Line (Weeks 1-4)
First Lines of JavaScript
Topics:
- Where JavaScript runs: the browser, the console, and why no install is needed to start
- Setting up VS Code and running a script inside an HTML page
- Values and variables: let and const, and when each is right
- Numbers and strings, and what happens when you mix them
- Template literals for building sentences out of data
- console.log as your first debugging tool
- Comments and naming things so future-you understands the code
Projects built:
- Story generator: a script that assembles a silly story from variables, then from user input via prompt
Practice: 10 short console exercises: swap variables, build sentences, fix three broken scripts
Making Decisions
Topics:
- Comparisons: equal, strictly equal, greater, less, and why === matters
- if, else if, else: teaching a program to choose
- Boolean values and expressions that produce them
- Combining conditions with and, or, not
- Truthy and falsy values, and the bugs they cause
- Nesting conditions without losing the plot
Projects built:
- Number guessing game, round one: the computer picks, you guess, it answers higher or lower
Practice: Decision drills: grade calculator, ticket price rules, a login age check with edge cases
Loops and Repetition
Topics:
- while loops: repeat until something changes
- for loops: counting, stepping, and counting backwards
- Accumulator patterns: totals, counters, and building strings in a loop
- break and continue, used sparingly
- Nested loops and when they are worth it
- Reading a loop you did not write and predicting its output
Projects built:
- Times-table printer with formatting
- Guessing game, round two: limited tries, a running score, play-again logic
Practice: 12 loop katas, including FizzBuzz and a countdown timer printed to the console
Functions
Topics:
- Declaring functions: inputs, outputs, and the return statement
- Parameters vs arguments, and default values
- Arrow function syntax and where you will meet it
- Scope: what a function can and cannot see
- Breaking a messy script into small named functions
- Testing a function by hand with sample inputs
Projects built:
- Tip calculator and unit converter built as a small library of reusable functions
Practice: Write 8 functions from written specs, then refactor week 3 projects to use functions
Assessment: Month 1 skills check: write four short functions live, explaining each

choice

Month 2: The DOM and Events (Weeks 5-8)
Meeting the DOM
Topics:
- Just enough HTML: tags, ids, and classes, taught as we need them
- The DOM tree: how the browser sees a page
- querySelector and querySelectorAll: finding elements
- Changing text with textContent and innerHTML, and the difference
- Changing styles and toggling classes from JavaScript
- The dev tools Elements panel as an x-ray of your page
Projects built:
- Mood page: buttons that change the page's colors, text, and heading live
Practice: Select-and-change drills on a provided practice page with 15 small targets
Events: Pages That Listen
Topics:
- addEventListener: click, input, and change events
- The event object and what it tells you
- Reading values out of text inputs
- Updating the page in response to typing, live
- Preventing default behavior and when you need to
- Common event bugs: listeners attached too early, wrong element, wrong event
Projects built:
- Click counter with milestones
- Live character counter for a message box, with a limit warning
Practice: Build three tiny widgets from spec: a like button, a show-password toggle, a color picker preview
Interactive Widgets
Topics:
- Showing and hiding elements cleanly with classes
- Creating and removing elements with createElement and remove
- Building lists in the DOM from JavaScript data
- classList patterns: toggle, add, remove
- Dark mode done properly: one class on the body
- Organizing widget code so each piece has one job
Projects built:
- Dark mode toggle for a full page
- FAQ accordion that opens one answer at a time
Practice: Recreate two widgets from screenshots of real websites, structure first, then behavior
Project Week: The Interactive Quiz
Topics:
- Planning a small app: screens, states, and what happens on each click
- Keeping score and moving between questions
- Ending states: results screen and restart
- Basic input validation: no empty answers
- Polish: progress display and honest feedback messages
- Reading your own code a week later: comments and naming revisited
Projects built:
- Interactive quiz app: questions, scoring, a results screen, and a restart button
Practice: Extend the quiz with one feature of your own choosing, written up in three sentences
Assessment: Quiz app demo and code walkthrough: each student explains one function line by line

---
PHASE 2: DATA AND THE NETWORK (MONTHS 3-4, WEEKS 9-16)

Arrays, objects, and JSON give projects real data to work with. Then fetch opens the door to public APIs and pages built on live information.

Month 3: Arrays, Objects, and JSON (Weeks 9-12)
Arrays
Topics:
- Creating arrays and reading items by index
- push, pop, shift, unshift: growing and shrinking lists
- Looping over arrays with for and for...of
- indexOf and includes: finding things
- Arrays and the DOM: rendering a list from data
- slice vs splice, and the bug everyone hits once
Projects built:
- To-do list, version one: add, display, and delete tasks backed by an array
Practice: 15 array exercises: totals, longest word, reversing, filtering by hand with loops
Array Methods That Do the Work
Topics:
- map: transforming every item
- filter: keeping what matches
- find: the first match

- sort, and why sorting numbers needs a compare function
- Chaining methods to answer questions in one line
- When a plain loop is still the clearer choice

Projects built:

- Movie list page: search box and filter buttons that narrow a list of films live

Practice: Rewrite five loop solutions from week 9 using map and filter, compare readability

Objects

Topics:

- Objects as labeled data: properties and values
- Dot notation vs bracket notation
- Objects inside arrays: the shape of most real data
- Looping over object properties
- Nesting: objects inside objects, read carefully
- Designing the data shape before writing the code

Projects built:

- Contact cards: render a grid of profile cards from an array of person objects

Practice: Model three real things as objects: a song, a match result, a school timetable entry

JSON and Saving Data

Topics:

- What JSON is and why every API speaks it
- JSON.stringify and JSON.parse
- localStorage: saving data in the browser
- The save-load cycle: persisting an app's state across refreshes
- What localStorage cannot do, and where databases come in later
- Debugging storage with the dev tools Application panel

Projects built:

- To-do list, version two: tasks survive a page refresh using localStorage

Practice: Add save and load to the movie list project; inspect the stored JSON by hand

Assessment: Data checkpoint: given a JSON file of real data, load it, answer five questions with code

Month 4: Fetch and Public APIs (Weeks 13-16)

What an API Is

Topics:

- Requests and responses: how the browser asks servers for data
- URLs as questions: endpoints and paths
- Reading API documentation without fear
- fetch and .then: your first request to a live joke API
- Status codes: 200, 404, and what they mean
- Looking at raw JSON responses in the browser

Projects built:

- Joke machine: a button that fetches and displays a fresh joke from a public API

Practice: Explore two public APIs in the browser, write down what three endpoints return

async, await, and Things Going Wrong

Topics:

- async and await: the cleaner way to write fetch code
- Loading states: telling the user something is happening
- try and catch: handling failed requests honestly
- The network tab: watching your requests in flight
- Slow connections and what your app looks like on them
- Never trusting a response blindly: checking before rendering

Projects built:

- Weather lookup page: type a city, see live conditions, with loading and error states

Practice: Break your own weather app on purpose three ways, then make each failure show a decent message

Search Interfaces

Topics:

- Query parameters: sending the user's search to the API
- Building a URL safely from input
- Rendering result lists with the DOM skills from month 2
- Empty results and misspelled searches: designing for them
- Debouncing, gently introduced: not firing a request per keystroke
- Caching a result you already fetched

Projects built:

- Dictionary app: search a word, show definitions, phonetics, and an example sentence from a free dictionary API

Practice: Swap the dictionary API for a different public API of your choice, keep the same interface

Project Week: The Two-API Dashboard

Topics:

- Combining two data sources on one page
- Structuring code when an app has parts: one file, clear sections, named functions
- Handling two requests that can each fail independently
- Layout for dashboards: cards and sections, with just enough CSS
- A refresh button done right
- Writing a short README that says what the app does

```
      Projects built:
        - Personal dashboard: two public APIs of the student's choice on one page, for example weather
          plus news headlines
      Practice: Trade dashboards with a classmate and file two improvement suggestions each
      Assessment: Dashboard demo: live walkthrough plus questions on how each fetch works

------------------------------------------------------------
PHASE 3: CANVAS GAMES AND THE CAPSTONE (MONTHS 5-6, WEEKS 17-24)
------------------------------------------------------------
A month of real game programming on the HTML canvas, then a capstone month: scope, build,
deploy, and present an interactive site of your own.

  Month 5: Games on the Canvas (Weeks 17-20)
    Drawing and the Game Loop
      Topics:
        - The canvas element and its coordinate system
        - Drawing rectangles, circles, lines, and text
        - Color, stroke, and fill
        - requestAnimationFrame: the heartbeat of every game
        - Clearing and redrawing: why animation is just fast drawing
        - Moving a shape across the screen with velocity
      Projects built:
        - Bouncing ball: a ball that moves, hits the walls, and bounces, with adjustable speed
      Practice: Draw a scene of your choice in code, then animate one element of it
    Player Control
      Topics:
        - Keyboard events: keydown, keyup, and tracking held keys
        - Moving a player smoothly, not one hop per press
        - Boundaries: keeping the player on screen
        - Separating update logic from drawing logic
        - Game state as an object: player, score, settings in one place
        - Frame-rate honesty: why movement uses small steps
      Projects built:
        - Paddle controller: a paddle that glides left and right under arrow-key control, ready for a
          game
      Practice: Add a second control scheme (WASD) and an on-screen speed display
    Collisions, Score, and Lives
      Topics:
        - Rectangle collision detection, explained with pictures before code
        - Circle collision using distance
        - Spawning objects: falling items with random positions and speeds
        - Score, lives, and difficulty that ramps up
        - Removing off-screen objects so the game does not slow down
        - Game over conditions and detecting them cleanly
      Projects built:
        - Catcher game core: falling objects, a moving basket, score on catch, lives lost on miss
      Practice: Tune your game's difficulty curve and write down the three numbers you
      changed and why
    Finish and Polish the Game
      Topics:
        - Start screen, pause, and game-over screen as states
        - Sound effects with the Audio API, used tastefully
        - High score saved with localStorage, from month 3
        - Small touches that read as polish: flash on hit, score pop
        - Playtesting: watching someone else play your game without helping them
        - Packaging the game on a page with instructions
      Projects built:
        - Finished catcher or breakout-style game with start, pause, game over, sound, and a saved high
          score
      Practice: Run two playtests with family members and fix the most confusing thing each
      one hit
      Assessment: Game demo day: every student's game played live by a classmate, followed by
      a code Q&A

  Month 6: The Capstone Site (Weeks 21-24)
    Scoping the Capstone
      Topics:
        - Choosing a project you can finish: the honest feature list
        - Wireframing on paper before touching code
        - Picking your data source: localStorage, a public API, or both
        - Breaking the build into tasks with a simple checklist
        - Setting up the project folder and skeleton page
        - What done means: writing acceptance criteria in plain language
      Projects built:
        - Approved capstone plan: one page with wireframe, feature list, and task breakdown
      Practice: Build the static skeleton of your capstone: structure and placeholder
      content, no behavior yet
    Build Sprint One: Core Features
      Topics:
```

```
          - Working feature by feature, smallest first
          - Instructor code review: reading feedback and applying it
          - Debugging your own project methodically: reproduce, isolate, fix
          - Keeping functions small while the project grows
          - When to delete a feature: scope trimming without shame
          - Committing progress notes at the end of each session
        Projects built:
          - Capstone core: the two or three features that make the project itself
        Practice: Daily 30-minute build sessions with a written note on what moved forward
      Build Sprint Two: Data and Fit
        Topics:
          - Wiring in the data layer: saving, loading, or fetching live data
          - Making the layout survive a phone screen: the essential media query
          - Empty states and first-use experience
          - Error states for anything that can fail
          - A second code review round
          - Cutting the last risky feature if time demands it
        Projects built:
          - Feature-complete capstone: data working, layout presentable on desktop and phone
        Practice: Test your capstone on a phone and one other browser, log what broke
      Ship and Present
        Topics:
          - Bug hunt: a structured final pass over every feature
          - Deploying to a free host so the site has a real URL
          - Writing a README: what it is, how it works, what you would add next
          - Presenting technical work: demo first, code second
          - Answering questions about your own code
          - Where to go from here: React, Node.js, or deeper JavaScript
        Projects built:
          - Deployed capstone site with README, presented live to the class and family
        Practice: Send your capstone link to three people who are not in the class
        Assessment: Capstone presentation and code Q&A, plus course-completion certificate
        review

PROJECTS THE STUDENT BUILDS AND KEEPS

  - Number guessing game with score and limited tries
  - Interactive quiz app with results screen and restart
  - To-do list that survives refresh with localStorage
  - Movie list page with live search and filters
  - Weather lookup page built on a live public API
  - Dictionary app with definitions and phonetics
  - Two-API personal dashboard of the student's choice
  - Canvas catcher game with score, lives, sound, and a saved high score
  - Deployed capstone: an interactive site scoped, built, and presented by the student

  Total projects: 12+ working projects, from console games to a deployed capstone site

SKILLS THE STUDENT WILL HAVE AT THE END

  - JavaScript core: variables, conditionals, loops, and functions written with confidence
  - DOM and events: selecting, changing, and building page content that responds to users
  - Data handling: arrays, objects, JSON, and the array methods real codebases lean on
  - The network: fetch, async and await, loading and error states, and reading API docs
  - Canvas games: the game loop, keyboard control, collision detection, and game states
  - Working habits: debugging methodically, scoping projects, and presenting your own code

HOW A TYPICAL WEEK IS SPLIT

  Live classes: 2 live one-hour classes per week, coding along with the instructor
  Practice: 2-3 hours of set exercises and project work between classes
  Review: Homework reviewed with written feedback; stuck points reopened in the next class
  Homework: A task or problem set after every class, and a monthly mixed-review assignment that
    deliberately folds in earlier topics

SUPPORT INCLUDED

  Doubt support: WhatsApp doubt support between classes, so nobody stays stuck until the next
    session
  Progress updates: Regular progress notes to parents: what was covered, what was built, what
    needs practice

CERTIFICATION DETAIL

  Completion: Certificate from Modern Age Coders, awarded on passing the final assessment. Fall
    short and there is focused revision and a free retest: the certificate certifies real
    learning, not attendance

WHERE THIS CAN LEAD
```

- Front-end development track: our React and full-stack courses build directly on this
  foundation
- Back-end JavaScript with Node.js once the language core is solid
- School hackathons and coding competitions with a working project toolkit
- Game development courses, carrying over the canvas and game-loop experience
- A stronger base for computer science electives and board CS subjects

COMMON QUESTIONS ABOUT THIS COURSE

For anything about cost, use PART 4 and RULE 1. Do not quote two regions.

Q: Should my teen learn JavaScript or Python first?
A: Either works, and we teach both, so this is about the student, not the language. JavaScript wins for teens motivated by visible results: it runs in the browser, so every lesson changes something they can see, click, and share. Python reads a little more like English and suits students drawn to data, maths, or automation. If your teen talks about websites and games, start here; if they talk about AI and data, start with Python.

Q: Does my teen need to know HTML before starting?
A: No. We teach the small amount of HTML and CSS each project needs, exactly when the project needs it. Students who want to go deep on page structure and design can take our HTML and CSS course before or alongside this one, but it is not a requirement.

Q: What will my teen actually build in six months?
A: Twelve or more working projects, in rising order of ambition: console games, an interactive quiz, a to-do app that saves its data, a live weather page, a dictionary app, a two-API dashboard, a canvas game with score and sound, and finally a capstone site they scope and build themselves. The capstone is deployed to a real URL, so it exists outside the classroom.

Q: How are the classes taught?
A: Live one-hour online classes, twice a week, with a real instructor and a small group. Students write and run code during class rather than watching someone else do it, and homework comes back with written feedback. Group batches are capped at 20, with mini-batch and 1-on-1 options for students who want closer attention.

Q: Is 13 too young for real JavaScript?
A: No, the course is written for exactly this range. We pace the abstract parts, functions, scope, asynchronous code, with more examples and more practice than an adult course would, and every concept lands inside a project rather than a slide. For children under 13 we recommend our kids coding courses, which build the same thinking through friendlier tools first.

Q: How am I assessed, and is the certificate just for showing up?
A: No. A task follows every class with feedback, monthly reviews deliberately mix new material with earlier topics so nothing is forgotten, and the course ends with a final exam covering the whole course. Passing earns the certificate; falling short earns focused revision and a free retest. We measure real learning, not attendance.

Q: Can we try a class before enrolling?
A: Yes, the first demo class is free and carries no obligation. Book it at learn.modernagecoders.com/contact or message us on WhatsApp at +91 91233 66161. Parents are welcome to sit in and ask the teacher questions afterwards.

Q: What software and computer are needed?
A: Everything used in the course is free: a modern browser like Chrome and the VS Code editor, which we help set up in the first class. Any reasonably recent laptop or desktop with a stable internet connection is enough; there is no heavy software to install.

Q: What should a student take after this course?
A: The natural next steps are our React course for modern front-end work, Node.js for the server side, or our data structures and algorithms course for students eyeing competitive programming and technical interviews later. Many students also carry their canvas experience into deeper game development. The instructor gives each student a specific recommendation at the end based on what they enjoyed most.

To enrol, message Shivam Sir on +91 9123366161 or send the parent this link: https://learn.modernagecoders.com/courses/javascript-course-for-teens-beginners-interactive-web
For a demo: the Priority Live Demo (guaranteed, today or tomorrow) is booked at https://learn.modernagecoders.com/priority-demo . The free demo is a waiting list with no fixed date.

==========
COURSE 90 OF 137: JEE FOUNDATION MATHS CLASS 8-10: PROOFS & PROBLEM SOLVING
==========

Course link: https://learn.modernagecoders.com/courses/jee-foundation-maths-course-class-8-10
Subject area: Foundation Mathematics

Designed for: High school
Who can join: Class 8 to 10 students, batched by class
Course length: 12 months (48 weeks)
Time needed: 2 live classes/week + 3-4 hours of problem sets
Certificate: Certificate from Modern Age Coders, awarded on passing the final assessment

PRICE FOR THIS COURSE (quote only the one that applies to the person asking)
  In India, per month: group Rs 1,499, mini batch Rs 2,999, one to one Rs 4,999
  In Canada, per month: group CAD 140, one to one CAD 210
  Anywhere else, per month: group $100, one to one $150
  Classes: group and mini batch two live classes a week, eight a month; one to one in India one live class a week, four a month; one to one outside India two live classes a week, eight a month. Each class is one hour.

WHAT THIS COURSE IS

  JEE foundation maths course for Class 8-10: NCERT-aligned depth, geometry proof skills, olympiad-style problem solving and timed MCQ practice in live batches.

  In one line: Class 11 physics and maths punish shaky algebra. This course is where the algebra stops being shaky.

ABOUT THE PROGRAMME

  Most students who struggle in JEE preparation do not struggle with Class 11 topics; they struggle with Class 8 to 10 topics that were never made solid. Fractions handled nervously, identities half-remembered, geometry never actually proved. A foundation course exists to fix that before it costs anything, and this one does it honestly: no rank promises, no 'future IITian' theatre, just the school syllabus taught deeper than school goes, plus the problem-solving habits that entrance exams eventually demand. The 12-month plan runs in four phases. First, numbers and algebra at real depth: divisibility and remainders, exponents and surds, identities and factorisation, equations and inequalities. Second, geometry as a proof discipline, congruence, similarity, circles, because writing a correct proof is the closest a school student comes to real mathematical thinking. Third, mensuration, introductory trigonometry and coordinate geometry, the toolkit chapters. Fourth, the part school never teaches: problem-solving heuristics, olympiad-style questions, and a full timed MCQ phase in the style of NTSE-type talent exams and entrance papers, with error logs and review clinics. Content is NCERT-aligned and batched by class, so a Class 8 student and a Class 10 student meet the same ideas at different depths. School marks tend to improve as a side effect; the actual product is a student who reaches Class 11 with nothing to repair.

WHAT MAKES THIS COURSE DIFFERENT

  - NCERT-aligned but deeper: every chapter is taken past the textbook stopping point, into the why and the harder problem forms
  - Proof skills taught deliberately: given, to prove, construction, proof, drilled until writing a geometry argument feels normal
  - A genuine problem-solving phase: heuristics like working backwards, small cases and clean diagrams, practised on olympiad-style questions
  - A full timed MCQ phase with error logs: elimination, option testing and time budgeting, the craft entrance exams actually test
  - Honest positioning: this is foundation, not JEE coaching, and we say plainly that nobody can promise selections or ranks
  - Batched by class: Class 8, 9 and 10 groups meet the same arc at the right depth, so nobody is drowned or bored

THE LEARNING PATH, STEP BY STEP

  Phase 1: Numbers and algebra at depth: divisibility and remainders, exponents and surds, identities, factorisation, equations and inequalities
  Phase 2: Geometry as a proof discipline: angles, congruence, similarity, quadrilaterals and circle theorems, with proof writing drilled throughout
  Phase 3: The toolkit chapters: mensuration in 2D and 3D, introductory trigonometry with heights and distances, and coordinate geometry
  Phase 4: Problem-solving heuristics and olympiad-style questions, then a timed MCQ and mock phase with error clinics and a readiness review

WHAT A STUDENT NEEDS BEFORE STARTING

  Maths level: Comfortable with the previous class's school maths. The week 1 diagnostic finds the gaps and the early weeks patch them
  Class: Class 8, 9 or 10. Batches are separated by class so depth and pace fit the student
  Equipment: The student's NCERT maths textbook, a geometry box, graph paper, notebooks, and a device with stable internet
  Mindset: Willingness to write solutions out in full. This course grades reasoning, not just answers

WHO THIS COURSE IS FOR

  Future jee aspirants: Students in Class 8 to 10 who intend to attempt JEE or similar

entrances and want the base built before Class 11 raises the stakes
Strong students underfed: Students who find school maths easy and are bored, and need harder problems rather than more of the same
Proof never taught: Students who can compute but have never been taught to prove, which is most students
Mcq first timers: Students who have only ever written school papers and need timed MCQ craft before any talent or entrance exam
Families avoiding hype: Parents who want serious foundation work without rank promises and future-topper theatre

FULL CURRICULUM, WEEK BY WEEK

This is the complete teaching plan. Parents can ask about any week.

PHASE 1: NUMBERS AND ALGEBRA AT DEPTH (MONTHS 1-3, WEEKS 1-12)

The chapters every entrance exam quietly assumes: number theory basics, exponents and surds, identities, factorisation, and equations, taken well past the textbook stopping point.

Month 1: Number Systems, Properly (Weeks 1-4)
Weeks 1-2: The Number Line, End to End
Topics:
- Diagnostic paper: arithmetic, fractions, basic algebra and geometry from earlier classes
- Integers, rationals and irrationals, and how to prove a number belongs where it does
- Decimal expansions: terminating, recurring, and converting recurring decimals to fractions
- Representing surds on the number line
- Density: finding rationals and irrationals between any two numbers
- Comparing numbers cleverly: without calculators, by squaring or bounding
Projects built:
- Number-line dossier: one page classifying 20 assorted numbers with a one-line justification each
Practice: 30 classification and conversion problems, including 5 recurring-decimal conversions written out in full
Weeks 3-4: Divisibility and Remainders
Topics:
- Divisibility rules for 2 through 11, proved rather than just stated
- Primes, composites and prime factorisation as the master tool
- HCF and LCM: computation, the product relationship, and word problems
- Remainder thinking: what is left when powers are divided, kept concrete
- Digit problems: unit digits of large powers, digit sums
- First olympiad-style flavour: divisibility puzzles with small numbers
Projects built:
- Divisibility rule proof sheet: the rules for 3, 9 and 11 explained in the student's own words with examples
Practice: 25 divisibility and HCF-LCM problems plus 5 unit-digit puzzles, hardest two attempted before class discussion
Assessment: Month 1 test: a 25-mark paper on number systems mixing standard questions with two puzzle-style problems

Month 2: Exponents, Surds and Identities (Weeks 5-8)
Weeks 5-6: Exponents and Surds
Topics:
- Laws of exponents for integer and rational powers, with the proofs sketched
- Negative and fractional exponents handled without fear
- Surds: simplifying, adding, and rationalising denominators including two-term denominators
- Comparing surds and exponential expressions by clever bounding
- Scientific notation and orders of magnitude
- Exam forms: simplify-this-monster questions and how to dismantle them
Projects built:
- Simplification gauntlet: 10 layered exponent-surd expressions reduced step by step, each step justified
Practice: 35 exponent and surd problems including 8 rationalisations and 5 comparison questions without a calculator
Weeks 7-8: Identities and Factorisation
Topics:
- The square and cube identities, derived, visualised, and drilled
- Sum and difference of cubes, and the three-variable identity for a cubed sum
- Factorisation strategy: common factors, grouping, splitting the middle term, identities
- The remainder theorem and factor theorem, introduced with numeric checks
- Evaluating expressions cleverly: 99 squared, 101 cubed via identities
- Identity-based olympiad-style problems: finding values without finding variables
Projects built:
- Identity map: every identity in the phase on one sheet with a numeric example and one exam use each
Practice: 30 factorisations across all five strategies plus 8 evaluate-cleverly problems, strategy named before each
Assessment: Month 2 test: a 30-mark paper on exponents, surds and identities including two multi-step simplifications

  Month 3: Equations and Inequalities (Weeks 9-12)
    Weeks 9-10: Linear Equations and Systems
      Topics:
        - Linear equations in one variable, including fractional and bracketed forms
        - Word-problem craft: translating ages, digits, mixtures and motion into equations
        - Pairs of linear equations: substitution and elimination done cleanly
        - Consistency: when systems have one, many or no solutions, seen graphically
        - Parameter questions: for what value of k does the system break
        - Checking solutions as a habit, not an afterthought
      Projects built:
        - Translation drill sheet: 12 word problems converted to equations before any are solved
      Practice: 25 equations and systems plus 8 word problems, with the check step written
      for every answer
    Weeks 11-12: Inequalities and a First Look at Quadratics
      Topics:
        - Linear inequalities: solving, representing on the number line, and the sign-flip rule proved
        - Compound conditions: and versus or, read carefully
        - Quadratic equations by factorisation: the bridge from identities to solving
        - The idea of a discriminant, previewed for the Class 10 batch
        - Absolute value as distance, kept geometric and gentle
        - Phase consolidation: mixed algebra sets that do not announce their chapter
      Projects built:
        - Personal error log opened: every phase 1 test miss classified as concept, method or slip,
          used all year
      Practice: 20 inequalities and 15 factorisation-solved quadratics, plus one mixed set of
      15 unannounced problems
      Assessment: Phase 1 milestone: a 40-mark numbers-and-algebra paper, one third of it in
      MCQ format as a preview of phase 4

PHASE 2: GEOMETRY AS A PROOF DISCIPLINE (MONTHS 4-6, WEEKS 13-24)

Geometry is where students first learn what mathematical certainty means. Congruence,
similarity, quadrilaterals and circles, with proof writing drilled from the first week.

  Month 4: Angles, Triangles and Congruence (Weeks 13-16)
    Weeks 13-14: Lines, Angles and What a Proof Is
      Topics:
        - Angles on a line, vertically opposite angles, and angles with parallel lines
        - The triangle angle-sum result and exterior angle theorem, proved
        - What a proof is: statements, reasons, and why 'it looks true' is not enough
        - The four-part format: given, to prove, construction, proof
        - Angle chasing: finding unknown angles in layered figures
        - Drawing honest figures: large, labelled, and not misleadingly special
      Projects built:
        - First proof portfolio entries: angle-sum and exterior-angle proofs written in full four-part
          format
      Practice: 20 angle-chasing figures of rising difficulty plus 2 proofs, every figure
      redrawn by hand before solving
    Weeks 15-16: Congruence
      Topics:
        - Congruence criteria: SAS, ASA, AAS, SSS and RHS, and why AAA fails
        - Choosing the right criterion: reading the figure for what is actually given
        - Isosceles triangle results, proved both directions
        - Inequalities in a triangle: bigger side, bigger angle, and the triangle inequality
        - Multi-step congruence proofs: proving parts equal via congruent triangles
        - Common proof errors: assuming the conclusion, circular reasoning, unstated steps
      Projects built:
        - Criterion sorting sheet: 12 figures matched to their congruence criterion with the given
          parts marked
      Practice: 15 congruence problems including 5 full proofs, each proof peer-checked
      against the four-part format
      Assessment: Month 4 test: a 25-mark geometry paper with two full proofs marked strictly
      on structure and justification

  Month 5: Similarity, Pythagoras and Quadrilaterals (Weeks 17-20)
    Weeks 17-18: Similarity and Pythagoras
      Topics:
        - Similar triangles: the AA, SSS and SAS similarity criteria
        - The basic proportionality theorem and its converse
        - How similarity scales lengths and areas differently, seen with numbers first
        - The Pythagoras theorem proved by similarity, and its converse
        - Applications: heights via shadows, distances across rivers, ladders and slopes
        - Pythagorean triples and spotting them fast in MCQs
      Projects built:
        - Proof portfolio extended: BPT and the similarity proof of Pythagoras written in full
      Practice: 20 similarity and Pythagoras problems including 3 proofs and 5 real-setting
      applications

Weeks 19-20: Quadrilaterals and the Midpoint Theorem
Topics:
- The parallelogram theorems: sides, angles and diagonals, proved and reversed
- Tests for a parallelogram: which minimal facts force the shape
- Rectangle, rhombus and square as parallelograms with extra conditions
- The midpoint theorem and its converse, with applications
- Multi-step figures: midpoints inside triangles inside parallelograms
- Proof strategy: what to construct when the figure refuses to yield

Projects built:
- Quadrilateral family tree: the shapes and the exact conditions separating them, made by the student

Practice: 18 quadrilateral problems including 4 proofs, plus 5 midpoint-theorem applications
Assessment: Month 5 test: a 25-mark paper on similarity and quadrilaterals with two proofs and one construction-strategy question

Month 6: Circles and the Geometry Workshop (Weeks 21-24)
Weeks 21-22: Circle Theorems
Topics:
- Chords: equal chords, distances from the centre, the perpendicular from the centre
- The central angle theorem: the angle at the centre doubles the angle at the arc
- Angles in the same segment, and the angle in a semicircle
- Cyclic quadrilaterals and their opposite angles
- Tangents: perpendicularity to the radius and equal tangents from an external point
- Angle chasing in circle figures, the entrance-exam favourite

Projects built:
- Circle theorem atlas: every theorem drawn, stated and proved or justified on the student's own pages

Practice: 20 circle problems from single-theorem to three-theorem figures, plus 2 full proofs
Weeks 23-24: The Geometry Problem Workshop
Topics:
- Hard multi-step figures mixing congruence, similarity, quadrilaterals and circles
- Auxiliary constructions: when and what to draw, taught as a decision, not magic
- Working backwards from what must be proved
- Olympiad-style geometry: problems where the figure is the puzzle
- Timed geometry MCQs: answering from the figure without full proofs
- Phase review: the proof portfolio completed and audited

Projects built:
- Workshop set: 6 multi-step geometry problems solved with the construction decision written out for each

Practice: One timed 15-question geometry MCQ set plus 4 workshop problems, error log updated with figure-reading misses
Assessment: Phase 2 milestone: a 40-mark geometry paper, half proofs and half timed MCQs, with a one-on-one proof review

---
PHASE 3: MENSURATION, TRIGONOMETRY AND COORDINATES (MONTHS 7-9, WEEKS 25-36)

The toolkit chapters every entrance exam draws on: 2D and 3D mensuration, introductory trigonometry with heights and distances, and coordinate geometry.

Month 7: Mensuration in Two and Three Dimensions (Weeks 25-28)
Weeks 25-26: Areas in the Plane
Topics:
- Areas of triangles: half base times height, and Heron's formula for when heights hide
- Areas of parallelograms, trapeziums and rhombuses, derived not memorised
- Circles, sectors and segments, with arc lengths
- Composite figures: decomposing shaded regions cleanly
- Same base, same parallels: area relationships without any measuring
- Estimation checks: is that area plausible for that figure

Projects built:
- Decomposition sheet: 8 shaded-region problems with the cut lines drawn and named before any formula is used

Practice: 22 area problems including 5 Heron applications and 5 composite figures, decomposition stated in one line each
Weeks 27-28: Solids and Scaling
Topics:
- Surface areas and volumes: cube, cuboid, cylinder, cone, sphere, hemisphere
- Combined solids and which surfaces vanish at the joins
- Melting and recasting problems: volume as the conserved quantity
- Scaling laws: double the length, four times the area, eight times the volume
- Unit discipline across centimetres, metres and litres
- MCQ forms: ratio-based mensuration questions solved without computing either quantity

Projects built:
- Scaling experiment write-up: one solid scaled by 2 and by 3, with areas and volumes tabulated and the pattern stated

Practice: 18 solid problems including 4 recasting and 4 ratio questions, units checked on every line

Assessment: Month 7 test: a 25-mark mensuration paper mixing computation, ratio reasoning and one composite figure

Month 8: Introductory Trigonometry (Weeks 29-32)
Weeks 29-30: Ratios and Identities
Topics:
- The six trigonometric ratios in a right triangle and the naming logic
- Exact values at 0, 30, 45, 60 and 90 degrees, rebuilt from two triangles rather than memorised
- Finding all ratios from one, with Pythagoras doing the work
- The fundamental identity and its rearrangements
- Proving simple identities with a fixed strategy list
- Ratio MCQs at speed: value questions in under a minute

Projects built:
- Two-triangle derivation page: the 30-60-90 and 45-45-90 triangles built and every standard value read off them

Practice: 30 ratio evaluations and 6 identity proofs, plus one 10-question timed MCQ set on values

Weeks 31-32: Heights and Distances
Topics:
- Angles of elevation and depression on honest, labelled figures
- Single-triangle problems: towers, poles, kites and slopes
- Two-triangle problems: two observation points and moving observers
- Choosing the ratio that solves in one step
- Rounding sensibly and sanity-checking against the figure
- Where trigonometry goes in Class 11: a preview, not a syllabus

Projects built:
- Figure-first set: 8 heights and distances problems where the marked figure is drawn and approved before solving

Practice: 15 heights and distances problems including 4 two-triangle setups, every figure labelled with the given angle

Assessment: Month 8 test: a 25-mark trigonometry paper of ratios, identities and applications, one third MCQ

Month 9: Coordinate Geometry (Weeks 33-36)
Weeks 33-34: The Plane and Its Formulas
Topics:
- The Cartesian plane: plotting, quadrants and reading coordinates fluently
- The distance formula from Pythagoras, derived and drilled
- Classifying triangles and quadrilaterals by computed distances
- The section formula and midpoints, with internal division problems
- Ratios from coordinates: where the axes cut a segment
- Sketch-first habit: every coordinate problem starts with a drawing

Projects built:
- Coordinate gallery: 6 figures plotted, classified and verified by distances, presented on graph paper

Practice: 25 distance and section formula problems, each with a labelled sketch, plus 5 classification questions

Weeks 35-36: Lines and Coordinate Problem Solving
Topics:
- Slope as steepness: computing it and reading it from a sketch
- Parallel and perpendicular slopes, kept concrete
- Collinearity by slope and by distance, two roads to one answer
- Coordinate proofs: choosing axes cleverly to make geometry easy
- Mixed coordinate MCQs under time
- Phase review: the toolkit chapters consolidated onto revision sheets

Projects built:
- Coordinate proof piece: one classical geometry fact proved by placing coordinates well, written up in full

Practice: 20 slope and collinearity problems plus one timed 12-question coordinate MCQ set, error log updated

Assessment: Phase 3 milestone: a 40-mark paper across mensuration, trigonometry and coordinates, half MCQ, fully reviewed

---

PHASE 4: PROBLEM SOLVING AND THE MCQ PHASE (MONTHS 10-12, WEEKS 37-48)

The part school never teaches: heuristics for unfamiliar problems, olympiad-style questions, then a full timed MCQ and mock phase in the style of NTSE-type talent exams and entrance papers.

Month 10: How Hard Problems Are Actually Solved (Weeks 37-40)
Weeks 37-38: The Heuristics
Topics:
- Understand, plan, execute, check: the honest version of problem solving
- Trying small cases and looking for the pattern that survives
- Working backwards from what is asked
- Drawing the right diagram, and redrawing when it misleads
- Parity and simple invariants: what cannot change no matter the moves

- Olympiad-style number and algebra problems using the heuristics, difficulty honest but humane
Projects built:
- Solution journal opened: every hard problem written up with the heuristic used and the dead ends kept, not erased
Practice: 8 problems for the week, chosen to need different heuristics; write-ups matter more than answer counts

Weeks 39-40: Counting and Logical Structure
Topics:
- Systematic listing: counting without missing and without double-counting
- The multiplication principle and simple arrangements
- Combinations kept concrete: choosing teams and handshakes
- The pigeonhole principle through puzzles
- Logic puzzles: knights, liars and truth tables lite
- Where these ideas reappear: Class 11 permutations and combinations, and reasoning sections of talent exams
Projects built:
- Counting problem set write-up: 5 counting problems solved twice, once by listing and once by principle, results reconciled
Practice: 12 counting and logic problems with full write-ups in the solution journal
Assessment: Month 10 checkpoint: a 20-mark problem-solving paper where method write-ups earn marks alongside answers

Month 11: MCQ Craft Under Time (Weeks 41-44)

Weeks 41-42: The Craft of the Multiple Choice Question
Topics:
- How MCQ setters build wrong options, and what that tells the solver
- Elimination: discarding options by sign, size, units or parity
- Option testing: substituting answers back instead of solving forwards
- Special values: choosing convenient numbers for variable-heavy questions
- Estimation as a weapon: bounding the answer before computing it
- When to solve honestly: questions where shortcuts are traps
Projects built:
- Technique tally: 30 MCQs solved with the technique noted per question, then tallied to see each student's habits
Practice: Three 15-question topic-wise MCQ sets under time, error log updated with technique choices, not just misses

Weeks 43-44: Sectional Timing and the Error Log
Topics:
- Time budgeting: marks per minute and the discipline of moving on
- Sectional MCQ sets across algebra, geometry, mensuration, trigonometry and coordinates
- The two-pass strategy: bank the easy questions first
- Guessing policy: when unanswered beats wrong, and reading the paper's rules
- Error log analytics: which topic, which technique, which minute of the section
- Building each student's personal weak-topic drill plan for the mock month
Projects built:
- Error log analysis report: the student's own two-page summary of their MCQ patterns going into the mocks
Practice: Four timed sectional sets across the fortnight, each reviewed the same week, drill plan agreed with the teacher
Assessment: Month 11 checkpoint: one full-length topic-mixed MCQ paper under exam timing, fully debriefed

Month 12: Mocks and the Readiness Review (Weeks 45-48)

Weeks 45-46: The Mock Series
Topics:
- Full-length foundation mocks in the style of NTSE-type talent exams and entrance papers
- Exam-day routine rehearsed: instructions, bubbling, rough-work discipline
- Review clinic after every mock: every miss classified and assigned a fix
- Score movement read honestly: trends matter, single papers do not
- Targeted drills between mocks from each student's plan
- Stamina: holding accuracy in the last quarter of a long paper
Projects built:
- Mock file: each paper filed with its marked script, error classification and one-line fix per miss
Practice: One additional mock at home under honest timing, self-marked and brought to the review clinic

Weeks 47-48: Final Mocks and the Road to Class 11
Topics:
- Two final mocks under strict conditions, spaced for recovery
- The readiness map: every topic rated from the year's evidence, no vibes
- The solution journal and proof portfolio reviewed as a body of work
- What Class 11 changes: pace, abstraction, and how this foundation meets it
- Keeping the edge: a weekly problem habit for the months after the course
- Course close: one-on-one review with each family
Projects built:
- Personal readiness map: topic-by-topic strengths and fixes, built from the error log and mock file
- Completed solution journal: a year of hard problems with the student's own write-ups
Practice: Light targeted drills only, set individually from the final error log

Assessment: Course milestone: final full-length mock and readiness review with the family, plus certificate review

PROJECTS THE STUDENT BUILDS AND KEEPS

- A proof portfolio: every major theorem of the course written in full four-part format
- A solution journal: hard problems written up with heuristics and honest dead ends
- A personal error log maintained from phase 1 and analysed before the mock phase
- The identity map and circle theorem atlas, built by the student
- A coordinate proof piece: classical geometry proved by clever axis placement
- A scaling experiment write-up connecting length, area and volume
- The technique tally and error log analysis report from the MCQ phase
- A mock file with marked scripts and a final topic-by-topic readiness map

Total projects: A year-long body of work: proof portfolio, solution journal, error log, mock file and readiness map

SKILLS THE STUDENT WILL HAVE AT THE END

- Number theory basics: divisibility, primes, HCF-LCM and remainder thinking
- Algebra at depth: exponents, surds, identities, factorisation, equations and inequalities
- Proof writing across congruence, similarity, quadrilaterals and circle theorems
- Mensuration, introductory trigonometry and coordinate geometry to entrance-exam standard
- Problem-solving heuristics: small cases, working backwards, invariants and clean diagrams
- Timed MCQ craft: elimination, option testing, time budgeting and error-log-driven improvement

HOW A TYPICAL WEEK IS SPLIT

Live classes: 2 live one-hour classes per week; mock sittings in month 12 run longer for full papers
Practice: 3-4 hours weekly of problem sets, proofs and journal write-ups between classes
Review: Problem sets marked with written feedback; proofs and journal entries reviewed line by line each month
Homework: A problem set after every class, and a monthly mixed-review assignment that deliberately folds in earlier topics

SUPPORT INCLUDED

Doubt support: WhatsApp doubt support between classes, with worked solutions for stuck problems
Progress updates: Monthly progress notes to parents with test scores, error-log trends and the current readiness picture

CERTIFICATION DETAIL

Completion: Certificate from Modern Age Coders, awarded on passing the final assessment. Fall short and there is focused revision and a free retest: the certificate certifies mastery, not attendance

WHERE THIS CAN LEAD

- Class 11 maths in the science stream, entered with algebra and geometry that do not need repair
- Formal JEE preparation from Class 11, with the foundation layer already done
- Olympiad tracks such as IOQM for students who discover they enjoy the hard problems
- School exams along the way: the depth here makes board-level questions feel routine
- Our data science and programming courses, where the same structured thinking transfers directly

COMMON QUESTIONS ABOUT THIS COURSE

For anything about cost, use PART 4 and RULE 1. Do not quote two regions.

Q: What exactly is a foundation course? Is this JEE coaching for a 13-year-old?
A: No, and be wary of anything that says otherwise. JEE tests Class 11 and 12 material; no Class 8 student should be solving JEE papers. A foundation course strengthens the Class 8 to 10 layer that JEE preparation later stands on: algebra done at depth, geometry actually proved, and the problem-solving and MCQ habits school never teaches. Students who arrive in Class 11 with that layer solid cope with the pace; students who arrive with gaps spend Class 11 repairing them.

Q: Do you promise selection in JEE or any exam?
A: No. Nobody can honestly promise a selection or a rank, least of all three or four years out, and we think enrolling a 13-year-old on the back of such a promise is wrong. What we commit to is specific: the full curriculum taught at depth, marked work with written feedback, a proof portfolio and solution journal the student builds, a timed mock series, and honest monthly reporting on exactly where the student stands.

Q: Is this course NTSE preparation? Is NTSE even happening?
A: We are careful here because many courses are not: NCERT suspended the National Talent

Search Scheme, and the exam has not been conducted since the 2021-22 cycle, with the scheme stalled until further orders. There has been talk of a revamped revival, but nothing a family should plan around. We use NTSE-style papers in the mock phase because the format is excellent training, and if the exam returns our students will be ready for it, but nobody should enrol anywhere on the promise of an exam that is currently not running.

Q: Which class is the right time to start, 8, 9 or 10?
A: Any of the three works, which is why batches are separated by class. Starting in Class 8 gives the most room: depth can build gradually with no exam pressure. Class 9 is the most common entry point and aligns well, since Class 9 NCERT is where proofs and harder algebra begin. Class 10 students run the same arc with board preparation happening in parallel, and the overlap actually helps, because the foundation depth makes board questions feel easy.

Q: Will this clash with what school teaches?
A: No, because the course is NCERT-aligned by design. We teach the same chapters school does, in a compatible order, and go deeper rather than sideways: harder problem forms, the proofs behind the formulas, and extensions school skips for time. Most families find school marks improve as a side effect, since school papers sample the easier end of what students here practise weekly.

Q: What are the olympiad-style problems? Is this an olympiad course?
A: It is not a dedicated olympiad course; serious olympiad preparation for exams like IOQM is its own track with its own syllabus. What we teach in month 10 is the thinking style olympiads reward: heuristics like small cases, working backwards and invariants, practised on genuinely unfamiliar problems at a humane difficulty. Students who light up during that phase get pointed, honestly, toward proper olympiad training as a next step.

Q: How much homework should we expect?
A: Three to four hours a week: problem sets after each class, proof write-ups during the geometry phase, journal entries during the problem-solving phase, and timed papers in the final months. The write-ups are non-negotiable, because this course grades reasoning, not answer lists. It is a real commitment, and we would rather say so now than surprise you in month 2.

Q: How am I assessed, and is the certificate just for showing up?
A: No. A problem set follows every class with written feedback, monthly reviews deliberately mix new material with earlier topics so nothing is forgotten, and the course ends with a full mock paper as the final assessment. Passing earns the certificate; falling short earns focused revision and a free retest. We measure real understanding, not attendance.

Q: Can we try a class before enrolling?
A: Yes, the first demo class is free and carries no obligation. Book it at learn.modernagecoders.com/contact or message us on WhatsApp at +91 91233 66161. The demo includes a short diagnostic, after which the teacher will tell you plainly whether the student is ready for this course or better served by our school maths courses first.

To enrol, message Shivam Sir on +91 9123366161 or send the parent this link: https://learn.modernagecoders.com/courses/jee-foundation-maths-course-class-8-10
For a demo: the Priority Live Demo (guaranteed, today or tomorrow) is booked at https://learn.modernagecoders.com/priority-demo . The free demo is a waiting list with no fixed date.

==========
COURSE 91 OF 137: KOTLIN AND ANDROID COURSE: ZERO TO PUBLISHED-READY APPS
==========

Course link: https://learn.modernagecoders.com/courses/complete-kotlin-programming-masterclass-professional
Subject area: App Development
Designed for: College students
Who can join: Complete beginner (18+); college students, graduates and working professionals
Course length: 10-12 months (44-52 weeks)
Time needed: 2 live classes/week + 4-6 hours practice
Certificate: Certificate from Modern Age Coders, awarded on passing the final exam

PRICE FOR THIS COURSE (quote only the one that applies to the person asking)
In India, per month: group Rs 1,499, mini batch Rs 2,999, one to one Rs 4,999
In Canada, per month: group CAD 140, one to one CAD 210
Anywhere else, per month: group $100, one to one $150
Classes: group and mini batch two live classes a week, eight a month; one to one in India one live class a week, four a month; one to one outside India two live classes a week, eight a month. Each class is one hour.

WHAT THIS COURSE IS

Kotlin course for college students and professionals: modern Kotlin, coroutines, then real Android development with Jetpack Compose in 10-12 months.

In one line: The modern Android stack, learned in its native language: Kotlin to real depth, then apps built the way Google builds them, with Jetpack Compose.

ABOUT THE PROGRAMME

Android runs on Kotlin now, and the modern stack, Compose for UI, coroutines for concurrency, is genuinely pleasant when learned in order. This live online masterclass does exactly that: Kotlin as a language first, null-safety, functional style, coroutines and flows understood properly, then Android development the modern way: Jetpack Compose interfaces, architecture that survives rotation and growth, data with Room, networking, and the production habits, testing, releases, honest store literacy, that separate app builders from tutorial followers. A finale month ships a capstone app and sits the final exam. The pace is honest: ten teaching months at two live classes a week plus four to six hours of practice, with two more in hand. Problem sets, monthly mixed reviews, phase exams, and a final exam that decides the certificate with a free retest. Real Kotlin, real apps, depth over dopamine.

WHAT MAKES THIS COURSE DIFFERENT

- Kotlin learned as a language, not as Android syntax: coroutines and flows understood before they are needed
- Compose-first: the UI toolkit Google actually recommends, not legacy XML nostalgia
- Architecture that survives: state, lifecycles and structure taught as the core Android skill they are
- Store literacy told straight: what publishing takes, without fake promises
- An honest 10-month arc with 2 months in hand
- Real assessment: weekly problem sets, monthly mixed reviews, phase exams and a final exam with a free retest

THE LEARNING PATH, STEP BY STEP

Phase 1: Kotlin (Months 1-3): the language to real depth, null-safety to coroutines
Phase 2: Advanced Kotlin (Months 4-6): functional style, flows, and the idioms production code uses
Phase 3: Android with Compose (Months 7-9): UI, architecture, data, networking and production habits
Phase 4: The finale (Month 10): the capstone app, shipped and defended, and the final exam

WHAT A STUDENT NEEDS BEFORE STARTING

Coding experience: None. The language is taught from the first line
Equipment: Any reasonably recent computer; Android Studio and every tool used are free, and the emulator plus any Android phone cover testing
Age: 18+; college students, graduates and working professionals
Time commitment: 2 live classes plus 4-6 hours of practice a week

WHO THIS COURSE IS FOR

College students: Students who want a shippable, demonstrable skill alongside the degree
App dreamers: Builders with an app idea and the patience to build it properly
Java refugees: Developers from Java-era Android ready for the modern stack
Career switchers: Professionals entering mobile, the most portfolio-friendly specialization
Backend curious: Learners who want Kotlin depth that also serves server-side later

FULL CURRICULUM, WEEK BY WEEK

This is the complete teaching plan. Parents can ask about any week.

PHASE 1: FOUNDATION & CORE KOTLIN SKILLS (MONTHS 1-3, WEEKS 1-13)

Build rock-solid Kotlin fundamentals. Learn programming logic, master Kotlin syntax, OOP principles, functional programming, and create your first applications.

Months 1-2: Kotlin Fundamentals & Programming Basics (Weeks 1-7)
Introduction to Kotlin & Development Environment Setup
Topics:
- What is Kotlin? History, features, and JetBrains creation
- Why Kotlin? Advantages over Java and other languages
- Kotlin ecosystem: Android, Backend, Multiplatform, Native
- Kotlin/JVM, Kotlin/JS, Kotlin/Native explained
- Interoperability with Java
- Installing JDK (Java 17 LTS or latest)
- Setting up development environment: IntelliJ IDEA, Android Studio
- Understanding IDE features and Kotlin-specific shortcuts
- Kotlin REPL (Read-Eval-Print Loop) for quick testing
- Your first Kotlin program: Hello World
- Kotlin program structure: main function, packages
- Compiling and running Kotlin programs
- Understanding bytecode and JVM execution
- Comments: single-line (//), multi-line (/* */), KDoc (/** */)
- Kotlin coding conventions and naming standards

    - Type inference and concise syntax
  Projects built:
    - Hello World variations with string templates
    - Simple output programs using println
    - Personal information display with string interpolation
    - ASCII art generator in Kotlin
    - Interactive REPL experiments
  Practice: Daily: 30 min Kotlin syntax practice, write 5-10 simple programs
Variables, Data Types & Operators
  Topics:
    - Variables: val (immutable) vs var (mutable)
    - Type inference: let the compiler infer types
    - Explicit type declarations
    - Basic types: Int, Long, Short, Byte, Double, Float, Char, Boolean
    - String type and string templates
    - String interpolation with $ and ${}
    - Multi-line strings with triple quotes
    - Type checking with is operator
    - Smart casts after type checking
    - Type casting: as and as? (safe cast)
    - Nullable types: Type? notation
    - Null safety: ?., ?:, !!, let
    - Operators: arithmetic (+, -, *, /, %, ++, --)
    - Relational operators: ==, !=, >, <, >=, <=
    - Logical operators: &&, ||, !
    - Assignment operators: =, +=, -=, *=, /=, %=
    - Bitwise operators: and, or, xor, inv, shl, shr, ushr
    - Range operator: ..
    - in operator for range checking
    - Elvis operator: ?:
    - Safe call operator: ?.
    - Not-null assertion: !!
  Projects built:
    - Null-safe calculator with Kotlin operators
    - Temperature converter with smart casts
    - Age calculator with null safety
    - BMI calculator with safe operations
    - Currency converter with type-safe design
    - Area calculator using when expressions
    - Compound interest calculator with ranges
    - String manipulation utility
  Practice: Solve 40 problems on variables, null safety, and operators
Control Flow & Expressions
  Topics:
    - If as an expression (returns value)
    - If-else expression
    - If-else-if ladder
    - When expression: Kotlin's switch replacement
    - When with values, ranges, types
    - When without argument
    - When as expression vs statement
    - While loop
    - Do-while loop
    - For loop with ranges
    - For loop with collections
    - Iterating with indices: forEachIndexed
    - Until vs downTo in ranges
    - Step in ranges
    - Break and continue
    - Labeled break and continue
    - Nested loops and loop patterns
    - repeat function for simple loops
  Projects built:
    - Number guessing game with when expression
    - Grade calculator using when
    - Even/odd checker with ranges
    - Prime number checker and generator
    - Multiplication table with for loops
    - Factorial calculator using ranges
    - Fibonacci series generator
    - Pattern printing (stars, pyramids, diamonds)
    - FizzBuzz challenge with when
    - Menu-driven calculator
    - Simple ATM simulation with when
  Practice: Solve 45 control flow and expression problems
Functions & Collections Basics
  Topics:
    - Functions: fun keyword
    - Function parameters and return types

- Unit return type (like void)
- Single-expression functions
- Default parameter values
- Named arguments
- Variable number of arguments: vararg
- Extension functions concept
- Infix functions
- Local functions (nested functions)
- Higher-order functions introduction
- Lambda expressions basics
- Arrays: arrayOf, intArrayOf, etc.
- Array access and modification
- Lists: listOf (immutable), mutableListOf
- Sets: setOf, mutableSetOf
- Maps: mapOf, mutableMapOf
- Collection operations: size, isEmpty, contains

Projects built:
- Function library for mathematical operations
- Extension functions for String utilities
- Collection statistics calculator
- Array manipulation utilities
- List-based todo manager
- Map-based contact book
- Set operations demonstrator
- Higher-order function examples
- Lambda-based filtering
- Custom collection utilities

Practice: Create 30 functions, solve 35 collection problems

Month 3: Object-Oriented Programming & Functional Concepts (Weeks 8-13)

Classes, Objects & OOP in Kotlin

Topics:
- Classes: class keyword
- Primary constructor in class header
- Secondary constructors
- init blocks for initialization
- Properties: val and var in classes
- Getters and setters (automatic and custom)
- Backing fields: field keyword
- Late initialization: lateinit var
- Lazy initialization: lazy delegation
- Creating objects (no 'new' keyword)
- Visibility modifiers: public, private, protected, internal
- Data classes for data holding
- Copy function in data classes
- Destructuring declarations
- Object declarations (singleton)
- Companion objects (like static in Java)
- Object expressions (anonymous objects)

Projects built:
- Student data class with properties
- Bank Account class with encapsulation
- Book data class for library
- Employee class with companion object
- Rectangle/Circle classes with properties
- Car class with lateinit properties
- Singleton configuration object
- Product data class for inventory
- Person class with destructuring
- Date utility with companion functions

Practice: Create 25 different classes modeling real-world entities

Inheritance, Interfaces & Polymorphism

Topics:
- Inheritance with open keyword
- Classes are final by default
- Open functions for overriding
- Override keyword (mandatory)
- Calling superclass: super keyword
- Abstract classes and members
- Interfaces in Kotlin
- Multiple interface implementation
- Interface properties
- Default implementations in interfaces
- Resolving conflicts in multiple inheritance
- Sealed classes for restricted hierarchies
- Sealed class subtypes
- Enum classes
- Enum with properties and methods
- Polymorphism and type checking

- Smart casts in polymorphism
Projects built:
- Animal hierarchy with sealed classes
- Shape hierarchy with abstract classes
- Vehicle system with interfaces
- Employee hierarchy with polymorphism
- Payment system with sealed classes
- School management (Person -> Student, Teacher)
- E-commerce with product categories
- State machine using sealed classes
- Enum-based menu system
- Multiple interface implementation demo
Practice: Build 20 inheritance hierarchies, solve 30 polymorphism problems
Functional Programming in Kotlin
Topics:
- First-class functions
- Lambda expressions syntax
- Lambda with receivers
- Anonymous functions
- Higher-order functions
- Function types: (Int) -> String
- Returning functions from functions
- Closures and capturing variables
- Inline functions for performance
- noinline and crossinline
- Standard library functions: let, run, with, apply, also
- Collection operations: map, filter, reduce
- flatMap and flatten
- fold and reduce operations
- Sequences for lazy evaluation
- Function composition
- Currying and partial application
Projects built:
- Functional collection processor
- Lambda-based calculator
- DSL (Domain Specific Language) creation
- Scope functions showcase
- Lazy sequence operations
- Function composition utilities
- Higher-order function library
- PHASE 1 MINI CAPSTONE: Functional Library Management System
- Features: Immutable data, functional operations, sealed classes, DSL
Practice: Solve 40 functional programming problems
Assessment: Phase 1 exam: a practical build defended live, plus a written paper mixing this phase with everything before it

---
PHASE 2: ADVANCED KOTLIN & MODERN FEATURES (MONTHS 4-6, WEEKS 14-26)

Master advanced Kotlin features, coroutines, DSLs, delegation, generics, and professional coding patterns.

Month 4: Advanced Language Features & Coroutines (Weeks 14-18)
Generics & Type System
Topics:
- Generic types in Kotlin
- Generic functions
- Generic constraints: where clause
- Variance: in, out, invariance
- Covariance with out
- Contravariance with in
- Star projection: *
- Reified type parameters
- Type erasure and reified
- Generic class inheritance
- Type aliases for complex types
- Inline classes (value classes)
- Phantom types pattern
- Generic builders
- Type-safe builders with generics
Projects built:
- Generic repository pattern
- Type-safe builder DSL
- Generic data structures (Stack, Queue)
- Variance examples with collections
- Reified function utilities
- Type-safe API client
- Generic validation framework
- Phantom types for compile-time safety

  Practice: Create 20 generic classes, solve 30 variance problems
Delegation & Property Delegates
  Topics:
    - Class delegation with by keyword
    - Delegation pattern in Kotlin
    - Property delegation
    - Lazy delegate for late initialization
    - Observable delegate for property observation
    - Vetoable delegate
    - Storing properties in a map
    - Custom delegates creation
    - ReadOnlyProperty and ReadWriteProperty
    - provideDelegate for dynamic delegation
    - Delegated properties in interfaces
    - Multiple delegation
    - Delegation vs inheritance trade-offs
  Projects built:
    - Lazy loading system
    - Observable property pattern
    - Preferences management with delegation
    - Custom logging delegate
    - Validation delegate
    - Cache delegate implementation
    - Thread-safe property delegate
    - Map-backed properties example
  Practice: Implement 15 different delegates, solve 25 delegation problems
Collections Deep Dive
  Topics:
    - List operations: filter, map, flatMap, fold
    - Set operations: union, intersect, subtract
    - Map operations: mapKeys, mapValues, filterKeys
    - Grouping: groupBy, groupingBy
    - Partitioning: partition
    - Zipping and unzipping
    - Windowed and chunked
    - Aggregate operations: sumOf, maxOf, minOf
    - Sorting: sortedBy, sortedWith
    - Distinct and distinctBy
    - Take, drop, slice operations
    - Associate operations
    - Sequences vs Collections performance
    - asSequence for lazy operations
    - generateSequence for infinite sequences
  Projects built:
    - Advanced collection processor
    - Data transformation pipeline
    - Student grade analyzer
    - E-commerce order processor
    - Log file analyzer
    - Sequence-based file reader
    - Performance comparison tool
    - Custom collection operations library
  Practice: Solve 50 advanced collection problems
Coroutines Fundamentals
  Topics:
    - Asynchronous programming need
    - Coroutines vs threads
    - Suspend functions
    - launch coroutine builder
    - async and await
    - runBlocking for blocking code
    - Coroutine context and dispatchers
    - Dispatchers.Main, IO, Default, Unconfined
    - withContext for switching context
    - Coroutine scope
    - GlobalScope vs structured concurrency
    - Job and Deferred
    - Cancellation and timeouts
    - Exception handling in coroutines
    - supervisorScope for independent children
  Projects built:
    - Parallel API calls with async
    - File downloader with coroutines
    - Timeout handling example
    - Cancellation demonstration
    - Exception handling in coroutines
    - Background task processor
    - Coroutine-based calculator
    - Multi-threaded data processor

    Practice: Build 15 coroutine-based applications
  Advanced Coroutines & Flow
    Topics:
      - Channels for communication
      - Channel types: rendezvous, buffered, unlimited
      - produce and consumeEach
      - Flow for async streams
      - Flow builders: flow, flowOf, asFlow
      - Flow operators: map, filter, transform
      - Terminal flow operators: collect, toList
      - Flow context and dispatchers
      - Flow cancellation
      - Flow exceptions
      - StateFlow and SharedFlow
      - Cold vs hot flows
      - Flow combinations: combine, zip, merge
      - flatMapConcat, flatMapMerge, flatMapLatest
      - Flow buffering and conflation
    Projects built:
      - Real-time data stream processor
      - Channel-based producer-consumer
      - Flow-based search implementation
      - StateFlow example (state management)
      - SharedFlow for events
      - Flow transformation pipeline
      - Reactive UI updates with Flow
      - Network request with Flow
    Practice: Create 12 Flow-based systems

Month 5: DSLs, Reflection & Professional Patterns (Weeks 19-22)
  Domain-Specific Languages (DSLs)
    Topics:
      - What are DSLs?
      - Type-safe builders
      - Lambda with receiver
      - Extension functions in DSLs
      - Infix notation for DSLs
      - Operator overloading
      - invoke operator
      - Creating HTML DSL
      - Creating SQL-like DSL
      - Creating test DSL
      - DslMarker annotation
      - Context receivers (Kotlin 1.6+)
      - Building fluent APIs
      - DSL scope control
      - Real-world DSL examples
    Projects built:
      - HTML builder DSL
      - JSON builder DSL
      - SQL query DSL
      - Configuration DSL
      - Test specification DSL
      - Route definition DSL
      - UI layout DSL
      - Build script DSL
    Practice: Build 10 different DSLs
  Reflection & Annotations
    Topics:
      - Kotlin reflection API
      - Class references: ::class
      - KClass, KFunction, KProperty
      - Callable references
      - Function references: ::functionName
      - Property references
      - Bound and unbound references
      - Reflection for generics
      - Annotations in Kotlin
      - Creating custom annotations
      - Annotation targets
      - Annotation retention
      - Annotation parameters
      - Reading annotations at runtime
      - Annotation processing
      - Meta-annotations
    Projects built:
      - Dependency injection framework
      - JSON serializer using reflection
      - Validation framework with annotations

- ORM mapper with reflection
- Custom test framework
- Route mapping with annotations
- Configuration reader
- Plugin system with reflection

Practice: Build 8 reflection-based utilities

Design Patterns in Kotlin

Topics:

- Singleton with object declaration
- Factory pattern with companion object
- Builder pattern with DSL
- Observer pattern with delegation
- Strategy pattern with lambdas
- Decorator pattern with delegation
- Adapter pattern
- Proxy pattern with lazy
- Command pattern
- State pattern with sealed classes
- Chain of responsibility
- Template method
- Visitor pattern
- Repository pattern
- Dependency injection patterns

Projects built:

- Notification system (Observer)
- Payment strategies implementation
- Logging decorator
- State machine with sealed classes
- Command processor
- Repository pattern implementation
- DI container creation
- Plugin architecture

Practice: Implement 20 design patterns in Kotlin style

Testing in Kotlin

Topics:

- Unit testing with JUnit 5
- Kotlin-specific test features
- Assertions with Kotlin
- Kotest framework
- Property-based testing
- Mocking with MockK
- Coroutine testing
- Testing suspending functions
- TestCoroutineDispatcher
- Testing flows
- Turbine for Flow testing
- Test-driven development in Kotlin
- Behavior-driven development
- Integration testing
- Test coverage with JaCoCo

Projects built:

- Comprehensive test suite
- Coroutine tests
- Flow testing examples
- Property-based tests
- BDD-style tests with Kotest
- Mock-based testing
- TDD practice projects
- Integration test suite

Practice: Write tests for all previous projects, 85%+ coverage

Month 6: Server-Side Kotlin with Ktor (Weeks 23-26)

Ktor Framework - Part 1

Topics:

- Introduction to Ktor
- Ktor vs Spring Boot
- Setting up Ktor project
- Routing in Ktor
- HTTP methods handling
- Request and response
- Content negotiation
- JSON serialization with kotlinx.serialization
- Status pages and error handling
- Authentication and authorization
- JWT authentication in Ktor
- Sessions in Ktor
- Static content serving

Projects built:

- Hello World REST API with Ktor

```
        - CRUD API for products
        - User authentication API with JWT
        - File upload service
        - Static website hosting
        - API with JSON responses
        - Session-based auth
      Practice: Build 8 Ktor-based APIs
    Ktor Framework - Part 2
      Topics:
        - Database integration with Exposed
        - Exposed DSL and DAO
        - Database transactions
        - Connection pooling
        - WebSockets in Ktor
        - Real-time communication
        - Testing Ktor applications
        - Client-side Ktor HTTP client
        - Dependency injection in Ktor (Koin)
        - Monitoring and metrics
        - Ktor deployment
        - Docker containerization
      Projects built:
        - Full-stack CRUD with database
        - Real-time chat with WebSockets
        - API testing suite
        - HTTP client for third-party APIs
        - Deployed Ktor application
        - Monitored production service
      Practice: Build 6 complete Ktor applications
    Database Access with Kotlin
      Topics:
        - JDBC with Kotlin
        - Exposed framework deep dive
        - Exposed DSL queries
        - Exposed DAO pattern
        - Relationships in Exposed
        - Transactions in Exposed
        - jOOQ with Kotlin
        - SQLDelight for type-safe SQL
        - MongoDB with Kotlin
        - Redis with Kotlin
        - Database migrations
        - Connection pool configuration
      Projects built:
        - Exposed-based ORM project
        - Type-safe database queries
        - Multi-table operations
        - NoSQL integration
        - Migration scripts
        - Connection pool setup
        - Database performance optimization
      Practice: Build 8 database-driven applications
    Build Tools & Kotlin Scripting
      Topics:
        - Gradle with Kotlin DSL
        - Gradle Kotlin DSL syntax
        - Build script configuration
        - Dependencies management
        - Multi-module projects
        - Publishing libraries
        - Kotlin scripting (.kts files)
        - Custom Gradle tasks
        - Maven with Kotlin
        - Continuous integration setup
        - Git best practices for Kotlin
      Projects built:
        - Gradle Kotlin DSL project
        - Multi-module application
        - Published library to Maven Central
        - Custom Gradle plugin
        - Kotlin scripts for automation
        - CI/CD pipeline setup
      Practice: Configure all projects with Gradle Kotlin DSL
      Assessment: Phase 2 exam: a practical build defended live, plus a written paper mixing
      this phase with everything before it

---------------------------------------------------------------
PHASE 3: ANDROID DEVELOPMENT MASTERY (MONTHS 7-9, WEEKS 27-39)
---------------------------------------------------------------
```

Master modern Android development with Kotlin, Jetpack Compose, Material Design, Architecture Components, and professional app development.

Month 7: Android Fundamentals & Jetpack Compose (Weeks 27-31)
Android Basics & Setup
Topics:
- Android platform overview
- Android architecture
- Android SDK and tools
- Android Studio setup and features
- Project structure in Android
- Gradle build system for Android
- AndroidManifest.xml
- Activities and lifecycle
- Intents: explicit and implicit
- Activity navigation
- Passing data between activities
- Fragment basics
- Fragment lifecycle
- Fragment transactions
- UI with XML layouts
- View and ViewGroup
- Common layouts: LinearLayout, RelativeLayout, ConstraintLayout

Projects built:
- Hello Android app
- Multi-activity application
- Intent-based navigation
- Fragment-based UI
- Data passing between screens
- Basic calculator app
- Profile display app
- Navigation drawer app

Practice: Build 10 basic Android apps

Jetpack Compose Fundamentals
Topics:
- Introduction to Jetpack Compose
- Declarative UI paradigm
- Composable functions
- @Composable annotation
- Compose preview
- State in Compose: remember, mutableStateOf
- Recomposition concept
- State hoisting
- Modifiers in Compose
- Layout composables: Column, Row, Box
- LazyColumn and LazyRow
- Text, Image, Button composables
- TextField and user input
- Spacer and Divider
- Card and Surface
- Material Design 3 components
- Theming in Compose

Projects built:
- Hello Compose app
- Counter app with state
- Todo list with LazyColumn
- Form with TextFields
- Material Design 3 app
- Custom theme implementation
- Card-based UI
- Image gallery with LazyGrid

Practice: Build 12 Compose-based UIs

Advanced Compose & Navigation
Topics:
- Compose Navigation library
- NavHost and NavController
- Route-based navigation
- Passing arguments in navigation
- Bottom navigation with Compose
- Navigation drawer in Compose
- Nested navigation graphs
- Side effects in Compose: LaunchedEffect, DisposableEffect
- SideEffect, derivedStateOf
- remember vs rememberSaveable
- ViewModel integration with Compose
- Lifecycle-aware composables
- Animation in Compose
- AnimatedVisibility, animateContentSize
- Custom animations

```
    Projects built:
      - Multi-screen navigation app
      - Bottom navigation app
      - Navigation with arguments
      - Animated UI transitions
      - ViewModel-backed Compose app
      - Side effect demonstrations
      - Complex navigation flow
      - Login flow with navigation
    Practice: Build 10 navigation-based apps
  Android Architecture Components
    Topics:
      - MVVM architecture pattern
      - ViewModel and LiveData
      - StateFlow and SharedFlow in Android
      - Repository pattern
      - Data layer architecture
      - Use cases / Interactors
      - Dependency injection with Hilt
      - Hilt setup and annotations
      - @HiltAndroidApp, @HiltViewModel
      - Providing dependencies
      - Scopes in Hilt
      - Testing with Hilt
      - Clean Architecture in Android
      - Separation of concerns
    Projects built:
      - MVVM app with ViewModel
      - Repository pattern implementation
      - Hilt dependency injection setup
      - Clean architecture project
      - Multi-layer application
      - Testable architecture demo
      - State management with StateFlow
      - Use case layer implementation
    Practice: Refactor 8 apps to clean architecture
  Local Data Storage
    Topics:
      - SharedPreferences for simple data
      - DataStore (Preferences and Proto)
      - Room database introduction
      - Entity, DAO, Database classes
      - Room with Kotlin Coroutines
      - Room with Flow
      - Database migrations
      - Relationships in Room
      - Type converters
      - Database testing
      - File storage basics
      - Internal vs external storage
    Projects built:
      - Preferences-based settings screen
      - DataStore implementation
      - Room database CRUD app
      - Notes app with Room
      - Contact manager with Room
      - Offline-first architecture
      - Database migration example
      - Complex relationships in Room
    Practice: Build 10 data persistence apps

Month 8: Networking, APIs & Advanced Android (Weeks 32-36)
  Networking & REST APIs
    Topics:
      - HTTP basics for Android
      - Retrofit library for REST APIs
      - Setting up Retrofit
      - Defining API interfaces
      - GET, POST, PUT, DELETE requests
      - Query parameters and path variables
      - Request and response models
      - JSON parsing with Gson/Moshi
      - kotlinx.serialization in Android
      - OkHttp interceptors
      - Authentication headers
      - Error handling in network calls
      - Coroutines with Retrofit
      - Loading states management
      - Offline caching strategies
```

```
  Projects built:
    - Weather app with API
    - News reader app
    - Movie database app (TMDB API)
    - REST API consumer
    - Authenticated API calls
    - Offline-first with Room cache
    - Error handling examples
    - Loading state UI
  Practice: Build 10 API-consuming apps
Image Loading & Media
  Topics:
    - Coil library for image loading
    - Glide library
    - Image caching strategies
    - Placeholder and error images
    - Image transformations
    - AsyncImage in Compose
    - Loading images from network
    - Camera integration
    - Gallery access
    - Image picker
    - Video playback: ExoPlayer
    - Media permissions
    - MediaStore API
    - Uploading images to server
  Projects built:
    - Image gallery app with Coil
    - Photo viewer with zoom
    - Camera app
    - Image picker implementation
    - Video player app
    - Image upload to server
    - Media browser
    - Photo editor basics
  Practice: Build 8 media-handling apps
Advanced UI & Material Design
  Topics:
    - Material Design 3 principles
    - Dynamic theming
    - Color schemes in Material 3
    - Custom themes and colors
    - Typography in Compose
    - Scaffold and top app bar
    - Bottom sheet in Compose
    - Dialogs and alerts
    - Snackbars and toasts
    - Tabs with TabRow
    - Chips and badges
    - Progress indicators
    - Swipe to refresh
    - Pull to refresh
    - Custom composables creation
  Projects built:
    - Material Design 3 showcase app
    - Custom themed app
    - Bottom sheet examples
    - Dialog-based workflows
    - Tab-based navigation
    - Complex custom UI components
    - Accessible UI implementation
    - Responsive layouts
  Practice: Design 10 Material Design apps
Background Work & Services
  Topics:
    - WorkManager for background tasks
    - One-time and periodic work
    - Constraints for WorkManager
    - Chaining work requests
    - Monitoring work status
    - Foreground services
    - Notifications in Android
    - NotificationCompat builder
    - Notification channels
    - Push notifications with Firebase
    - FCM integration
    - Handling notification clicks
    - AlarmManager for scheduling
    - JobScheduler basics
```

```
    Projects built:
      - Background sync with WorkManager
      - Periodic data refresh
      - Notification system
      - Push notification handler
      - Foreground service example
      - Reminder app with AlarmManager
      - Download manager
      - Background upload service
    Practice: Build 8 background processing apps
  Testing Android Apps
    Topics:
      - Unit testing in Android
      - JUnit for Android
      - Testing ViewModels
      - Testing coroutines in Android
      - Mocking with MockK
      - Instrumented tests
      - Espresso for UI testing
      - Compose UI testing
      - Testing navigation
      - Testing Room database
      - Testing network calls
      - Test doubles and fakes
      - Screenshot testing
      - Code coverage in Android
    Projects built:
      - Comprehensive unit tests
      - ViewModel test suite
      - UI tests with Espresso
      - Compose UI tests
      - Integration tests
      - E2E testing
      - TDD Android app
      - Tested production app
    Practice: Write tests for all Android projects, 80%+ coverage

Month 9: Ship-Quality Android: Performance, Publishing & Security (Weeks 37-39)
  Performance & Optimization
    Topics:
      - Android performance profiling
      - CPU profiler in Android Studio
      - Memory profiler
      - Network profiler
      - Layout Inspector
      - Detecting memory leaks
      - LeakCanary integration
      - App startup optimization
      - Lazy loading strategies
      - Image optimization
      - Database query optimization
      - Compose performance
      - Recomposition optimization
      - Battery optimization
      - App size reduction
    Projects built:
      - Profiled and optimized app
      - Memory leak fixes
      - Performance benchmark
      - Optimized startup time
      - Lazy-loaded content
      - APK size optimization
      - Battery-efficient app
    Practice: Optimize all previous Android apps
  Publishing & Deployment
    Topics:
      - Preparing app for release
      - App signing with keystore
      - ProGuard and R8
      - Code obfuscation
      - Building release APK/AAB
      - Google Play Console setup
      - Creating store listing
      - Screenshots and graphics
      - App versioning strategy
      - Release management
      - Beta testing with Play Console
      - Internal testing tracks
      - App updates and migrations
```

```
        - Analytics integration: Firebase Analytics
        - Crash reporting: Firebase Crashlytics
      Projects built:
        - Signed release build
        - Play Store ready app
        - Complete store listing
        - Beta test distribution
        - Analytics-enabled app
        - Crash reporting setup
        - Update mechanism
      Practice: Prepare 3 apps for Play Store
    Security Best Practices
      Topics:
        - Android security overview
        - Secure data storage
        - Encrypted SharedPreferences
        - Keystore system
        - Biometric authentication
        - Certificate pinning
        - ProGuard for security
        - SQL injection prevention
        - Secure network communication
        - HTTPS enforcement
        - API key protection
        - Code obfuscation
        - Root detection
        - SafetyNet API
        - OWASP mobile security
      Projects built:
        - Secured data storage app
        - Biometric auth implementation
        - Certificate pinned API calls
        - Encrypted database
        - Secure authentication flow
        - Obfuscated production app
      Practice: Security audit all Android apps
      Assessment: Phase 3 exam: a practical build defended live, plus a written paper mixing
      this phase with everything before it

---------------------------------------------------------------
PHASE 4: THE FINALE (MONTH 10, WEEKS 40-44)
---------------------------------------------------------------
The capstone month: spec, build, ship and defend, then the final exam that decides the
certificate.

  Month 10: Capstone and the Final Exam (Weeks 40-44)
    Capstone Spec and Setup
      Topics:
        - Choosing the capstone: a complete Android app with real data, offline behavior and polished
          Compose UI
        - A one-page spec: scope, milestones, stack
        - Repository and project skeleton ready on day one
        - Instructor sign-off before the build begins
      Projects built:
        - Approved capstone spec plus the running skeleton
      Practice: Pitch the spec to the batch and absorb one hard question
    Capstone Build
      Topics:
        - Two focused weeks of building in vertical slices
        - Instructor checkpoints and honest scope cuts
        - Using the whole course: Kotlin depth, coroutines, Compose, architecture and testing
        - Daily commits and an always-working build
      Projects built:
        - The capstone, feature-complete with version control
      Practice: A working build at the end of every session
    Ship and Polish
      Topics:
        - The finishing pass: edge cases, errors, documentation
        - Store-readiness pass: assets, versioning and the honest release checklist
        - A README worth reading and a demo worth watching
        - A full-course spiral review before the exam
      Projects built:
        - The capstone shipped, documented and rehearsed
      Practice: Two mock demos, each tighter than the last
    Demo Day and the Final Exam
      Topics:
        - Presenting the capstone: live demo plus the hardest bug story
        - The honest map of next roads: production Android work, Kotlin backend services, or
          multiplatform
```

- Where our other courses continue the journey
Projects built:
- Demo day presentation delivered to the batch
Assessment: FINAL EXAM: a practical build plus a written paper with questions mixed from every phase. Passing earns the certificate; falling short earns a focused revision plan and a free retest

PROJECTS THE STUDENT BUILDS AND KEEPS

- Phase 1: Kotlin programs from fundamentals through coroutine-based tools
- Phase 2: idiomatic Kotlin utilities and flow-based systems
- Phase 3: Compose apps with architecture, Room data and networking
- Phase 4: the capstone app, store-grade and defended at demo day

Total projects: 20+ real builds, crowned by a store-grade capstone app

SKILLS THE STUDENT WILL HAVE AT THE END

- Kotlin to real depth: null-safety, functional style, coroutines and flows
- Jetpack Compose: modern Android UI as a first language
- Architecture: state, lifecycles and structure that survive growth
- Data and networking: Room, Retrofit-class clients and offline judgment
- Production habits: testing, releases and honest store literacy

HOW A TYPICAL WEEK IS SPLIT

Live classes: 2 live one-hour classes per week, coding along with the instructor
Homework: A problem set after every class, and a mixed-review assignment at the end of every month
Practice: 4-6 hours of building between classes
Review: Every submission reviewed with written feedback; recurring gaps reopened in class

SUPPORT INCLUDED

Doubt support: WhatsApp doubt support between classes
Progress updates: Honest monthly progress reviews: what is solid, what is wobbly, and the plan for the wobble

CERTIFICATION DETAIL

Completion: Certificate from Modern Age Coders, awarded on passing the final exam. Fall short and there is focused revision and a free retest: the certificate certifies knowledge, not attendance

WHERE THIS CAN LEAD

- Production Android roles: this is the modern stack they hire for
- Kotlin backend services: the language carries straight across
- Multiplatform later, entered when it earns its complexity
- Our full-stack course for the web half of product building

EARNING POTENTIAL (share only if asked, and never promise it)

Market context: The ranges below are general market salary bands for these roles in India and abroad, drawn from public industry data. They are shown for career context only and are not a promise or guarantee of income. Actual pay depends on your skills, experience, location, and the job market.
Early career roles: Rs 3-6 LPA (Junior Kotlin/Android Developer)
Growing roles: Rs 6-10 LPA (Android Developer); Rs 10-18 LPA (Senior Android Developer)
Experienced roles: Rs 15-30 LPA (Senior Kotlin Developer / Tech Lead); Rs 20-45 LPA (Lead Developer / Architect)
Freelance: Rs 1,500-6,000/hour based on expertise
International usa: $90k-200k USD (Android/Kotlin Developer to Senior)
International europe: €55k-130k EUR based on country

COMMON QUESTIONS ABOUT THIS COURSE

For anything about cost, use PART 4 and RULE 1. Do not quote two regions.

Q: What does this Kotlin and Android course cover?
A: Kotlin as a real language first, null-safety, functional style, coroutines and flows, then modern Android: Jetpack Compose UI, architecture that survives rotation and growth, Room data, networking, testing and honest store literacy, ending with a store-grade capstone app and the final exam. Compose-first throughout: the stack Google actually recommends in 2026.

Q: How long does it take to learn Kotlin and Android properly?
A: Ten months of teaching at 2 live classes a week plus 4 to 6 hours of practice, with two more months in hand for learners who need them. The three teaching phases build the language and its real-world domain; the finale month ships a capstone and sits the final exam.

Q: How am I assessed? Is the certificate just for attending?
A: No. Problem sets follow every class with written feedback, monthly reviews deliberately mix new material with earlier topics, each phase ends with a cumulative exam, and the course ends with a final exam: a practical build plus written questions from the whole syllabus. Passing earns the certificate; falling short earns focused revision and a free retest.

Q: Do I need to know Java first?
A: No: Kotlin is taught from zero and is the better first language for Android today. Java interop is explained where it matters (older codebases), but modern Android development, and this course, runs Kotlin-first with Compose.

Q: Will my app actually go on the Play Store?
A: The course builds to store-grade discipline and walks the release process honestly: developer account costs, review rules, testing tracks. Publishing itself is your call and your account; what the course guarantees is an app and a release checklist that are genuinely ready for it.

Q: Can I try a class before enrolling?
A: Yes, a free demo class with no commitment: book at learn.modernagecoders.com/contact or message us on WhatsApp at +91 91233 66161. (Agent note: the free demo is a waiting list with no fixed date. The Priority Live Demo is a guaranteed class today or tomorrow, booked at https://learn.modernagecoders.com/priority-demo . Offer both, as RULE 3 says.)

Q: Are classes live or recorded?
A: Live, always: small groups with a real instructor reading your actual code, never pre-recorded videos.

To enrol, message Shivam Sir on +91 9123366161 or send the parent this link: https://learn.modernagecoders.com/courses/complete-kotlin-programming-masterclass-professional
For a demo: the Priority Live Demo (guaranteed, today or tomorrow) is booked at https://learn.modernagecoders.com/priority-demo . The free demo is a waiting list with no fixed date.

==========

COURSE 92 OF 137: KS2 SATS MATHS: ARITHMETIC, REASONING AND TIMES TABLES

==========

Course link: https://learn.modernagecoders.com/courses/ks2-sats-maths-course
Subject area: UK Primary Mathematics
Designed for: Elementary school
Who can join: Children in Years 4, 5 and 6 at primary schools in England, ages 8 to 11
Course length: 8 months (32 weeks), timed to finish before the May tests
Time needed: 2 live classes/week + 20 minutes of practice on most days
Certificate: Course-completion certificate from Modern Age Coders

PRICE FOR THIS COURSE (quote only the one that applies to the person asking)
In India, per month: group Rs 1,499, mini batch Rs 2,999, one to one Rs 4,999
In Canada, per month: group CAD 140, one to one CAD 210
Anywhere else, per month: group $100, one to one $150
Classes: group and mini batch two live classes a week, eight a month; one to one in India one live class a week, four a month; one to one outside India two live classes a week, eight a month. Each class is one hour.

WHAT THIS COURSE IS

KS2 SATs maths course online for Years 4 to 6: times tables for the multiplication check, the arithmetic paper and both reasoning papers, taught live.

In one line: Instant times tables, a calm arithmetic paper and reasoning answers that show their thinking, built up over eight months rather than crammed in April.

ABOUT THE PROGRAMME

The key stage 2 maths test is three papers. The test framework sets them out plainly: Paper 1 is arithmetic, 40 marks in 30 minutes, and Papers 2 and 3 are mathematical reasoning, 35 marks and 40 minutes each, so 110 marks across 110 minutes in total. In 2027 the maths papers are timetabled for Wednesday 12 May (Papers 1 and 2) and Thursday 13 May (Paper 3). Results come back as a scaled score between 80 and 120, and a score of at least 100 meets the expected standard. Underneath all of it sit the times tables. The national curriculum expects children to have memorised the tables up to 12 by the end of Year 4, and the multiplication tables check tests exactly that: 25 questions, six seconds each, taken in June of Year 4. A child who still counts up in fives to find 7 times 5 loses time on every paper, so this course starts there. The course runs in four phases: times tables to instant recall, the arithmetic paper method by method, the reasoning papers question type by question type, and finally full papers under real timing. Classes are live and small, so the teacher sees each child's working, not just the answer, and parents get a short written note every month on what has moved and what is next.

WHAT MAKES THIS COURSE DIFFERENT

- Built from the government's own key stage 2 mathematics test framework: the three papers, their marks and timings, and the resource list children actually use
- Times tables first, because the multiplication tables check and every SATs paper lean on instant recall
- The arithmetic paper taught as a set of written methods, each practised until it is automatic and checked
- Reasoning taught by question type: multi-step word problems, explain-your-answer questions, measures, geometry and statistics
- Full papers under real timing in the last two months, marked against the published mark schemes
- Calm by design: short daily practice and clear progress notes for parents, not late-night cramming

THE LEARNING PATH, STEP BY STEP

Phase 1: Times tables to instant recall: every table to 12 by 12, the related division facts, and timed practice in the multiplication check format
Phase 2: The arithmetic paper: place value, the four written methods, fractions, decimals and percentages as calculations
Phase 3: The reasoning papers: word problems, measures, geometry, statistics and explaining an answer
Phase 4: Full papers under timing: past and practice papers, marked and reviewed, with a calm plan for test week

WHAT A STUDENT NEEDS BEFORE STARTING

Maths level: Working on Year 4, 5 or 6 maths at school. The first week's diagnostic shows where each child is, and the plan starts from there
School system: Built for the key stage 2 tests at primary schools in England. Children elsewhere are welcome for the content, but the papers are England's
Equipment: Pencil, ruler, protractor, a small mirror, squared paper, and a device with stable internet for live classes
Timing: Ideally started in the autumn of Year 6, or earlier in Years 4 and 5 for times tables and arithmetic. Later joiners get a shorter plan focused on papers

WHO THIS COURSE IS FOR

Year 6 children: Year 6 children preparing for the May tests who want steady, structured practice
Year 4 children: Year 4 children getting ready for the multiplication tables check
Year 5 children: Year 5 children who want arithmetic and times tables secure a year early
Children needing confidence: Children who know the maths but freeze or rush under time
Children aiming higher: Children who are already secure and want the harder reasoning questions

FULL CURRICULUM, WEEK BY WEEK

This is the complete teaching plan. Parents can ask about any week.

PHASE 1: TIMES TABLES TO INSTANT RECALL (MONTHS 1-2, WEEKS 1-8)

Every table up to 12 by 12 and its division facts, learned through patterns first and speed second. Year 4 children practise in the format of the multiplication tables check; older children use it as a warm-up for the papers.

Month 1: Tables by Pattern (Weeks 1-4)
Weeks 1-2: Diagnostic and the Easy Tables
Topics:
- A short diagnostic: which facts are instant, which are counted, which are guessed
- The 2, 5 and 10 tables and the patterns that make them quick
- Doubling to reach the 4 and 8 tables
- Commutativity: why learning 3 times 7 also gives 7 times 3
- The 11 table and its pattern up to 11 times 9
- A personal fact chart: green for instant, amber for slow, red for unknown

Projects built:
- Fact chart started: every fact up to 12 by 12 coloured by speed after the diagnostic

Practice: Ten minutes of mixed facts on most days, focusing on amber facts
Weeks 3-4: The Harder Tables
Topics:
- The 3, 6 and 9 tables and how they connect
- The 7 table, the one most children find hardest, with memory hooks
- The 12 table built from the 10 and 2 tables
- Square numbers up to 12 by 12
- Spotting which facts are still slow and why
- Using known facts to work out unknown ones

Projects built:

- Fact chart updated: amber and red facts listed with a hook for each
Practice: Daily mixed practice weighted towards the 6, 7, 8 and 12 tables
Assessment: Month 1 check: 25 mixed facts, untimed, then the same 25 timed

Month 2: Speed and Division Facts (Weeks 5-8)
Weeks 5-6: Division Facts and Missing Numbers
Topics:
- Division facts from each table, read the other way
- Missing number questions such as 6 times something equals 42
- Fact families: four facts from three numbers
- Multiplying by 10 and 100 using place value
- Scaling a known fact: from 3 times 4 to 30 times 4
- Recognising factors and multiples
Projects built:
- Fact family cards made for the ten facts the child finds slowest
Practice: Mixed multiplication and division facts with a short timer
Weeks 7-8: Six-Second Recall
Topics:
- Practice in the multiplication check format: 25 questions, six seconds each
- Typing answers quickly and accurately on a keyboard or tablet
- Staying calm when one fact is missed and moving to the next
- Re-testing every fact that was amber in month 1
- Using tables inside short calculations
- Keeping recall instant with five minutes a day
Projects built:
- Fact chart completed: the aim is every fact green
Practice: Three short timed checks a week in the check format
Assessment: Month 2 check: a full 25-question timed check, scored out of 25

PHASE 2: THE ARITHMETIC PAPER (MONTHS 3-4, WEEKS 9-16)

Paper 1 is 40 marks in 30 minutes, all calculation. Each written method is taught, practised
and checked until it is automatic, then mixed under time.

Month 3: Whole Numbers and Written Methods (Weeks 9-12)
Weeks 9-10: Place Value and Addition and Subtraction
Topics:
- Place value to ten million and reading large numbers
- Column addition with several carries
- Column subtraction with exchanging across zeros
- Adding and subtracting decimals by lining up the point
- Estimating before calculating to catch slips
- Inverse operations as a check
Projects built:
- Method book started: one worked example per method, written by the child
Practice: 20 column calculations a week, each checked by estimation
Weeks 11-12: Multiplication and Division
Topics:
- Short multiplication by a one-digit number
- Long multiplication by a two-digit number
- Short division, including remainders
- Long division by a two-digit number
- Order of operations with brackets
- Choosing a mental method when the numbers allow it
Projects built:
- Method book entry: long multiplication and long division set out step by step
Practice: 15 multiplication and division calculations a week
Assessment: Month 3 test: a half-length arithmetic paper, 20 marks in 15 minutes

Month 4: Fractions, Decimals and Percentages (Weeks 13-16)
Weeks 13-14: Fraction Calculations
Topics:
- Equivalent fractions and simplifying
- Adding and subtracting fractions with different denominators
- Mixed numbers and improper fractions
- Multiplying fractions, including by a whole number
- Dividing a fraction by a whole number
- Fractions of amounts
Projects built:
- Method book entry: every fraction method with a worked example
Practice: 20 fraction calculations a week, answers simplified
Weeks 15-16: Decimals, Percentages and the Full Paper
Topics:
- Multiplying and dividing decimals by 10, 100 and 1000
- Multiplying a decimal by a whole number
- Percentages of amounts
- Squares, cubes and simple powers
- Working through a full arithmetic paper in 30 minutes

- Checking strategy for the last five minutes
Projects built:
- Arithmetic tracker: score and time recorded for every practice paper
Practice: One full arithmetic paper a week under timing
Assessment: Month 4 test: a full arithmetic paper, 40 marks in 30 minutes, marked and reviewed

---
PHASE 3: THE REASONING PAPERS (MONTHS 5-6, WEEKS 17-24)

Papers 2 and 3 are 35 marks and 40 minutes each, and they test whether a child can use maths in context and explain it. Each question type is taught on its own, then mixed.

Month 5: Number Reasoning and Measures (Weeks 17-20)
Weeks 17-18: Multi-Step Word Problems
Topics:
- Reading a word problem twice and finding the question
- Bar models for comparison and part-whole problems
- Multi-step problems that combine two or three operations
- Ratio and scaling problems
- Simple algebra: missing numbers and formulae in words
- Showing working so method marks are possible
Projects built:
- Problem journal started: one solved problem per question type with a bar model
Practice: 10 word problems a week, each with a written plan before the calculation
Weeks 19-20: Measures, Money and Time
Topics:
- Converting units of length, mass and capacity
- Money problems with change and value-for-money comparisons
- Reading and calculating with time, including timetables
- Perimeter and area of rectangles and compound shapes
- Area of triangles and parallelograms
- Volume of cuboids
Projects built:
- Problem journal entry: a measures question for each unit type
Practice: 12 measures questions a week in reasoning-paper style
Assessment: Month 5 test: a 20-minute reasoning section, marked against a published scheme

Month 6: Geometry, Statistics and Explaining (Weeks 21-24)
Weeks 21-22: Geometry and Statistics
Topics:
- Angles on a line, around a point and in triangles and quadrilaterals
- Measuring and drawing angles with a protractor
- Properties of 2-D and 3-D shapes, including circles
- Coordinates in four quadrants, translations and reflections
- Reading line graphs, tables and pie charts
- Calculating and interpreting the mean
Projects built:
- Problem journal entry: geometry and statistics questions with labelled diagrams
Practice: 12 geometry and statistics questions a week
Weeks 23-24: Explain, Show and Check
Topics:
- Explain-your-answer questions and what a full answer includes
- Always, sometimes or never true statements
- Spotting and correcting a mistake in someone else's working
- Checking that an answer is sensible in context
- Mixed reasoning sets that do not announce their topic
- Pacing a 40-minute paper
Projects built:
- Explanation bank: model answers to ten explain questions, written in the child's own words
Practice: One full reasoning paper a week under timing
Assessment: Month 6 test: a full reasoning paper, 35 marks in 40 minutes, marked and reviewed

---
PHASE 4: FULL PAPERS UNDER TIMING (MONTHS 7-8, WEEKS 25-32)

No new content. Full sets of three papers under real timing, marked against the published mark schemes, with a short review after each one and a calm plan for test week.

Month 7: Paper Sets (Weeks 25-28)
Weeks 25-26: First Full Sets
Topics:
- A full set: arithmetic paper, then both reasoning papers on separate days
- Marking against the published mark scheme
- Sorting lost marks: recall, method, reading or carelessness
- Re-teaching the two weakest areas
- Times tables kept instant with short warm-ups

- Using the resource list: ruler, protractor and mirror
Projects built:
- Paper tracker: scores for each paper on one chart
Practice: One full set of three papers each fortnight
Weeks 27-28: Targeted Repair
Topics:
- Short lessons on each child's own weak spots, taken from the tracker
- Arithmetic speed drills on the slowest methods
- Reasoning questions of the types most often dropped
- Reading questions aloud in the head before answering
- Leaving and returning to a hard question
- Checking answers in the final minutes
Projects built:
- Repair list: each weak area with the date it was fixed
Practice: Focused sets on two weak areas a week
Assessment: Month 7 checkpoint: a second full set of three papers, marked

Month 8: Ready for Test Week (Weeks 29-32)
Weeks 29-30: Final Sets
Topics:
- A final full set under real timing
- Review of every lost mark
- Mixed practice from the repair list
- Arithmetic in under 30 minutes with checking time left
- Reasoning pacing: 40 minutes per paper
- Confidence from seeing the tracker rise
Projects built:
- Paper tracker completed
Practice: Short daily mixed practice, no all-day sessions
Weeks 31-32: Calm Before the Tests
Topics:
- Light revision of methods from the method book
- Times tables warm-ups
- What to expect on each day of test week
- Sleep, breakfast and a normal routine
- A short talk with parents about keeping test week low-pressure
- Planning maths for the summer and Year 7
Projects built:
- Finished method book, problem journal and explanation bank, kept for Year 7
Practice: Ten minutes a day of light, familiar practice
Assessment: Final review with the teacher and a written note for parents

PROJECTS THE STUDENT BUILDS AND KEEPS

- A colour-coded times tables fact chart, filled to green
- A method book with a worked example of every written calculation method
- A problem journal with a solved example of every reasoning question type
- An explanation bank of model answers in the child's own words
- An arithmetic tracker and a full-paper tracker
- A repair list showing each weak area and when it was fixed

Total projects: A complete SATs maths kit: fact chart, method book, problem journal, explanation bank and paper trackers

SKILLS THE STUDENT WILL HAVE AT THE END

- Times tables to 12 by 12 recalled instantly, with division facts
- Every written method on the arithmetic paper, with checking
- Fractions, decimals and percentages as calculations
- Reasoning with measures, geometry and statistics
- Explaining an answer clearly enough to earn the mark
- Pacing a timed paper and checking in the final minutes

HOW A TYPICAL WEEK IS SPLIT

Live classes: 2 live classes per week, 45 to 60 minutes each depending on age and phase
Practice: About 20 minutes on most days, including a few minutes of times tables
Review: Practice marked with short comments; papers marked against published schemes

SUPPORT INCLUDED

Doubt support: WhatsApp support for parents between classes, with worked examples for stuck questions
Progress updates: A short written note to parents each month with tracker scores and next steps

CERTIFICATION DETAIL

Completion: Course-completion certificate from Modern Age Coders

WHERE THIS CAN LEAD

  - A smooth start to Year 7 maths with times tables and written methods already secure
  - Our KS3 and 11 plus maths courses for children who want to keep going
  - Our mental maths and coding courses for children who enjoy number puzzles

COMMON QUESTIONS ABOUT THIS COURSE

  For anything about cost, use PART 4 and RULE 1. Do not quote two regions.

  Q: What is in the KS2 SATs maths test?
  A: Three papers. Paper 1 is arithmetic, 40 marks in 30 minutes. That is 110 marks over 110 minutes in total, set out in the government's key stage 2 mathematics test framework.

  Q: When are the KS2 SATs maths papers in 2027?
  A: The multiplication tables check for Year 4 runs in a two-week window from Monday 7 June 2027.

  Q: What score does my child need in SATs maths?
  A: Results are scaled scores from 80 to 120. A scaled score of at least 100 means the child has met the expected standard. The number of raw marks needed for 100 can change from year to year, because the difficulty of the tests varies.

  Q: What is the Year 4 multiplication tables check?
  A: A short on-screen check taken in June of Year 4. It checks instant recall, which is why this course spends its first two months on times tables.

  Q: Can children use a calculator in the SATs maths test?
  A: The resource list in the test framework is a pen or pencil, a ruler and an optional rubber for the arithmetic paper, plus an angle measurer or protractor and a mirror for the reasoning papers. A calculator is not on it, so this course teaches every calculation by hand.

  Q: Is SATs maths the same as 11 plus maths?
  A: No. SATs are national tests taken by Year 6 children in England. The 11 plus is a selection test set by some areas and schools, usually in Year 5 or early Year 6, with its own format. There is overlap in the maths, and we also run a separate 11 plus maths course.

  Q: Are the SATs changing?
  A: We follow the published framework and will update the course if anything changes.

  Q: How are the classes run?
  A: Live online classes with a real teacher, either in a group of 15 to 20 children at a similar level or one to one. Practice is short and frequent, and parents get a written note each month. Current fees for your region are shown in the pricing section of this page.

  Q: My child is in Year 4. Is it too early?
  A: Not for times tables and arithmetic. Year 4 is when the multiplication check happens, and secure tables make every later year easier. Younger children follow the first two phases at their own pace and join the paper practice later.

  Q: Can we try a lesson first?
  A: Yes. Book a free demo class. The teacher plays a few times tables games and arithmetic questions with your child, sees where they are, and suggests whether group or one-to-one teaching fits better. There is no obligation to enrol. (Agent note: the free demo is a waiting list with no fixed date. The Priority Live Demo is a guaranteed class today or tomorrow, booked at https://learn.modernagecoders.com/priority-demo . Offer both, as RULE 3 says.)

  To enrol, message Shivam Sir on +91 9123366161 or send the parent this link: https://learn.modernagecoders.com/courses/ks2-sats-maths-course
  For a demo: the Priority Live Demo (guaranteed, today or tomorrow) is booked at https://learn.modernagecoders.com/priority-demo . The free demo is a waiting list with no fixed date.

==========
COURSE 93 OF 137: MATHS FOR DATA SCIENCE: STATISTICS, LINEAR ALGEBRA AND ML
==========

Course link: https://learn.modernagecoders.com/courses/data-analytics-mathematics-masterclass
Subject area: Data Science Mathematics
Designed for: Working professionals
Who can join: School-level maths assumed; built for college students and working professionals
Course length: 12-14 months (48-56 weeks)
Time needed: 2 live classes/week + 4-6 hours practice
Certificate: Certificate from Modern Age Coders, awarded on passing the final exam

PRICE FOR THIS COURSE (quote only the one that applies to the person asking)
  In India, per month: group Rs 1,499, mini batch Rs 2,999, one to one Rs 4,999
  In Canada, per month: group CAD 140, one to one CAD 210

Anywhere else, per month: group $100, one to one $150
Classes: group and mini batch two live classes a week, eight a month; one to one in India one live class a week, four a month; one to one outside India two live classes a week, eight a month. Each class is one hour.

WHAT THIS COURSE IS

Maths for data science, live online: statistics, probability, linear algebra, regression, ML mathematics, Bayesian methods and A/B testing in 12-14 months.

In one line: The difference between running models and understanding them is mathematics. This is that mathematics, taught honestly in twelve months.

ABOUT THE PROGRAMME

Every data career eventually hits the same wall: the tools are easy, the mathematics behind them is not, and interviews, promotions and real analytical judgment all live on the far side of that wall. This live online course teaches exactly the mathematics data work stands on: statistics that tell the truth, probability that calibrates uncertainty, the linear algebra inside every model, regression and classification understood from first principles, optimization, the mathematics of neural networks, Bayesian methods, time series, and the experimental design behind honest A/B testing. The course is deliberately practical about rigor: every concept is derived enough to be owned, then immediately exercised on real data questions, the kind analysts and data scientists actually face. Statistical malpractice gets named and corrected throughout: p-hacking, leakage, confounding, the graph that lies. By the end, a student does not just know the formulas; they know which analysis is honest and can defend it in an interview or a meeting. The pace is real: two live classes a week plus four to six hours of practice fits the syllabus in twelve months, and learners who need longer take up to fourteen, the batch adapts. Assessment is honest too: problem sets after every class, monthly mixed reviews that reach back deliberately, phase exams, and a final exam that decides the certificate, with focused revision and a free retest for those who fall short. Real knowledge, real work, depth over dopamine.

WHAT MAKES THIS COURSE DIFFERENT

- Mathematics first, tools second: understanding that transfers across every library and language
- Interview-honest coverage: the statistics, linear algebra and ML mathematics that data interviews actually probe
- Statistical malpractice named and corrected: p-hacking, leakage, confounding and misleading charts, studied on purpose
- Every concept lands on real data: derivations earn their keep in applied exercises the same week
- An honest 12-month arc with 2 months of margin: learners who need more time take up to 14, nobody is rushed
- Real assessment: weekly problem sets, monthly mixed reviews, and a final exam that decides the certificate, with focused revision and a free retest

THE LEARNING PATH, STEP BY STEP

Phase 1: Statistics that tell the truth (Months 1-3): descriptive statistics, visualization, probability and the great distributions
Phase 2: Linear algebra and inference (Months 4-6): vectors to PCA, sampling, confidence intervals and hypothesis testing done honestly
Phase 3: The mathematics of machine learning (Months 7-9): regression from first principles, classification, trees, clustering and evaluation
Phase 4: Modern practice (Months 10-12): optimization, neural network mathematics, Bayesian methods, time series, A/B testing and the capstone

WHAT A STUDENT NEEDS BEFORE STARTING

Maths background: School mathematics (Class 12 or equivalent). Calculus is refreshed where needed; no university maths assumed
Coding background: Helpful but not required; the mathematics is the syllabus, with spreadsheets and light Python used as calculators
Equipment: A computer with a stable internet connection
Age: College students and working professionals (18+)
Time commitment: 2 live classes plus 4-6 hours of practice a week

WHO THIS COURSE IS FOR

Aspiring analysts: Students and professionals aiming at data analyst and data science roles who keep hitting the maths wall
Tool users: People fluent in Excel, SQL or pandas who want to finally understand what the numbers are doing
Interview candidates: Candidates whose next round is statistics, probability and ML fundamentals
Ml learners: Students in ML courses who realize the mathematics was assumed, not taught
Decision makers: Managers and founders who want to read analyses and experiments without

being fooled

FULL CURRICULUM, WEEK BY WEEK

This is the complete teaching plan. Parents can ask about any week.

PHASE 1: STATISTICS THAT TELL THE TRUTH (MONTHS 1-3, WEEKS 1-12)

The bedrock: describing data honestly, visualizing without lying, and the probability language every model speaks.

Month 1: Describing Data Honestly (Weeks 1-4)

Introduction to Statistical Thinking

Topics:

- What is data science? The role of mathematics
- Types of data: numerical, categorical, ordinal
- Scales of measurement: nominal, ordinal, interval, ratio
- Population vs sample concepts
- Parameters vs statistics
- Data collection methods and sampling techniques
- Simple random sampling
- Stratified and cluster sampling
- Sampling bias and selection bias
- Data quality: missing data, outliers, errors
- Data cleaning principles
- Exploratory Data Analysis (EDA) philosophy

Projects built:

- Design a data collection strategy
- Data quality assessment tool
- Sampling simulation study

Practice: Analyze 20 real-world datasets for quality issues

Measures of Central Tendency and Spread

Topics:

- Mean: arithmetic, geometric, harmonic
- Median and quartiles
- Mode and multimodal distributions
- Weighted averages and their applications
- Range and interquartile range
- Variance and standard deviation
- Coefficient of variation
- Mean absolute deviation
- Moments: skewness and kurtosis
- Box plots and five-number summary
- Z-scores and standardization
- Detecting outliers: IQR method, z-score method

Projects built:

- Statistical calculator from scratch
- Outlier detection system
- Interactive visualization dashboard

Practice: Calculate statistics for 50 different distributions

Assessment: Month 1 check: describe a messy real dataset honestly, plus a mixed quiz on everything so far

Month 2: Visualization and Probability (Weeks 5-8)

Data Visualization and Graphical Analysis

Topics:

- Principles of effective visualization
- Histograms and density plots
- Scatter plots and correlation patterns
- Bar charts and categorical data visualization
- Pie charts: when to use and avoid
- Heat maps and correlation matrices
- Time series plots and trends
- Parallel coordinates for high-dimensional data
- Q-Q plots and probability plots
- Interactive visualizations with Plotly
- Dashboard design principles
- Misleading visualizations and how to spot them

Projects built:

- Build comprehensive EDA toolkit
- Create interactive data dashboard
- Visualization best practices guide

Practice: Create 100 different types of visualizations

Probability Fundamentals

Topics:

- Sample spaces and events
- Classical, frequentist, and subjective probability
- Probability axioms and properties

- Conditional probability and independence
- Bayes' theorem and applications
- Law of total probability
- Combinatorics for probability
- Permutations and combinations in data
- Birthday paradox and probability paradoxes
- Monte Carlo simulation basics
- Random number generation
- Probability in machine learning context

Projects built:
- Probability simulator
- Bayes theorem calculator
- Monte Carlo estimation tool

Practice: Solve 150 probability problems with data applications

Assessment: Month 2 check: a probability problem set with one deliberately misleading chart to expose

Month 3: The Great Distributions (Weeks 9-12)

Discrete Probability Distributions

Topics:
- Random variables: discrete vs continuous
- Probability mass functions
- Bernoulli and binomial distributions
- Geometric and negative binomial distributions
- Poisson distribution and rare events
- Hypergeometric distribution
- Multinomial distribution
- Expected value and variance calculations
- Moment generating functions
- Joint discrete distributions
- Marginal and conditional distributions
- Applications in A/B testing

Projects built:
- Distribution calculator and visualizer
- A/B test simulator
- Discrete event simulator

Practice: Work with 100 discrete distribution problems

Continuous Probability Distributions

Topics:
- Probability density functions
- Uniform distribution
- Normal distribution: properties and importance
- Standard normal and z-tables
- Exponential distribution and memoryless property
- Gamma and beta distributions
- Chi-square distribution
- Student's t-distribution
- F-distribution
- Log-normal distribution
- Weibull distribution for reliability
- Distribution fitting and selection

Projects built:
- Distribution fitting tool
- Normal distribution simulator
- Reliability analysis system

Practice: Master 100 continuous distribution applications

Assessment: Phase 1 exam: distributions and probability in anger, mixed with months 1-2 material

---

PHASE 2: LINEAR ALGEBRA AND STATISTICAL INFERENCE (MONTHS 4-6, WEEKS 13-24)

The two pillars: the vector and matrix language models are written in, and inference, how honest conclusions get drawn from samples.

Month 4: Linear Algebra for Data (Weeks 13-16)

Linear Algebra for Data Science - Vectors

Topics:
- Vectors as data points
- Vector operations: addition, scalar multiplication
- Dot product and cosine similarity
- Vector norms: L1, L2, L-infinity
- Distance metrics: Euclidean, Manhattan, Minkowski
- Orthogonality and orthogonal projections
- Vector spaces and subspaces
- Linear independence in feature space
- Basis vectors and coordinate systems
- Change of basis for data transformation
- Gram-Schmidt for orthogonalization

- Applications to feature engineering
Projects built:
- Vector similarity calculator
- Distance metric visualizer
- Feature space explorer
Practice: Complete 100 vector operations in data context
Linear Algebra for Data Science - Matrices
Topics:
- Matrices as datasets and transformations
- Matrix multiplication as data transformation
- Special matrices: diagonal, symmetric, orthogonal
- Matrix transpose and properties
- Matrix rank and linear independence of features
- Invertible matrices and their meaning
- Determinants and volume interpretation
- Systems of linear equations in ML
- Gaussian elimination for solving systems
- LU decomposition
- Matrix norms and condition numbers
- Sparse matrices in big data
Projects built:
- Matrix operations library
- Linear system solver
- Sparse matrix handler
Practice: Solve 100 matrix problems with data applications
Assessment: Month 4 check: matrix computations plus a mixed review reaching back to statistics

Month 5: Eigenvalues, PCA and Sampling (Weeks 17-20)
Eigenvalues, Eigenvectors and PCA
Topics:
- Eigenvalues and eigenvectors intuition
- Characteristic equation
- Geometric interpretation of eigenvectors
- Diagonalization of matrices
- Spectral decomposition
- Positive definite matrices
- Covariance matrices in data
- Principal Component Analysis (PCA) theory
- PCA algorithm step-by-step
- Variance explained and scree plots
- PCA for dimensionality reduction
- Applications in data compression
Projects built:
- PCA implementation from scratch
- Eigenface recognition system
- Dimensionality reduction tool
Practice: Apply PCA to 20 different datasets
Sampling Distributions and CLT
Topics:
- Sampling distribution concept
- Sampling distribution of the mean
- Standard error and its importance
- Central Limit Theorem (CLT)
- CLT applications and limitations
- Sample size determination
- Finite population correction
- Sampling distribution of proportions
- Sampling distribution of variances
- Chi-square distribution from normal samples
- t-distribution for small samples
- F-distribution for variance ratios
Projects built:
- CLT demonstration tool
- Sample size calculator
- Sampling distribution simulator
Practice: Explore 50 sampling distribution scenarios
Assessment: Month 5 check: run and interpret a PCA, plus sampling-distribution questions

Month 6: Inference Done Honestly (Weeks 21-24)
Confidence Intervals
Topics:
- Point estimates vs interval estimates
- Confidence level interpretation
- CI for population mean (known variance)
- CI for population mean (unknown variance)
- CI for population proportion
- CI for difference of means

- CI for paired differences
- CI for variance and standard deviation
- CI for ratio of variances
- Bootstrap confidence intervals
- Prediction intervals vs confidence intervals
- Sample size for desired margin of error

Projects built:
- Confidence interval calculator
- Bootstrap CI implementation
- CI visualization tool

Practice: Calculate 100 different confidence intervals

Hypothesis Testing Fundamentals

Topics:
- Null and alternative hypotheses
- Type I and Type II errors
- Significance level and p-values
- Test statistics and rejection regions
- One-sample t-test
- Two-sample t-test (equal and unequal variances)
- Paired t-test
- Z-test for proportions
- Chi-square test for variance
- F-test for equal variances
- One-tailed vs two-tailed tests
- Power of a test and effect size
- ANOVA in one honest lesson: comparing many groups
- p-hacking and multiple comparisons: how analysis goes wrong on purpose

Projects built:
- Hypothesis testing framework
- Power analysis tool
- A/B testing platform

Practice: Conduct 100 hypothesis tests

Assessment: Phase 2 exam: a full inference paper, hypothesis tests defended in writing, mixed with earlier phases

---

PHASE 3: THE MATHEMATICS OF MACHINE LEARNING (MONTHS 7-9, WEEKS 25-36)

Models from first principles: regression, regularization, classification, trees and clustering, with evaluation treated as the moral core of the discipline.

Month 7: Regression from First Principles (Weeks 25-28)

Simple Linear Regression

Topics:
- Linear relationship between variables
- Least squares estimation
- Geometric interpretation of least squares
- Normal equations derivation
- Properties of least squares estimators
- Gauss-Markov theorem
- R-squared and adjusted R-squared
- Residual analysis
- Assumptions of linear regression
- Diagnostic plots: Q-Q, residual plots
- Outliers and influential points
- Confidence and prediction intervals for regression

Projects built:
- Linear regression from scratch
- Regression diagnostics tool
- Outlier detection system

Practice: Build 50 linear regression models

Multiple Linear Regression

Topics:
- Multiple regression model
- Matrix formulation of regression
- Partial regression coefficients
- Multicollinearity detection and handling
- Variance Inflation Factor (VIF)
- Feature selection methods
- Forward, backward, stepwise selection
- All subsets regression
- Adjusted R-squared and model selection
- AIC, BIC, Mallows' Cp
- Cross-validation for model selection
- Interaction terms and polynomial regression

Projects built:
- Multiple regression toolkit
- Feature selection system
- Model comparison framework

```
    Practice: Develop 50 multiple regression models
    Assessment: Month 7 check: fit, diagnose and defend a regression on real data

Month 8: Regularization and Classification (Weeks 29-32)
  Regularized Regression
    Topics:
      - Overfitting and bias-variance tradeoff
      - Ridge regression (L2 regularization)
      - Ridge regression geometry
      - LASSO regression (L1 regularization)
      - LASSO for feature selection
      - Elastic Net regression
      - Choosing regularization parameters
      - Cross-validation for lambda selection
      - Bayesian interpretation of regularization
      - Group LASSO
      - Adaptive LASSO
      - Applications in high-dimensional data
    Projects built:
      - Regularized regression implementation
      - Lambda tuning system
      - High-dimensional regression tool
    Practice: Apply regularization to 40 datasets
  Classification Fundamentals
    Topics:
      - Classification vs regression
      - Bayes classifier and Bayes error
      - Linear Discriminant Analysis (LDA)
      - Quadratic Discriminant Analysis (QDA)
      - Fisher's linear discriminant
      - Naive Bayes classifier
      - Gaussian Naive Bayes
      - Multinomial and Bernoulli Naive Bayes
      - K-Nearest Neighbors classification
      - Distance metrics for KNN
      - Decision boundaries visualization
      - Class imbalance problems
      - Logistic regression as a generalized linear model
    Projects built:
      - Classifier comparison framework
      - Decision boundary visualizer
      - Imbalanced data handler
    Practice: Implement 50 classification models
    Assessment: Month 8 check: a classification problem end to end, plus mixed regression
    revision

Month 9: Trees, Clusters and Honest Evaluation (Weeks 33-36)
  Tree-Based Methods
    Topics:
      - Decision trees for classification
      - Entropy and information gain
      - Gini impurity
      - Tree pruning methods
      - Cost complexity pruning
      - Random Forests algorithm
      - Out-of-bag error estimation
      - Feature importance from trees
      - Extremely Randomized Trees
      - Gradient Boosting Machines (GBM)
      - XGBoost mathematics
      - LightGBM and CatBoost
    Projects built:
      - Decision tree from scratch
      - Random Forest implementation
      - Boosting algorithm suite
    Practice: Build 40 tree-based models
  Clustering Algorithms
    Topics:
      - K-means clustering algorithm
      - K-means++ initialization
      - Elbow method and silhouette analysis
      - Hierarchical clustering
      - Agglomerative vs divisive
      - Linkage methods: single, complete, average
      - Dendrograms and cutting trees
      - DBSCAN algorithm
      - Mean Shift clustering
      - Gaussian Mixture Models (GMM)
      - EM algorithm for GMMs
```

- Spectral clustering
- Model evaluation essentials: cross-validation, metrics and the leakage trap
- Choosing models like an adult: bias, variance and the problem in front of you

Projects built:
- Clustering algorithm suite
- Cluster validation tools
- Optimal K finder

Practice: Apply clustering to 40 datasets

Assessment: Phase 3 exam: build, evaluate and defend two models on one dataset, mixed with earlier phases

---

PHASE 4: OPTIMIZATION, NEURAL NETWORKS AND MODERN PRACTICE (MONTHS 10-12, WEEKS 37-48)

The mathematics behind modern AI and modern analytics: optimization, neural networks, Bayesian methods, time series, experiments, and a defensible capstone.

Month 10: Optimization and Neural Network Mathematics (Weeks 37-40)

Optimization Theory for ML

Topics:
- Convex sets and convex functions
- Convexity in machine learning
- Gradient descent algorithm
- Learning rate selection
- Momentum and Nesterov acceleration
- AdaGrad and RMSprop
- Adam and AdamW optimizers
- Second-order methods: Newton, L-BFGS
- Stochastic gradient descent (SGD)
- Mini-batch gradient descent
- Convergence analysis
- Constrained optimization for ML

Projects built:
- Optimizer implementations
- Convergence visualizer
- Learning rate scheduler

Practice: Implement 20 optimization algorithms

Neural Network Fundamentals

Topics:
- Perceptron algorithm
- Multi-layer perceptrons
- Universal approximation theorem
- Activation functions: sigmoid, tanh, ReLU
- Forward propagation mathematics
- Backpropagation derivation
- Chain rule in neural networks
- Gradient vanishing and exploding
- Weight initialization strategies
- Xavier and He initialization
- Batch normalization mathematics
- Dropout as regularization
- Where this leads: transformers and attention, mapped honestly for the AI/ML masterclass

Projects built:
- Neural network from scratch
- Backpropagation visualizer
- Activation function explorer

Practice: Build 30 neural network architectures

Assessment: Month 10 check: gradient descent by hand on a small network, plus mixed review

Month 11: Bayesian Methods and Time Series (Weeks 41-44)

Bayesian Fundamentals

Topics:
- Bayesian vs Frequentist philosophy
- Prior distributions and their selection
- Likelihood functions
- Posterior distributions
- Conjugate priors
- Beta-Binomial model
- Normal-Normal model
- Gamma-Poisson model
- Credible intervals vs confidence intervals
- Bayesian point estimates
- MAP vs MLE estimates
- Empirical Bayes methods

Projects built:
- Bayesian inference engine
- Prior selection tool
- Posterior calculator

Practice: Solve 100 Bayesian inference problems
Time Series Analysis
Topics:
- Time series components: trend, seasonality, noise
- Stationarity and unit root tests
- Autocorrelation and partial autocorrelation
- ARIMA models
- Box-Jenkins methodology
- Seasonal ARIMA (SARIMA)
- State space models
- Kalman filtering
- Exponential smoothing methods
- Holt-Winters method
- STL decomposition
- Time series cross-validation
Projects built:
- Time series toolkit
- ARIMA model builder
- Forecast evaluator
Practice: Analyze 50 time series
Assessment: Month 11 check: one Bayesian update argued in plain language, one forecast defended

Month 12: Experiments and the Capstone (Weeks 45-48)
A/B Testing and Experimental Design
Topics:
- A/B testing fundamentals
- Statistical power in A/B tests
- Multiple testing corrections
- Sequential testing
- Bandits vs A/B tests
- Multi-armed bandits
- Thompson sampling
- Contextual bandits
- Variance reduction techniques
- CUPED method
- Stratification in experiments
- Network effects in testing
- Design of experiments: the checklist before any test ships
- Ethics and interpretability: what a responsible analyst refuses to do
Projects built:
- A/B testing platform
- Bandit algorithm suite
- Variance reduction tool
Practice: Run 40 A/B tests
Capstone and Final Exam
Topics:
- The capstone: one real dataset, one honest question, full analysis
- From exploration to inference to model to recommendation
- Writing the analysis so a skeptic cannot shake it
- Presenting quantitative work to non-quantitative people
- A full-course spiral review, exam technique included
Projects built:
- The capstone analysis: explored, modeled, tested and written up defensibly, presented to the batch
Practice: Daily mixed revision sets through the final fortnight
Assessment: FINAL EXAM: a written paper plus a practical analysis, with questions mixed from every phase. Passing earns the certificate; falling short earns a focused revision plan and a free retest

PROJECTS THE STUDENT BUILDS AND KEEPS

- Phase 1: honest descriptive reports, a misleading-charts autopsy, probability simulations
- Phase 2: a PCA on real data, full inference write-ups, a p-hacking demonstration done ethically
- Phase 3: regressions and classifiers built from first principles and defended in writing
- Phase 4: a hand-computed neural network, a Bayesian analysis, a forecast, an A/B test design, and the final capstone

Total projects: 25+ applied analyses, ending with a defensible capstone on real data

SKILLS THE STUDENT WILL HAVE AT THE END

- Statistics: description, visualization and probability, wielded honestly
- Linear algebra: vectors, matrices, eigenvalues and PCA, the language of models
- Inference: sampling, confidence intervals, hypothesis testing and its abuses
- ML mathematics: regression, regularization, classification, trees, clustering, evaluation
- Modern methods: optimization, neural network mathematics, Bayesian thinking, time series
- Experimentation: designing and reading A/B tests that mean something

- Communication: writing and defending quantitative conclusions

HOW A TYPICAL WEEK IS SPLIT

Live classes: 2 live classes per week, worked problems and real data, not slideware
Homework: A problem set after every class, and a monthly mixed review that reaches back deliberately
Practice: 4-6 hours of problem and data practice between classes
Review: Every set marked with written feedback; recurring weaknesses reopened in class

SUPPORT INCLUDED

Doubt support: WhatsApp doubt support between classes, for the derivation that will not land
Progress updates: Honest monthly progress reviews: what is solid, what is wobbly, and the plan for the wobble

CERTIFICATION DETAIL

Completion: Certificate from Modern Age Coders, awarded on passing the final exam. Fall short and there is focused revision and a free retest: the certificate certifies knowledge, not attendance

WHERE THIS CAN LEAD

- AI and Machine Learning Masterclass: deep learning practice on top of this mathematical base
- Data analyst and data science roles: this is the mathematics their interviews test
- Our Data Analysis course: the tooling counterpart (SQL, Python, dashboards) to this mathematical core
- Quantitative and experimentation roles: A/B testing and causal thinking are the daily work
- Further statistics study: Bayesian and time-series doors are opened here

EARNING POTENTIAL (share only if asked, and never promise it)

Market context: The ranges below are general market salary bands for these roles in India and abroad, drawn from public industry data. They are shown for career context only and are not a promise or guarantee of income. Actual pay depends on your skills, experience, location, and the job market.
Early career roles: Rs 8-15 LPA / $70-100k USD
Growing roles: Rs 15-30 LPA / $100-150k USD
Experienced roles: Rs 30-60 LPA / $150-250k USD; Rs 60+ LPA / $250k+ USD
Consulting: Rs 5,000-15,000/hour

COMMON QUESTIONS ABOUT THIS COURSE

For anything about cost, use PART 4 and RULE 1. Do not quote two regions.

Q: What exactly does this maths for data science course teach?
A: The mathematics data careers actually stand on, in four phases: statistics and probability that tell the truth; linear algebra through eigenvalues and PCA plus honest statistical inference; the mathematics of machine learning, regression, classification, trees, clustering and evaluation from first principles; and modern practice, optimization, neural network mathematics, Bayesian methods, time series and A/B testing, ending in a capstone analysis on real data.

Q: How long does it take to learn the maths for data science?
A: Honestly: 12 months at 2 live classes a week plus 4 to 6 hours of practice, and the course keeps 2 months of margin in hand for learners who need more repetition, up to 14 months with no penalty. Crash courses compress this into weeks by skipping the understanding; the wall they skip is exactly what interviews and real work then test.

Q: How is progress measured? Is the certificate just for attending?
A: No. Problem sets follow every class and come back with written feedback, monthly reviews deliberately mix new material with earlier topics so nothing fades, each phase ends with an exam, and the course ends with a final exam, written plus practical, that decides the certificate. Falling short earns a focused revision plan and a free retest. The certificate certifies knowledge, not attendance.

Q: Do I need to know programming or calculus already?
A: Neither. School mathematics is the entry bar; the calculus that appears is refreshed as needed, and code is used only as a calculator, spreadsheets and light Python, because the mathematics is the syllabus. Students who already code simply see the connections faster.

Q: How is this different from a data science bootcamp?
A: Bootcamps teach tools and hope the mathematics arrives by osmosis; it does not. This course is the missing layer: the statistics, linear algebra and ML mathematics that make tool skills defensible in interviews and reliable at work. The two pair well, our Data Analysis course covers the tooling side, and this course makes it mean something.

Q: Will this help me in analytics interviews and real work?

A: Directly: probability puzzles, hypothesis testing, regression interpretation, evaluation metrics and A/B test design are the exact backbone of analytics and data science interviews, and the course drills them with written defense, not just computation. At work, the payoff is judgment: knowing which analysis is honest, and being the person in the room who can say why.

Q: Does this cover deep learning and AI?
A: It covers their mathematics honestly: optimization, gradient descent and the mathematics of neural networks, computed by hand on small networks, plus a clear map of where transformers and attention sit. Full deep learning practice, building and training real models, is our AI and Machine Learning Masterclass, which assumes exactly the mathematics this course builds.

Q: Can I take a trial class?
A: Yes, a free demo class with no commitment: book at learn.modernagecoders.com/contact or message us on WhatsApp at +91 91233 66161. Bring a statistics question from your own work or study; the demo is best when it runs on your real problem. (Agent note: the free demo is a waiting list with no fixed date. The Priority Live Demo is a guaranteed class today or tomorrow, booked at https://learn.modernagecoders.com/priority-demo . Offer both, as RULE 3 says.)

Q: Are lessons live or self-paced videos?
A: Live, always: small groups where problems are worked together and your reasoning gets corrected in real time, never pre-recorded videos. Mathematical judgment is built under feedback; a video cannot tell you why your hypothesis test is invalid.

To enrol, message Shivam Sir on +91 9123366161 or send the parent this link: https://learn.modernagecoders.com/courses/data-analytics-mathematics-masterclass
For a demo: the Priority Live Demo (guaranteed, today or tomorrow) is booked at https://learn.modernagecoders.com/priority-demo . The free demo is a waiting list with no fixed date.

==========
COURSE 94 OF 137: MATHS OLYMPIAD & COMPETITION COURSE: AMC, AIME TO IMO
==========

Course link: https://learn.modernagecoders.com/courses/olympiad-competition-mathematics-mastery
Subject area: Competition Mathematics & Olympiad Training
Designed for: Elementary school, Girls only batches, High school, Middle school
Who can join: Intermediate to International Competition Level
Course length: 12-14 months (52-60 weeks)
Time needed: 2 live classes/week + 5-7 hours problem-solving
Certificate: Certificate from Modern Age Coders, awarded on passing the final exam

PRICE FOR THIS COURSE (quote only the one that applies to the person asking)
In India, per month: group Rs 1,499, mini batch Rs 2,999, one to one Rs 4,999
In Canada, per month: group CAD 140, one to one CAD 210
Anywhere else, per month: group $100, one to one $150
Classes: group and mini batch two live classes a week, eight a month; one to one in India one live class a week, four a month; one to one outside India two live classes a week, eight a month. Each class is one hour.

WHAT THIS COURSE IS

One-year maths olympiad course: master number theory, combinatorics, algebra, geometry and inequalities, with problem-solving craft for AMC, AIME and IMO.

In one line: From Regional Contests to International Mathematical Olympiad

ABOUT THE PROGRAMME

This intensive program transforms talented mathematics students into competition champions. Designed for students aiming to excel in mathematical olympiads and competitions at all levels - from AMC to IMO. You'll master advanced problem-solving techniques, develop mathematical intuition, and learn to tackle the most challenging competition problems. Through systematic training in number theory, combinatorics, algebra, geometry, and more, you'll build the skills needed to compete at the highest levels. By completion, you'll have solved thousands of competition problems and be ready for any mathematical challenge.

WHAT MAKES THIS COURSE DIFFERENT

- Comprehensive coverage of all olympiad topics
- Progressive difficulty from AMC 8 to IMO level
- 1000+ carefully selected competition problems
- Strategies from past olympiad medalists
- Mock competitions and timed practice
- Proof writing and rigorous mathematics
- International competition exposure
- Personal coaching and problem discussions

THE LEARNING PATH, STEP BY STEP

  Phase 1: Foundation (Months 1-3): Competition Basics, Number Theory, Elementary Combinatorics
  Phase 2: Intermediate (Months 4-6): Advanced Algebra, Polynomial Theory, Sequences and Series
  Phase 3: Advanced (Months 7-9): Competition Geometry, Trigonometry, Coordinate Methods
  Phase 4: Master Level (Months 10-12): Inequalities, Functional Equations, IMO Preparation

WHAT A STUDENT NEEDS BEFORE STARTING

  Education: Strong foundation in school mathematics
  Coding experience: Basic algebra and geometry knowledge required
  Equipment: Computer with internet, graphing calculator, geometry tools
  Time commitment: 2 live classes plus 5 to 7 hours of problem-solving a week (olympiad
    training rewards more practice)
  English: Advanced mathematical reading ability
  Motivation: Passionate about mathematical problem solving

WHO THIS COURSE IS FOR

  Students: High school students aiming for olympiads
  Working professionals: Mathematics teachers and coaches
  Entrepreneurs: Competition preparation centers
  Freelancers: Private olympiad tutors
  Kids: Gifted middle school students
  Anyone: Anyone passionate about competition mathematics

FULL CURRICULUM, WEEK BY WEEK

  This is the complete teaching plan. Parents can ask about any week.

  PHASE 1: COMPETITION FUNDAMENTALS AND NUMBER THEORY (WEEKS 1-13)

  Build strong foundations in competition problem-solving, master number theory, and develop
  combinatorial thinking.

    Months 1-2: Competition Mathematics Basics & Number Theory (Weeks 1-8)
      Introduction to Competition Mathematics
        Topics:
          - Competition mathematics vs school mathematics
          - Major competitions overview: AMC, AIME, USAMO, IMO
          - Competition formats and scoring systems
          - Problem-solving strategies: working backwards
          - Pattern recognition and generalization
          - Extreme cases and boundary testing
          - Proof by contradiction
          - Proof by induction basics
          - Direct proof techniques
          - Constructive vs non-constructive proofs
          - Mathematical notation for competitions
          - Time management in competitions
        Projects built:
          - Solve 50 AMC 8 problems
          - Create problem-solving strategy guide
          - Analyze past competition papers
        Practice: Daily: 5 competition problems with increasing difficulty
      Divisibility and Prime Numbers
        Topics:
          - Advanced divisibility rules and proofs
          - GCD and LCM properties and algorithms
          - Euclidean algorithm and extended version
          - Bezout's identity and applications
          - Prime factorization uniqueness theorem
          - Distribution of primes
          - Sieve of Eratosthenes variations
          - Prime number theorem introduction
          - Fermat's Little Theorem
          - Wilson's Theorem
          - Prime testing algorithms
          - Applications in cryptography basics
        Projects built:
          - Implement prime generation algorithms
          - Solve 30 number theory competition problems
          - Create divisibility proof portfolio
        Practice: Master 40 divisibility and prime problems from competitions
      Modular Arithmetic
        Topics:
          - Modular arithmetic operations and properties
          - Congruence classes and equivalence

- Linear congruences and solutions
- Chinese Remainder Theorem
- Modular multiplicative inverse
- Euler's totient function ϕ(n)
- Euler's theorem and generalizations
- Quadratic residues introduction
- Legendre symbol
- Power patterns in modular arithmetic
- Solving Diophantine equations
- Applications to competition problems

Projects built:
- Modular arithmetic problem set
- CRT application problems
- Create modular arithmetic reference guide

Practice: Solve 50 modular arithmetic competition problems

Advanced Number Theory

Topics:
- Perfect numbers and Mersenne primes
- Arithmetic functions: σ(n), τ(n), μ(n)
- Multiplicative functions
- Mobius inversion formula
- Continued fractions basics
- Pell's equation
- Quadratic reciprocity introduction
- Sum of squares theorems
- Lifting the Exponent Lemma (LTE)
- Zsigmondy's theorem
- Carmichael's lambda function
- Advanced competition techniques

Projects built:
- Advanced number theory problem collection
- Historical theorems exploration
- IMO number theory problems analysis

Practice: 30 advanced number theory problems from national olympiads

Month 3: Combinatorics Fundamentals (Weeks 9-13)

Counting Principles and Techniques

Topics:
- Advanced counting principles
- Multiplication and addition principles
- Permutations with restrictions
- Circular permutations and necklaces
- Combinations with repetition
- Stars and bars method
- Inclusion-Exclusion Principle
- Derangements and subfactorial
- Stirling numbers of both kinds
- Partition function introduction
- Generating functions basics
- Recurrence relations

Projects built:
- Combinatorial identity proofs
- Counting problems compilation
- Create combinatorics formula sheet

Practice: Solve 40 counting problems from competitions

Graph Theory Basics

Topics:
- Graph definitions and terminology
- Types of graphs: complete, bipartite, planar
- Degree sequences and handshaking lemma
- Trees and forest properties
- Eulerian paths and circuits
- Hamiltonian paths and cycles
- Graph coloring and chromatic number
- Planar graphs and Euler's formula
- Bipartite matching basics
- Hall's marriage theorem
- Tournament graphs
- Competition graph problems

Projects built:
- Graph theory problem solving guide
- Visualization of graph algorithms
- Competition graph problems collection

Practice: Master 35 graph theory competition problems

Phase 1 Review and Competition

Topics:
- Number theory comprehensive review
- Modular arithmetic mastery check
- Combinatorics problem-solving strategies

- Graph theory applications
- Mixed problem sets
- Speed solving techniques
- Competition simulation

Projects built:
- Create Phase 1 solution manual
- Mock AMC 10 competition
- Peer problem exchange and solving

Assessment: Phase 1 cumulative exam: a written paper mixing this phase with everything before it, plus targeted revision for anything shaky

---

PHASE 2: ADVANCED ALGEBRA AND POLYNOMIAL THEORY (WEEKS 14-26)

Master algebraic manipulations, polynomial theory, sequences, and functional equations for competitions.

Months 4-5: Competition Algebra & Polynomials (Weeks 14-21)

Advanced Algebraic Techniques

Topics:
- Algebraic manipulation mastery
- Telescoping sums and products
- Partial fractions in competitions
- Symmetric expressions and polynomials
- Vieta's formulas and applications
- Newton's identities
- Power sum symmetric functions
- Discriminant and its properties
- Algebraic substitutions techniques
- Rationalizing complex expressions
- Nested radicals simplification
- Competition algebraic tricks

Projects built:
- Algebraic techniques handbook
- Solve 50 AIME algebra problems
- Create substitution strategy guide

Practice: Daily: 8 advanced algebra competition problems

Polynomial Theory

Topics:
- Polynomial division and remainder theorem
- Factor theorem and applications
- Rational root theorem extensions
- Descartes' rule of signs
- Complex roots and conjugate pairs
- Fundamental theorem of algebra
- Polynomial interpolation (Lagrange)
- Chebyshev polynomials introduction
- Cyclotomic polynomials
- Irreducibility testing
- Polynomial inequalities
- Roots and coefficients relationships

Projects built:
- Polynomial problem solving manual
- Root-finding techniques compilation
- IMO polynomial problems analysis

Practice: 45 polynomial problems from national olympiads

Sequences and Series

Topics:
- Arithmetic and geometric progressions advanced
- Arithmetico-geometric progressions
- Harmonic progressions and means
- Recursive sequences and linear recurrences
- Characteristic equations method
- Generating functions for sequences
- Fibonacci and Lucas sequences properties
- Catalan numbers and applications
- Convergence tests for series
- Telescoping series mastery
- Power series basics
- Competition sequence problems

Projects built:
- Sequence encyclopedia creation
- Recurrence relation solver
- Famous sequences investigation

Practice: Solve 40 sequence and series competition problems

Equations and Systems

Topics:
- Systems of linear equations (advanced)
- Nonlinear systems solving techniques

- Symmetric systems of equations
- Cyclic systems
- Homogeneous equations
- Parametric solutions
- Diophantine equations (advanced)
- Quadratic Diophantine equations
- Simon's Favorite Factoring Trick
- Equations with absolute values
- Floor and ceiling function equations
- Competition equation strategies

Projects built:

- Equation solving techniques manual
- Diophantine equation collection
- System solving flowchart

Practice: Master 50 competition equation problems

Complex Numbers in Competitions

Topics:

- Complex number operations review
- Geometric interpretation of complex operations
- De Moivre's theorem and applications
- Roots of unity and cyclotomic polynomials
- Complex number proofs in geometry
- Trigonometric identities via complex numbers
- Gaussian integers
- Complex conjugate root theorem
- Argument and modulus inequalities
- Competition problems using complex numbers
- Euler's formula applications
- Advanced complex number techniques

Projects built:

- Complex numbers in geometry guide
- Roots of unity problem set
- Complex number competition tricks

Practice: 30 complex number competition problems

Month 6: Functional Equations & Advanced Topics (Weeks 22-26)

Functional Equations

Topics:

- Introduction to functional equations
- Cauchy's functional equations
- Substitution methods in functional equations
- Finding solutions: injectivity, surjectivity
- Additive and multiplicative functions
- Jensen's functional equation
- D'Alembert's functional equation
- Polynomial functional equations
- Functional equations with multiple variables
- Cyclic functional equations
- IMO functional equation techniques
- Common competition patterns

Projects built:

- Functional equation solving guide
- Pattern recognition in functional equations
- IMO functional equations compilation

Practice: Solve 35 functional equation problems

Mathematical Induction Advanced

Topics:

- Strong induction principles
- Structural induction
- Double induction
- Infinite descent method
- Well-ordering principle applications
- Induction with inequalities
- Induction in number theory
- Induction in combinatorics
- Induction for sequences
- Forward-backward induction
- Transfinite induction introduction
- Competition induction strategies

Projects built:

- Induction proof portfolio
- Induction techniques classification
- Create induction problem bank

Practice: Complete 40 induction problems of varying difficulty

Pigeonhole Principle & Extremal Problems

Topics:

- Pigeonhole principle variations
- Generalized pigeonhole principle
- Infinite pigeonhole principle

- Probabilistic pigeonhole principle
- Dirichlet's theorem applications
- Extremal principle in problem solving
- Optimization in discrete mathematics
- Erdős-Ko-Rado theorem introduction
- Ramsey theory basics
- Van der Waerden's theorem introduction
- Extremal graph theory
- Competition applications

Projects built:
- Pigeonhole principle masterclass
- Extremal problems collection
- Ramsey theory exploration

Practice: 30 pigeonhole and extremal problems

Invariants and Monovariants

Topics:
- Invariant principle in problem solving
- Finding invariants in processes
- Monovariant strategies
- Parity as an invariant
- Coloring arguments
- Sum and product invariants
- Geometric invariants
- Game theory and invariants
- Invariants in combinatorial games
- Semi-invariants
- Competition invariant problems
- Creating invariant arguments

Projects built:
- Invariant problem solving guide
- Game theory invariants study
- Invariant problem creation

Practice: Master 35 invariant-based problems

Phase 2 Review and Competition

Topics:
- Algebra and polynomials review
- Sequences and series mastery
- Functional equations practice
- Complex numbers applications
- Induction and extremal principles
- Mixed advanced problems
- AIME simulation

Projects built:
- Phase 2 complete solution manual
- Mock AIME competition
- Problem-solving video tutorials

Assessment: Phase 2 cumulative exam: a written paper mixing this phase with everything before it, plus targeted revision for anything shaky

---

PHASE 3: COMPETITION GEOMETRY AND TRIGONOMETRY (WEEKS 27-39)

Master advanced geometric techniques, trigonometric identities, and coordinate geometry for olympiad success.

Months 7-8: Euclidean Geometry & Triangle Theory (Weeks 27-34)

Advanced Triangle Geometry

Topics:
- Cevians: medians, altitudes, angle bisectors
- Special points: centroid, orthocenter, incenter, circumcenter
- Euler line and nine-point circle
- Nagel point and Gergonne point
- Stewart's theorem and applications
- Menelaus' theorem
- Ceva's theorem and trigonometric form
- Mass point geometry
- Barycentric coordinates introduction
- Triangle inequality variations
- Routh's theorem
- Competition triangle problems

Projects built:
- Triangle centers encyclopedia
- Special points construction guide
- Triangle theorem proof collection

Practice: Solve 45 advanced triangle problems

Circle Geometry

Topics:
- Power of a point theorem
- Radical axis and radical center

```
      - Coaxial circles
      - Inversion in circles
      - Ptolemy's theorem and inequality
      - Cyclic quadrilaterals properties
      - Simson line and pedal triangles
      - Miquel's theorem
      - Pascal's theorem for circles
      - Brianchon's theorem
      - Nine-point circle properties
      - Competition circle techniques
    Projects built:
      - Circle theorems visual guide
      - Inversion problem solving
      - Cyclic quadrilateral mastery
    Practice: Master 40 circle geometry problems
  Similarity and Homothety
    Topics:
      - Advanced similarity principles
      - Spiral similarities
      - Homothety and homothetic centers
      - Similar triangles in competitions
      - Angle bisector theorem extensions
      - Apollonius' theorem
      - Harmonic division and conjugates
      - Cross-ratio and applications
      - Desargues' theorem
      - Monge's theorem
      - Homothety in circle problems
      - Competition applications
    Projects built:
      - Similarity techniques manual
      - Homothety problem collection
      - Projective geometry introduction
    Practice: Complete 35 similarity and homothety problems
  Geometric Transformations
    Topics:
      - Reflection properties and compositions
      - Rotation compositions and fixed points
      - Translation vectors and compositions
      - Glide reflections
      - Isometries classification
      - Dilation and scaling transformations
      - Affine transformations
      - Transformation approach to problems
      - Symmetry in problem solving
      - Spiral similarities revisited
      - Complex numbers for transformations
      - Competition transformation techniques
    Projects built:
      - Transformation problem solving guide
      - Symmetry exploitation techniques
      - Transformation composition calculator
    Practice: Solve 40 transformation-based problems
  Construction Problems
    Topics:
      - Classical constructions review
      - Constructible numbers theory
      - Impossible constructions and proofs
      - Mohr-Mascheroni constructions
      - Poncelet-Steiner constructions
      - Construction strategies in competitions
      - Locus problems
      - Construction with restrictions
      - Geometric optimization constructions
      - Construction existence proofs
      - Competition construction problems
      - Software-aided exploration
    Projects built:
      - Construction problem anthology
      - Impossible constructions proofs
      - Interactive construction tool
    Practice: Complete 30 construction problems

Month 9: Trigonometry & Coordinate Geometry (Weeks 35-39)
  Advanced Trigonometry
    Topics:
      - Trigonometric identities mastery
      - Sum-to-product and product-to-sum formulas
      - Multiple angle formulas
```

    - Half-angle formulas applications
    - Conditional identities
    - Trigonometric equations (advanced)
    - Trigonometric inequalities
    - Jensen's inequality for trigonometry
    - Chebyshev polynomials and trigonometry
    - Trigonometric substitutions
    - Competition trigonometry tricks
    - Proofs using trigonometry
  Projects built:
    - Trigonometric identity encyclopedia
    - Competition trigonometry handbook
    - Trigonometric proof portfolio
  Practice: Master 40 trigonometry competition problems
Analytic Geometry
  Topics:
    - Coordinate geometry strategies
    - Distance and section formulas
    - Area calculations in coordinates
    - Line equations and properties
    - Angle between lines
    - Conic sections: parabola, ellipse, hyperbola
    - Parametric representations
    - Polar coordinates applications
    - Coordinate transformations
    - Analytic proofs of geometric theorems
    - Optimization using coordinates
    - Competition coordinate techniques
  Projects built:
    - Coordinate geometry solver
    - Conic sections problem set
    - Analytic vs synthetic comparison
  Practice: Solve 35 coordinate geometry problems
Vectors in Geometry
  Topics:
    - Vector operations and properties
    - Dot product and cross product
    - Vector proofs of geometric theorems
    - Position vectors and applications
    - Vector equations of lines and planes
    - Distance using vectors
    - Angle calculations with vectors
    - Vector approach to transformations
    - Centroid and circumcenter via vectors
    - 3D geometry basics
    - Competition vector techniques
    - Vectors vs coordinates comparison
  Projects built:
    - Vector geometry manual
    - 3D geometry exploration
    - Vector solution compilation
  Practice: Complete 30 vector geometry problems
Area and Volume Methods
  Topics:
    - Area calculation techniques
    - Shoelace formula and applications
    - Pick's theorem
    - Heron's formula and extensions
    - Bretschneider's formula
    - Brahmagupta's formula
    - Volume calculation methods
    - Cavalieri's principle
    - Volume by cross-sections
    - Surface area calculations
    - Pappus's centroid theorems
    - Competition area/volume tricks
  Projects built:
    - Area formula compendium
    - Volume calculation guide
    - Historical formula exploration
  Practice: Master 35 area and volume problems
Phase 3 Review and Competition
  Topics:
    - Euclidean geometry mastery review
    - Circle theorems compilation
    - Transformation techniques
    - Trigonometry applications
    - Coordinate methods review
    - Vector approaches

- Mixed geometry problems
- USAMO geometry preparation

Projects built:
- Geometry techniques comparison chart
- Mock USAMO geometry round
- Geometry problem video solutions

Assessment: Phase 3 cumulative exam: a written paper mixing this phase with everything before it, plus targeted revision for anything shaky

---

PHASE 4: INEQUALITIES, OLYMPIAD PRACTICE AND FINAL REVISION (WEEKS 40-52)

Master inequalities, advanced problem-solving techniques, and prepare for international competitions.

Month 10: Inequalities & Optimization (Weeks 40-44)

Classical Inequalities

Topics:
- AM-GM inequality and applications
- Cauchy-Schwarz inequality proofs and uses
- Holder's inequality
- Minkowski's inequality
- Power mean inequalities
- Weighted AM-GM inequality
- Jensen's inequality for convex functions
- Karamata's inequality
- Rearrangement inequality
- Chebyshev's inequality
- Bernoulli's inequality
- Competition inequality techniques

Projects built:
- Inequality proof techniques guide
- Classical inequality applications
- Inequality chain constructions

Practice: Prove 50 competition inequalities

Advanced Inequality Techniques

Topics:
- Smoothing and majorization
- Mixing variables technique
- Lagrange multipliers introduction
- Homogenization techniques
- Substitutions in inequalities
- Cyclic and symmetric inequalities
- Buffalo Way method
- SOS (Sum of Squares) method
- Schur's inequality and generalizations
- Muirhead's inequality
- Newton's inequalities
- IMO inequality strategies

Projects built:
- Advanced inequality manual
- SOS method implementation
- IMO inequalities analysis

Practice: Master 40 advanced inequality problems

Optimization Problems

Topics:
- Discrete optimization techniques
- Continuous optimization basics
- Calculus in olympiad problems
- Derivatives for optimization
- Constrained optimization
- Geometric optimization problems
- Isoperimetric problems
- Algebraic optimization
- Combinatorial optimization
- Game theory optimization
- Dynamic programming introduction
- Competition optimization strategies

Projects built:
- Optimization techniques handbook
- Geometric optimization collection
- Create optimization problem set

Practice: Solve 35 optimization problems

Advanced Combinatorics

Topics:
- Bijective proofs and counting
- Double counting techniques
- Combinatorial identities (advanced)
- Vandermonde's identity applications

- Catalan number applications
- Bell numbers and Stirling numbers
- Integer partitions
- Young tableaux introduction
- Polya enumeration theorem
- Combinatorial game theory
- Probabilistic methods
- Competition combinatorics mastery

Projects built:

- Combinatorial proof anthology
- Counting techniques flowchart
- Game theory analysis

Practice: Complete 40 advanced combinatorics problems

Advanced Number Theory Topics

Topics:

- Quadratic reciprocity (complete)
- Primitive roots and indices
- Quadratic forms basics
- Continued fractions (advanced)
- Transcendental numbers introduction
- p-adic numbers introduction
- Analytic number theory glimpse
- Additive number theory basics
- Beatty sequences
- Thue's lemma
- Advanced Diophantine equations
- IMO number theory trends

Projects built:

- Advanced number theory compendium
- Historical problems exploration
- Number theory research topics

Practice: Tackle 30 research-level number theory problems

Month 11: Problem-Solving Mastery & Competition Strategy (Weeks 45-48)

IMO Problem Analysis

Topics:

- IMO problem structure and trends
- Problem 1 and 4 strategies (easier problems)
- Problem 2 and 5 strategies (medium problems)
- Problem 3 and 6 strategies (hardest problems)
- Time management for 4.5-hour exams
- Partial credit maximization
- Problem selection strategies
- Writing rigorous proofs
- Common IMO problem patterns
- Historical IMO problems analysis
- National olympiad comparison
- Training camp preparation

Projects built:

- IMO problems by topic classification
- Personal IMO strategy development
- Mock IMO with analysis

Practice: Solve 20 past IMO problems

Putnam Competition Preparation

Topics:

- Putnam exam format and scoring
- Putnam problem characteristics
- Abstract algebra in Putnam
- Real analysis topics
- Linear algebra applications
- Probability in Putnam problems
- Putnam trick techniques
- Time management for Putnam
- A vs B session strategies
- Historical Putnam analysis
- University-level competition transition
- Research mathematics introduction

Projects built:

- Putnam problem collection by topic
- University math preview
- Putnam simulation exam

Practice: Complete 30 Putnam problems

Asian Pacific Mathematics Olympiad

Topics:

- APMO problem characteristics
- Regional competition differences
- APMO vs IMO difficulty comparison
- Cultural problem-solving approaches
- APMO-specific techniques

- Time zone competition strategies
- Online competition protocols
- APMO historical trends
- Country-specific olympiad styles
- International collaboration benefits
- APMO as IMO preparation
- Regional olympiad circuit

Projects built:
- APMO complete solutions manual
- Regional olympiad comparison study
- APMO mock competition

Practice: Solve 25 APMO problems from past years

Competition Psychology & Peak Performance

Topics:
- Mental preparation for competitions
- Stress management techniques
- Visualization and positive thinking
- Competition day routines
- Dealing with difficult problems
- Recovery from mistakes
- Time pressure management
- Building mathematical confidence
- Team competition strategies
- Learning from competition failures
- Post-competition analysis
- Long-term training mindset

Projects built:
- Personal competition preparation guide
- Competition journal and reflection
- Mental training program design

Practice: Implement mental training with timed problem sets

Month 12: Mock Competitions & Final Preparation (Weeks 49-50)

National Olympiad Simulations

Topics:
- USAMO complete simulation
- USAJMO preparation strategies
- Canadian Mathematical Olympiad
- British Mathematical Olympiad
- Australian Mathematics Olympiad
- Indian National MO preparation
- China National Team Selection
- Russia Mathematical Olympiad
- Time management across formats
- Scoring system understanding
- Selection criteria for teams
- National camp preparation

Projects built:
- Complete 5 national olympiad mocks
- Cross-country problem comparison
- National team selection guide

Practice: One full national olympiad daily

International Competition Week

Topics:
- IMO Day 1 simulation (4.5 hours)
- IMO Day 2 simulation (4.5 hours)
- Complete solution writing
- Proof verification techniques
- Collaboration after competition
- Score prediction and analysis
- International competition etiquette
- Cultural exchange benefits
- Language considerations
- Travel and preparation logistics
- Team dynamics
- Medal boundaries analysis

Projects built:
- Complete IMO simulation with scoring
- Solution comparison international students
- Competition reflection essay

Practice: Full IMO mock over two days

Month 13: Final Assessments & Future Planning (Weeks 51-52)

Comprehensive Review & Mastery

Topics:
- Number theory complete review
- Combinatorics mastery assessment
- Algebra and polynomials review
- Geometry techniques compilation

- Inequality mastery check
- Functional equations review
- Problem-solving strategies synthesis
- Proof writing excellence
- Speed and accuracy balance
- Knowledge gap identification
- Personal strength analysis
- Improvement planning

Projects built:
- Complete technique reference manual
- Personal problem-solving guide
- Video solution library creation

Final Competition Series

Topics:
- AMC 12 simulation
- AIME simulation
- USAMO simulation Day 1
- USAMO simulation Day 2
- IMO simulation Day 1
- IMO simulation Day 2
- Score analysis and prediction
- Performance evaluation
- Peer competition and ranking
- Solution presentation
- Awards and recognition
- Competition portfolio completion

Deliverables:
- Complete competition portfolio
- All mock competition scores
- Solution manual for all attempts
- Performance analysis report
- Technique mastery certification
- Problem-solving speed metrics

Assessment: FINAL EXAM: a comprehensive written paper covering every phase of the course. Passing earns the certificate; falling short earns a focused revision plan and a free retest

PROJECTS THE STUDENT BUILDS AND KEEPS

- Phase 1: AMC Training Manual, Number Theory Proofs, Combinatorics Guide, Mock Competitions
- Phase 2: AIME Preparation Kit, Polynomial Mastery, Functional Equations Solver, Complex Numbers Toolkit
- Phase 3: Geometry Compendium, Trigonometry Manual, Construction Problems, Vector Methods Guide
- Phase 4: Inequality Bible, IMO Solutions Archive, Competition Strategy Guide, Research Paper
- Final: Complete Olympiad Preparation System, Original Problem Collection, Teaching Materials

Total projects: 75+ mathematical projects and problem collections

SKILLS THE STUDENT WILL HAVE AT THE END

- Number Theory: Modular arithmetic, Diophantine equations, prime theory, quadratic reciprocity
- Combinatorics: Advanced counting, graph theory, generating functions, probabilistic method
- Algebra: Polynomials, functional equations, complex numbers, inequalities, optimization
- Geometry: Euclidean geometry, transformations, coordinate methods, construction problems
- Proof Techniques: Induction, contradiction, pigeonhole, invariants, extremal principle
- Inequalities: Classical inequalities, SOS method, smoothing, Lagrange multipliers
- Problem Solving: Pattern recognition, case analysis, working backwards, generalization
- Competition Skills: Time management, partial credit, proof writing, score optimization
- Advanced Topics: Generating functions, game theory, research mathematics introduction
- Mental Skills: Competition psychology, stress management, peak performance
- Mathematical Writing: Rigorous proofs, LaTeX, problem creation, solution exposition
- International Competitions: IMO, APMO, Putnam, national olympiads preparation

HOW A TYPICAL WEEK IS SPLIT

Live classes: 2 live one-hour classes per week with a real teacher, working problems together
Homework: A problem set after every class, and a mixed-review assignment at the end of every month that deliberately folds in earlier topics
Practice: 3-5 hours of problem-solving between classes
Review: Every set reviewed with written feedback; recurring mistakes reopened in class until they are gone

SUPPORT INCLUDED

Doubt support: WhatsApp doubt support between classes
Progress updates: Honest monthly progress reviews: which topics are solid, which are wobbly, and the plan for the wobble

CERTIFICATION DETAIL

Completion: Certificate from Modern Age Coders, awarded on passing the final exam. Fall short and there is focused revision and a free retest: the certificate certifies mastery, not attendance

WHERE THIS CAN LEAD

- International Mathematical Olympiad Participant
- National Olympiad Team Member
- University Mathematics Major
- Mathematics Research Career
- Quantitative Finance Analyst
- Data Science and Machine Learning
- Cryptography and Security
- Academic Mathematics Professor
- Competition Mathematics Coach
- Mathematical Content Creator

COMMON QUESTIONS ABOUT THIS COURSE

For anything about cost, use PART 4 and RULE 1. Do not quote two regions.

Q: What does the olympiad mathematics program cover?
A: The 12 month curriculum works through the four classical olympiad pillars: number theory and combinatorics, competition algebra with polynomials and functional equations, Euclidean and coordinate geometry with trigonometry, and inequalities with advanced problem solving strategy, ending in mock competitions. The goal is genuine problem solving depth, not memorized tricks.

Q: Which competitions does this prepare students for?
A: The training maps to the Indian olympiad pipeline, IOQM leading toward RMO and INMO, plus NMTC and SOF style olympiads, and the same material serves AMC and AIME aspirants since the topic areas overlap heavily. We prepare students honestly for the level they are at, and we never promise medals or ranks, because no honest program can.

Q: Is my child ready for this course?
A: It suits students with a strong grasp of school mathematics who enjoy hard problems, typically from middle school upward. It is not designed for closing school level gaps; students who need foundations first are better served by our school mathematics programs and can graduate into this one.

Q: What are the prerequisites?
A: Solid school algebra and geometry, care in reading mathematical statements, and a genuine appetite for problems that take longer than five minutes. Competition maths rewards consistent weekly practice more than raw talent, so expect a serious commitment.

Q: How is progress measured in competition maths?
A: Through weekly problem sets at calibrated difficulty, a personal problem log tracking which techniques are secure, and regular timed mock papers in the final months. Progress here looks like solving harder problems more independently, and the log makes that visible.

Q: How is my child assessed, and is the certificate just for attending?
A: No. A problem set follows every class with written feedback, monthly reviews deliberately mix new material with earlier topics so nothing is forgotten, each phase ends with a cumulative exam, and the course ends with a final exam covering the whole syllabus. Passing earns the certificate; falling short earns focused revision and a free retest. We measure understanding, not attendance.

Q: Can we try a session first?
A: Yes, book a free demo class at learn.modernagecoders.com/contact with no commitment; we use it to gauge your child's current problem solving level and to recommend honestly whether this course or a foundations course fits better. WhatsApp +91 91233 66161 for quick questions. (Agent note: the free demo is a waiting list with no fixed date. The Priority Live Demo is a guaranteed class today or tomorrow, booked at https://learn.modernagecoders.com/priority-demo . Offer both, as RULE 3 says.)

Q: What is the class format?
A: Live one hour online classes with a real teacher in deliberately small groups, never recorded lectures. Students present their attempts and the mentor works the reasoning with them, which is the only way competition thinking actually develops.

Q: Is there a certificate, and what else does my child take away?
A: Yes, an Olympiad Mathematics Excellence Certificate on completion, plus the more valuable artifact: a documented problem portfolio and mock paper record showing the level reached. That evidence outlasts any single contest result.

To enrol, message Shivam Sir on +91 9123366161 or send the parent this link: https://learn.modernagecoders.com/courses/olympiad-competition-mathematics-mastery

For a demo: the Priority Live Demo (guaranteed, today or tomorrow) is booked at https://learn.modernagecoders.com/priority-demo . The free demo is a waiting list with no fixed date.

==========

COURSE 95 OF 137: MATHS THROUGH CODING: LEARN MATH IN PYTHON (AGES 10-15)

==========

Course link: https://learn.modernagecoders.com/courses/maths-through-coding
Subject area: Mathematics & Creative Technology
Designed for: Middle school
Who can join: Ages 10-15 (grades 5-10); no coding experience required
Course length: 9 months (36 weeks)
Time needed: 2 live one-hour classes per week + one small build between classes
Certificate: Certificate from Modern Age Coders, awarded on passing the final assessment

PRICE FOR THIS COURSE (quote only the one that applies to the person asking)
In India, per month: group Rs 1,499, mini batch Rs 2,999, one to one Rs 4,999
In Canada, per month: group CAD 140, one to one CAD 210
Anywhere else, per month: group $100, one to one $150
Classes: group and mini batch two live classes a week, eight a month; one to one in India one live class a week, four a month; one to one outside India two live classes a week, eight a month. Each class is one hour.

WHAT THIS COURSE IS

Live course where kids ages 10-15 learn maths by coding it: fractions, algebra, geometry and probability built as Python projects. Small live batches or 1-on-1, free demo.

In one line: If you can build it, you understand it. Students build the maths.

ABOUT THE PROGRAMME

A 9-month live course teaching mathematics the way our whole school believes it should be met: by building it. Students write Python programs that ARE the maths, a fraction simplifier that forces understanding of GCD, turtle geometry that makes angles visceral, probability simulators that settle arguments with ten thousand dice rolls, and function grapher projects that turn algebra into something you can watch. This is the signature Modern Age Coders fusion, taught by mentors genuinely fluent in both subjects, and for Ontario families, it happens to cover the coding expectations now examined inside math class from Grade 1. No prior coding needed; the mathematics runs roughly grades 5-9 territory with stretch room.

WHAT MAKES THIS COURSE DIFFERENT

- The maths is the syllabus, the code is the method: every program exists to force a mathematical idea into the open
- A computer rejects vague understanding, code that half-understands fractions simply does not run, which makes debugging a mathematics lesson
- Mentors fluent in both subjects, because a coding teacher who waves at the maths (or vice versa) breaks the whole idea
- Real Python from week one, at a pace built for ages 10-15
- Every topic ends with a working artifact the student built and can demo
- Directly serves Ontario's coding-in-math strand, and the computational-thinking push in curricula worldwide
- The engagement answer for the child who says maths is boring but plays with code for hours, or the reverse
- One dedicated mentor, one full interactive hour, twice a week

THE LEARNING PATH, STEP BY STEP

Phase 1: Numbers as programs: Python foundations through arithmetic, divisibility, fractions and number patterns
Phase 2: Shape and change: turtle geometry, coordinates, and algebra brought alive through variables, functions and graphing
Phase 3: Chance and data: probability simulators, statistics on real datasets, and a capstone project of the student's own design

WHAT A STUDENT NEEDS BEFORE STARTING

Education: Ages 10-15 (roughly grades 5-10)
Math background: Comfortable whole-number arithmetic; everything else is built inside the course
Coding experience: None required, Python taught from zero
Equipment: Computer with stable internet; free tools only (no purchases)
English: Course taught in English
Motivation: Curiosity about either half, maths or code, is enough; the course supplies the other

WHO THIS COURSE IS FOR

Bored by worksheets: The child who says maths is boring but builds in Minecraft for hours
Maths lovers: The child who loves maths and deserves the best maths toy ever made
Ontario families: Families facing coding-inside-math curriculum expectations with nobody home fluent in both
Understanding seekers: Students who pass tests but want (or need) the ideas to actually make sense
Future builders: Kids headed for our programming tracks who want the mathematical spine first

FULL CURRICULUM, WEEK BY WEEK

This is the complete teaching plan. Parents can ask about any week.

PHASE 1: NUMBERS AS PROGRAMS (MONTHS 1-3)

Python foundations learned through number theory a student can touch: parity, divisibility, primes, factors and fractions. By phase end the student programs comfortably and, the real goal, has met arithmetic ideas so concretely they can never again be mysterious.

Month 1: First Programs, First Number Ideas (Weeks 1-4)

Hello Python: Editor, Print and Variables

Topics:
- Setting up and using the Python editor
- The print function
- Variables and naming
- Numbers and text as data
- A diagnostic of maths comfort
- A diagnostic of machine comfort

Projects built:
- Write a Python script that prints a personalised greeting built from variables

Practice: Write and run a short program that stores your name and age in variables and prints a sentence.

Detail: Hello, Python: the editor, print, variables, and a diagnostic of both maths comfort and machine comfort

Arithmetic Operators and Order of Operations

Topics:
- Addition, subtraction, multiplication and division operators
- Order of operations in code
- Brackets to control evaluation
- Integer versus decimal results
- Matching code grammar to maths grammar
- Predicting an expression before running it

Projects built:
- Write a Python calculator that evaluates a multi-step expression and prints the result

Practice: Predict the value of several mixed-operator expressions, then check each by running it.

Detail: Arithmetic operators and order of operations: the computer obeys the same grammar your maths teacher does

Integer Division, Remainders and Modulo

Topics:
- Integer division
- The modulo operator
- Modulo as a parity machine
- Even and odd detectors
- Cycle and repeating patterns with modulo
- The clock-arithmetic idea

Projects built:
- Write a Python script that labels every number from 1 to 50 as even or odd using modulo

Practice: Use modulo to test a list of numbers for even or odd and describe the pattern you see.

Detail: Integer division and remainders: modulo as the parity machine, even/odd detectors and cycle patterns

Conditionals and Divisibility Rules

Topics:
- if, elif and else
- Comparison operators
- Coding divisibility tests
- Explaining divisibility rules backwards
- Combining conditions
- Reading a program's branches

Projects built:
- Write a Python program that reports which of 2, 3, 5 and 10 a number is divisible by

Practice: Code a divisibility checker for 2, 3 and 5 and explain in your own words why each rule works.

Detail: Conditionals with number tests: divisibility rules coded and then explained backwards

Month 2: Loops Meet Number Theory (Weeks 5-8)

```
    Loops and Times-Table Patterns
      Topics:
        - for loops and range
        - Loops as purposeful repetition
        - Generating times tables
        - Hunting patterns inside the tables
        - Explaining the patterns found
        - The nested-loop idea introduced
      Projects built:
        - Write a Python script that visualises a times-table as a grid of rows and columns
      Practice: Generate several times tables with a loop and write down one pattern you
      notice in each.
      Detail: Loops as repetition with purpose: times tables generated, then patterns in them
      hunted and explained
    Factor Finders and Prime Testers
      Topics:
        - Finding all factors of a number
        - Building a prime tester
        - The definition of a prime
        - Why 1 is not prime, settled by code
        - Writing your first real algorithms
        - Testing an algorithm across many inputs
      Projects built:
        - Write a Python program that lists every factor of a number
        - Write a Python prime tester that prints all primes up to 100
      Practice: Run your prime tester across the numbers 1 to 30 and confirm the results by
      hand.
      Detail: Factor finders and prime testers: the student's first real algorithms, and why
      1 is not prime, settled by code

  Month 3: The Fraction Machine (Weeks 9-12)
    GCD and the Fraction Simplifier
      Topics:
        - Common factors and the GCD
        - The Euclidean idea for finding a GCD
        - Coding a GCD function
        - Fraction equivalence
        - Building a fraction simplifier
        - Why the machine forces real understanding
      Projects built:
        - Write a Python fraction simplifier that reduces any fraction to lowest terms using the GCD
      Practice: Simplify several fractions by hand, then confirm each one with your
      simplifier.
      Detail: GCD discovered through the Euclidean idea; a fraction simplifier built, which
      forces equivalence to be truly understood
    Fraction Arithmetic and Phase Demo Day
      Topics:
        - Adding and subtracting fractions in code
        - Why a machine needs common denominators
        - Multiplying and dividing fractions
        - Combining the GCD with fraction arithmetic
        - Preparing a clear demo
        - Presenting the number toolkit
      Projects built:
        - Write a Python fraction calculator that adds, subtracts and simplifies two fractions
      Practice: Extend your fraction program to add and subtract two fractions and simplify
      the result.
      Assessment: Phase demo day: each student presents their number toolkit and explains the
      mathematics behind it.
      Detail: Fraction arithmetic programmed (common denominators become obvious when a
      machine needs them); phase demo day: each student presents their number toolkit

------------------------------------------------------------
PHASE 2: SHAPE AND CHANGE (MONTHS 4-6)
------------------------------------------------------------
Geometry becomes visceral through turtle graphics, exterior angles are unforgettable once you
have steered them, and algebra comes alive as code: variables that actually vary, functions
as machines, and graphs the student plots themselves.

  Month 4: Turtle Geometry (Weeks 13-16)
    Turtle Basics and the Exterior-Angle Discovery
      Topics:
        - Turtle graphics setup
        - Drawing squares and triangles
        - Forward and turn commands
        - Discovering exterior angles by steering
        - Why 360 divided by n draws a regular polygon
        - Connecting turning to angle size
      Projects built:
```

- Write a Python turtle program that draws any regular polygon from the number of sides
Practice: Draw three different regular polygons with turtle and record the turn angle each one needs.
Detail: Turtle basics: squares, triangles and the exterior-angle discovery (why 360 divided by n draws every regular polygon)

Star Polygons, Spirals and Angle Art

Topics:
- Drawing star polygons
- Spirals with a changing step or angle
- Angle-art compositions
- Interior-angle sums
- Verifying angle sums by walking them
- Combining loops with turtle turns

Projects built:
- Write a Python turtle program that draws a star polygon or spiral of your own design

Practice: Create an angle-art pattern and explain the interior or exterior angles that make it close.
Detail: Star polygons, spirals and angle art; interior-angle sums verified by walking them

Month 5: Coordinates and Real Variables (Weeks 17-20)

The Coordinate Plane in Code

Topics:
- The screen as a coordinate plane
- Plotting points from coordinates
- Drawing lines between points
- Finding midpoints
- The distance-between-points idea
- Reading coordinates back off a drawing

Projects built:
- Write a Python program that plots points and draws the line and midpoint between two of them

Practice: Plot a set of points in code and compute the midpoint of two of them.
Detail: The coordinate plane as the screen it literally is; plotting points, lines and midpoints in code

Algebra as Code: Expressions and Equations

Topics:
- Evaluating algebraic expressions in code
- Variables that actually vary
- Solving equations by guess, check and refine
- Why balance methods beat brute force
- Substituting into a formula
- Checking a solution programmatically

Projects built:
- Write a Python script that solves a linear equation by guess-check-refine and prints each step

Practice: Solve a linear equation both with a guess-check-refine loop and by balancing, then compare.
Detail: Algebra as code: expressions evaluated, equations solved by guess-check-refine, and why balance methods beat brute force

Month 6: Functions as Machines, Literally (Weeks 21-24)

Functions as Machines: Input, Rule, Output

Topics:
- Defining a Python function
- Parameters and return values
- Mathematical functions as machines
- Input, rule and output as one idea
- Evaluating a function for many inputs
- Building a table of values

Projects built:
- Write a Python function that takes x and returns a rule such as 2x plus 1, then tabulates it

Practice: Write a function for a simple rule and print a table of its outputs for several inputs.
Detail: Python functions and mathematical functions introduced as the same idea: input, rule, output

The Grapher Project and Phase Demo Day

Topics:
- Plotting y = mx + c
- The role of the gradient m
- The role of the intercept c
- Plotting parabolas
- Watching parameters reshape the graph
- Presenting the grapher at demo day

Projects built:
- Write a Python grapher that plots y = mx + c for chosen values of m and c
- Extend the grapher to plot a parabola and watch how its shape changes

Practice: Use your grapher to compare two lines with different m and c and describe the difference.
Assessment: Phase demo day: each student presents their grapher and explains how m and

c shape the line.
Detail: The grapher project: plot y = mx + c and watch m and c do their jobs; then parabolas, and phase demo day

---

PHASE 3: CHANCE, DATA AND THE CAPSTONE (MONTHS 7-9)

Probability stops being formulas when you can roll ten thousand dice per second: simulators settle intuitions, real datasets get summarized and questioned, and the course closes with a capstone the student designs, a working program where the mathematics is the star.

Month 7: Probability by Simulation (Weeks 25-28)

Randomness: Coin Flippers and Dice Rollers

Topics:

- Random numbers in Python
- Coin-flip simulation
- Dice-roll simulation
- Experimental probability from many trials
- Theoretical probability
- Watching results converge as trials grow

Projects built:

- Write a Python script that simulates thousands of dice rolls and reports the proportion of each outcome

Practice: Simulate 1000 coin flips and compare the experimental probability with the theoretical value.

Detail: Randomness in code: coin flippers and dice rollers; experimental versus theoretical probability, watched converging

Simulating Classic Probability Puzzles

Topics:

- Two-dice sum distributions
- Why 7 is the most likely sum
- Streaks in coin flips
- Calibrating intuition with evidence
- Counting outcomes versus simulating them
- Comparing simulation with theory

Projects built:

- Write a Python simulation of two-dice sums that displays the frequency of each total

Practice: Simulate two-dice sums many times and chart how often each sum appears.

Detail: The classic puzzles simulated: two-dice sums, streaks in coin flips, intuition calibrated by evidence

Month 8: Statistics on Real Data (Weeks 29-32)

Mean, Median and Range in Code

Topics:

- Computing the mean in code
- Finding the median by sorting
- Calculating the range
- Making vague definitions precise
- Handling a list of data
- Checking results against a hand calculation

Projects built:

- Write a Python program that reads a list of numbers and reports the mean, median and range

Practice: Write code to compute the mean, median and range of a data list, then verify each by hand.

Detail: Mean, median and range computed by the student's own code, the definitions can no longer be vague

Exploring a Real Dataset

Topics:

- Loading a real dataset
- Summarising the data
- Making simple charts
- Spotting outliers
- Questioning the sample size
- Judging whether a comparison is fair

Projects built:

- Write a Python program that summarises a real dataset and draws a simple chart from it

Practice: Summarise a small real dataset and write down two sceptic's questions it raises.

Detail: A real dataset explored: summaries, simple charts, and the sceptic's questions (outliers, sample size, fair comparisons)

Month 9: The Capstone (Weeks 33-36)

Capstone Chosen and Scoped

Topics:

- Choosing a capstone idea
- Scoping the mathematics inside it
- Planning the build in steps
- Setting a realistic target
- Options: a trainer, an art generator, a game or a data story

- Mentor rigour applied to the maths
Projects built:
- Begin building your chosen capstone program in Python from your scoped plan
Practice: Write a one-page plan for your capstone that names the mathematics it will make visible.
Detail: Capstone chosen and scoped: a times-table trainer, geometry art generator, probability game, data story, the student's call, the mentor's rigor

Capstone Build, Test and Demo Day
Topics:
- Building the capstone
- Testing and debugging
- Polishing the program
- Preparing a clear demo
- Presenting the program
- Explaining the mathematics behind it
Projects built:
- Complete, test and polish your capstone program ready to demo
Practice: Test your capstone on several cases, fix what breaks, and rehearse your demo explanation.
Assessment: Final demo day: each student presents the capstone and explains the mathematics it is built on.
Detail: Build, test, polish; demo day, the student presents their program and, more importantly, explains its mathematics

PROJECTS THE STUDENT BUILDS AND KEEPS

- Number toolkit: parity detector, divisibility tester, prime finder, factor lister
- The fraction machine: simplifier and calculator built on real GCD understanding
- Turtle geometry gallery: polygons, stars and angle art with the maths explained
- Function grapher: lines and parabolas plotted, parameters explored live
- Probability simulators and a real-data statistics story
- The capstone: a self-designed program where the mathematics is the star

Total projects: 12+ working programs, demo-ready

SKILLS THE STUDENT WILL HAVE AT THE END

- Number theory made concrete: primes, factors, GCD, modulo
- Fraction understanding at machine-proof depth
- Geometry through construction: angles, polygons, coordinates
- Algebra as living code: variables, expressions, functions
- Linear functions and graphing
- Probability by simulation and statistics on real data
- Python fundamentals: variables, conditionals, loops, functions
- Computational thinking and debugging discipline

HOW A TYPICAL WEEK IS SPLIT

Live classes: 2 one-hour live build-and-explain classes
Between class: One small build or extension challenge
Demo days: Each phase ends with the student presenting their work
Total per week: About 3-4 absorbed hours
Homework: A problem set after every class, and a monthly mixed-review assignment that deliberately folds in earlier topics

SUPPORT INCLUDED

Live sessions: 8 live one-hour classes every month, 2 per week
Mentorship: One mentor fluent in both mathematics and programming
Recordings: Every class recorded
Progress tracking: Project portfolio + concept checks shared with parents
Flexibility: Slots move around school and family plans

CERTIFICATION DETAIL

Completion: Certificate from Modern Age Coders, awarded on passing the final assessment. Fall short and there is focused revision and a free retest: the certificate certifies mastery, not attendance

WHERE THIS CAN LEAD

- Mathematics that holds through high school, because it was built
- Ready for our full Python and AI programming masterclasses
- Computational-thinking maturity that shows up in science and school projects
- A natural bridge to competition mathematics for the puzzle-hungry

COMMON QUESTIONS ABOUT THIS COURSE

For anything about cost, use PART 4 and RULE 1. Do not quote two regions.

Q: Is this a maths course or a coding course?
A: A maths course that uses code as its laboratory. The syllabus is mathematical, number theory, fractions, geometry, algebra, probability, statistics, and every program exists to force one of those ideas into the open. Students do finish with real Python skills, which is a genuine bonus, but the mathematics is the star.

Q: Does my child need coding experience?
A: None. Python is taught from the first hello, at a pace built for ages 10-15. Children who already code a little move faster into the mathematical meat; the mentor adjusts either way.

Q: Why does building things teach maths better than practicing problems?
A: Because a computer rejects vague understanding. A student who 'sort of' knows fraction equivalence writes a simplifier that fails, and fixing it requires actually understanding GCD. That debugging loop, predict, test, explain the gap, is the deepest mathematical practice there is, and it feels like play.

Q: We're in Ontario and coding is now examined inside math class. Does this help?
A: Directly, this course is our sweet spot for exactly that curriculum. Ontario weaves coding expectations through math from Grade 1, most homes have nobody fluent in both halves, and our mentors teach both natively. Students walk back into class ahead on the strand instead of puzzled by it.

Q: My child loves games but says maths is boring. Will this work?
A: This course exists for that child. The maths arrives wearing a project the child wants to build, angle art, a dice game, a grapher, and engagement does the heavy lifting. The reverse child (loves maths, indifferent to screens) discovers code as the best maths toy ever made.

Q: What maths level does it assume and reach?
A: It starts from comfortable whole-number arithmetic (roughly grade 5) and reaches into linear functions, probability and statistics (roughly grade 9 territory), with stretch room for strong students. It runs happily alongside any school curriculum and strengthens it rather than clashing.

Q: How am I assessed, and is the certificate just for showing up?
A: No. A problem set follows every class with written feedback, monthly reviews deliberately mix new material with earlier topics so nothing is forgotten, and the course ends with a final exam plus a portfolio of working maths programs. Passing earns the certificate; falling short earns focused revision and a free retest. We measure real understanding, not attendance.

Q: Can we try it before paying?
A: Yes. Every student starts with a free live demo class, they will build and run their first small program inside that hour, and you will see the method working with your own child. No card details required.

To enrol, message Shivam Sir on +91 9123366161 or send the parent this link: https://learn.modernagecoders.com/courses/maths-through-coding
For a demo: the Priority Live Demo (guaranteed, today or tomorrow) is booked at https://learn.modernagecoders.com/priority-demo . The free demo is a waiting list with no fixed date.

==========

COURSE 96 OF 137: MENTAL MATHS FOR KIDS: NUMBER SENSE, NOT TRICKS (AGES 5-10)

==========

Course link: https://learn.modernagecoders.com/courses/mental-maths-mastery-kids
Subject area: Elementary Mathematics
Designed for: Elementary school
Who can join: Ages 5-10 (roughly grades K-5), all starting levels
Course length: 12 months (52 weeks)
Time needed: 2 live one-hour classes per week + 10 minutes of daily play-practice
Certificate: Certificate from Modern Age Coders, awarded on passing the final assessment

PRICE FOR THIS COURSE (quote only the one that applies to the person asking)
In India, per month: group Rs 1,499, mini batch Rs 2,999, one to one Rs 4,999
In Canada, per month: group CAD 140, one to one CAD 210
Anywhere else, per month: group $100, one to one $150
Classes: group and mini batch two live classes a week, eight a month; one to one in India one live class a week, four a month; one to one outside India two live classes a week, eight a month. Each class is one hour.

WHAT THIS COURSE IS

Live mental maths course for kids ages 5-10: number bonds, decomposition and estimation build real number sense, the honest alternative to abacus. Free demo.

In one line: Number sense, not tricks. The speed follows, and it never expires.

ABOUT THE PROGRAMME

A 12-month live program that builds genuine mental arithmetic in children aged 5-10, the honest alternative to abacus franchises and 'Vedic tricks' courses. Trick-based speed impresses at demos and quietly expires: it bypasses understanding, so it cannot transfer to fractions, algebra or problem solving. We build number sense instead, numbers as decomposable quantities, number bonds, compensation and estimation, through games and puzzles a child genuinely enjoys. The result is a child who calculates fast because they see numbers clearly, and that clarity keeps paying through every year of school mathematics.

WHAT MAKES THIS COURSE DIFFERENT

- Number sense over tricks: strategies a child can explain always beat procedures they can only perform
- The speed is real and durable, decomposition, bonds and compensation transfer straight into fractions and algebra later
- Games, puzzles and number talks: children wait for these classes, which is the engagement no drill sheet buys
- Concrete-pictorial-abstract progression, the method behind the world's strongest maths systems
- Explain-back in every class: what a child can teach, a child owns
- One dedicated mentor who knows exactly which facts and strategies each child holds
- A genuine on-ramp: graduates flow into our grade-level maths programs already ahead
- One full interactive hour per class, twice a week, built for young attention spans with variety, not lectures

THE LEARNING PATH, STEP BY STEP

Phase 1: Number sense foundations: quantities, bonds to 10 and 20, and the part-whole thinking everything else stands on
Phase 2: The strategy toolkit: make-ten, doubles, compensation, and multiplication as structure, not chanting
Phase 3: Big-number courage: multi-digit mental strategies, fraction sense beginnings, estimation mastery and speed with understanding

WHAT A STUDENT NEEDS BEFORE STARTING

Education: Ages 5-10; can count to 20 to start the youngest track
Math background: None assumed, the diagnostic finds the true stage
Equipment: Computer or tablet with stable internet; household objects double as manipulatives
Time commitment: 2 live hours plus 10 minutes of daily play
English: Course taught in English
Motivation: None needed on day one, building it is the course's job

WHO THIS COURSE IS FOR

Finger counters: Children counting on fingers past grade 2, whose bonds never became automatic
Maths worriers: Children already saying 'I'm bad at maths', the belief this course exists to reverse
Abacus shoppers: Parents comparing abacus and Vedic programs who want speed that transfers and lasts
Young starters: Ages 5-6 whose parents want the foundation laid right the first time
Quick kids: Naturally strong children ready to go deeper than school arithmetic allows

FULL CURRICULUM, WEEK BY WEEK

This is the complete teaching plan. Parents can ask about any week.

PHASE 1: NUMBER SENSE FOUNDATIONS (MONTHS 1-4)

Before speed comes seeing: numbers as quantities that break apart and recombine. This phase builds subitizing, part-whole thinking and the bonds of 10 and 20 through concrete materials and games, tuned to each child's starting stage.

Month 1: Seeing Numbers (Weeks 1-4)
Getting to Know Your Number Sense
Topics:
- Counting games that show how far a child counts with ease
- Quick quantity flashes to see which small numbers are known on sight
- Simple addition play that reveals the current strategy (counting on, known facts, or guessing)
- Noticing confidence and comfort with numbers, not only right answers
- Spotting facts already automatic, such as small doubles or bonds
- Setting a friendly starting point tuned to the child, not the age

Practice: Over a snack, ask your child to grab a small handful of raisins and guess how many before counting, then count together to check, keeping it light and playful.
Detail: Playful diagnostic: which facts, strategies and confidence the child already

holds, disguised as games
Seeing How Many at a Glance
Topics:
- Recognising 1 to 5 dots instantly without counting (subitizing)
- Reading dice patterns as whole amounts
- Meeting the ten-frame as a picture of numbers
- Seeing 6 to 10 as a small group sitting on top of five
- Flashing and hiding quantities to build quick recognition
- Talking about how the amount was seen, not just the answer
Practice: Roll one die a few times each evening and race to say the number before counting the dots, and whoever spots it first wins that round.
Detail: Subitizing and quantity sense: dots, dice and ten-frames, recognising amounts without counting
Numbers Are Made of Smaller Numbers
Topics:
- Breaking a small number into two parts in different ways
- Seeing 7 as 5 and 2, 6 and 1, or 4 and 3
- Using fingers or counters to split a group across two hands
- Understanding that the parts always rebuild the whole
- Finding every way to make a chosen number
- Explaining a split out loud in the child's own words
Practice: Give your child 6 buttons and ask how many ways they can split them into two piles, writing each way down together like a treasure list.
Detail: Part-whole thinking: every number is made of other numbers (7 is 5-and-2, 6-and-1, 3-and-4)
Living on the Number Line
Topics:
- Placing numbers in order along a line
- Deciding which number is bigger from its position
- Measuring the distance or jump between two numbers
- Hopping forwards and backwards along the line
- Meeting the empty number line as a thinking tool
- Estimating where a number belongs before checking
Practice: Draw a long line on paper with 0 at one end and 10 at the other, then take turns pointing to where numbers like 7 or 3 should sit.
Detail: The number line as home: position, order, distance and the empty-number-line game

Months 2-3: The Bonds That Power Everything (Weeks 5-12)
The Pairs That Make Ten
Topics:
- Finding both parts that add to make 10
- Recognising 6 and 4, 7 and 3, 8 and 2 as ten-friends
- Using ten-frames to see the missing part
- Answering ten-bonds quickly through repeated play
- Spotting a ten-bond hidden inside a larger problem
- Building speed through fun, never flashcard pressure
Practice: Play make ten: you say a number under ten and your child shouts the partner that finishes the ten, then swap roles after five turns.
Detail: Bonds of 10 to automaticity, through games, never flashcard grind
Doubles and Their Neighbours
Topics:
- Learning the doubles up to 10 plus 10 as anchor facts
- Using a known double to solve a near-double (6 plus 7 is double 6 and one more)
- Adding 9 by adding 10 and stepping back one
- Adding 11 by adding 10 and stepping up one
- Seeing how one known fact unlocks several nearby ones
- Choosing the closest double to lean on
Practice: At bedtime, call out a double like double 4 for a quick answer, then a near-double like 4 plus 5, and let your child explain how the double helped.
Detail: Doubles and near-doubles as anchor facts; adding 9 and 11 by compensation preview
Making Ten to Add Bigger
Topics:
- Splitting the second number to fill up to ten first
- Turning 8 plus 5 into 10 plus 3
- Using ten-frames to see the bridge across ten
- Knowing how much a number needs to reach ten
- Adding the leftover part after reaching ten
- Choosing make-ten when numbers sit close to ten
Practice: With two ten-frames and some counters, set up sums like 8 plus 5 and let your child slide counters to fill the first ten, then read the answer.
Detail: Bridging through 10: the make-ten strategy that turns 8+5 into 10+3
Bonds to Twenty and Fact Families
Topics:
- Finding pairs that add to make 20
- Linking a ten-bond to its twenty partner
- Seeing a fact family: 13 plus 7, 7 plus 13, 20 minus 7, 20 minus 13
- Understanding addition and subtraction as two views of one picture

- Using a known adding fact to find its subtracting partner
- Building all four facts from one number trio

Practice: Pick three numbers that fit together, like 6, 4 and 10, and challenge your child to say all four facts they can make from them.

Detail: Bonds to 20 and fact families: addition and subtraction as one idea seen from two sides

Month 4: Subtraction as Distance + Stage Checkpoint (Weeks 13-16)

Two Ways to Subtract

Topics:
- Taking away by counting back from the larger number
- Finding the gap by counting up between the numbers
- Deciding which way is faster for a given problem
- Seeing subtraction as the distance between two numbers
- Using the number line to picture both methods
- Explaining which route was chosen and why

Practice: Ask a shopping question like you have 10 and a toy costs 8, how much change, and let your child try both counting back and counting up to compare.

Detail: Subtraction two ways: taking away versus finding the gap, and when each is faster

The Shopkeeper's Counting-Up Trick

Topics:
- Counting up from the price to the money paid
- Using friendly stops like the next ten
- Adding the small jumps to find the change
- Seeing why counting up avoids hard take-away sums
- Playing shop with real or pretend coins
- Checking the change makes sense

Practice: Set up a tiny pretend shop with priced items and let your child be the shopkeeper, counting up from the price to give you the right change.

Detail: Counting up for change: the shopkeeper's method every adult secretly uses

Many Roads to the Same Answer

Topics:
- Solving one problem in more than one way
- Sharing a strategy out loud in a number talk
- Listening to a different route to the same total
- Comparing which method felt quickest
- Respecting that different minds pick different paths
- Naming the strategy used (make-ten, doubles, or counting up)

Practice: Give one sum like 7 plus 8 and ask your child for two different ways to solve it, then you share a third way you thought of.

Detail: Mixed strategy play: number talks where children compare routes to the same answer

Phase One Check Through Play

Topics:
- Revisiting bonds of 10 and 20 through games
- Choosing a strategy for each problem confidently
- Explaining the thinking behind an answer
- Teaching a strategy back to the mentor or a parent
- Celebrating the facts now known by heart
- Noticing which few facts still want more play

Practice: Let your child be the teacher for ten minutes and show you one number strategy they learned this phase, explaining each step.

Assessment: A relaxed review game covering number bonds, part-whole thinking and the early strategies, where the child solves a problem, explains it, and teaches a favourite method back, with no timing or pressure.

Detail: Stage mastery check through games: solve it, explain it, teach it back

---

PHASE 2: THE STRATEGY TOOLKIT (MONTHS 5-8)

The heart of mental maths: named strategies the child chooses between, make-ten, compensation, doubling and halving, plus multiplication met as structure and arrays rather than chanted tables. Choice is the skill; speed is the side effect.

Month 5: Two-Digit Courage (Weeks 17-20)

Adding Two-Digit Numbers in Jumps

Topics:
- Adding the tens first in one jump
- Then adding the leftover ones
- Using an empty number line to record the jumps
- Holding the running total in mind
- Solving sums like 34 plus 23 step by step
- Checking the answer feels about right

Practice: Call out a two-digit sum like 42 plus 30 during a car ride and ask your child to jump the tens out loud, then add any ones.

Detail: Adding two-digit numbers mentally: jumps of ten, then the leftover ones

The Compensation Superpower

Topics:

- Rounding a number up to a friendly ten
- Adjusting the other number to keep the total fair
- Turning 39 plus 26 into 40 plus 25
- Subtracting 19 by taking 20 and giving one back
- Understanding why the give-and-take keeps it equal
- Choosing compensation when a number sits near a ten

Practice: Give a near-ten sum like 29 plus 14 and let your child bump the 29 up to 30, solve it, then give the one back at the end.

Detail: Compensation as a superpower: 39 + 26 becomes 40 + 25; subtracting 19 by taking 20 and giving one back

Month 6: Multiplication as Structure (Weeks 21-24)

Multiplication as Groups You Can See

Topics:
- Making equal groups with objects
- Building rows and columns as an array
- Reading 3 rows of 4 as three fours
- Connecting repeated addition to multiplication
- Seeing that an array can be counted two ways
- Using the words times and groups of

Practice: Arrange snacks or blocks into equal rows, like 3 rows of 5, and ask your child to find the total by seeing the groups rather than counting one by one.

Detail: Multiplication as groups and arrays, seen and built before recited

The Clever Route Through the Tables

Topics:
- Learning the easy 2s, 5s and 10s first
- Doubling the 2s to reach the 4s
- Doubling the 4s to reach the 8s
- Finding 9s by using 10s and stepping back a group
- Seeing how known tables build the harder ones
- Using skip counting as a rhythm for each table

Practice: Practise one table a day by skip counting it like a chant on the walk to the door, starting with the easy 2s, 5s or 10s.

Detail: The clever tables route: 2s, 10s and 5s first, then doubling to 4s and 8s; 9s by compensation

Month 7: The Full Tables, Owned (Weeks 25-28)

Taming the Trickiest Facts

Topics:
- Learning the 3s by skip counting and grouping
- Reaching the 6s by doubling the 3s
- Meeting the square facts like 6 times 6 and 7 times 7
- Spotting the small handful of facts that feel hardest
- Using a known nearby fact to reach a tricky one
- Practising just the stubborn facts, not the whole grid

Practice: Pick the one fact your child finds hardest this week and turn it into a silly rhyme or picture together to make it stick.

Detail: 3s, 6s and the tricky squares; the handful of hard facts isolated and conquered

Division Is Multiplication Backwards

Topics:
- Seeing division as sharing into equal groups
- Linking 3 times 4 is 12 to 12 shared by 4 is 3
- Building the multiplication and division fact family
- Using a known times fact to answer a divide fact
- Playing fact-family games for speed
- Understanding remainders as leftovers, gently

Practice: Share a small pile of objects equally between two or three plates and ask your child which times fact just proved the answer.

Detail: Division as the other side of multiplication; fact-family fluency through games

Month 8: Doubling, Halving and Strategy Choice (Weeks 29-32)

Doubling and Halving Magic

Topics:
- Halving one number while doubling the other
- Turning 16 times 5 into 8 times 10
- Seeing why the answer stays the same
- Choosing which number to halve to make it easy
- Using this to multiply by 5 quickly
- Chaining a halve and a double smoothly

Practice: Offer a times-five problem like 14 times 5 and let your child halve the 14 to 7 and double the 5 to 10, then read off 7 times 10.

Detail: Doubling and halving chains: 16 x 5 as 8 x 10, the strategy that feels like magic and is pure structure

Strategy Tournament and Phase Two Check

Topics:
- Solving one problem several different ways
- Deciding which strategy suits which problem
- Explaining why a chosen route was quickest
- Reviewing make-ten, compensation and doubling-halving

- Owning the full multiplication and division facts
- Thinking about one's own thinking

Practice: Hold a friendly strategy tournament: give one problem and see how many different correct routes your child can find and name.

Assessment: A relaxed review game across the strategy toolkit, where the child picks and explains a strategy for each problem and teaches a favourite one back, with no timing pressure.

Detail: Strategy tournaments: same problem, different routes, and the metacognition of choosing, plus stage mastery check

---

PHASE 3: BIG NUMBERS, ESTIMATION AND DURABLE SPEED (MONTHS 9-12)

The toolkit scales up: multi-digit mental arithmetic, the beginnings of fraction sense, estimation as judgment, and, now that understanding holds, genuine speed work. The course closes with each child measurably faster and, more importantly, able to explain every move.

Month 9: Multi-Digit Mental Arithmetic (Weeks 33-36)

Big Numbers Without Fear

Topics:

- Jumping by hundreds and tens using place value
- Adding to a friendly round number first
- Using compensation on larger numbers
- Adding numbers like 240 plus 130 in the head
- Keeping the place values lined up while jumping
- Checking the size of the answer makes sense

Practice: During a walk, add house or page numbers like 120 plus 60, encouraging your child to jump the hundreds and tens out loud.

Detail: Hundreds without fear: place-value jumps, friendly numbers and compensation at scale

Multiplying Beyond the Tables

Topics:

- Splitting a two-digit number into tens and ones
- Multiplying each part then adding (23 times 4 is 20 times 4 plus 3 times 4)
- Using halving and doubling on bigger products
- Choosing the neatest way to split a number
- Holding partial answers in mind to combine
- Estimating first to check the result

Practice: Give a problem like 21 times 3 and let your child split it into 20 times 3 and 1 times 3, then add the two parts.

Detail: Mental multiplication beyond tables: 23 x 4 by splitting, 15 x 6 by halving-doubling

Month 10: Estimation as Judgment (Weeks 37-40)

Rounding to Get Close Fast

Topics:

- Rounding a number to the nearest ten or hundred
- Using rounded numbers for a quick estimate
- Deciding how close an estimate needs to be
- Comparing an estimate to the real answer
- Rounding both numbers before adding
- Understanding when an estimate is enough

Practice: At the shop, ask your child to round a couple of prices and guess the rough total before you reach the till, then compare with the real total.

Detail: Rounding with purpose: getting close fast, and knowing how close is close enough

Does This Answer Make Sense?

Topics:

- Checking whether an answer looks reasonable
- Using an estimate to catch a big mistake
- Spotting answers that are far too big or too small
- Asking about how much this should be first
- Trusting number sense over a typed answer
- Explaining why an answer cannot be right

Practice: Say a deliberately silly answer to an easy sum, like 3 plus 4 is 30, and let your child catch it and explain why it is wrong.

Detail: The reasonableness habit: catching wrong answers by sense, the skill calculators cannot replace

Month 11: Fraction Sense Beginnings (Weeks 41-44)

Halves and Quarters of Things

Topics:

- Splitting a shape or group into equal parts
- Finding half of a quantity, like half of 12
- Finding a quarter by halving twice
- Seeing halves and quarters in real objects
- Understanding fair, equal shares
- Reading a simple fraction from a picture

Practice: Share a snack fairly and ask your child for half, then a quarter, of a small

group of items, checking the shares are equal.
Detail: Halves, quarters and the fraction-of-a-quantity game, mental fractions from pictures

Half, Point Five and Fifty Percent
Topics:
- Seeing one-half written as 0.5
- Meeting fifty percent as another name for half
- Linking a quarter to 0.25 and 25 percent
- Understanding these are the same amount in different clothes
- Spotting halves and percents in everyday life
- Reading these friendly numbers with confidence

Practice: Point out a half price or 50 percent off sign and ask your child what that means for a simple price, like half of 10.
Detail: Fraction and decimal friends: one-half is 0.5 is 50%, the bridge built early

Month 12: Speed With Understanding + Graduation (Weeks 45-52)

Beat Your Own Record
Topics:
- Using known strategies quickly and calmly
- Timing oneself gently to beat a personal best
- Tracking progress on a personal record ladder
- Choosing the fastest strategy for each fact
- Building speed on top of real understanding
- Racing only against yesterday's self, never a classmate

Practice: Set a friendly one-minute challenge of easy facts and let your child try to beat their own score from last time, celebrating any gain.
Detail: Timed play now that meaning holds: beat-your-own-record ladders, never child-versus-child pressure

Graduation and the Road Ahead
Topics:
- Choosing a favourite strategy to teach
- Running a number talk for the class or mentor
- Explaining each step clearly to others
- Reviewing all the strategies learned this year
- Celebrating durable, understood speed
- Looking ahead to the next maths adventure

Practice: Let your child teach the whole family their favourite strategy in a five-minute mini-lesson, using a real example.
Assessment: A gentle final review where the child leads a number talk teaching a chosen strategy, revisits the year's key ideas, and celebrates progress, with a friendly road-ahead plan instead of a test.
Detail: Graduation project: each child runs a number talk, teaching their favourite strategy, plus final stage mastery check and the road-ahead plan

PROJECTS THE STUDENT BUILDS AND KEEPS

- The child's own strategy book: every named strategy with their worked example
- Number-talk leadership: each child regularly explains routes to the class or mentor
- Beat-your-own-record fluency ladders, tracked across the year
- Estimation journal: real-life guesses checked and calibrated
- Graduation number talk taught by the child

Total projects: A year-long strategy book plus 4+ fluency artifacts

SKILLS THE STUDENT WILL HAVE AT THE END

- Number bonds to 20 at automaticity
- Make-ten, compensation and bridging strategies
- Doubling-halving and the clever tables route
- Full multiplication and division fact fluency
- Multi-digit mental arithmetic
- Estimation and reasonableness judgment
- Early fraction and decimal sense
- Explaining mathematical thinking aloud

HOW A TYPICAL WEEK IS SPLIT

Live classes: 2 one-hour live classes, built with variety for young attention
Daily play: About 10 minutes of assigned games or number talks
Family involvement: Simple number-talk prompts parents can run at dinner
Total per week: About 3 focused hours
Homework: A problem set after every class, and a monthly mixed-review assignment that deliberately folds in earlier topics

SUPPORT INCLUDED

Live sessions: 8 live one-hour classes every month, 2 per week
Mentorship: One dedicated mentor who knows the child's exact fact map
Recordings: Every class recorded

  Progress tracking: Stage mastery checks shared with parents
  Flexibility: Slots move around school and family plans

CERTIFICATION DETAIL

  Completion: Certificate from Modern Age Coders, awarded on passing the final assessment. Fall short and there is focused revision and a free retest: the certificate certifies mastery, not attendance

WHERE THIS CAN LEAD

  - Ready for the Elementary Mathematics Masterclass, arriving ahead
  - The fluency base that makes fractions and early algebra feel light
  - Competition-maths readiness for children who catch fire
  - A natural bridge into maths-through-coding for the builder types

COMMON QUESTIONS ABOUT THIS COURSE

  For anything about cost, use PART 4 and RULE 1. Do not quote two regions.

  Q: How is this different from abacus or Vedic maths classes?
  A: It rarely transfers to fractions, word problems or algebra, and it fades when practice stops. We build number sense instead: strategies the child understands and chooses between. The speed arrives a little later and then never leaves, because it is made of understanding.

  Q: What age is right to start?
  A: Ages 5-10, and the mentor meets each child at their actual stage rather than their age. Five-year-olds start with quantity games and bonds; nine-year-olds might start at the strategy toolkit. The playful diagnostic in the free demo places every child accurately. (Agent note: the free demo is a waiting list with no fixed date. The Priority Live Demo is a guaranteed class today or tomorrow, booked at https://learn.modernagecoders.com/priority-demo . Offer both, as RULE 3 says.)

  Q: Will my child actually enjoy this, or is it drilling in disguise?
  A: Enjoyment is the engine of the whole method: number talks, strategy tournaments, beat-your-own-record ladders and games carry every class. Parents consistently tell us their children wait for these classes, which sounds impossible for arithmetic until you watch one. That is what the free demo is for. (Agent note: the free demo is a waiting list with no fixed date. The Priority Live Demo is a guaranteed class today or tomorrow, booked at https://learn.modernagecoders.com/priority-demo . Offer both, as RULE 3 says.)

  Q: My child counts on fingers past age 7. Is that a problem this fixes?
  A: Yes, and gently. Finger counting past grade 2 means number bonds never became automatic, so every calculation starts from scratch. We rebuild the bonds through games until known facts replace counting, without ever shaming the fingers on the way.

  Q: Does this replace school maths or run alongside it?
  A: Alongside, and underneath: number sense is the foundation school maths quietly assumes. Children in this course typically find school arithmetic suddenly easy, which buys the confidence that changes everything else.

  Q: How much practice is needed between classes?
  A: About ten minutes a day of assigned play, a game, a strategy challenge, a number talk with a parent. Small daily doses beat weekend marathons for fluency building, and ten minutes keeps it joyful.

  Q: How is my child assessed, and is the certificate just for attending?
  A: No. A problem set follows every class with written feedback, monthly reviews deliberately mix new material with earlier topics so nothing is forgotten, and the course ends with a final assessment (a friendly speed-and-accuracy check of everything learned). Passing earns the certificate; falling short earns focused revision and a free retest. We measure real understanding, not attendance.

  Q: Can we try it before paying?
  A: Yes. Every child starts with a free live demo class that doubles as the playful diagnostic, no card details, no obligation.

  To enrol, message Shivam Sir on +91 9123366161 or send the parent this link: https://learn.modernagecoders.com/courses/mental-maths-mastery-kids
  For a demo: the Priority Live Demo (guaranteed, today or tomorrow) is booked at https://learn.modernagecoders.com/priority-demo . The free demo is a waiting list with no fixed date.

==========
COURSE 97 OF 137: MERN STACK COURSE: MONGODB, EXPRESS, REACT AND NODE
==========

Course link: https://learn.modernagecoders.com/courses/mern-stack-development-masterclass-college
Subject area: Web Development

Designed for: College students
Who can join: Complete beginner (18+); college students, graduates and working professionals
Course length: 10-12 months (44-52 weeks)
Time needed: 2 live classes/week + 4-6 hours practice
Certificate: Certificate from Modern Age Coders, awarded on passing the final exam

PRICE FOR THIS COURSE (quote only the one that applies to the person asking)
  In India, per month: group Rs 1,499, mini batch Rs 2,999, one to one Rs 4,999
  In Canada, per month: group CAD 140, one to one CAD 210
  Anywhere else, per month: group $100, one to one $150
  Classes: group and mini batch two live classes a week, eight a month; one to one in India one live class a week, four a month; one to one outside India two live classes a week, eight a month. Each class is one hour.

WHAT THIS COURSE IS

  MERN stack course for college students and professionals: JavaScript foundations, React, Node and Express APIs, MongoDB and full-stack integration in 10-12 months.

  In one line: One language, the whole product: MongoDB, Express, React and Node learned as a single coherent craft, ending in a deployed full-stack capstone.

ABOUT THE PROGRAMME

  The MERN promise is coherence: JavaScript on both ends, one mental model from database to interface, and the fastest honest route to being the person who can build the whole thing. This live online masterclass delivers it in order: web and JavaScript foundations done properly, React to production patterns, then the backend half, Node and Express APIs designed like a professional, MongoDB modeled with judgment, authentication done safely, and finally full-stack integration: the two halves wired, deployed and behaving like one product. A finale month ships a complete MERN capstone and sits the final exam. The pace is honest: ten teaching months at two live classes a week plus four to six hours of practice, with two more in hand. Problem sets, monthly mixed reviews, phase exams, and a final exam that decides the certificate with a free retest.

WHAT MAKES THIS COURSE DIFFERENT

  - The stack taught as one craft: contracts between the halves get real attention
  - Foundations first: MERN on weak JavaScript is four buzzwords in a trench coat
  - Auth and security done safely: hashing, tokens and the OWASP basics as habits
  - Everything deploys: both halves live from their respective phases onward
  - An honest 10-month arc with 2 months in hand
  - Real assessment: weekly problem sets, monthly mixed reviews, phase exams and a final exam with a free retest

THE LEARNING PATH, STEP BY STEP

  Phase 1: Foundations (Months 1-3): the web and JavaScript learned properly
  Phase 2: React (Months 4-6): production patterns on the frontend half
  Phase 3: Node, Express and MongoDB (Months 7-9): the backend half with safe auth
  Phase 4: The finale (Month 10): full-stack integration capstone and the final exam

WHAT A STUDENT NEEDS BEFORE STARTING

  Coding experience: None. Everything is taught from the first line
  Equipment: Any computer with a stable internet connection; every tool used is free
  Age: 18+; college students, graduates and working professionals
  Time commitment: 2 live classes plus 4-6 hours of practice a week

WHO THIS COURSE IS FOR

  College students: Students who want the classic full-stack employability package
  Placement candidates: Candidates whose target roles say MERN in the listing
  Self taught: Learners with scattered tutorial knowledge who need it forged into one craft
  Product builders: Founders and makers who want the whole product in one language
  Career switchers: Professionals entering web development with one coherent path

FULL CURRICULUM, WEEK BY WEEK

  This is the complete teaching plan. Parents can ask about any week.

  PHASE 1: WEB DEVELOPMENT FOUNDATION (MONTHS 1-3, WEEKS 1-13)

  Build solid foundations in HTML, CSS, JavaScript, and modern web development tools.

    Month 1: HTML, CSS & Web Basics (Weeks 1-4)
      Introduction to Web Development
        Topics:

    - How the internet works: clients, servers, protocols
    - Web development career paths and opportunities
    - Development environment setup: VS Code, extensions
    - HTML5 fundamentals and document structure
    - Semantic HTML elements and accessibility
    - Forms and input validation
    - Media elements: images, audio, video
    - Tables and data representation
    - SEO basics and meta tags
    - HTML best practices and standards
    - Introduction to developer tools
    - Version control with Git and GitHub
  Projects built:
    - Personal portfolio HTML structure
    - Multi-page website
    - Contact form with validation
  Practice: Build 10 HTML pages from scratch
  Tools:
    - VS Code setup
    - Live Server extension
    - Git initialization
CSS Fundamentals & Styling
  Topics:
    - CSS syntax and selectors hierarchy
    - Box model: margin, padding, border
    - Colors, typography, and units
    - Flexbox layout system complete
    - CSS Grid layout mastery
    - Positioning: relative, absolute, fixed, sticky
    - Transforms, transitions, and animations
    - Pseudo-classes and pseudo-elements
    - CSS variables and custom properties
    - Mobile-first responsive design
    - Media queries and breakpoints
    - CSS preprocessors introduction (Sass)
  Projects built:
    - Responsive portfolio design
    - Landing page with animations
    - CSS art and illustrations
  Practice: Style 15 different layouts
  Tools:
    - Chrome DevTools
    - Sass compiler
    - CSS frameworks overview
Advanced CSS & Modern Techniques
  Topics:
    - Advanced Flexbox patterns
    - Complex Grid layouts
    - CSS architecture: BEM, SMACSS
    - CSS modules and scoping
    - Performance optimization techniques
    - Critical CSS and lazy loading
    - CSS-in-JS introduction
    - Tailwind CSS fundamentals
    - Bootstrap 5 framework
    - Material Design principles
    - Accessibility (a11y) best practices
    - Cross-browser compatibility
  Projects built:
    - Company website with Tailwind
    - Dashboard UI with Bootstrap
    - Accessible web application
  Practice: Create 10 responsive components
  Tools:
    - Tailwind CSS setup
    - PostCSS configuration
    - Autoprefixer
JavaScript Fundamentals
  Topics:
    - JavaScript basics: variables, data types, operators
    - Control flow: conditionals, loops, switch
    - Functions: declaration, expression, arrow functions
    - Scope, hoisting, and closures
    - Objects and arrays manipulation
    - Array methods: map, filter, reduce, forEach
    - String methods and regular expressions
    - Error handling: try, catch, finally
    - ES6+ features: destructuring, spread, rest
    - Template literals and tagged templates

```
      - Modules: import/export patterns
      - Debugging techniques and tools
    Projects built:
      - Interactive calculator
      - Todo list application
      - Quiz application
    Practice: Solve 50 JavaScript challenges
    Tools:
      - Node.js installation
      - npm basics
      - ESLint setup

Month 2: Advanced JavaScript & DOM (Weeks 5-9)
  DOM Manipulation & Events
    Topics:
      - Document Object Model (DOM) tree structure
      - Selecting elements: querySelector, getElementById
      - Creating and modifying elements
      - Event handling and event listeners
      - Event bubbling and delegation
      - Form handling and validation
      - Local storage and session storage
      - Cookies and web storage API
      - Drag and drop functionality
      - File API and uploads
      - Intersection Observer API
      - Performance optimization in DOM
    Projects built:
      - Dynamic content management system
      - Drag-and-drop task board
      - Image gallery with lazy loading
    Practice: Build 20 interactive features
    Tools:
      - Browser storage inspector
      - Performance profiler
      - Memory profiler
  Asynchronous JavaScript
    Topics:
      - Callbacks and callback hell
      - Promises: creation and chaining
      - Async/await syntax and patterns
      - Fetch API and HTTP requests
      - REST API consumption
      - Error handling in async code
      - Promise.all, Promise.race, Promise.allSettled
      - Web Workers for parallel processing
      - Service Workers basics
      - WebSockets introduction
      - Server-Sent Events (SSE)
      - Real-time data handling
    Projects built:
      - Weather application with API
      - Real-time chat interface
      - News aggregator
    Practice: Integrate 10 different APIs
    Tools:
      - Postman for API testing
      - JSON Server
      - WebSocket clients
  Object-Oriented & Functional Programming
    Topics:
      - OOP in JavaScript: classes, inheritance
      - Prototypes and prototype chain
      - Private and public fields
      - Static methods and properties
      - Design patterns: Singleton, Factory, Observer
      - Functional programming concepts
      - Pure functions and immutability
      - Higher-order functions
      - Currying and partial application
      - Composition over inheritance
      - SOLID principles in JavaScript
      - Code organization and architecture
    Projects built:
      - Game development with OOP
      - State management library
      - Design pattern implementations
    Practice: Implement 15 design patterns
    Tools:
```

```
      - TypeScript introduction
      - Jest for testing
      - Code coverage tools
  Build Tools & Modern Workflow
    Topics:
      - Module bundlers: Webpack fundamentals
      - Babel for transpilation
      - Package management with npm/yarn
      - Task runners and automation
      - Environment variables and configuration
      - Code splitting and lazy loading
      - Hot module replacement
      - Source maps for debugging
      - Production optimization
      - Progressive Web Apps basics
      - Testing fundamentals: unit, integration
      - Continuous Integration basics
    Projects built:
      - Custom webpack configuration
      - PWA with offline support
      - Automated build pipeline
    Practice: Configure 5 different build setups
    Tools:
      - Webpack DevServer
      - Babel presets
      - npm scripts
  Phase 1 Capstone Project
    Topics:
      - Project planning and wireframing
      - Git workflow and branching
      - Code review practices
      - Documentation writing
      - Deployment to Netlify/Vercel
    Projects built:
      - CAPSTONE: Full-Featured Web Application
      - Complete responsive website with JavaScript functionality
      - Include API integration, local storage, and animations
    Assessment: Phase 1 Final Assessment

Month 3: Advanced Frontend & Introduction to React (Weeks 10-13)
  Modern JavaScript & TypeScript
    Topics:
      - Advanced ES6+ features
      - Symbols, iterators, and generators
      - Proxy and Reflect APIs
      - WeakMap and WeakSet
      - TypeScript fundamentals
      - Type annotations and interfaces
      - Generics and type inference
      - Enums and type aliases
      - TypeScript with DOM
      - Configuration and tsconfig.json
      - TypeScript best practices
      - Migration from JavaScript
    Projects built:
      - TypeScript utility library
      - Type-safe API client
      - JavaScript to TypeScript migration
    Practice: Convert 10 projects to TypeScript
    Tools:
      - TypeScript compiler
      - ts-node
      - Type definition files
  Introduction to React
    Topics:
      - React philosophy and virtual DOM
      - Vite setup
      - JSX syntax and expressions
      - Components: functional vs class
      - Props and prop types
      - State management basics
      - Event handling in React
      - Conditional rendering
      - Lists and keys
      - Forms and controlled components
      - Component lifecycle (class components)
      - React DevTools usage
    Projects built:
      - React portfolio website
```

```
        - Interactive todo application
        - Recipe finder app
      Practice: Build 20 React components
      Tools:
        - Vite
        - React DevTools
        - React playground
    React Hooks & Modern Patterns
      Topics:
        - useState for state management
        - useEffect for side effects
        - useContext for global state
        - useReducer for complex state
        - useCallback and useMemo optimization
        - useRef for DOM references
        - Custom hooks creation
        - Rules of hooks
        - Hook patterns and best practices
        - Error boundaries
        - Suspense and lazy loading
        - Concurrent features introduction
      Projects built:
        - Blog platform with hooks
        - E-commerce product catalog
        - Real-time dashboard
      Practice: Create 15 custom hooks
      Tools:
        - React Hook Form
        - SWR/React Query
        - Hookstate
    Component Libraries & Styling
      Topics:
        - CSS Modules in React
        - Styled-components deep dive
        - Emotion CSS-in-JS
        - Material-UI components
        - Ant Design integration
        - Chakra UI setup
        - Headless UI components
        - Storybook for component development
        - Component documentation
        - Design systems creation
        - Theme management
        - Responsive design in React
      Projects built:
        - Custom component library
        - Design system implementation
        - Storybook showcase
      Practice: Build 30 reusable components
      Assessment: Phase 1 exam: a practical build defended live, plus a written paper mixing
      this phase with everything before it
      Tools:
        - Storybook setup
        - Chromatic for visual testing
        - Figma to React workflow

----------------------------------------------------------------
PHASE 2: REACT MASTERY & ADVANCED FRONTEND (MONTHS 4-6, WEEKS 14-26)
----------------------------------------------------------------
Master React ecosystem, state management, advanced patterns, and modern frontend development.

  Month 4: Advanced React & State Management (Weeks 14-19)
    React Router & Navigation
      Topics:
        - React Router v6 setup and configuration
        - Route definition and nesting
        - Dynamic routing and parameters
        - Protected routes and authentication
        - Programmatic navigation
        - Route guards and middleware
        - Lazy loading routes
        - 404 handling and redirects
        - Query parameters and state
        - Animated route transitions
        - Breadcrumbs implementation
        - Deep linking strategies
      Projects built:
        - Multi-page application router
        - Admin dashboard with auth
```

```
    - E-commerce site navigation
  Practice: Implement 10 routing patterns
  Tools:
    - React Router DevTools
    - Route testing utilities
    - History API
State Management with Redux
  Topics:
    - Redux principles and architecture
    - Actions, reducers, and store
    - Redux Toolkit modern approach
    - Slices and createSlice
    - Async actions with createAsyncThunk
    - RTK Query for data fetching
    - Redux DevTools and debugging
    - Middleware creation and usage
    - Redux persist for local storage
    - Normalization and selectors
    - Performance optimization
    - Redux best practices
  Projects built:
    - Shopping cart with Redux
    - Task management system
    - Real-time notifications
  Practice: Build 5 Redux applications
  Tools:
    - Redux Toolkit
    - Redux DevTools Extension
    - Immer for immutability
Alternative State Management
  Topics:
    - Context API advanced patterns
    - Zustand state management
    - MobX reactive programming
    - Recoil atomic state
    - Valtio proxy state
    - Jotai atomic approach
    - State machines with XState
    - Form state with React Hook Form
    - Server state with React Query
    - Local vs global state strategies
    - State management comparison
    - Choosing the right solution
  Projects built:
    - App with multiple state solutions
    - Form-heavy application
    - Real-time collaborative app
  Practice: Compare 5 state solutions
  Tools:
    - Zustand DevTools
    - React Query DevTools
    - XState Visualizer
Performance Optimization
  Topics:
    - React performance profiling
    - React.memo and PureComponent
    - useMemo and useCallback optimization
    - Code splitting strategies
    - Lazy loading components and routes
    - Bundle size optimization
    - Virtual scrolling implementation
    - Image optimization techniques
    - Web Vitals and metrics
    - Lighthouse audits
    - Performance monitoring
    - Production optimization
  Projects built:
    - Performance-optimized app
    - Large list virtualization
    - Image-heavy gallery
  Practice: Optimize 10 slow applications
  Tools:
    - React Profiler
    - Bundle analyzer
    - Lighthouse CI
Testing React Applications
  Topics:
    - Testing philosophy and strategies
    - Jest configuration and setup
```

```
      - React Testing Library
      - Component unit testing
      - Integration testing
      - Mocking and stubbing
      - Testing hooks and context
      - Async testing patterns
      - Snapshot testing
      - End-to-end with Cypress
      - Test coverage reports
      - CI/CD integration
    Projects built:
      - Full test suite for app
      - TDD React application
      - E2E test scenarios
    Practice: Write 100+ test cases
    Tools:
      - Jest
      - React Testing Library
      - Cypress

Month 5: Next.js & Server-Side Rendering (Weeks 20-23)
  Next.js Fundamentals
    Topics:
      - Next.js architecture and benefits
      - File-based routing system
      - Pages and layouts
      - Static generation (SSG)
      - Server-side rendering (SSR)
      - Incremental Static Regeneration (ISR)
      - API routes creation
      - Dynamic routes and params
      - Image optimization with next/image
      - Font optimization
      - SEO optimization
      - Internationalization (i18n)
    Projects built:
      - Blog with Next.js
      - E-commerce frontend
      - Portfolio with CMS
    Practice: Build 5 Next.js applications
    Tools:
      - Next.js CLI
      - Vercel deployment
      - Next.js DevTools
  Advanced Next.js Features
    Topics:
      - App Router and React Server Components
      - Streaming and Suspense
      - Parallel and intercepting routes
      - Route handlers and middleware
      - Authentication in Next.js
      - Database integration
      - Caching strategies
      - Edge functions and runtime
      - Serverless functions
      - Static export
      - Performance optimization
      - Production deployment
    Projects built:
      - Full-stack Next.js app
      - SaaS application frontend
      - Real-time application
    Practice: Master 10 Next.js patterns
    Tools:
      - Next.js Analytics
      - Edge Runtime
      - Turbopack
  GraphQL & Modern APIs
    Topics:
      - GraphQL fundamentals
      - Queries, mutations, subscriptions
      - Apollo Client setup
      - GraphQL with React
      - Code generation with GraphQL
      - Optimistic updates
      - Caching strategies
      - Error handling
      - File uploads with GraphQL
      - Real-time subscriptions
```

```
      - Federation and microservices
      - REST vs GraphQL comparison
    Projects built:
      - GraphQL-powered app
      - Real-time chat with subscriptions
      - Apollo Client integration
    Practice: Build 5 GraphQL integrations
    Tools:
      - Apollo Studio
      - GraphQL Playground
      - GraphQL Code Generator
  Progressive Web Apps
    Topics:
      - PWA principles and benefits
      - Service Workers deep dive
      - Offline functionality
      - Cache strategies
      - Web App Manifest
      - Install prompts and A2HS
      - Push notifications
      - Background sync
      - App shell architecture
      - Performance patterns
      - PWA testing and debugging
      - App store deployment
    Projects built:
      - Offline-first PWA
      - News app with notifications
      - PWA e-commerce site
    Practice: Convert 5 apps to PWAs
    Tools:
      - Workbox
      - PWA Builder
      - Lighthouse PWA audit

Month 6: Frontend Polish: Animation, Accessibility & Security (Weeks 24-26)
  Advanced Animation & Graphics
    Topics:
      - Framer Motion deep dive
      - Complex animations and gestures
      - SVG animations
      - Canvas API with React
      - WebGL and Three.js basics
      - React Three Fiber
      - Data visualization with D3.js
      - Chart libraries integration
      - Parallax scrolling effects
      - Scroll-triggered animations
      - Performance optimization
      - 60fps animations
    Projects built:
      - Animated landing page
      - Data visualization dashboard
      - 3D product showcase
    Practice: Create 20 animations
    Tools:
      - Framer Motion
      - GreenSock (GSAP)
      - Lottie React
  Accessibility & Internationalization
    Topics:
      - WCAG guidelines and compliance
      - Semantic HTML in React
      - ARIA attributes and roles
      - Keyboard navigation
      - Screen reader testing
      - Color contrast and visibility
      - Focus management
      - Accessible forms and errors
      - i18n setup with React
      - Translation management
      - RTL language support
      - Date and number formatting
    Projects built:
      - Fully accessible application
      - Multi-language platform
      - WCAG compliant site
    Practice: Audit and fix 10 applications
    Tools:
```

```
        - axe DevTools
        - NVDA/JAWS
        - react-i18next
    Security & Best Practices
      Topics:
        - Frontend security principles
        - XSS prevention in React
        - CSRF protection
        - Content Security Policy
        - Secure authentication flows
        - OAuth and social login
        - JWT handling and storage
        - Input validation and sanitization
        - Secure API communication
        - HTTPS and SSL
        - Security headers
        - Dependency vulnerability scanning
      Projects built:
        - Secure authentication system
        - Security audit implementation
        - Penetration testing prep
      Practice: Secure 5 applications
      Assessment: Phase 2 exam: a practical build defended live, plus a written paper mixing
      this phase with everything before it
      Tools:
        - OWASP ZAP
        - Snyk
        - npm audit

---------------------------------------------------------------
PHASE 3: BACKEND DEVELOPMENT WITH NODE.JS (MONTHS 7-9, WEEKS 27-39)
---------------------------------------------------------------
Master Node.js, Express, MongoDB, and build production-ready backend systems.

  Month 7: Node.js & Express Fundamentals (Weeks 27-31)
    Node.js Fundamentals
      Topics:
        - Node.js architecture and event loop
        - Global objects and process
        - Modules system: CommonJS and ES modules
        - File system operations
        - Path and OS modules
        - Streams and buffers
        - Events and EventEmitter
        - Child processes
        - Cluster module for scaling
        - Worker threads
        - Error handling in Node.js
        - Debugging Node applications
      Projects built:
        - CLI tool development
        - File processing system
        - Task automation scripts
      Practice: Build 15 Node.js utilities
      Tools:
        - Node.js debugger
        - nodemon
        - PM2
    Express.js Framework
      Topics:
        - Express application setup
        - Routing and route parameters
        - Middleware concept and creation
        - Request and response handling
        - Static file serving
        - Template engines integration
        - Body parsing and file uploads
        - Cookie and session handling
        - Error handling middleware
        - Security middleware setup
        - Compression and optimization
        - Express best practices
      Projects built:
        - RESTful API server
        - Blog backend system
        - File upload service
      Practice: Create 10 Express applications
      Tools:
        - Postman
```

```
      - Thunder Client
      - Morgan logger
  Database Design & MongoDB
    Topics:
      - Database fundamentals and types
      - MongoDB architecture and concepts
      - Document-based data modeling
      - CRUD operations in MongoDB
      - Indexes and performance
      - Aggregation framework
      - Transactions in MongoDB
      - Schema design patterns
      - References vs embedding
      - Data validation and migration
      - Backup and restore strategies
      - MongoDB Atlas cloud setup
    Projects built:
      - Database schema design
      - MongoDB aggregation pipelines
      - Data migration system
    Practice: Design 10 database schemas
    Tools:
      - MongoDB Compass
      - Atlas cloud
      - Robo 3T
  Mongoose ODM & Data Modeling
    Topics:
      - Mongoose setup and connection
      - Schema definition and types
      - Model creation and methods
      - Validation and custom validators
      - Middleware: pre and post hooks
      - Virtual properties
      - Population and references
      - Query building and optimization
      - Plugins and reusable logic
      - Transactions with Mongoose
      - Error handling patterns
      - Testing database operations
    Projects built:
      - User management system
      - E-commerce data models
      - Social media schemas
    Practice: Create 15 Mongoose models
    Tools:
      - Mongoose documentation
      - Faker.js for seeding
      - MongoDB Memory Server
  RESTful API Design
    Topics:
      - REST principles and constraints
      - API versioning strategies
      - Resource naming conventions
      - HTTP methods and status codes
      - Request/response format
      - Pagination and filtering
      - Sorting and field selection
      - API documentation with Swagger
      - Postman collection creation
      - API testing strategies
      - Rate limiting implementation
      - API security best practices
    Projects built:
      - Complete REST API
      - API documentation
      - API testing suite
    Practice: Build 5 different APIs
    Tools:
      - Swagger/OpenAPI
      - Postman collections
      - Newman CLI

Month 8: Authentication & Advanced Backend (Weeks 32-36)
  Authentication & Authorization
    Topics:
      - Authentication vs authorization
      - Password hashing with bcrypt
      - JWT token generation and validation
      - Refresh token implementation
```

```
    - Session-based authentication
    - OAuth 2.0 implementation
    - Social login integration
    - Two-factor authentication
    - Role-based access control (RBAC)
    - API key authentication
    - Security best practices
    - CSRF and XSS protection
  Projects built:
    - Complete auth system
    - OAuth integration
    - Multi-factor authentication
  Practice: Implement 5 auth strategies
  Tools:
    - Passport.js
    - JWT debugger
    - OAuth playground
Real-time Communication
  Topics:
    - WebSocket protocol understanding
    - Socket.io setup and configuration
    - Real-time events and broadcasting
    - Rooms and namespaces
    - Private messaging implementation
    - Presence detection
    - Reconnection handling
    - Scaling WebSocket servers
    - Redis adapter for Socket.io
    - Server-Sent Events (SSE)
    - WebRTC basics
    - Real-time notifications
  Projects built:
    - Chat application
    - Live collaboration tool
    - Real-time dashboard
  Practice: Build 5 real-time features
  Tools:
    - Socket.io client/server
    - Redis pub/sub
    - WebRTC libraries
File Handling & Cloud Storage
  Topics:
    - File upload strategies
    - Multer configuration and usage
    - Image processing with Sharp
    - Video processing basics
    - AWS S3 integration
    - Cloudinary integration
    - File validation and security
    - Streaming large files
    - ZIP file generation
    - CSV and Excel processing
    - PDF generation
    - CDN integration
  Projects built:
    - Media upload system
    - Cloud storage integration
    - Document processing service
  Practice: Handle 10 file types
  Tools:
    - Multer
    - Sharp
    - AWS SDK
Email & Notification Systems
  Topics:
    - Email service setup
    - SMTP configuration
    - SendGrid/Mailgun integration
    - HTML email templates
    - Email queue implementation
    - Bounce handling
    - Push notifications setup
    - SMS integration with Twilio
    - In-app notifications
    - Notification preferences
    - Unsubscribe management
    - Email analytics
  Projects built:
    - Email service
```

```
      - Notification system
      - Marketing automation
    Practice: Implement 5 notification channels
    Tools:
      - Nodemailer
      - SendGrid
      - Bull queue
  Caching & Performance
    Topics:
      - Caching strategies and patterns
      - Redis setup and operations
      - Memory caching with Node.js
      - Database query optimization
      - API response caching
      - CDN caching strategies
      - Session store with Redis
      - Rate limiting with Redis
      - Queue implementation
      - Performance monitoring
      - Load testing
      - Optimization techniques
    Projects built:
      - Caching layer implementation
      - Performance optimization
      - Load testing suite
    Practice: Optimize 5 slow endpoints
    Tools:
      - Redis
      - Artillery
      - New Relic

Month 9: GraphQL, Testing & Security (Weeks 37-39)
  GraphQL Backend
    Topics:
      - GraphQL server setup
      - Schema definition
      - Resolvers implementation
      - Mutations and queries
      - Subscriptions setup
      - DataLoader for N+1 problem
      - Authentication in GraphQL
      - File uploads in GraphQL
      - Error handling
      - Testing GraphQL APIs
      - Federation setup
      - Performance optimization
    Projects built:
      - GraphQL API server
      - Subscription service
      - Federated GraphQL
    Practice: Build 3 GraphQL APIs
    Tools:
      - Apollo Server
      - GraphQL Playground
      - DataLoader
  Testing & Quality Assurance
    Topics:
      - Testing strategies for Node.js
      - Unit testing with Jest
      - Integration testing
      - API testing with Supertest
      - Database testing strategies
      - Mocking and stubbing
      - Test coverage reports
      - End-to-end testing
      - Load testing
      - Security testing
      - Continuous testing
      - TDD and BDD approaches
    Projects built:
      - Complete test suite
      - CI/CD pipeline with tests
      - Load testing scenarios
    Practice: Write 200+ tests
    Tools:
      - Jest
      - Supertest
      - Sinon
  Security & Compliance
```

```
      Topics:
        - OWASP Top 10 for Node.js
        - SQL injection prevention
        - NoSQL injection prevention
        - Input validation and sanitization
        - Rate limiting strategies
        - DDoS protection
        - Helmet.js configuration
        - CORS setup and security
        - Environment variables security
        - Secrets management
        - GDPR compliance
        - PCI DSS basics
      Projects built:
        - Security audit
        - Compliance implementation
        - Penetration testing prep
      Practice: Secure 5 applications
      Assessment: Phase 3 exam: a practical build defended live, plus a written paper mixing
      this phase with everything before it
      Tools:
        - Helmet.js
        - Express-validator
        - OWASP ZAP

---------------------------------------------------------------
PHASE 4: THE FINALE (MONTH 10, WEEKS 40-44)
---------------------------------------------------------------
The capstone month: spec, build, ship and defend, then the final exam that decides the
certificate.

  Month 10: Capstone and the Final Exam (Weeks 40-44)
    Capstone Spec and Setup
      Topics:
        - Choosing the capstone: a complete MERN product: social app, marketplace-lite or productivity
          tool
        - A one-page spec: scope, milestones, stack
        - Repository and skeleton ready on day one
        - Instructor sign-off before the build begins
      Projects built:
        - Approved capstone spec plus the running skeleton, deployed where applicable
      Practice: Pitch the spec to the batch and absorb one hard question
    Capstone Build
      Topics:
        - Two focused weeks in vertical slices
        - Instructor checkpoints and honest scope cuts
        - Using the whole course: React patterns, Express API design, MongoDB modeling and safe auth
          end to end
        - Daily commits and an always-working build
      Projects built:
        - The capstone, feature-complete with version control
      Practice: A working build at the end of every session
    Ship and Polish
      Topics:
        - The finishing pass: edge cases, errors, documentation
        - One-product pass: both halves deployed, wired and behaving as one
        - A README worth reading and a demo worth watching
        - A full-course spiral review before the exam
      Projects built:
        - The capstone shipped, documented and rehearsed
      Practice: Two mock demos, each tighter than the last
    Demo Day and the Final Exam
      Topics:
        - Presenting the capstone: live demo plus the hardest bug story
        - The honest map of next roads: full-stack roles, TypeScript across the stack, or backend depth
        - Where our other courses continue the journey
      Projects built:
        - Demo day presentation delivered to the batch
      Assessment: FINAL EXAM: a practical build plus a written paper with questions mixed
      from every phase. Passing earns the certificate; falling short earns a focused revision
      plan and a free retest

PROJECTS THE STUDENT BUILDS AND KEEPS

  - Phase 1: JavaScript builds and deployed foundations
  - Phase 2: production-patterned React applications
  - Phase 3: Express APIs with MongoDB and safe authentication
  - Phase 4: the full MERN capstone, deployed and defended
```

Total projects: 20+ real builds, crowned by a deployed full-stack MERN capstone

SKILLS THE STUDENT WILL HAVE AT THE END

- JavaScript depth on both ends of the stack
- React with production patterns: state, data and honest loading states
- Node and Express: APIs designed and documented professionally
- MongoDB: modeling with judgment, not just Mongoose incantations
- Full-stack integration: auth, contracts and deployment as one product

HOW A TYPICAL WEEK IS SPLIT

Live classes: 2 live one-hour classes per week, coding along with the instructor
Homework: A problem set after every class, and a mixed-review assignment at the end of every month
Practice: 4-6 hours of building between classes
Review: Every submission reviewed with written feedback; recurring gaps reopened in class

SUPPORT INCLUDED

Doubt support: WhatsApp doubt support between classes
Progress updates: Honest monthly progress reviews: what is solid, what is wobbly, and the plan for the wobble

CERTIFICATION DETAIL

Completion: Certificate from Modern Age Coders, awarded on passing the final exam. Fall short and there is focused revision and a free retest: the certificate certifies knowledge, not attendance

WHERE THIS CAN LEAD

- Full-stack roles: MERN remains a hiring staple, especially in product companies
- TypeScript across the stack: our TypeScript course is the natural upgrade
- Backend depth: from Express patterns into production architectures
- DSA for the interview rounds beside the portfolio

EARNING POTENTIAL (share only if asked, and never promise it)

Market context: The ranges below are general market salary bands for these roles in India and abroad, drawn from public industry data. They are shown for career context only and are not a promise or guarantee of income. Actual pay depends on your skills, experience, location, and the job market.
Early career roles: Rs 3-5 LPA (Junior Frontend)
Growing roles: Rs 5-10 LPA (React Developer); Rs 8-15 LPA (Full Stack)
Experienced roles: Rs 12-25+ LPA (Senior MERN)
Freelance: Rs 1,000-5,000/hour
International: $60k-150k+ USD

COMMON QUESTIONS ABOUT THIS COURSE

For anything about cost, use PART 4 and RULE 1. Do not quote two regions.

Q: What does this MERN stack course cover?
A: The full JavaScript product craft in order: web and JavaScript foundations, React with production patterns, then Node and Express APIs designed professionally, MongoDB modeled with judgment, authentication done safely, and full-stack integration where the halves become one deployed product. A finale month ships a complete MERN capstone and sits the final exam.

Q: How long does it take to learn the MERN stack properly?
A: Ten months of teaching at 2 live classes a week plus 4 to 6 hours of practice, with two more months in hand for learners who need them. The three teaching phases build the skill and its real-world application; the finale month ships a capstone and sits the final exam.

Q: How am I assessed? Is the certificate just for attending?
A: No. Problem sets follow every class with written feedback, monthly reviews deliberately mix new material with earlier topics, each phase ends with a cumulative exam, and the course ends with a final exam: a practical build plus written questions from the whole syllabus. Passing earns the certificate; falling short earns focused revision and a free retest.

Q: Is MERN still relevant, or should I learn Next.js instead?
A: Both, in order: MERN teaches the separated architecture that makes you understand what frameworks like Next.js later collapse for convenience. Job listings still name MERN constantly, and a developer who owns this stack picks up Next.js in a week, the reverse is rarely true. Our React and full-stack courses cover the Next.js road explicitly.

Q: Can I try a class before enrolling?
A: Yes, a free demo class with no commitment: book at learn.modernagecoders.com/contact or message us on WhatsApp at +91 91233 66161. (Agent note: the free demo is a waiting list with

no fixed date. The Priority Live Demo is a guaranteed class today or tomorrow, booked at https://learn.modernagecoders.com/priority-demo . Offer both, as RULE 3 says.)

Q: Are classes live or recorded?
A: Live, always: small groups with a real instructor reading your actual code, never pre-recorded videos.

To enrol, message Shivam Sir on +91 9123366161 or send the parent this link: https://learn.modernagecoders.com/courses/mern-stack-development-masterclass-college
For a demo: the Priority Live Demo (guaranteed, today or tomorrow) is booked at https://learn.modernagecoders.com/priority-demo . The free demo is a waiting list with no fixed date.

==========
COURSE 98 OF 137: MICROSOFT OFFICE FOR KIDS: WORD, POWERPOINT AND EXCEL
==========

Course link: https://learn.modernagecoders.com/courses/microsoft-office-kids-mastery
Subject area: Digital Skills for Kids
Designed for: Kids
Who can join: Complete beginner, ages 7 to 12
Course length: 5-6 months (20-24 weeks)
Time needed: 2 live classes/week + 1-2 hours practice
Certificate: Certificate from Modern Age Coders, awarded on passing the final exam

PRICE FOR THIS COURSE (quote only the one that applies to the person asking)
In India, per month: group Rs 1,499, mini batch Rs 2,999, one to one Rs 4,999
In Canada, per month: group CAD 140, one to one CAD 210
Anywhere else, per month: group $100, one to one $150
Classes: group and mini batch two live classes a week, eight a month; one to one in India one live class a week, four a month; one to one outside India two live classes a week, eight a month. Each class is one hour.

WHAT THIS COURSE IS

Microsoft Office course for kids aged 7-12: live online classes for Word, PowerPoint, Excel, OneNote and Teams. School-ready digital skills in 5-6 months.

In one line: The digital skills school quietly assumes: real Word documents, presentations that earn applause, first spreadsheets, and tidy digital habits, learned properly at 7 to 12.

ABOUT THE PROGRAMME

Schools assume children can format a document, build a presentation and manage their files, but nobody actually teaches it. This live online course does, properly, for children aged 7 to 12: Windows fundamentals and tidy file habits, digital art with the built-in creative tools, real Microsoft Word skills, PowerPoint presentations with restraint and style, first Excel spreadsheets with formulas and charts, and OneNote and Teams, the tools their school life increasingly runs on. Everything is project-based: children produce school reports, posters, family newsletters, quiz presentations, pocket-money trackers and a final integrated project they present at demo day. The pace is honest and kid-sized: five months of teaching at two live classes a week, with a sixth month in hand for children who need more practice. Classwork in every session, a small homework task after every class, a mixed challenge at each month's end, and a final exam, a project demo plus a friendly practical test, that decides the certificate. Real skills, really tested, immediately useful at school.

WHAT MAKES THIS COURSE DIFFERENT

- Project-based from week one: real school reports, presentations and trackers, not button tours
- Current tools, honestly taught: Windows 11, the free Office web apps, Photos and Clipchamp, no outdated software
- Typing and file hygiene built in: the quiet skills that make every later computer subject easier
- Kid-sized honest pace: 5 months at 2 classes a week, with a 6th month in hand when needed
- Real assessment, gently done: monthly mixed challenges and a final practical exam that decides the certificate, with a free retest after revision
- Small live batches capped at 10, grouped by age, with mini-batch and 1-on-1 options

THE LEARNING PATH, STEP BY STEP

Month 1: Windows and creativity (Weeks 1-4): computer confidence, tidy files, and digital art with Paint, Photos and Clipchamp
Month 2: Word (Weeks 5-8): documents that look professional, from formatting to images and tables
Month 3: PowerPoint (Weeks 9-12): presentations with real design sense, animation used with restraint
Month 4: Excel (Weeks 13-16): first spreadsheets, formulas, charts and honest data thinking
Month 5: OneNote, Teams and the finale (Weeks 17-20): school organization, collaboration, one

integrated project, and the final exam

WHAT A STUDENT NEEDS BEFORE STARTING

Computer experience: None. The course starts at the desktop and the mouse
Reading: Basic reading ability
Equipment: A Windows computer or laptop with internet. The free Office web apps are enough; desktop Office is used where the family already has it
Age: 7 to 12. Batches are grouped by age
Time commitment: 2 live classes plus 1-2 hours of practice a week

WHO THIS COURSE IS FOR

School students: Kids aged 8-14 who need computer skills for school projects
Digital beginners: Children with little or no computer experience
Presentation skills: Students who want to create impressive school presentations
Future professionals: Kids building early professional digital literacy skills
Homeschoolers: Families wanting structured digital skills education

FULL CURRICULUM, WEEK BY WEEK

This is the complete teaching plan. Parents can ask about any week.

MONTH 1: WINDOWS BASICS & DIGITAL ART

Windows fundamentals, tidy file habits, and creative confidence with Paint, Photos and Clipchamp.

Introduction to Windows & Computer Basics
Topics:
- Computer components: monitor, keyboard, mouse, CPU
- Turning computer on/off properly
- Windows 11 desktop overview
- Start menu navigation
- Taskbar features and customization
- Desktop icons and shortcuts
- Mouse skills: click, double-click, right-click, drag
- Keyboard basics: letters, numbers, special keys
- Caps Lock, Shift, Enter, Backspace, Delete
- Windows key shortcuts introduction
- Volume and brightness controls
- Connecting to WiFi networks
Projects built:
- Customize desktop wallpaper and theme
- Create desktop shortcuts
- Organize taskbar with favorite apps
- Personal desktop setup
Practice: Practice starting up and shutting down the computer the right way, then pin your three favorite apps to the taskbar and show a parent.

File Management & Organization
Topics:
- Understanding files and folders
- File Explorer navigation
- Creating new folders
- Naming conventions for files
- Moving and copying files
- Cut, copy, paste operations
- Deleting and Recycle Bin
- Searching for files
- File types and extensions
- Organizing Downloads folder
- Creating folder structures
- File properties and details
- Compressing files with ZIP
- OneDrive basics and cloud storage
Projects built:
- Create organized folder system for schoolwork
- Digital filing cabinet setup
- Photo organization project
- Backup important files
Practice: Create a folder tree for your school subjects and sort five files into the right folders using cut, copy and paste.

Microsoft Paint Fundamentals
Topics:
- Opening and navigating Paint
- Drawing tools: pencil, brushes, shapes

- Color palette and custom colors
- Fill tool and color picker
- Line and curve tools
- Shape tools: rectangle, circle, polygon
- Text tool and fonts
- Selection tools and moving objects
- Resize and rotate features
- Zoom in/out for detail work
- Saving in different formats (PNG, JPEG, BMP)
- Image size and canvas size
- Copying and pasting images
- Using Paint for school projects

Projects built:
- Create pixel art characters
- Design birthday card
- Draw house and landscape
- Make school poster
- Create emoji collection

Practice: Draw your dream treehouse in Paint using at least four different tools and the fill bucket.

Photos, Clipchamp and Creative Projects

Topics:
- Editing pictures with the Windows Photos app
- Cropping, lighting and honest photo fixes
- Clipchamp: first video edits with clips and titles
- Adding music and simple transitions
- Making a family slideshow video
- Screenshots and the Snipping Tool
- Saving projects where you can find them again
- A creative mini-showcase for the family

Projects built:
- Edited photo set: before and after
- A 60-second family slideshow video in Clipchamp

Practice: Make one tiny video about your week

Assessment: Month 1 check: a files-and-creativity challenge mixing everything so far

---

MONTH 2: MICROSOFT WORD MASTERY

Become a Word expert, creating professional documents, reports, and creative writing projects.

Word Basics & Text Formatting

Topics:
- Opening Microsoft Word and interface tour
- Creating new documents
- Ribbon interface explanation
- Quick Access Toolbar customization
- Typing and text selection techniques
- Font types and sizes
- Bold, italic, underline formatting
- Text color and highlighting
- Alignment: left, center, right, justify
- Line spacing and paragraph spacing
- Bullets and numbering
- Indentation and tabs
- Copy, cut, paste operations
- Undo and redo features
- Saving documents and file formats

Projects built:
- Write and format a story
- Create class notes template
- Design invitation letter
- Format poem with styling

Practice: Type a short paragraph about your favorite animal in Word and format it with two fonts, one color and bold key words.

Advanced Formatting & Page Layout

Topics:
- Page setup: margins, orientation, size
- Headers and footers
- Page numbers and formatting
- Section breaks and page breaks
- Columns for newsletters
- Borders and shading
- Watermarks and page color
- Themes and style sets
- Creating and using styles

- Table of contents generation
- Cover pages and templates
- Drop caps and special effects
- Text boxes and positioning
- WordArt for titles
- Page borders and art

Projects built:
- Create school newsletter
- Design book report template
- Make professional letter
- Build recipe book layout

Practice: Make a one page mini newsletter about your week using two columns, a header and a page border.

Working with Images & Graphics

Topics:
- Inserting pictures from computer
- Online pictures and stock images
- Picture formatting and styles
- Cropping and resizing images
- Picture effects and corrections
- Text wrapping options
- SmartArt graphics creation
- Charts and graphs in Word
- Shapes and drawing tools
- Icons and 3D models
- Screenshots and screen clipping
- Arranging multiple objects
- Grouping and ungrouping
- Captions for images
- Compress pictures for file size

Projects built:
- Illustrated story book
- Science project report with diagrams
- Travel brochure with images
- How-to guide with screenshots

Practice: Insert three pictures into a 'My Hobbies' document, then crop one, style another and wrap text around the third.

Tables, References & Collaboration

Topics:
- Creating tables from scratch
- Table styles and formatting
- Adding/deleting rows and columns
- Merging and splitting cells
- Table calculations and formulas
- Converting text to tables
- Footnotes and endnotes
- Citations and bibliography
- Hyperlinks and bookmarks
- Track changes feature
- Comments and reviewing
- Comparing documents
- Sharing and co-authoring
- Protecting documents
- Printing options and preview

Projects built:
- Class schedule table
- Research paper with citations
- Collaborative story writing
- Data comparison report

Practice: Build your weekly class timetable as a Word table and give the header row its own color.

Assessment: Month 2 check: format a document live from a messy draft, plus a mixed quiz reaching back to month 1

MONTH 3: POWERPOINT PRESENTATION EXCELLENCE

Master the art of creating engaging, professional presentations with PowerPoint.

PowerPoint Fundamentals

Topics:
- PowerPoint interface overview
- Slide layouts and placeholders
- Adding new slides
- Slide themes and variants
- Text formatting in slides
- Bullet points and numbering

- Slide backgrounds and fills
- Color schemes and fonts
- Slide master basics
- Notes and comments
- Outline view for planning
- Slide sorter view
- Saving presentations
- PowerPoint file formats
- Presenter view introduction

Projects built:
- About Me presentation
- Book report slideshow
- Science topic presentation
- Family photo album

Practice: Create a four slide PowerPoint about your favorite place using one theme and tidy bullet points.

Animations & Transitions

Topics:
- Slide transitions types
- Transition timing and duration
- Transition sounds
- Animation basics
- Entrance animations
- Emphasis animations
- Exit animations
- Motion path animations
- Animation pane control
- Animation timing and delay
- Animation triggers
- Combining multiple animations
- Morph transition feature
- 3D models animation
- Creating smooth flows

Projects built:
- Animated story presentation
- Kinetic typography project
- Science process animation
- Interactive quiz show

Practice: Add a different transition to each slide of your deck and give the title text an entrance animation.

Multimedia & Interactive Elements

Topics:
- Inserting images and graphics
- Photo albums in PowerPoint
- Video insertion and editing
- Video playback options
- Audio and music addition
- Recording narration
- Screen recording feature
- Creating hyperlinks
- Action buttons
- Interactive navigation
- Zoom feature for emphasis
- Embedding web content
- Charts and graphs
- SmartArt in presentations
- QR codes in slides

Projects built:
- Video presentation project
- Interactive story with choices
- Virtual tour presentation
- Music video slideshow

Practice: Add a photo album slide, one short video and a little background music to your presentation.

Advanced Design & Presenting

Topics:
- Slide Master customization
- Creating custom layouts
- Design Ideas feature
- Icons and stock images
- 3D models and rotation
- Cameo (PowerPoint Live)
- Presenter Coach feature
- Rehearse with Coach
- Live captions and subtitles
- Translation features

- Broadcasting presentations
- Export options (video, PDF, etc.)
- PowerPoint Designer AI
- Accessibility checker
- Mobile presenting

Projects built:
- Professional pitch deck
- Educational tutorial
- Digital portfolio
- Conference presentation

Practice: Design a custom layout in Slide Master, then rehearse presenting your deck out loud for two minutes.

Assessment: Month 3 check: build and present three slides live, with mixed questions from earlier months

---

MONTH 4: EXCEL AND DATA SKILLS

Learn spreadsheet basics, data management, charts, and basic formulas with Excel.

Excel Basics & Data Entry

Topics:
- Excel interface and terminology
- Workbooks and worksheets
- Cells, rows, and columns
- Selecting cells and ranges
- Entering text and numbers
- AutoFill feature
- Number formats (currency, percentage, date)
- Cell formatting and styles
- Column width and row height
- Inserting and deleting rows/columns
- Copy, cut, paste special
- Find and replace
- Freeze panes
- Splitting windows
- Worksheet tabs management

Projects built:
- Class grade tracker
- Personal budget sheet
- Chore chart with dates
- Sports statistics table

Practice: Enter a pretend week of family fruit shopping into Excel and use AutoFill to complete the days of the week.

Formulas & Functions

Topics:
- Understanding formulas
- Basic arithmetic operations (+, -, *, /)
- Cell references (relative vs absolute)
- SUM function
- AVERAGE function
- COUNT and COUNTA
- MIN and MAX functions
- IF statements basics
- AutoSum feature
- Function wizard
- Formula bar usage
- Order of operations
- Copying formulas
- Common formula errors
- Simple problem solving

Projects built:
- Grade calculator with average
- Shopping budget calculator
- Simple game scorecard
- Time tracking sheet

Practice: Track your pocket money for an imaginary week, then total it with SUM and find the daily average with AVERAGE.

Charts & Data Visualization

Topics:
- Types of charts (column, line, pie)
- Creating charts from data
- Chart elements and parts
- Chart styles and colors
- Chart titles and labels
- Legend positioning
- Data labels addition

- Changing chart types
- Sparklines for mini charts
- Combination charts
- 3D chart effects
- Chart templates
- Printing charts
- Charts in other Office apps
- Infographic creation

Projects built:
- Weather data visualization
- Survey results charts
- Growth tracking chart
- Game statistics dashboard

Practice: Turn your favorite game or sports scores into a column chart and a pie chart, each with a proper title and labels.

Data Management & Analysis

Topics:
- Sorting data A-Z, Z-A
- Custom sort orders
- Filter data basics
- AutoFilter features
- Conditional formatting
- Data bars and color scales
- Icon sets for visual cues
- Tables in Excel
- Table styles and formatting
- PivotTable basics (introduction)
- Data validation rules
- Drop-down lists creation
- Protecting cells and sheets
- Sharing and collaboration
- Import/export data

Projects built:
- Student database
- Inventory tracking system
- Event planning spreadsheet
- Analysis report with visuals

Practice: Sort a list of ten pretend test scores from highest to lowest and use conditional formatting to highlight the top three.

Assessment: Month 4 check: a mini spreadsheet challenge with formulas and one chart, plus mixed revision

---

MONTH 5: ONENOTE, TEAMS AND THE GRAND FINALE

The organizational tools school life runs on, one integrated project that uses everything, and the final exam.

OneNote Digital Notebook

Topics:
- OneNote interface overview
- Notebooks, sections, and pages
- Creating notebook structure
- Typing and formatting notes
- Handwriting and drawing
- Inserting images and files
- Audio and video recording
- Screen clipping tool
- Tags for organization
- Search functionality
- To-do lists and checkboxes
- Tables in OneNote
- Math equations
- Syncing across devices
- Sharing notebooks

Projects built:
- Digital school binder
- Research project notebook
- Personal journal/diary
- Study guide creation

Practice: Set up a OneNote notebook with one section per school subject and fill one page with notes plus a small drawing.

Microsoft Teams for Students

Topics:
- Teams interface navigation
- Joining and creating teams
- Channels and conversations

- Chat features and etiquette
- Video calls and meetings
- Screen sharing basics
- File sharing in Teams
- Assignments submission
- Calendar integration
- Together mode and backgrounds
- Breakout rooms
- Meeting recordings
- Live events basics
- Teams mobile app
- Notifications management

Projects built:
- Class collaboration project
- Virtual study group setup
- Team presentation delivery
- Digital club meeting

Practice: With a parent, practice joining a video call, sending one polite chat message and sharing your screen for a minute.

The Integrated Project

Topics:
- Mail merge Word with Excel
- Embedding Excel charts in Word
- PowerPoint with Excel data
- OneNote integration with Office
- Teams assignments workflow
- Creating templates library
- Macro basics (introduction)
- Quick Parts and building blocks
- Custom ribbons basics
- Office themes consistency
- Cloud synchronization
- Version history usage
- Co-authoring features
- Office mobile apps
- Office on the web

Projects built:
- Newsletter with mail merge
- Report with live Excel data
- Integrated presentation package
- Complete project workflow

Practice: Embed an Excel chart of your scores or savings into a Word report and write two sentences explaining what it shows.

Final Exam and Demo Day

Topics:
- Project planning and scope
- Requirements gathering
- Timeline creation
- Resource planning
- Design documentation
- Development phases
- Testing and revision
- User feedback incorporation
- Final polishing
- Presentation preparation
- Documentation writing
- Reflection and learning

Practice: Write a mini plan for your final project: what you will make, which Office apps you will use and your three work sessions.

Deliverables:
- Complete project files
- Documentation package
- Presentation deck
- Video demonstration
- Reflection report

Assessment: FINAL EXAM: a practical test across Word, PowerPoint and Excel plus the integrated project demo. Passing earns the certificate; a child who falls short gets focused revision and a free retest

PROJECTS THE STUDENT BUILDS AND KEEPS

- Month 1: a tidy personal folder system, edited photos and a first Clipchamp video
- Month 2: a school report, a poster and a family newsletter in Word
- Month 3: a hobby presentation and an animated quiz in PowerPoint
- Month 4: a pocket-money tracker and a class survey with charts in Excel
- Month 5: a OneNote study notebook and the integrated final project

Total projects: 20+ real documents, presentations, spreadsheets and videos

SKILLS THE STUDENT WILL HAVE AT THE END

- Windows confidence: files, folders, shortcuts and calm problem-solving
- Word: formatting, images, tables and documents that look professional
- PowerPoint: clear slides, tasteful animation and confident presenting
- Excel: data entry, formulas, functions and honest charts
- OneNote and Teams: the organization tools school increasingly runs on
- Creative tools: photo editing and first video edits with free built-in apps
- Typing and digital habits that make every later computer subject easier

HOW A TYPICAL WEEK IS SPLIT

Live classes: 2 live one-hour classes per week, building along with the teacher
Homework: A small homework task after every class, and a mixed challenge at the end of every month
Practice: 1-2 hours of practice between classes, structured as real little projects
Review: Every submitted piece gets teacher feedback; wobbly skills are reopened in class

SUPPORT INCLUDED

Doubt support: WhatsApp doubt support between classes for stuck homework
Progress updates: Regular progress notes to parents: what was learned, what comes next, and how to encourage practice

CERTIFICATION DETAIL

Completion: Certificate from Modern Age Coders, awarded on passing the final exam, a practical test plus a project demo. A child who falls short gets focused revision and a free retest: the certificate certifies skills, not attendance

WHERE THIS CAN LEAD

- Digital Content Creator
- Student Technology Leader
- Office Productivity Expert
- Data Analysis Beginner
- Professional Document Designer
- Ready for advanced coding or design courses

COMMON QUESTIONS ABOUT THIS COURSE

For anything about cost, use PART 4 and RULE 1. Do not quote two regions.

Q: What will my child learn in this course?
A: Real, school-ready digital skills: Windows confidence and tidy file habits, photo editing and first videos with the free Photos and Clipchamp apps, professional documents in Word, presentations with actual design sense in PowerPoint, first spreadsheets with formulas and charts in Excel, and OneNote and Teams for school organization.

Q: Which age group is this designed for?
A: Ages 7 to 12, with batches grouped by age so the pace and examples fit the room. No prior computer experience is needed; the course starts at the desktop and the mouse and builds up patiently.

Q: How long does it take a child to learn Microsoft Office?
A: To real, school-ready capability: 5 months at 2 live classes a week plus an hour or two of practice. The course keeps a 6th month in hand for children who need more repetition, with no rushing and no penalty. Skills show up at school almost immediately, the first properly formatted report usually appears within month 2.

Q: How is my child assessed? Is the certificate just for attending?
A: No. There is classwork in every session, a small homework task after every class, and a mixed challenge at the end of each month that deliberately revisits earlier skills so they stop fading. The course ends with a final practical exam plus a project demo. Passing earns the certificate; a child who falls short gets focused revision and a free retest. Gentle in tone, real in standard.

Q: Does my child need computer experience before starting?
A: No. Everything builds step by step from there.

Q: What software does my child need at home?
A: A Windows computer with internet is enough. The free Office web versions of Word, PowerPoint, Excel and OneNote cover the whole course, and we use them alongside free built-in tools like Photos, Clipchamp and the Snipping Tool. If your family already has desktop Office or Microsoft 365, your child can use that too; nothing needs to be purchased.

Q: How does this help with school, and what comes next?

A: The skills map directly to schoolwork: essays and reports in Word, class presentations in PowerPoint, and data projects in Excel. Afterwards, many students move into our Scratch or kids coding courses, since comfortable computer use makes learning to code much smoother.

Q: Can my child attend a trial class first?
A: Yes, the first step for every family is a free demo class, booked at learn.modernagecoders.com/contact. There is no commitment attached, and parents can sit in to see exactly how the teacher works with kids. (Agent note: the free demo is a waiting list with no fixed date. The Priority Live Demo is a guaranteed class today or tomorrow, booked at https://learn.modernagecoders.com/priority-demo . Offer both, as RULE 3 says.)

Q: What do the classes look like?
A: Each class is a live 1-hour online session with a real teacher guiding a small group, never a pre-recorded video. Children practice hands-on in the actual software during class and get help the moment they are stuck.

Q: Will my child receive a certificate?
A: Yes, and it is earned: the certificate is awarded on passing the final exam, a practical test across Word, PowerPoint and Excel plus the integrated project demo, with a free retest after revision if the first attempt falls short. Alongside it stands a portfolio of 20+ real documents, presentations and spreadsheets.

To enrol, message Shivam Sir on +91 9123366161 or send the parent this link: https://learn.modernagecoders.com/courses/microsoft-office-kids-mastery
For a demo: the Priority Live Demo (guaranteed, today or tomorrow) is booked at https://learn.modernagecoders.com/priority-demo . The free demo is a waiting list with no fixed date.

==========

COURSE 99 OF 137: MIDDLE SCHOOL MATH COMPETITIONS: MATHCOUNTS, AMC 8 AND MATH KANGAROO PREP

==========

Course link: https://learn.modernagecoders.com/courses/middle-school-math-competitions-course
Subject area: Competition Mathematics & Olympiad Training
Designed for: Middle school
Who can join: Students roughly aged 10 to 14 (grades 5 to 8) who are comfortable with school maths and want more challenge
Course length: 6 months (24 weeks), repeatable as a second season with new problem sets
Time needed: 2 live classes/week + weekly problem sets and timed rounds
Certificate: Certificate from Modern Age Coders, awarded on passing the final assessment

PRICE FOR THIS COURSE (quote only the one that applies to the person asking)
In India, per month: group Rs 1,499, mini batch Rs 2,999, one to one Rs 4,999
In Canada, per month: group CAD 140, one to one CAD 210
Anywhere else, per month: group $100, one to one $150
Classes: group and mini batch two live classes a week, eight a month; one to one in India one live class a week, four a month; one to one outside India two live classes a week, eight a month. Each class is one hour.

WHAT THIS COURSE IS

Live online math competition prep for ages 10 to 14: number theory, counting, algebra and geometry problem solving for MATHCOUNTS, AMC 8 and Math Kangaroo, with timed rounds.

In one line: The problem-solving toolkit behind MATHCOUNTS, the AMC 8 and Math Kangaroo, built idea by idea and tested against the clock.

ABOUT THE PROGRAMME

Middle school math competitions ask for something school maths rarely does: seeing an unfamiliar problem, choosing an idea, and getting it right quickly. The three best-known contests for this age reward the same core toolkit. MATHCOUNTS is a national program for students in grades 6 to 8, with four levels of competition (school, chapter, state and national) and four rounds: the Sprint Round of 30 problems in 40 minutes without a calculator, the Target Round of four pairs of problems with 6 minutes per pair, the Team Round of 10 problems in 20 minutes, and the optional fast-paced Countdown Round. Math Kangaroo USA is a 75-minute multiple-choice test with 30 questions for students in grade 5 and above, scored 3, 4 or 5 points per question with no points taken away for wrong answers. The AMC 8, from the Mathematical Association of America, is a multiple-choice contest for middle school students. This 6-month live course teaches that shared toolkit in a deliberate order: arithmetic and number sense, number theory, algebra and word problems, counting and probability, geometry, then patterns, sequences and logic. Every topic is taught through problems written in the styles of these contests, and every month includes a timed round so speed and accuracy grow together. The final two months are contest craft: Sprint and Countdown speed without a calculator, Target and Team strategy with one, and multiple-choice technique for the AMC 8 and Math Kangaroo. Students keep an error log from the first week, so they learn as much from mistakes as from successes. We teach the mathematics and the habits; we never promise medals or qualification, and families register for each contest through the routes the organisers set.

WHAT MAKES THIS COURSE DIFFERENT

- One toolkit for three contests: MATHCOUNTS, the AMC 8 and Math Kangaroo reward the same core ideas, so students prepare for all three at once
- Topics taught in a deliberate order, from number sense to geometry, so each idea builds on the one before
- A timed round every month, so speed and accuracy are trained together rather than left to the final weeks
- Round-specific craft: no-calculator speed for Sprint and Countdown, calculator strategy for Target and Team, and elimination for multiple-choice tests
- An error log kept from week one, reviewed with the teacher every month
- Problems written in the contest styles, plus the official free sample problems the organisers publish

THE LEARNING PATH, STEP BY STEP

Phase 1: The problem-solving base: number sense, number theory, ratios and rates, and the first counting principles
Phase 2: Core contest topics: probability, geometry from angles to solids, patterns and sequences, remainders and logic
Phase 3: Contest craft: MATHCOUNTS round strategy, multiple-choice technique for the AMC 8 and Math Kangaroo, and full mock contests

WHAT A STUDENT NEEDS BEFORE STARTING

Maths level: Comfortable with school maths at grade level, including fractions, decimals and basic equations. No contest experience needed
Age: Roughly 10 to 14 (grades 5 to 8). Younger students who are strong at maths are welcome after the free demo
Equipment: A device with stable internet for live classes, paper and pencil, and a basic calculator for Target and Team practice
Timing: Joinable any month. Starting several months before a contest leaves time for both the toolkit and the timed mocks

WHO THIS COURSE IS FOR

First time competitors: Students who are good at school maths and want to try their first competition
Returning competitors: Students who have taken part before and want a structured toolkit and stronger timing
School team hopefuls: Students aiming to join or contribute to a school MATHCOUNTS team
Multiple choice contest students: Students preparing for Math Kangaroo or the AMC 8 who want more than past-paper drilling
Curious problem solvers: Children who simply enjoy puzzles and want maths that is harder and more interesting than school

FULL CURRICULUM, WEEK BY WEEK

This is the complete teaching plan. Parents can ask about any week.

PHASE 1: THE PROBLEM-SOLVING BASE (MONTHS 1-2, WEEKS 1-8)

Fast, reliable number work and the first big competition ideas: divisibility, primes, ratios and counting.

Month 1: Number Sense and Number Theory (Weeks 1-4)
Weeks 1-2: Diagnostic, Contest Formats and Fast Arithmetic
Topics:
- A diagnostic round to find each student's starting point
- How MATHCOUNTS, the AMC 8 and Math Kangaroo are structured
- Mental arithmetic shortcuts: compensation, doubling and halving, and multiplying near 100
- Fractions, decimals and percents converted quickly
- Order of operations and careful reading
- Starting an error log

Projects built:
- Personal diagnostic summary with three target topics and an opened error log

Practice: Daily ten-minute arithmetic sprint, with the time and score recorded each day

Weeks 3-4: Primes, Factors and Divisibility
Topics:
- Divisibility rules and why they work
- Prime factorisation and factor trees
- Greatest common divisor and least common multiple
- Counting the factors of a number from its prime factorisation
- Perfect squares and cubes
- Contest problems that hide a factorisation

Projects built:
- Number theory toolkit page: each rule with a worked contest-style example

Practice: A 20-problem number theory set, with the idea used written beside each answer

      Assessment: Month 1 timed round: a short no-calculator round on arithmetic and number theory

  Month 2: Ratios, Word Problems and Counting (Weeks 5-8)
    Weeks 5-6: Ratios, Rates and Algebra Word Problems
      Topics:
        - Ratios and proportions set up from words
        - Rates, work and distance problems
        - Percent change and successive percentages
        - Writing and solving linear equations from a story
        - Averages and how adding a value changes them
        - Checking an answer against the question
      Projects built:
        - Word problem casebook: ten problem types, each with a model solution
      Practice: A 20-problem word problem set, half solved with an equation and half by reasoning
    Weeks 7-8: Counting Basics
      Topics:
        - Making organised lists so nothing is missed or counted twice
        - The multiplication principle
        - Arrangements: permutations of objects in a row
        - Choosing groups: combinations
        - Complementary counting: count what you do not want
        - Venn diagrams for overlapping groups
      Projects built:
        - Counting toolkit page: when to list, multiply, arrange, choose or subtract
      Practice: A 15-problem counting set, each answer checked by a second method where possible
      Assessment: Phase 1 assessment: a timed mixed round covering number theory, word problems and counting

---
PHASE 2: CORE CONTEST TOPICS (MONTHS 3-4, WEEKS 9-16)

Probability, geometry and the patterns and logic questions that appear across all three contests.

  Month 3: Probability and Plane Geometry (Weeks 9-12)
    Weeks 9-10: Probability
      Topics:
        - Probability as favourable outcomes over possible outcomes
        - Dice, coins, cards and spinners
        - Independent events and multiplying probabilities
        - Using counting to find probabilities
        - Complementary probability
        - Simple expected value
      Projects built:
        - Probability lab: run a small experiment, compare it with the calculated answer and explain the difference
      Practice: A 15-problem probability set with a sketch of the sample space for every problem
    Weeks 11-12: Angles, Triangles and Area
      Topics:
        - Angle facts: straight lines, triangles, polygons and parallel lines
        - The Pythagorean theorem and common Pythagorean triples
        - Area of triangles, quadrilaterals and composite shapes
        - Similar triangles and scale factors
        - Adding a helpful line to a diagram
        - Coordinate geometry: distance and area on a grid
      Projects built:
        - Geometry fact sheet with a diagram for every fact
      Practice: A 15-problem geometry set, redrawing each diagram to scale before solving
      Assessment: Month 3 timed round: probability and geometry, with a written review of every miss

  Month 4: Circles, Solids, Patterns and Logic (Weeks 13-16)
    Weeks 13-14: Circles and Solids
      Topics:
        - Circumference, area, arcs and sectors
        - Shaded-region problems
        - Surface area and volume of prisms, cylinders, pyramids and cones
        - Nets and cube-counting puzzles
        - Visualising folds, rotations and views of solids
        - Exact answers in terms of pi
      Projects built:
        - Shaded-region and solids casebook with ten worked problems
      Practice: A 15-problem circles and solids set, with exact answers left in terms of pi
    Weeks 15-16: Patterns, Sequences, Remainders and Logic
      Topics:

- Arithmetic sequences and the sum of the first n terms
- Spotting and proving simple patterns
- Units digits and remainders in long calculations
- Number bases beyond ten
- Logic puzzles: truth-tellers, ordering and elimination grids
- Visual reasoning puzzles of the kind Math Kangaroo is known for

Projects built:

- Patterns and logic casebook, with a one-line explanation of why each pattern holds

Practice: A mixed set of patterns, remainders and logic puzzles, half with a timer and half without

Assessment: Phase 2 assessment: a timed mixed round across all topics so far

---

PHASE 3: CONTEST CRAFT AND MOCK CONTESTS (MONTHS 5-6, WEEKS 17-24)

Turning knowledge into results on the day: round-by-round strategy for MATHCOUNTS, multiple-choice technique for the AMC 8 and Math Kangaroo, and full mock contests.

Month 5: MATHCOUNTS Round Strategy (Weeks 17-20)

Weeks 17-18: Sprint and Countdown Speed

Topics:

- Sprint Round pacing: 30 problems in 40 minutes without a calculator
- Which problems to bank first and which to return to
- Mental shortcuts that save seconds on common problem types
- Countdown Round practice: answering against a short per-problem clock
- Staying accurate when going fast
- Reviewing a sprint: speed errors versus knowledge errors

Projects built:

- Two timed Sprint-style rounds with a personal pacing plan written after each

Practice: One Sprint-style round a week under exact timing, with every miss logged

Weeks 19-20: Target and Team Strategy

Topics:

- Target Round pacing: pairs of problems in 6 minutes
- Using a calculator well, and knowing when not to
- Showing enough working to check an answer quickly
- Team Round: 10 problems in 20 minutes, splitting and checking work
- Communicating clearly in a team
- Practising with the organisers' free sample problems

Projects built:

- Full MATHCOUNTS-style mock: Sprint, Target and Team rounds, with a written review

Practice: One Target-style set and one team problem set each week

Assessment: Month 5 assessment: the full MATHCOUNTS-style mock, reviewed round by round

Month 6: Multiple-Choice Craft and Mock Contests (Weeks 21-24)

Weeks 21-22: Multiple-Choice Technique for the AMC 8 and Math Kangaroo

Topics:

- Using the answer choices: elimination, estimation and testing values
- Spotting the trap answer a common mistake produces
- Math Kangaroo scoring: 3, 4 and 5-point questions and no penalty for wrong answers
- Pacing a 75-minute, 30-question Math Kangaroo paper
- Planning time for a multiple-choice contest and checking marked answers
- Reading each organiser's current rules before the contest

Projects built:

- Timed multiple-choice mock papers in the AMC 8 and Math Kangaroo styles, with written reviews

Practice: One timed multiple-choice paper a week and a written plan for the next one

Weeks 23-24: Final Mocks and the Next Season

Topics:

- A final mixed mock contest under exact timing
- Error log review: the five fixes that matter most
- Contest-day routine: sleep, materials and nerves
- How to keep practising between contests
- Planning the next season or moving toward high school contests
- Presenting a favourite problem and its solution to the class

Projects built:

- Final mock contest and a personal next-season plan based on the error log

Practice: Write a full solution to your favourite problem of the course, explained for a younger student

Assessment: Final assessment: a mixed mock contest plus a short conversation on method choices

PROJECTS THE STUDENT BUILDS AND KEEPS

- Diagnostic summary and error log kept all course
- Number theory and counting toolkit pages
- Word problem, geometry, solids and logic casebooks
- Probability lab write-up
- Full MATHCOUNTS-style mock with a round-by-round review
- Timed multiple-choice mock papers with written reviews
- Personal next-season plan

Total projects: A complete contest kit: toolkit pages, casebooks, an error log and reviewed mock rounds

SKILLS THE STUDENT WILL HAVE AT THE END

- Fast, accurate arithmetic and estimation without a calculator
- Number theory: primes, factors, divisibility, remainders and bases
- Counting and probability: lists, arrangements, choices and complements
- Algebra and word problems: ratios, rates, percents and equations
- Geometry: angles, triangles, area, circles, solids and coordinates
- Patterns, sequences and logic puzzles
- Round-by-round contest strategy and multiple-choice technique

HOW A TYPICAL WEEK IS SPLIT

Live classes: 2 live one-hour classes per week, with problems solved together and individually
Practice: A problem set after every class, with core and stretch problems
Review: Problem sets and timed rounds reviewed with written comments, and the error log checked monthly

SUPPORT INCLUDED

Doubt support: WhatsApp doubt support between classes, with hints first and full solutions after a real attempt
Progress updates: A monthly progress note to parents with timed-round results and next steps

CERTIFICATION DETAIL

Completion: Certificate from Modern Age Coders, awarded on passing the final assessment. Fall short and there is focused revision and a free retest: the certificate certifies real learning, not attendance

WHERE THIS CAN LEAD

- A second season of this course with new problem sets, aimed at the next contest year
- Our Olympiad Mathematics course, for proof-based problems and high school contests
- Algebra and high school maths courses, started with a strong problem-solving base
- Coding courses, where the same logical habits carry straight into programming
- School maths clubs and team competitions, joined with real preparation

COMMON QUESTIONS ABOUT THIS COURSE

For anything about cost, use PART 4 and RULE 1. Do not quote two regions.

Q: Which contests does this course prepare for?
A: MATHCOUNTS, the AMC 8 and Math Kangaroo. All three reward the same core ideas: number theory, counting and probability, algebra, geometry and logic. The course teaches that toolkit, then adds round-specific strategy for MATHCOUNTS and multiple-choice technique for the AMC 8 and Math Kangaroo.

Q: What are the MATHCOUNTS rounds?
A: MATHCOUNTS has four rounds. The Sprint Round is 30 problems in 40 minutes without a calculator. The Target Round gives four pairs of problems, with 6 minutes per pair and a calculator assumed. The Team Round is 10 problems in 20 minutes, taken officially by a school's four-student team. The Countdown Round focuses on speed and accuracy, with a maximum of 45 seconds per problem and no calculator,, optional at the school, chapter and state levels.

Q: How does Math Kangaroo work?
A: Math Kangaroo is a 75-minute multiple-choice test. Students in grade 5 and above answer 30 questions; a third are worth 3 points, a third 4 points and a third 5 points, and no points are taken away for wrong answers. In the USA the individual competition is held in March, organised through Math Kangaroo centers.

Q: What about the AMC 8?
A: The AMC 8 is a multiple-choice contest for middle school students run by the Mathematical Association of America. The course covers the topics and multiple-choice technique it rewards. Contest dates, format details and registration routes are set by the MAA each year, so check its official page for the current rules.

Q: How do we register for these contests?
A: MATHCOUNTS works through registered schools, and students whose school does not take part can register as non-school competitors. Math Kangaroo is organised through its own centers. The AMC 8 is offered through schools and other hosts as the MAA sets out. We are happy to explain the options during the demo.

Q: Is my child ready for this course?
A: The course suits students roughly aged 10 to 14 who are comfortable with school maths and

enjoy a challenge. They do not need contest experience. The first-week diagnostic shows where to start, and problem sets have core and stretch problems so both newer and more experienced students are stretched.

Q: How is this different from your Olympiad Mathematics course?
A: Our Olympiad Mathematics course is for older, stronger students working toward proof-based olympiad problems and high school contests. This course is the step before: the problem-solving toolkit and contest habits for middle school competitions. Students who finish it and enjoy competition maths often move on to the olympiad course.

Q: Will this guarantee a medal or a place at nationals?
A: No, and we would not promise it. Results depend on the student, the contest and the day. What the course gives is a solid toolkit, regular timed practice and an honest error log, so you can see real progress month by month.

Q: How are the classes run?
A: Live online classes, twice a week, with a real teacher, in a group of 15 to 20 students, a mini batch of up to 6, or one to one. Current fees for your region are shown in the pricing section of this page.

Q: Can we try a class first?
A: Yes. Book a free demo class. The teacher works through a few contest-style problems with your child, sees how they think, and suggests whether group, mini batch or one-to-one classes fit best. There is no obligation to enrol. (Agent note: the free demo is a waiting list with no fixed date. The Priority Live Demo is a guaranteed class today or tomorrow, booked at https://learn.modernagecoders.com/priority-demo . Offer both, as RULE 3 says.)

To enrol, message Shivam Sir on +91 9123366161 or send the parent this link: https://learn.modernagecoders.com/courses/middle-school-math-competitions-course
For a demo: the Priority Live Demo (guaranteed, today or tomorrow) is booked at https://learn.modernagecoders.com/priority-demo . The free demo is a waiting list with no fixed date.

==========

COURSE 100 OF 137: MIDDLE SCHOOL MATHEMATICS MASTERY: PRE-ALGEBRA & GEOMETRY

==========

Course link: https://learn.modernagecoders.com/courses/comprehensive-middle-school-mathematics-mastery
Subject area: Middle School Mathematics Education
Designed for: Girls only batches, Middle school
Who can join: Complete Beginner to Advanced Middle School Level
Course length: 12-14 months (52-60 weeks)
Time needed: 2 live classes/week + 3-5 hours practice
Certificate: Certificate from Modern Age Coders, awarded on passing the final exam

PRICE FOR THIS COURSE (quote only the one that applies to the person asking)
In India, per month: group Rs 1,499, mini batch Rs 2,999, one to one Rs 4,999
In Canada, per month: group CAD 140, one to one CAD 210
Anywhere else, per month: group $100, one to one $150
Classes: group and mini batch two live classes a week, eight a month; one to one in India one live class a week, four a month; one to one outside India two live classes a week, eight a month. Each class is one hour.

WHAT THIS COURSE IS

A 1-year middle school maths program taking students from basic arithmetic to pre-algebra, geometry and statistics with real problem-solving strategies.

In one line: From Number Basics to Advanced Mathematical Thinking

ABOUT THE PROGRAMME

This comprehensive program transforms students into confident mathematical thinkers. Whether starting with basic arithmetic or advancing to complex problem-solving, this 1-year program builds a rock-solid foundation in mathematics. Students will master essential mathematical concepts through interactive lessons, real-world applications, and engaging projects. From fractions to functions, geometry to statistics, every topic is covered with depth and clarity. By completion, students will excel in standardized tests and be fully prepared for high school mathematics.

WHAT MAKES THIS COURSE DIFFERENT

- Starts from absolute basics - no prerequisites required
- Full year of structured, progressive learning
- Covers entire middle school math curriculum
- Real-world applications and STEM connections
- Test preparation and exam strategies included
- Interactive visualizations and manipulatives
- Personalized learning paths based on progress

- Parent progress reports and involvement tools

THE LEARNING PATH, STEP BY STEP

Phase 1: Foundation (Months 1-3): Number Systems, Operations, and Basic Problem Solving
Phase 2: Arithmetic Mastery (Months 4-6): Fractions, Decimals, Percentages, and Ratios
Phase 3: Algebraic Thinking (Months 7-9): Pre-Algebra, Equations, Functions, and Patterns
Phase 4: Geometry & Advanced Topics (Months 10-12): Geometry, Statistics, Probability, and Complex Problem Solving

WHAT A STUDENT NEEDS BEFORE STARTING

Education: Elementary school mathematics completion
Coding experience: Basic arithmetic knowledge helpful
Equipment: Computer/tablet with internet, calculator
Time commitment: 2 live classes plus 3 to 5 hours of practice a week
English: Grade-appropriate reading level
Motivation: Enthusiasm for learning mathematics

WHO THIS COURSE IS FOR

Students: Middle school students grades 6-8
Working professionals: Parents helping children with math
Entrepreneurs: Homeschool families
Freelancers: Tutors and educators
Kids: Advanced elementary students ready for challenge
Anyone: Anyone wanting strong math foundation

FULL CURRICULUM, WEEK BY WEEK

This is the complete teaching plan. Parents can ask about any week.

PHASE 1: NUMBER SYSTEMS AND FUNDAMENTAL OPERATIONS (WEEKS 1-13)

Build unshakeable foundations in number concepts, operations, and mathematical thinking.

Months 1-2: Number Systems and Basic Operations (Weeks 1-8)
Introduction to Number Systems
Topics:
- Understanding place value system
- Reading and writing large numbers (up to billions)
- Expanded form and word form
- Comparing and ordering whole numbers
- Number line representation
- Rounding to nearest 10, 100, 1000
- Roman numerals basics
- Introduction to negative numbers
- Integer concepts and number line
- Absolute value understanding
- Real-world contexts for negative numbers
- Temperature, elevation, and financial contexts
Projects built:
- Create a number system timeline
- Design a place value game
- Real-world number investigation project
Practice: Daily: 20 problems on place value, 15 minutes mental math
Addition and Subtraction Mastery
Topics:
- Multi-digit addition with regrouping
- Addition properties: commutative, associative, identity
- Mental math strategies for addition
- Multi-digit subtraction with borrowing
- Subtraction as inverse of addition
- Estimation strategies for sums and differences
- Adding and subtracting integers
- Using number lines for integer operations
- Word problems with addition and subtraction
- Multi-step problem solving
- Checking answers using inverse operations
- Real-world applications: budgets, distances
Projects built:
- Budget planning project
- Distance calculation map activity
- Integer game design
Practice: Solve 30 addition/subtraction problems daily with increasing complexity
Multiplication Fundamentals
Topics:
- Multiplication as repeated addition

- Times tables mastery (up to 12×12)
- Multiplication properties: commutative, associative, distributive
- Multi-digit multiplication algorithms
- Lattice multiplication method
- Area model for multiplication
- Multiplying by powers of 10
- Estimation in multiplication
- Mental math tricks for multiplication
- Multiplying integers and sign rules
- Word problems involving multiplication
- Real-world applications: area, arrays, scaling

Projects built:
- Multiplication strategy booklet
- Area calculation for room design
- Array art project

Practice: Master times tables, 25 multi-digit multiplication problems

Division and Factors

Topics:
- Division as inverse of multiplication
- Long division algorithm step-by-step
- Division with remainders
- Interpreting remainders in context
- Divisibility rules (2, 3, 4, 5, 6, 9, 10)
- Factors and multiples
- Prime and composite numbers
- Prime factorization
- Greatest Common Factor (GCF)
- Least Common Multiple (LCM)
- Division of integers and sign rules
- Word problems with division

Projects built:
- Factor tree artwork
- Divisibility rule investigation
- Prime number sieve project

Practice: 30 division problems, find factors and multiples daily

Month 3: Order of Operations and Problem Solving (Weeks 9-13)

Order of Operations (PEMDAS/BODMAS)

Topics:
- Introduction to order of operations
- Parentheses/Brackets in expressions
- Exponents and powers basics
- Multiplication and Division (left to right)
- Addition and Subtraction (left to right)
- Complex expressions with multiple operations
- Nested parentheses
- Common mistakes and misconceptions
- Using calculators correctly
- Writing expressions from word problems
- Evaluating expressions with variables
- Creating equivalent expressions

Projects built:
- PEMDAS puzzle creation
- Expression evaluation game
- Calculator investigation project

Practice: Evaluate 20 complex expressions daily

Problem-Solving Strategies

Topics:
- Understanding the problem: what's being asked?
- Identifying relevant information
- Drawing diagrams and models
- Making organized lists
- Looking for patterns
- Working backwards strategy
- Guess and check method
- Using simpler numbers first
- Breaking complex problems into steps
- Checking reasonableness of answers
- Multiple solution methods
- Mathematical communication and explanation

Projects built:
- Problem-solving portfolio
- Create word problems for peers
- Strategy comparison presentation

Practice: Solve 5 multi-step word problems daily using different strategies

Phase 1 Review and Assessment

Topics:
- Number systems comprehensive review
- Operations mastery check

- Order of operations practice
- Problem-solving strategy application
- Common errors and corrections
- Speed and accuracy building

Projects built:
- Create a math tutorial video
- Design a board game using Phase 1 concepts
- Peer tutoring sessions

Assessment: Phase 1 cumulative exam: a written paper mixing this phase with everything before it, plus targeted revision for anything shaky

---

PHASE 2: FRACTIONS, DECIMALS AND PROPORTIONAL REASONING (WEEKS 14-26)

Master rational numbers, proportional relationships, and their real-world applications.

Months 4-5: Fractions and Mixed Numbers (Weeks 14-21)

Understanding Fractions

Topics:
- Fraction concepts: parts of a whole
- Numerator and denominator meaning
- Proper fractions, improper fractions, mixed numbers
- Converting between improper fractions and mixed numbers
- Fractions on a number line
- Equivalent fractions using models
- Simplifying fractions to lowest terms
- Finding equivalent fractions algebraically
- Comparing fractions with like denominators
- Comparing fractions with unlike denominators
- Cross multiplication for comparison
- Ordering fractions from least to greatest

Projects built:
- Fraction pizza party planning
- Fraction art with geometric shapes
- Recipe conversion project

Practice: 30 fraction problems daily, visual and numerical

Operations with Fractions

Topics:
- Adding fractions with like denominators
- Adding fractions with unlike denominators
- Finding common denominators
- Adding mixed numbers with regrouping
- Subtracting fractions and mixed numbers
- Borrowing in mixed number subtraction
- Multiplying fractions by whole numbers
- Multiplying fractions by fractions
- Understanding fraction multiplication visually
- Dividing fractions: keep-change-flip
- Dividing mixed numbers
- Word problems with fraction operations

Projects built:
- Cooking with fractions project
- Construction measurements activity
- Fraction operations game design

Practice: 25 fraction operation problems with increasing difficulty

Decimals and Place Value

Topics:
- Decimal place value: tenths, hundredths, thousandths
- Reading and writing decimals
- Decimals on number lines
- Comparing and ordering decimals
- Rounding decimals to various places
- Converting fractions to decimals
- Converting decimals to fractions
- Terminating vs repeating decimals
- Adding and subtracting decimals
- Lining up decimal points
- Estimation with decimals
- Real-world decimal applications: money, measurements

Projects built:
- Shopping budget with decimals
- Sports statistics analysis
- Decimal measurement lab

Practice: 30 decimal problems including conversions

Multiplying and Dividing Decimals

Topics:
- Multiplying decimals by whole numbers
- Multiplying decimals by decimals
- Counting decimal places in products

- Multiplying by powers of 10
- Dividing decimals by whole numbers
- Dividing by decimals: moving decimal points
- Dividing decimals by powers of 10
- Scientific notation introduction
- Estimation strategies for decimal operations
- Calculator use and interpretation
- Word problems with decimal operations
- Unit pricing and comparison shopping

Projects built:
- Business profit calculation project
- Science measurement conversions
- Create a decimal operations tutorial

Practice: 25 decimal multiplication and division problems

Percentages and Applications

Topics:
- Understanding percent as per hundred
- Converting between fractions, decimals, and percents
- Finding percentages of numbers
- Mental math with percentages (10%, 25%, 50%)
- Finding what percent one number is of another
- Finding the whole given a part and percent
- Percent increase and decrease
- Simple interest calculations
- Sales tax and discount problems
- Tips and commission calculations
- Percent error in measurements
- Data representation with percentages

Projects built:
- Sales and discount investigation
- Survey data percentage analysis
- Personal finance percentage project

Practice: 20 percentage problems from real-world contexts

Month 6: Ratios and Proportional Relationships (Weeks 22-26)

Understanding Ratios

Topics:
- Ratio concepts and notation
- Part-to-part vs part-to-whole ratios
- Equivalent ratios
- Simplifying ratios
- Ratios with three quantities
- Rates and unit rates
- Finding unit prices
- Speed, distance, and time relationships
- Comparing rates
- Best buy problems
- Ratio tables and their uses
- Graphing ratios on coordinate plane

Projects built:
- Recipe scaling project
- Speed comparison investigation
- Mix and match ratio art

Practice: 25 ratio and rate problems

Proportions and Scale

Topics:
- Understanding proportions
- Setting up proportions from word problems
- Cross multiplication to solve proportions
- Checking proportion solutions
- Direct variation
- Inverse variation introduction
- Scale drawings and maps
- Finding actual distances from maps
- Creating scale drawings
- Similar figures and proportions
- Scale factor
- Proportional relationships in data

Projects built:
- Map scale project
- Architectural drawing activity
- Proportion in art exploration

Practice: 20 proportion problems including scale applications

Real-World Applications

Topics:
- Currency exchange rates
- Unit conversions using proportions
- Mixture problems
- Work rate problems

- Population density calculations
- Fuel efficiency comparisons
- Nutritional information analysis
- Sports statistics and ratios
- Business applications: profit margins
- Scientific applications: concentrations
- Engineering: gear ratios
- Cooking and baking proportions

Projects built:
- International currency project
- Nutrition label analysis
- Sports statistics presentation

Practice: Apply proportional reasoning to 15 real-world scenarios

Data with Fractions, Decimals, and Percents

Topics:
- Circle graphs (pie charts) with percentages
- Bar graphs with fractional values
- Line graphs with decimal scales
- Converting between data representations
- Misleading graphs and statistics
- Surveys and sampling basics
- Calculating averages with decimals
- Finding median and mode with fractions
- Data interpretation questions
- Creating data displays
- Spreadsheet basics for calculations
- Technology tools for data analysis

Projects built:
- Class survey data analysis
- Create infographic with percentages
- Data story presentation

Practice: Analyze 10 different data sets using various representations

Phase 2 Review and Assessment

Topics:
- Comprehensive fraction review
- Decimal operations mastery
- Percentage problem solving
- Ratio and proportion applications
- Mixed problem sets
- Speed and accuracy challenges

Projects built:
- Create a fraction-decimal-percent converter tool
- Design a proportion puzzle book
- Real-world math fair project

Assessment: Phase 2 cumulative exam: a written paper mixing this phase with everything before it, plus targeted revision for anything shaky

---

PHASE 3: ALGEBRAIC THINKING AND PRE-ALGEBRA (WEEKS 27-39)

Develop algebraic reasoning, solve equations, and understand functions and patterns.

Months 7-8: Introduction to Algebra (Weeks 27-34)

Variables and Expressions

Topics:
- Introduction to variables as unknowns
- Variables as varying quantities
- Writing algebraic expressions
- Translating words to algebra
- Evaluating expressions with substitution
- Terms, coefficients, and constants
- Like terms and unlike terms
- Combining like terms
- Distributive property with variables
- Factoring out common factors
- Expanding expressions
- Simplifying algebraic expressions

Projects built:
- Expression matching game
- Variable story problems creation
- Algebraic art patterns

Practice: 30 expression problems: writing, evaluating, simplifying

One-Step Equations

Topics:
- Understanding equations vs expressions
- Solution concept and checking
- Solving using addition/subtraction
- Solving using multiplication/division
- Inverse operations review

- Equations with negative numbers
- Equations with fractions
- Equations with decimals
- Writing equations from word problems
- Checking solutions by substitution
- Special cases: no solution, infinite solutions
- Real-world equation modeling

Projects built:
- Equation balance demonstration
- Word problem equation book
- Equation solving race game

Practice: Solve 25 one-step equations with various number types

Two-Step and Multi-Step Equations

Topics:
- Two-step equations strategy
- Order of operations in reverse
- Equations with parentheses
- Distributive property in equations
- Combining like terms before solving
- Variables on both sides
- Equations with fractions: clearing denominators
- Decimal equations: clearing decimals
- Word problems requiring multi-step equations
- Consecutive integer problems
- Perimeter and area equations
- Mixture and motion problems basics

Projects built:
- Multi-step equation puzzle
- Real-world equation modeling project
- Create equation tutorial video

Practice: 20 multi-step equations with increasing complexity

Inequalities

Topics:
- Understanding inequality symbols
- Graphing inequalities on number lines
- Writing inequalities from situations
- Solving one-step inequalities
- Solving two-step inequalities
- Multiplying/dividing by negatives: flipping the sign
- Compound inequalities (AND, OR)
- Graphing compound inequalities
- Inequality word problems
- Systems of inequalities introduction
- Real-world constraints and inequalities
- Checking inequality solutions

Projects built:
- Inequality graphing art
- Budget constraint project
- Design inequality game

Practice: 25 inequality problems with graphing

Introduction to Functions

Topics:
- Input-output relationships
- Function machines concept
- Function notation: f(x)
- Function tables
- Finding patterns in functions
- Linear functions basics
- Graphing functions on coordinate plane
- Domain and range introduction
- Vertical line test
- Real-world functions: temperature conversion
- Function composition basics
- Inverse operations and functions

Projects built:
- Function machine construction
- Real-world function investigation
- Create function puzzle book

Practice: Evaluate and graph 20 different functions

Month 9: Coordinate Geometry and Graphing (Weeks 35-39)

The Coordinate Plane

Topics:
- Cartesian coordinate system
- x-axis and y-axis
- Quadrants I, II, III, IV
- Plotting points (x, y)
- Finding coordinates of points
- Distance between points (horizontal/vertical)

- Midpoint of a line segment
- Reflections across axes
- Translations on coordinate plane
- Rotations (90°, 180°)
- Creating designs with coordinates
- Coordinate plane applications

Projects built:
- Coordinate art project
- Treasure map coordinates
- Transformation artwork

Practice: Plot 30 points and perform transformations

Linear Relationships

Topics:
- Understanding slope as rate of change
- Calculating slope from two points
- Positive, negative, zero, undefined slopes
- Slope-intercept form: y = mx + b
- Finding y-intercept
- Graphing using slope-intercept form
- Point-slope form introduction
- Writing equations from graphs
- Writing equations from two points
- Parallel and perpendicular lines
- Systems of linear equations (graphing method)
- Real-world linear relationships

Projects built:
- Linear relationship investigation
- Cost analysis with linear functions
- Design with linear equations

Practice: Graph 20 linear equations and find equations from graphs

Patterns and Sequences

Topics:
- Number patterns recognition
- Arithmetic sequences
- Finding common difference
- nth term of arithmetic sequence
- Geometric sequences introduction
- Finding common ratio
- Extending patterns
- Visual patterns and growth
- Fibonacci sequence exploration
- Recursive patterns
- Creating pattern rules
- Patterns in nature and art

Projects built:
- Pattern investigation poster
- Sequence art creation
- Pattern puzzle book

Practice: Identify and extend 25 different patterns

Polynomials Introduction

Topics:
- Monomials, binomials, trinomials
- Degree of polynomials
- Adding polynomials
- Subtracting polynomials
- Multiplying monomials
- Multiplying polynomials by monomials
- FOIL method for binomials
- Special products: $(a+b)^2$, $(a-b)^2$
- Factoring out GCF from polynomials
- Factoring simple trinomials
- Zero product property
- Polynomial applications

Projects built:
- Polynomial art with algebra tiles
- Area models for multiplication
- Polynomial puzzle creation

Practice: 20 polynomial operations and factoring problems

Phase 3 Review and Assessment

Topics:
- Algebraic expressions and equations review
- Inequality solving and graphing
- Function concepts and graphing
- Coordinate geometry mastery
- Linear relationships
- Patterns and sequences
- Polynomial operations

Projects built:
- Algebra tutorial video series

- Create algebraic board game
- Real-world algebra applications portfolio

Assessment: Phase 3 cumulative exam: a written paper mixing this phase with everything before it, plus targeted revision for anything shaky

---

PHASE 4: GEOMETRY, STATISTICS AND FINAL REVISION (WEEKS 40-52)

Master geometric concepts, statistical analysis, probability, and complex problem-solving strategies.

Month 10: Geometry Foundations (Weeks 40-44)

Basic Geometric Concepts

Topics:

- Points, lines, and planes
- Line segments and rays
- Parallel and perpendicular lines
- Angles: acute, right, obtuse, straight
- Measuring angles with protractor
- Angle relationships: complementary, supplementary
- Vertical angles and linear pairs
- Angles formed by transversals
- Corresponding angles
- Alternate interior and exterior angles
- Triangle angle sum theorem
- Exterior angles of triangles

Projects built:

- Angle art creation
- Architecture angle investigation
- Geometric city design

Practice: Measure and calculate 30 angle problems

Triangles and Quadrilaterals

Topics:

- Types of triangles by sides: equilateral, isosceles, scalene
- Types of triangles by angles: acute, right, obtuse
- Triangle inequality theorem
- Congruent triangles: SSS, SAS, ASA
- Similar triangles and proportions
- Pythagorean theorem
- Pythagorean theorem applications
- Special right triangles: 45-45-90, 30-60-90
- Quadrilaterals: parallelograms, rectangles, squares
- Rhombus and trapezoid properties
- Diagonals of quadrilaterals
- Polygon angle sum formulas

Projects built:

- Triangle construction project
- Pythagorean theorem proofs
- Quadrilateral classification poster

Practice: 25 triangle and quadrilateral problems

Circles

Topics:

- Circle vocabulary: center, radius, diameter
- Circumference formula: $C = 2\pi r$
- Area of circles: $A = \pi r^2$
- Arc length
- Sector area
- Chords and secants
- Tangent lines to circles
- Inscribed angles
- Central angles
- Circle word problems
- Composite figures with circles
- Real-world circle applications

Projects built:

- Circle art with compass
- Pi investigation project
- Design circular patterns

Practice: 20 circle calculation problems

Area and Perimeter

Topics:

- Perimeter of polygons
- Area of rectangles and squares
- Area of parallelograms
- Area of triangles: ½bh
- Area of trapezoids
- Area of regular polygons
- Area of composite figures
- Perimeter of composite figures

- Area and perimeter word problems
- Optimization problems: maximum area
- Surface area introduction
- Real-world applications: flooring, fencing

Projects built:
- Garden design project
- Floor plan area calculations
- Packaging design optimization

Practice: Calculate area and perimeter of 25 figures

3D Geometry and Volume

Topics:
- 3D shapes: prisms, pyramids, cylinders, cones, spheres
- Faces, edges, and vertices
- Nets of 3D shapes
- Volume of rectangular prisms
- Volume of triangular prisms
- Volume of cylinders
- Volume of pyramids and cones
- Volume of spheres
- Surface area of prisms
- Surface area of cylinders
- Composite 3D figures
- Volume and capacity conversions

Projects built:
- 3D shape construction
- Volume investigation lab
- Package design project

Practice: Calculate volume and surface area of 20 3D shapes

Month 11: Statistics and Data Analysis (Weeks 45-49)

Data Collection and Representation

Topics:
- Types of data: categorical vs numerical
- Data collection methods
- Surveys and sampling techniques
- Bias in data collection
- Frequency tables
- Bar graphs and histograms
- Line graphs and time series
- Circle graphs (pie charts)
- Stem-and-leaf plots
- Box-and-whisker plots
- Scatter plots introduction
- Choosing appropriate graphs

Projects built:
- School survey project
- Data visualization poster
- Create data infographic

Practice: Create 10 different data representations

Measures of Central Tendency

Topics:
- Mean (average) calculation
- Weighted averages
- Median finding
- Mode identification
- Comparing mean, median, mode
- Effects of outliers
- Range as measure of spread
- Quartiles and interquartile range
- Mean absolute deviation
- Standard deviation introduction
- Interpreting data spread
- Using measures to compare data sets

Projects built:
- Grade analysis project
- Sports statistics comparison
- Weather data analysis

Practice: Calculate statistics for 15 data sets

Probability Fundamentals

Topics:
- Probability as likelihood
- Probability scale: 0 to 1
- Experimental vs theoretical probability
- Sample space and outcomes
- Simple probability calculations
- Complement of an event
- Probability of compound events
- Independent vs dependent events
- Tree diagrams

- Fundamental counting principle
- Permutations introduction
- Combinations introduction

Projects built:
- Probability game design
- Dice experiment analysis
- Real-world probability investigation

Practice: Solve 25 probability problems

Statistical Analysis and Interpretation

Topics:
- Correlation vs causation
- Positive and negative correlation
- Line of best fit basics
- Making predictions from data
- Margin of error concept
- Confidence intervals introduction
- Misleading statistics
- Statistical significance basics
- Comparing populations
- Data-driven decision making
- Technology tools for statistics
- Spreadsheet data analysis

Projects built:
- Correlation investigation
- Statistical report writing
- Data prediction project

Practice: Analyze and interpret 10 real-world data scenarios

Problem Solving with Multiple Concepts

Topics:
- Multi-step problems combining algebra and geometry
- Rate, ratio, and proportion in geometry
- Statistical problems with percentages
- Probability with fractions and decimals
- Optimization problems
- Logic puzzles and reasoning
- Mathematical modeling
- Estimation and approximation
- Working with constraints
- Breaking down complex problems
- Checking solutions for reasonableness

Projects built:
- Complex problem-solving portfolio
- Mathematical modeling project
- Create problem-solving guide

Practice: Solve 15 complex, multi-concept problems

Month 12: Advanced Topics and Test Preparation (Weeks 50-51)

Competition Mathematics

Topics:
- Problem-solving strategies review
- Competition problem types
- Speed and accuracy techniques
- Mental math advanced strategies
- Olympiad-style problems
- Logic and reasoning puzzles
- Number theory problems
- Geometry competition problems
- Combinatorics basics
- Proof techniques
- Time management in tests

Projects built:
- Math competition preparation
- Create competition problems
- Strategy guide compilation

Practice: Solve 20 competition-level problems

Test Preparation and Strategies

Topics:
- Standardized test formats
- Multiple choice strategies
- Grid-in question techniques
- Extended response writing
- Time management during tests
- Test anxiety management
- Common test mistakes
- Calculator vs non-calculator sections
- Checking work efficiently
- Practice test analysis
- Study planning and organization

Projects built:

- Test-taking strategy guide
- Practice test creation
- Study plan development

Practice: Complete 3 full-length practice tests

Month 13: Final Projects and Comprehensive Review (Week 52)

Comprehensive Review and Integration

Topics:

- Number systems and operations review
- Fractions, decimals, percentages mastery
- Algebraic concepts consolidation
- Geometry theorems and applications
- Statistics and probability review
- Problem-solving strategies compilation
- Cross-curricular connections
- Real-world applications synthesis
- Mathematical communication skills
- Technology integration review
- Portfolio organization
- Self-assessment and reflection

Projects built:

- Year-long portfolio compilation
- Mathematical autobiography
- Comprehensive problem set creation

Assessment: FINAL EXAM: a comprehensive written paper covering every phase of the course. Passing earns the certificate; falling short earns a focused revision plan and a free retest

PROJECTS THE STUDENT BUILDS AND KEEPS

- Phase 1: Number System Timeline, Budget Planner, Factor Tree Art, Problem-Solving Portfolio
- Phase 2: Fraction Pizza Party, Shopping Budget Calculator, Scale Drawing, Data Infographic
- Phase 3: Equation Balance Game, Function Machine, Coordinate Art, Pattern Investigation
- Phase 4: Geometric City Design, Statistics Survey Project, Probability Game, Math Fair Project
- Final: Comprehensive Portfolio, Research Project, Real-World Application

Total projects: 60+ projects ranging from simple to complex applications

SKILLS THE STUDENT WILL HAVE AT THE END

- Number Systems: Whole numbers, integers, rational numbers, real numbers
- Operations: All four operations with various number types, order of operations
- Fractions & Decimals: Operations, conversions, real-world applications
- Percentages: Calculations, increases/decreases, financial applications
- Algebra: Variables, expressions, equations, inequalities, functions
- Geometry: 2D shapes, 3D solids, measurements, transformations, proofs
- Statistics: Data collection, analysis, measures of central tendency, displays
- Probability: Basic probability, compound events, counting principles
- Problem Solving: Multiple strategies, mathematical modeling, logic
- Technology: Calculator use, spreadsheets, graphing tools, online resources
- Communication: Mathematical writing, presentations, explanations
- Test Taking: Standardized test strategies, time management, accuracy

HOW A TYPICAL WEEK IS SPLIT

Live classes: 2 live one-hour classes per week with a real teacher, working problems together
Homework: A problem set after every class, and a mixed-review assignment at the end of every month that deliberately folds in earlier topics
Practice: 3-5 hours of problem-solving between classes
Review: Every set reviewed with written feedback; recurring mistakes reopened in class until they are gone

SUPPORT INCLUDED

Doubt support: WhatsApp doubt support between classes
Progress updates: Honest monthly progress reviews: which topics are solid, which are wobbly, and the plan for the wobble

CERTIFICATION DETAIL

Completion: Certificate from Modern Age Coders, awarded on passing the final exam. Fall short and there is focused revision and a free retest: the certificate certifies mastery, not attendance

WHERE THIS CAN LEAD

- High School Advanced Mathematics Track
- AP Mathematics Preparation

  - STEM Program Readiness
  - Mathematics Competition Participant
  - Science Fair Participant
  - Engineering Program Preparation
  - Computer Science Foundation
  - Financial Literacy
  - Data Science Introduction
  - Mathematical Research Interest

COMMON QUESTIONS ABOUT THIS COURSE

  For anything about cost, use PART 4 and RULE 1. Do not quote two regions.

  Q: What does the Middle School Mathematics program cover?
  A: The 12 month program builds in four phases: number systems and operations; fractions, decimals, percentages and ratios; pre-algebra with equations, functions and graphing; and finally geometry, statistics, probability and multi-step problem solving. The aim is to make the middle school years the strongest part of a child's maths story.

  Q: Who is this course right for?
  A: A gentle diagnostic in the first weeks means each child starts where their actual understanding is, not where their grade label says.

  Q: What does my child need before joining?
  A: Just completed elementary school mathematics, a computer or tablet with internet, and a calculator. No coding background is needed, and grade level reading is enough to follow the classes comfortably.

  Q: Will this help with school exams and word problems?
  A: Yes. Word problems and multi-step reasoning are treated as core skills throughout, not an afterthought: children learn to translate situations into maths before computing. Because the course teaches the concepts under every school syllabus, the work transfers directly to classroom tests.

  Q: How is progress measured?
  A: Through weekly practice reviewed for method, phase-end checks before new material begins, and a running mastery record shared with parents. The final month includes projects and a comprehensive review, so you finish with visible evidence of what your child can now do.

  Q: How is my child assessed, and is the certificate just for attending?
  A: No. A problem set follows every class with written feedback, monthly reviews deliberately mix new material with earlier topics so nothing is forgotten, each phase ends with a cumulative exam, and the course ends with a final exam covering the whole syllabus. Passing earns the certificate; falling short earns focused revision and a free retest. We measure understanding, not attendance.

  Q: Can my child attend a class before we decide?
  A: Of course. The first step for every family is a free demo class, booked at learn.modernagecoders.com/contact with no commitment, where your child meets the teacher and we assess the right starting point together. You can also WhatsApp us at +91 91233 66161. (Agent note: the free demo is a waiting list with no fixed date. The Priority Live Demo is a guaranteed class today or tomorrow, booked at https://learn.modernagecoders.com/priority-demo . Offer both, as RULE 3 says.)

  Q: What is the class format?
  A: Live one hour online classes with a real teacher, never pre-recorded videos. Groups stay small so quieter children get airtime too, and every child solves problems aloud during class rather than just watching.

  Q: Does my child receive a certificate?
  A: Yes, the Middle School Mathematics Excellence Certificate on completion, plus a record of the projects and problem work done across the year. Modern Age Coders holds a 4.9 star rating from 547+ Google reviews.

  To enrol, message Shivam Sir on +91 9123366161 or send the parent this link: https://learn.modernagecoders.com/courses/comprehensive-middle-school-mathematics-mastery
  For a demo: the Priority Live Demo (guaranteed, today or tomorrow) is booked at https://learn.modernagecoders.com/priority-demo . The free demo is a waiting list with no fixed date.

==========
COURSE 101 OF 137: MINECRAFT CODING FOR KIDS: FROM BLOCKS TO REAL CODE
==========

Course link: https://learn.modernagecoders.com/courses/minecraft-coding-for-kids-course
Subject area: Kids Coding
Designed for: Kids
Who can join: Beginner, ages 7 to 12
Course length: 4 months (16 weeks)

Time needed: 2 live classes/week + 1-2 hours practice
Certificate: Certificate from Modern Age Coders, awarded on passing the final assessment

PRICE FOR THIS COURSE (quote only the one that applies to the person asking)
  In India, per month: group Rs 1,499, mini batch Rs 2,999, one to one Rs 4,999
  In Canada, per month: group CAD 140, one to one CAD 210
  Anywhere else, per month: group $100, one to one $150
  Classes: group and mini batch two live classes a week, eight a month; one to one in India one live class a week, four a month; one to one outside India two live classes a week, eight a month. Each class is one hour.

WHAT THIS COURSE IS

  Minecraft coding classes for kids ages 7-12: live online lessons using block-based MakeCode, from first commands to robot agents, auto-farms, and mini-games.

  In one line: The game your child already loves becomes the place they learn to think in code.

ABOUT THE PROGRAMME

  Minecraft has a superpower most parents never see: a built-in coding environment where children snap together blocks of code, press run, and watch the game obey. A castle wall appears in two seconds. A robot agent plants a farm. A trap springs when someone steps on the wrong block. This 4-month live course uses that loop, code it, run it, see it, to teach real programming ideas to children aged 7 to 12. Months 1 and 2 build the core: commands, the agent robot, loops that build faster than hands ever could, variables, and decisions. Months 3 and 4 turn those pieces into games: randomness, scores, timers, a full mini-game classmates play, and a finishing capstone the student designs. Along the way, older students get to flip the same blocks into JavaScript view and see what their program looks like as typed code. Every class is live and hands-on. The instructor sets a build challenge, students code their own solution while the instructor watches and helps, and each week ends with something running in the world that was not there before.

WHAT MAKES THIS COURSE DIFFERENT

  - Coding happens inside Minecraft itself, so the feedback loop is instant and the motivation is already installed
  - The agent robot makes loops and conditions physical: children watch their code walk, turn, plant, and build block by block
  - Challenges are sized for live classes: every session ends with a working build, not a half-finished follow-along
  - Block code is flipped to JavaScript view for curious older kids, so the bridge to typed programming is walked, not just mentioned
  - Screen time turns productive: the same game hours now produce farms, machines, and mini-games the child engineered
  - Small live batches mean the instructor sees every child's screen and every child's thinking, every class

THE LEARNING PATH, STEP BY STEP

  Phase 1: Code that builds: chat commands, the agent robot, then loops, variables, and decisions that construct in seconds what hands build in hours
  Phase 2: Code that plays: randomness, scores, timers, and events combined into real mini-games, then a student-designed capstone showcased to families

WHAT A STUDENT NEEDS BEFORE STARTING

  Coding experience: None. The course starts from the very first block of code
  Reading: Basic reading comfort, enough to follow labeled blocks. Seven-year-olds who read simple sentences do fine
  Minecraft setup: Minecraft Education, which includes the built-in coding editor. We help every family set it up before classes start
  Equipment: A computer or iPad that runs Minecraft Education, plus a stable internet connection

WHO THIS COURSE IS FOR

  Minecraft fans: Kids who play Minecraft daily and are ready to command it instead of just mining in it
  Complete beginners: Children aged 7 to 12 with zero coding exposure who need a first step that feels like play
  Restless learners: Kids who resist worksheets but will happily debug a robot farmer for twenty minutes
  Future typers: Older kids in the range who are curious what real typed code looks like, met here through the JavaScript view
  Screen time worriers: Parents who want existing Minecraft hours converted into planning, logic, and finished projects

FULL CURRICULUM, WEEK BY WEEK

This is the complete teaching plan. Parents can ask about any week.

PHASE 1: CODE THAT BUILDS (MONTHS 1-2, WEEKS 1-8)

From the first chat command to an automated farm: children learn sequencing, loops, variables, and decisions by making Minecraft do the building for them.

Month 1: First Commands and the Agent (Weeks 1-4)

Hello, Code Builder

Topics:

- Opening the coding editor inside Minecraft and a tour of the block palette
- On chat command: making code run when you type a magic word
- Placing your first block with code instead of your hands
- Running, stopping, and re-running a program
- Changing one block in the code and predicting what changes in the world
- Saving projects so next class starts where this one ended

Projects built:

- Magic words: three chat commands that summon a block tower, a splash of flowers, and a chicken

Practice: Invent two new chat commands of your own and draw what each one should do before coding it

The Agent, Your Robot

Topics:

- Meeting the agent: the robot that obeys your program
- Move forward, turn left, turn right: navigating step by step
- Agent place and agent destroy: building and clearing
- Sequencing: why the order of blocks changes everything
- Walking a maze on paper first, then in code
- Teleporting the agent back when it wanders off

Projects built:

- Maze runner: program the agent to walk a maze you built for it, placing a torch at the exit

Practice: Build a new maze for a classmate's agent and solve theirs, comparing step counts

Loops: Building at Superspeed

Topics:

- The repeat block: doing something ten times without ten copies
- Building a wall with a loop instead of block-by-block
- Loops inside loops: from a wall to a whole floor
- Counting carefully: the off-by-one surprise
- The forever loop and when it is useful
- Hand-build vs loop-build: racing the same wall both ways

Projects built:

- Wall factory: one program that builds a wall of any length, then a full square fort using nested loops

Practice: Use loops to build a staircase to the clouds, then estimate how long it would have taken by hand

Big Builds with Loops

Topics:

- Planning a build as layers: what repeats and what does not
- Pyramids: each layer smaller than the last
- Hollow shapes: skipping the middle to save blocks
- Combining agent moves and loops for long structures
- Debugging a build gone wrong: reading the code out loud
- Showing your build: a mini tour for the class

Projects built:

- Pyramid of Giza: a layered pyramid built entirely by code, with a hollow secret chamber inside

Practice: Design and code one original loop-built monument for the class world

Assessment: Month 1 build check: the agent completes a fresh maze and a loop-built structure, explained block by block

Month 2: Variables and Decisions (Weeks 5-8)

Variables: Code That Remembers

Topics:

- What a variable is: a labeled box the program remembers
- A size variable: one number that controls how big the build is
- Changing a variable while the program runs
- Counting things: how many blocks the agent has placed
- Announcing values in chat: the program reports back
- Naming variables so they explain themselves

Projects built:

- Any-size house: one program that builds a house small, medium, or giant by changing a single number

Practice: Add a height variable to your fort program and test it at three different values

Decisions: Code That Checks

Topics:

- If and else: teaching the program to choose
- Agent detect: is there a block in front of me?
- Obstacle dodging: walk forward, but go around what blocks you
- Checking what a block is made of before acting
- Combining checks: if this and not that
- Predict-then-run: guessing what a decision program will do

Projects built:
- Smart explorer: an agent that crosses rough ground by detecting obstacles and stepping around them

Practice: Program a tunnel-digger that stops when it detects water, so nobody floods the base

Events: Code That Reacts

Topics:
- On player walk: code that fires when someone steps somewhere
- On block placed and on block broken
- Building a pressure-plate trap the coding way
- Surprise effects: fireworks, sounds, and chat messages
- Being a fair trap-maker: warnings and escape routes
- Multiple events in one world without chaos

Projects built:
- Trap gauntlet: a walkway with three coded surprises, from harmless confetti to a drop into a pool

Practice: Add a welcome event to the class world that greets any player who arrives at your base

Project Week: The Auto-Farm

Topics:
- Automation: teaching the agent a full job, start to finish
- Till, plant, wait, harvest: the farming loop
- Combining loops, variables, and detection in one program
- Testing a long program one section at a time
- Making the farm bigger without rewriting it
- Explaining your automation to someone who does not code

Projects built:
- Agent auto-farm: a robot farmer that tills the soil, plants crops in rows, and harvests when ready

Practice: Extend your farm with a fence-building routine, then measure how many crops one run produces

Assessment: Month 2 skills check: a live automation challenge solved with loops, a variable, and at least one detect decision

---

PHASE 2: CODE THAT PLAYS (MONTHS 3-4, WEEKS 9-16)

The building skills become game-making skills: randomness, scores, and timers combine into real mini-games, and the course ends with a student-designed capstone and a peek at real typed code.

Month 3: Mini-Games (Weeks 9-12)

Randomness

Topics:
- Random numbers: why games need surprise
- Spawning animals at random positions
- Random blocks: a patchwork floor no one can predict
- Hiding treasure somewhere new every game
- Fair vs unfair randomness in games
- Testing random code: run it many times, watch the spread

Projects built:
- Treasure hunt: a diamond block hidden at a random spot each round, with hot-and-cold chat hints

Practice: Make a random pet generator that spawns one of five animals, and tally twenty runs to see the spread

Keeping Score

Topics:
- A score variable that events update
- Announcing the score in chat after each point
- Win conditions: first to ten
- Resetting the game for a fresh round
- Counting down instead of up: lives
- Score displays that players actually notice

Projects built:
- Collector clash: gather the glowing blocks scattered by code, one point each, first to ten wins

Practice: Add a lives system to your treasure hunt: three wrong digs and the round ends

Timers and Pressure

Topics:
- Countdown timers built from loops and waits
- Beat the clock: finishing a task before time runs out
- Announcing time left at the right moments
- Combining a timer with a score for real tension

- Rounds: game start, game play, game over
- Tuning time limits so the game is hard but winnable

Projects built:
- Build rush: players race a two-minute timer to copy a target structure, with a code-checked finish

Practice: Playtest your build rush with family and adjust the time limit after two rounds

Project Week: The Arena Game

Topics:
- Combining the month: randomness, score, timer, and events in one game
- Building the arena with your loop skills
- Rules players can learn in ten seconds
- Running a game for classmates: host duties
- Watching players find the fun and the flaws
- One improvement pass after the first playtest

Projects built:
- Falling-floor arena: a coded mini-game where floor sections vanish on a timer and the last player standing wins

Practice: Host two rounds of your arena for classmates and write down the one rule that confused people most

Assessment: Arena game demo: classmates play a full round, then the builder explains the timer and event code behind it

Month 4: The Capstone and the Code Peek (Weeks 13-16)

Functions: Naming Your Powers

Topics:
- Functions: wrapping a build routine in a name
- One buildTower function used five times
- Functions with a size input
- A personal toolkit: your best routines, reusable forever
- Cleaner programs: reading code made of named pieces
- Sharing a function with a classmate and using theirs

Projects built:
- Village in a minute: houses, paths, and lamp posts, each a function, assembled into a whole village program

Practice: Turn your favorite build from the course into a function and use it three times in one world

The JavaScript Peek

Topics:
- Flipping the editor: the same program as blocks and as JavaScript text
- Finding your loop and your variable in the typed code
- What brackets, dots, and semicolons are doing
- Making one tiny change in text view and running it
- Block coding vs typed coding: same thinking, different clothes
- Where typed languages lead: Python, JavaScript, and beyond

Projects built:
- Two-view build: a fountain program written in blocks, then modified once in JavaScript view to change its size

Practice: Flip three of your old programs to code view and find the repeat loop in each one

Capstone Build Sprint

Topics:
- Choosing a capstone: an original game or a grand automation
- The one-page plan: what it does, what code it needs, what done means
- Building must-haves first
- Reusing your own functions and past code honestly
- Instructor check-in: unblocking the hard part early
- Trimming the plan when time runs short, without giving up the core

Projects built:
- Capstone, part one: the core of an original mini-game or automation, planned and working end to end

Practice: Two 30-minute build sessions at home, each ending with a one-sentence progress note

Finish and Showcase

Topics:
- The final bug hunt: testing every part on purpose
- Polish: sounds, messages, and a proper welcome
- Writing simple instructions for players
- Presenting: show the game first, then the code behind the best part
- Answering questions about your own program
- What comes next: Python for kids, or Roblox game coding

Projects built:
- Finished capstone: an original, tested Minecraft game or automation presented live to classmates and families

Practice: Run your capstone for two family members and collect one compliment and one improvement idea from each

Assessment: Capstone showcase and code Q&A, plus course-completion certificate review

PROJECTS THE STUDENT BUILDS AND KEEPS

- Magic chat commands that summon builds and creatures
- Agent maze runner with a torch-lit victory exit
- Nested-loop square fort and cloud staircase
- Code-built Pyramid of Giza with a hidden chamber
- Any-size house driven by a single variable
- Smart explorer agent that detects and dodges obstacles
- Agent auto-farm that tills, plants, and harvests
- Random treasure hunt with hot-and-cold hints
- Falling-floor arena mini-game with timer and score
- Village-in-a-minute built from student-written functions
- Original capstone game or automation, showcased to families

Total projects: 14+ working programs, from a first chat command to an original mini-game

SKILLS THE STUDENT WILL HAVE AT THE END

- Sequencing and the agent: precise step-by-step instructions a robot can follow
- Loops and nested loops: building in seconds what hands build in hours
- Variables and decisions: programs that remember, count, check, and choose
- Events, randomness, scores, and timers: the ingredients of every mini-game
- Functions: naming and reusing routines like a real programmer
- Reading typed code: finding loops and variables in the JavaScript view of their own programs

HOW A TYPICAL WEEK IS SPLIT

Live classes: 2 live one-hour classes per week, coding challenges solved along with the instructor
Practice: 1-2 hours of build challenges between classes, sized for young attention spans
Review: Practice builds reviewed with feedback; tricky concepts replayed at the start of the next class
Homework: A task or problem set after every class, and a monthly mixed-review assignment that deliberately folds in earlier topics

SUPPORT INCLUDED

Doubt support: WhatsApp doubt support between classes, so nobody stays stuck until the next session
Progress updates: Regular progress notes to parents: what was covered, what was built, what needs practice

CERTIFICATION DETAIL

Completion: Certificate from Modern Age Coders, awarded on passing the final assessment. Fall short and there is focused revision and a free retest: the certificate certifies real learning, not attendance

WHERE THIS CAN LEAD

- Our Python for kids course, the natural next step once block logic is solid
- Roblox game coding, where the same ideas graduate to typed Luau scripts in a 3D engine
- Our Scratch-based creative coding track for students who want more game design first
- School coding competitions and clubs, entered with a portfolio of working programs
- App development for kids, for children who want to build beyond games

COMMON QUESTIONS ABOUT THIS COURSE

For anything about cost, use PART 4 and RULE 1. Do not quote two regions.

Q: Is this course run by Mojang or Microsoft?
A: No. Modern Age Coders is an independent coding school, and this course is not affiliated with, sponsored by, or endorsed by Mojang or Microsoft. We teach coding using Minecraft Education and its built-in MakeCode editor, tools Microsoft makes available for exactly this kind of learning, but the curriculum and classes are entirely ours.

Q: Which version of Minecraft do we need? Will our normal Minecraft work?
A: The course uses Minecraft Education, the school-focused version with the coding editor (Code Builder) built in. The regular Bedrock or Java editions your child may already own do not include this editor, so Education is required; it runs on Windows, Mac, iPad, and most Chromebooks, and needs its own low-cost licence or a school Microsoft 365 Education account. Before the batch starts we walk every family through the setup, and we confirm your device runs it during the free demo. (Agent note: the free demo is a waiting list with no fixed date. The Priority Live Demo is a guaranteed class today or tomorrow, booked at https://learn.modernagecoders.com/priority-demo . Offer both, as RULE 3 says.)

Q: Will my child actually learn coding, or just play Minecraft in class?
A: Every class is a coding class; Minecraft is the place the code runs, not the activity. Students spend sessions writing programs: loops that raise walls, decisions that steer a robot, events that trigger traps, timers that run games. The game world is what makes a

seven-year-old care whether their loop is correct, because a wrong loop builds a crooked castle in front of everyone.

Q: My child already gets too much screen time. Does this add more?
A: For most families it converts time rather than adds it. The hours a child was already spending in Minecraft start producing farms they automated, games they invented, and bugs they fixed, which exercises planning and logic in a way passive play does not. Classes are one focused hour, and home practice is deliberately kept to one or two hours a week, sized for this age group.

Q: Is 7 too young? My older child is 12, is it too basic?
A: Both ends of the range are served, differently. Sevens thrive because block coding removes typing and spelling from the equation; they drag, snap, and run. Twelves stay stretched through harder challenges, functions, and the JavaScript view, where they read and edit their own programs as typed code. Batches are grouped by age so the pace fits the room.

Q: What does my child move on to after this course?
A: The two most common paths are our Python for kids course, which takes the same ideas into the world's most-used typed language, and Roblox game coding, where students script 3D games in Luau. The instructor recommends a path for each child at the end of the course based on what they gravitated toward.

Q: How is my child assessed, and is the certificate just for attending?
A: No. A task follows every class with feedback, monthly reviews deliberately mix new material with earlier topics so nothing is forgotten, and the course ends with a friendly final assessment of everything learned. Passing earns the certificate; falling short earns focused revision and a free retest. We measure real learning, not attendance.

Q: Can we try a class before enrolling?
A: Yes, the first demo class is free and carries no obligation. Book it at learn.modernagecoders.com/contact or message us on WhatsApp at +91 91233 66161. The demo doubles as a tech check: we make sure Minecraft Education runs on your device and answer setup questions with a parent present.

Q: Do parents need to know anything about coding or Minecraft?
A: No. Many parents tell us that presentation is the first time they understood what the course was building all along.

To enrol, message Shivam Sir on +91 9123366161 or send the parent this link: https://learn.modernagecoders.com/courses/minecraft-coding-for-kids-course
For a demo: the Priority Live Demo (guaranteed, today or tomorrow) is booked at https://learn.modernagecoders.com/priority-demo . The free demo is a waiting list with no fixed date.

==========

COURSE 102 OF 137: MYSQL COURSE: SQL, DATABASE DESIGN AND REAL ADMINISTRATION

==========

Course link: https://learn.modernagecoders.com/courses/mysql-database-complete-masterclass-college
Subject area: Databases
Designed for: College students
Who can join: Complete beginner; college students and working professionals (18+)
Course length: 7-8 months (28-32 weeks)
Time needed: 2 live classes/week + 3-4 hours practice
Certificate: Certificate from Modern Age Coders, awarded on passing the final exam

PRICE FOR THIS COURSE (quote only the one that applies to the person asking)
In India, per month: group Rs 1,499, mini batch Rs 2,999, one to one Rs 4,999
In Canada, per month: group CAD 140, one to one CAD 210
Anywhere else, per month: group $100, one to one $150
Classes: group and mini batch two live classes a week, eight a month; one to one in India one live class a week, four a month; one to one outside India two live classes a week, eight a month. Each class is one hour.

WHAT THIS COURSE IS

MySQL course for college students and professionals: SQL mastery, database design, stored procedures, transactions, Python integration and honest admin in 7-8 months.

In one line: The data layer, owned end to end: SQL fluency, real schema design, the programmable database, and the production habits developers are actually judged on.

ABOUT THE PROGRAMME

Every application stands on a database, and every serious interview eventually reaches SQL. This live online masterclass takes college students and professionals from zero to genuine capability in seven months: SQL written fluently, schemas designed rather than accumulated, the programmable side of MySQL (views, stored procedures, triggers, transactions), Python integration where data becomes application, and the production basics, security, backups and

performance tuning, that separate developers who use databases from developers databases can trust. The scope is deliberately honest. Full database administration, replication clusters, multi-cloud failover, is its own profession, and courses that staple it onto a beginner syllabus produce neither developers nor DBAs. This course builds the 95% that developers, analysts and interviews actually demand, names the DBA path clearly for those who want it next, and spends the reclaimed months making the fundamentals genuinely deep: joins that never confuse, EXPLAIN read like a native, transactions understood well enough to argue about. The pace is honest: seven months at two live classes a week plus three to four hours of practice, with an eighth month in hand. Problem sets after every class, monthly mixed reviews, and a final exam, practical plus written, that decides the certificate with a free retest after revision. Real queries, real design, depth over dopamine.

WHAT MAKES THIS COURSE DIFFERENT

- Honest scope: the developer 95%, not a stapled-on DBA career track
- Design is taught as a craft: ER modeling, normalization and constraints, practiced on real domains
- The programmable database gets real weeks: views, procedures, triggers and transactions, not a demo each
- EXPLAIN fluency: performance tuning taught as reading, reasoning and measuring
- Ends integrated: MySQL driven from Python, with security, backups and tuning as habits
- Real assessment: weekly problem sets, monthly mixed reviews, and a final exam that decides the certificate, with focused revision and a free retest

THE LEARNING PATH, STEP BY STEP

Phase 1: SQL foundations (Months 1-2): setup, DDL, DML and SELECT mastery on real datasets
Phase 2: Design and joins (Months 3-4): relationships, joins without fear, subqueries and set operations, and schema design done properly
Phase 3: The programmable database (Months 5-6): views, indexes, stored procedures, triggers, transactions and Python integration
Phase 4: Production month (Month 7): security and backups, performance tuning with EXPLAIN, and the capstone exam

WHAT A STUDENT NEEDS BEFORE STARTING

Coding experience: None for the SQL core; the Python integration weeks are guided and beginner-safe
Equipment: A computer with a stable internet connection; MySQL Community Server and every tool used are free
Age: 18+; college students, graduates and working professionals
Time commitment: 2 live classes plus 3-4 hours of practice a week

WHO THIS COURSE IS FOR

College students: Students who want the DBMS course their degree gestures at, taught until it is actually owned
Placement candidates: Anyone whose next interview round includes SQL, which is nearly everyone
Developers: Working developers who copy-paste queries and want to stop
Analysts: Excel-strong professionals ready for the real data tool underneath
Builders: Founders and makers who need their product's data layer done right

FULL CURRICULUM, WEEK BY WEEK

This is the complete teaching plan. Parents can ask about any week.

PHASE 1: SQL FOUNDATIONS (MONTHS 1-2, WEEKS 1-8)

The language of data learned properly: definitions, manipulation and SELECT mastery on datasets that feel real.

Months 1-2: The SQL Core (Weeks 1-8)
Introduction to Databases & MySQL Setup
Topics:
- What are databases and why we need them
- Relational vs Non-relational databases
- History and evolution of MySQL
- MySQL vs other databases (PostgreSQL, Oracle, SQL Server)
- MySQL ecosystem: Community, Enterprise, MariaDB, Percona
- Installing MySQL on Windows, Linux, Mac
- MySQL Workbench installation and setup
- Command-line client basics
- phpMyAdmin and other GUI tools
- Creating your first database
- Understanding schemas and instances
- Basic security during installation
Projects built:

- Install MySQL on local machine
- Set up MySQL Workbench
- Create first database and tables
- Configure basic security settings

Practice: Complete 20 basic database operations

SQL Basics - Data Definition Language (DDL)

Topics:

- Creating databases with CREATE DATABASE
- Dropping databases safely
- Creating tables with CREATE TABLE
- Data types: Numeric (INT, DECIMAL, FLOAT)
- String types (CHAR, VARCHAR, TEXT)
- Date and time types (DATE, TIME, DATETIME, TIMESTAMP)
- Boolean and ENUM types
- Understanding NULL and NOT NULL
- Primary keys and their importance
- AUTO_INCREMENT for automatic numbering
- Altering tables with ALTER TABLE
- Dropping and truncating tables

Projects built:

- Design employee database schema
- Create online store database structure
- Build student management system tables
- Library management database design

Practice: Create 30 different table structures

SQL Basics - Data Manipulation Language (DML)

Topics:

- Inserting data with INSERT
- Bulk insert operations
- Updating records with UPDATE
- Safe update practices
- Deleting data with DELETE
- TRUNCATE vs DELETE
- Basic SELECT queries
- Selecting specific columns
- WHERE clause for filtering
- Comparison operators (=, !=, <, >, <=, >=)
- Logical operators (AND, OR, NOT)
- IN and BETWEEN operators

Projects built:

- Populate employee database with data
- Create product catalog with 1000+ items
- Build customer records system
- Inventory management data setup

Practice: Write 100 INSERT, UPDATE, DELETE queries

Querying Data - SELECT Mastery

Topics:

- ORDER BY for sorting results
- LIMIT for pagination
- DISTINCT for unique values
- Aliases with AS
- String functions: CONCAT, LENGTH, UPPER, LOWER
- LIKE operator for pattern matching
- Wildcards (% and _)
- Regular expressions in MySQL
- Date functions: NOW, CURDATE, DATE_FORMAT
- Mathematical functions: SUM, AVG, COUNT, MIN, MAX
- GROUP BY for aggregation
- HAVING clause for group filtering

Projects built:

- Sales reporting queries
- Customer analytics dashboard queries
- Product search functionality
- Date-based report generation

Practice: Master 150 SELECT query variations

Assessment: Phase 1 check: a timed SELECT gauntlet on a fresh dataset, plus a mixed review of the whole phase

---

PHASE 2: DESIGN AND JOINS (MONTHS 3-4, WEEKS 9-16)

Where amateurs are separated from professionals: relationships, joins without fear, subqueries, and schema design as a deliberate craft.

Months 3-4: Relationships to Real Design (Weeks 9-16)

Database Relationships

Topics:

- Understanding table relationships
- One-to-One relationships

    - One-to-Many relationships
    - Many-to-Many relationships
    - Foreign keys and referential integrity
    - CASCADE options (DELETE, UPDATE)
    - Creating foreign key constraints
    - Database normalization introduction
    - First Normal Form (1NF)
    - Second Normal Form (2NF)
    - Third Normal Form (3NF)
    - Denormalization when and why
  Projects built:
    - Design blog database with posts and comments
    - E-commerce database with orders and products
    - School database with students and courses
    - Social media database schema
  Practice: Design 20 relational database schemas
Mastering Joins
  Topics:
    - Understanding JOIN operations
    - INNER JOIN deep dive
    - LEFT JOIN (LEFT OUTER JOIN)
    - RIGHT JOIN (RIGHT OUTER JOIN)
    - CROSS JOIN
    - Self joins for hierarchical data
    - Multiple table joins
    - Using aliases in joins
    - Natural joins
    - Join performance considerations
    - UNION operations
    - INTERSECT and EXCEPT alternatives
  Projects built:
    - Employee-Department-Salary reports
    - Order-Customer-Product analysis
    - Multi-table inventory system
    - Hierarchical organization chart
  Practice: Write 100 complex JOIN queries
Subqueries and Set Operations
  Topics:
    - Understanding subqueries
    - Subqueries in SELECT clause
    - Subqueries in FROM clause
    - Subqueries in WHERE clause
    - Correlated vs non-correlated subqueries
    - EXISTS and NOT EXISTS
    - ANY, ALL, SOME operators
    - Subqueries vs JOINs performance
    - Common Table Expressions (CTEs)
    - Recursive CTEs
    - UNION and UNION ALL
    - Combining multiple result sets
  Projects built:
    - Complex reporting with subqueries
    - Hierarchical data queries with CTEs
    - Performance comparison study
    - PHASE 1 CAPSTONE: Complete Database Application
  Assessment: Phase 1 comprehensive SQL exam
Schema Design Done Properly
  Topics:
    - Database design methodology
    - Requirements gathering
    - Conceptual design with ER diagrams
    - Logical design and normalization
    - Physical design considerations
    - Denormalization strategies
    - Partitioning tables
    - Vertical vs horizontal partitioning
    - Sharding concepts
    - Archive strategies
    - Multi-tenant database design
    - Temporal database design
    - Database refactoring
    - Migration strategies
  Projects built:
    - Design multi-tenant SaaS database
    - Implement table partitioning
    - Create temporal data system
    - Database migration project
  Practice: Design 10 complex database systems
  Assessment: Phase 2 exam: design and defend a schema live from a brief, plus mixed

      questions from phase 1

PHASE 3: THE PROGRAMMABLE DATABASE (MONTHS 5-6, WEEKS 17-24)

MySQL beyond queries: views and indexes, stored procedures, triggers, transactions argued
about properly, and Python integration.

  Months 5-6: Views to Python (Weeks 17-24)
    Views & Indexes
      Topics:
        - Creating and using views
        - Updatable vs non-updatable views
        - View algorithms (MERGE, TEMPTABLE)
        - Security with views
        - Materialized views alternatives
        - Understanding indexes
        - B-Tree vs Hash indexes
        - Creating indexes strategically
        - Composite indexes
        - Unique indexes
        - Full-text indexes
        - Spatial indexes
        - Index hints
        - Analyzing index usage
      Projects built:
        - Create view layer for application
        - Index optimization for slow queries
        - Full-text search implementation
        - Performance improvement study
      Practice: Create 50 views and optimize with indexes
    Stored Procedures
      Topics:
        - Introduction to stored procedures
        - Creating procedures with CREATE PROCEDURE
        - IN, OUT, INOUT parameters
        - Variables and data types
        - Control flow: IF, CASE, LOOP, WHILE
        - REPEAT and LEAVE statements
        - Error handling with DECLARE HANDLER
        - Cursors for row-by-row processing
        - Nested procedures
        - Procedure security and permissions
        - Debugging stored procedures
        - Best practices for procedures
        - Performance implications
        - Version control for database code
        - Functions and triggers: the essentials, and when not to use them
      Projects built:
        - Order processing system procedures
        - Automated reporting procedures
        - Data validation procedures
        - Batch processing system
      Practice: Write 40 stored procedures
    Transactions & Concurrency
      Topics:
        - ACID properties explained
        - Starting transactions: BEGIN, START TRANSACTION
        - COMMIT and ROLLBACK
        - Savepoints in transactions
        - Autocommit mode
        - Isolation levels: READ UNCOMMITTED, READ COMMITTED
        - REPEATABLE READ, SERIALIZABLE
        - Dirty reads, non-repeatable reads, phantom reads
        - Locking mechanisms in MySQL
        - Table locks vs row locks
        - Deadlock detection and resolution
        - Optimistic vs pessimistic locking
        - Lock wait timeouts
        - Transaction best practices
      Projects built:
        - Banking transaction system
        - Inventory management with concurrency
        - Booking system with lock handling
        - Deadlock simulation and resolution
      Practice: Implement 20 transactional scenarios
    MySQL with Python
      Topics:
        - Python MySQL connectors

```
        - PyMySQL vs mysql-connector-python
        - Establishing connections
        - Executing queries from Python
        - Prepared statements
        - Fetching results
        - Connection pooling
        - ORM with SQLAlchemy
        - Database migrations with Alembic
        - Async database operations
        - Error handling in Python
        - Transaction management
        - Building data access layer
        - Best practices for Python-MySQL
      Projects built:
        - Python database application
        - REST API with MySQL backend
        - Data migration script
        - ORM-based application
      Practice: Build 10 Python-MySQL applications
      Assessment: Phase 3 exam: a procedure-plus-transaction task built live, with cumulative
      questions from phases 1-2

----------------------------------------------------------------
PHASE 4: THE PRODUCTION MONTH (MONTH 7, WEEKS 25-28)
----------------------------------------------------------------
What teams need before they trust you with data: security, backups, performance tuning with
EXPLAIN, and the capstone exam.

  Month 7: Production Essentials and the Finale (Weeks 25-28)
    Users, Security and Backups
      Topics:
        - MySQL security model
        - User account management
        - CREATE USER and ALTER USER
        - Password policies and validation
        - Authentication plugins
        - Privileges and GRANT system
        - Database, table, column privileges
        - Stored routine privileges
        - Proxy users and roles
        - SSL/TLS configuration
        - Encrypted connections
        - Transparent data encryption
        - Audit logging
        - Security best practices
        - Backups with mysqldump and the recovery drill you run before you need it
      Projects built:
        - Implement role-based access control
        - SSL setup for production
        - Security audit of database
        - User management system
      Practice: Configure 20 different security scenarios
    Performance Tuning with EXPLAIN
      Topics:
        - Performance tuning methodology
        - Identifying bottlenecks
        - EXPLAIN and query analysis
        - EXPLAIN FORMAT=JSON
        - Visual EXPLAIN in Workbench
        - Slow query log analysis
        - Performance Schema introduction
        - Key performance metrics
        - Buffer pool tuning
        - Query cache (deprecated but historical)
        - Connection pool tuning
        - Thread configuration
        - I/O optimization
        - Operating system tuning
        - Storage engines in one honest lesson: InnoDB and when anything else matters
      Projects built:
        - Performance baseline establishment
        - Slow query optimization
        - Server tuning project
        - Performance monitoring setup
      Practice: Optimize 50 slow queries
    Capstone Build
      Topics:
        - The capstone: a complete database product for a real domain
        - Schema designed and reviewed before data
```

- The query set: hard questions your database answers fast
- Procedures and transactions where they earn their place
- Security, backup and an EXPLAIN-verified performance pass
- Documentation another developer could onboard from

Projects built:

- The capstone: designed, secured, tuned, Python-connected and documented

Practice: Daily capstone progress; schema frozen by day 3

Demo Day and Final Exam

Topics:

- Presenting the capstone: schema, queries, decisions, measurements
- A full-course spiral review before the exam
- Where each path leads: data analytics, full-stack, or the dedicated DBA road

Projects built:

- Demo day presentation delivered to the batch

Assessment: FINAL EXAM: a practical database build plus a written paper with questions mixed from every phase. Passing earns the certificate; falling short earns a focused revision plan and a free retest

PROJECTS THE STUDENT BUILDS AND KEEPS

- Phase 1: real datasets queried daily, from first SELECT to timed gauntlets
- Phase 2: multi-table schemas designed from briefs, with ER diagrams and constraint sets
- Phase 3: views, procedures and transaction-safe operations on realistic systems, then Python integration
- Phase 4: a secured, tuned, documented capstone defended at demo day

Total projects: 15+ database builds and query projects, crowned by a production-shaped capstone

SKILLS THE STUDENT WILL HAVE AT THE END

- SQL fluency: DDL, DML and SELECT mastery including joins, subqueries and set operations
- Design: ER modeling, normalization and constraints practiced on real domains
- Programmable MySQL: views, indexes, stored procedures, triggers and transactions
- Integration: MySQL driven from Python applications
- Production habits: users and privileges, backups with recovery drills, EXPLAIN-driven tuning

HOW A TYPICAL WEEK IS SPLIT

Live classes: 2 live one-hour classes per week, querying and designing along with the instructor
Homework: A problem set after every class, and a mixed-review assignment at the end of every month
Practice: 3-4 hours of query and design practice between classes
Review: Every set reviewed with written feedback; recurring gaps reopened in class

SUPPORT INCLUDED

Doubt support: WhatsApp doubt support between classes, for the deadlock at midnight
Progress updates: Honest monthly progress reviews: what is solid, what is wobbly, and the plan for the wobble

CERTIFICATION DETAIL

Completion: Certificate from Modern Age Coders, awarded on passing the final exam. Fall short and there is focused revision and a free retest: the certificate certifies knowledge, not attendance

WHERE THIS CAN LEAD

- Data analytics: SQL here is the entry gate, our data analysis course continues the road
- Full-stack development: every backend needs exactly this data layer
- Backend engineering: transactions and tuning learned here compound there
- The DBA path: administration as a profession, entered with real fundamentals
- Interview rounds: SQL questions answered from understanding, not memory

EARNING POTENTIAL (share only if asked, and never promise it)

Market context: The ranges below are general market salary bands for these roles in India and abroad, drawn from public industry data. They are shown for career context only and are not a promise or guarantee of income. Actual pay depends on your skills, experience, location, and the job market.
Growing roles: Rs 4-6 LPA (Junior Database Developer)
Experienced roles: Rs 6-12 LPA (Database Administrator); Rs 10-20 LPA (Senior DBA); Rs 15-35+ LPA (Database Architect)
Freelance: Rs 1,500-5,000/hour
International: $60k-130k USD based on location and experience

COMMON QUESTIONS ABOUT THIS COURSE

For anything about cost, use PART 4 and RULE 1. Do not quote two regions.

Q: Is this course only about writing SQL queries?
A: No, and that is the point. Queries are phase 1; the course continues into schema design as a craft, the programmable database, views, stored procedures, triggers and transactions, Python integration, and the production habits of security, backups and EXPLAIN-driven performance tuning. What it deliberately does not staple on is the full DBA career track, replication clusters and multi-cloud failover, which is its own profession and is named honestly as a next path.

Q: How long does it take to learn MySQL properly?
A: Seven months at 2 live classes a week plus 3 to 4 hours of practice covers the developer 95%: SQL fluency, design, the programmable database and production basics. The course keeps an eighth month in hand for learners who need more repetition, no rushing and no penalty. Twelve-month database courses are stretched; two-week ones are demos.

Q: How am I assessed? Is the certificate just for attending?
A: No. Problem sets follow every class with written feedback, monthly reviews deliberately mix new topics with earlier ones, each phase ends with an exam, and the course ends with a final exam, a practical build plus written questions from the whole syllabus. Passing earns the certificate; falling short earns focused revision and a free retest.

Q: Do I need programming experience to start?
A: No. SQL is taught from the first statement and is one of the friendliest languages to begin with. The Python integration weeks in phase 3 are guided and assume nothing; students who already code simply move faster there.

Q: Which MySQL version and tools do you teach?
A: Current MySQL 8 with MySQL Workbench, all free Community editions, plus the command line where professionals actually live. Everything taught transfers to MariaDB and, concepts-wise, to PostgreSQL; SQL fluency is portable by design.

Q: How does this help with placements and interviews?
A: SQL rounds are near-universal in data and software hiring, and they test exactly what this course drills: joins under pressure, subqueries, aggregation edge cases, schema design judgment and transaction reasoning. The monthly mixed reviews keep older material interview-fresh, and the capstone gives you a designed, tuned, documented database to talk through.

Q: Can I evaluate the teaching first?
A: Yes, a free demo class with no commitment: book at learn.modernagecoders.com/contact or message us on WhatsApp at +91 91233 66161. Bring a query from your own work or coursework; the demo is best on your real problem. (Agent note: the free demo is a waiting list with no fixed date. The Priority Live Demo is a guaranteed class today or tomorrow, booked at https://learn.modernagecoders.com/priority-demo . Offer both, as RULE 3 says.)

Q: Are classes live or recorded?
A: Live, always: small groups where your actual SQL gets read and corrected in real time, never pre-recorded videos. Database judgment is built under feedback; a video cannot see your execution plan.

To enrol, message Shivam Sir on +91 9123366161 or send the parent this link: https://learn.modernagecoders.com/courses/mysql-database-complete-masterclass-college
For a demo: the Priority Live Demo (guaranteed, today or tomorrow) is booked at https://learn.modernagecoders.com/priority-demo . The free demo is a waiting list with no fixed date.

==========

COURSE 103 OF 137: MYSQL FOR TEENS: SQL FROM FIRST QUERY TO REAL APPS

==========

Course link: https://learn.modernagecoders.com/courses/mysql-mastery-for-teens
Subject area: Databases
Designed for: Teens
Who can join: Absolute beginner, ages 13 to 18
Course length: 5-6 months (20-24 weeks)
Time needed: 2 live classes/week + 2-3 hours practice
Certificate: Certificate from Modern Age Coders, awarded on passing the final exam

PRICE FOR THIS COURSE (quote only the one that applies to the person asking)
In India, per month: group Rs 1,499, mini batch Rs 2,999, one to one Rs 4,999
In Canada, per month: group CAD 140, one to one CAD 210
Anywhere else, per month: group $100, one to one $150
Classes: group and mini batch two live classes a week, eight a month; one to one in India one live class a week, four a month; one to one outside India two live classes a week, eight a month. Each class is one hour.

WHAT THIS COURSE IS

MySQL course for teens aged 13-18: live online classes from first SQL query to database design, real projects and Python-connected apps in 5-6 months.

In one line: Every app a teenager uses is a database wearing a nice shirt. Five months from first query to designing and connecting real databases of their own.

ABOUT THE PROGRAMME

Behind Instagram, Spotify and every game leaderboard sits the same quiet skill: SQL, the language of data. This live online course teaches it properly to students aged 13 to 18, from the first SELECT to real database design, in five honest months. SQL is one of the highest-value skills per hour of learning in all of computing: the language is compact, the concepts are learnable at 13, and the skill stays current for decades. The arc is practical from the first week: students query and build real databases about things they care about, music libraries, game inventories, school clubs, then learn the query toolkit (functions, aggregation, subqueries), real design (relationships, joins, ER diagrams, constraints), the power features professionals lean on (views, stored procedures, transactions, indexes), and finish by securing a database and connecting it to Python, where data becomes an actual application. The capstone is a complete, well-designed, connected database project defended at demo day. The pace is honest: five months at two live classes a week plus two to three hours of practice, with a sixth month in hand for students who need more time. Homework after every class, monthly mixed reviews that reach back deliberately, and a final exam that decides the certificate, with a free retest after revision. Real queries, real design, depth over dopamine.

WHAT MAKES THIS COURSE DIFFERENT

- Honest length: SQL fundamentals to real design in 5 months, not a stretched year
- Teen-real datasets: music, games, clubs and leaderboards, not employee-salary tables from 1998
- Design is taught, not skipped: ER diagrams, normalization and constraints, the part that separates users from designers
- The professional features that matter: views, procedures, transactions and indexes, each earning its place
- Ends connected: MySQL driven from Python, so the database becomes an application
- Real assessment: weekly homework, monthly mixed reviews, and a final exam that decides the certificate, with focused revision and a free retest

THE LEARNING PATH, STEP BY STEP

Month 1: SQL foundations (Weeks 1-4): databases demystified, tables created, data inserted, updated and queried safely
Month 2: Query power (Weeks 5-8): functions, dates, aggregation and subqueries, the everyday toolkit
Month 3: Real design (Weeks 9-12): relationships, joins, ER diagrams, normalization and constraints
Month 4: Power features (Weeks 13-16): views, stored procedures, transactions and indexes
Month 5: Apps and the exam (Weeks 17-20): security and backups, MySQL from Python, the capstone and the final exam

WHAT A STUDENT NEEDS BEFORE STARTING

Coding experience: None. SQL is taught from the first statement; the Python in month 5 is guided
Computer skills: Comfortable typing and installing software with guidance
Equipment: A computer with a stable internet connection; MySQL and every tool used are free
Age: 13 to 18. Batches are grouped by age and pace
Time commitment: 2 live classes plus 2-3 hours of practice a week

WHO THIS COURSE IS FOR

Data curious: Teens who wonder how apps remember everything, and want to build the memory themselves
Future developers: Students heading for web, app or game development, where the data layer is always waiting
Analysts in the making: Teens drawn to spreadsheets and statistics, ready for the real tool behind them
Complete beginners: Students with zero coding background: SQL is one of the friendliest first languages there is
Portfolio builders: Teens who want a genuinely uncommon skill on a school profile

FULL CURRICULUM, WEEK BY WEEK

This is the complete teaching plan. Parents can ask about any week.

MONTH 1: SQL FOUNDATIONS

Databases demystified and the four verbs of data: CREATE, INSERT, SELECT, UPDATE and DELETE,

used safely from the start.

Introduction to Databases & MySQL Setup
Topics:
- What is data and why do we need databases?
- Real-world database examples teens use daily (Instagram, TikTok, Spotify)
- Files vs Databases: Why databases win
- Types of databases: Relational vs NoSQL
- Introduction to MySQL: History and why it's popular
- MySQL in the real world: Facebook, Twitter, YouTube
- Installing MySQL on Windows/Mac/Linux
- MySQL Workbench installation and tour
- Command line basics for MySQL
- Creating your first database
- Understanding servers, clients, and connections
- Database terminology: tables, rows, columns, records
Projects built:
- Install and configure MySQL environment
- Create 'MyLife' database for personal data
- Design a simple contact list database
Practice: Daily: 30 min terminal practice, 1 hour MySQL basics

SQL Basics: Creating and Managing Databases
Topics:
- CREATE DATABASE statement
- USE, SHOW, and DROP commands
- Creating tables with CREATE TABLE
- Data types: INT, VARCHAR, TEXT, DATE, BOOLEAN
- Understanding NULL and NOT NULL
- Primary keys and their importance
- AUTO_INCREMENT for automatic IDs
- Altering tables: ADD, MODIFY, DROP columns
- Renaming tables and columns
- DESCRIBE and SHOW COLUMNS commands
- Comments in SQL code
- SQL naming conventions and best practices
Projects built:
- School database with students and classes
- Gaming stats tracker database
- Music library database structure
Practice: Create 10 different database schemas for teen apps

Data Manipulation: INSERT, SELECT Basics
Topics:
- INSERT INTO: Adding single records
- INSERT multiple records at once
- Understanding SQL syntax and semicolons
- SELECT statement fundamentals
- SELECT specific columns vs SELECT *
- WHERE clause for filtering data
- Comparison operators: =, !=, <, >, <=, >=
- AND, OR, NOT logical operators
- IN and NOT IN operators
- BETWEEN for range queries
- LIKE operator and wildcards (%, _)
- ORDER BY: Sorting results ASC and DESC
Projects built:
- Populate school database with student data
- Create and query a movie ratings database
- Build a sports team roster system
Practice: Write 50 different SELECT queries with various filters

UPDATE, DELETE, and Data Integrity
Topics:
- UPDATE statement: Modifying existing data
- Using WHERE with UPDATE (critical importance!)
- Updating multiple columns
- Using CASE in UPDATE statements
- DELETE statement: Removing records
- Safe deletion practices
- TRUNCATE vs DELETE vs DROP
- Understanding transactions basics
- Data integrity and consistency
- Handling NULL values in queries
- IS NULL and IS NOT NULL
- Default values and their uses
Projects built:
- Grade management system with updates
- Inventory system with stock updates

- Social media profile manager
Practice: Perform 30 UPDATE and DELETE operations safely
Assessment: Month 1 check: build and query a small database live, plus a take-home mixing everything from month 1

MONTH 2: QUERY POWER

The everyday toolkit: string and numeric functions, dates, aggregation with GROUP BY, and first subqueries.

MySQL Functions: String and Numeric
Topics:
- String functions: CONCAT, SUBSTRING, LENGTH
- UPPER, LOWER, TRIM, LTRIM, RTRIM
- REPLACE and string manipulation
- REVERSE, REPEAT, and SPACE
- Numeric functions: ROUND, CEIL, FLOOR
- ABS, MOD, POWER, SQRT
- RAND() for random numbers
- Mathematical operations in queries
- FORMAT for number formatting
- Working with CHAR_LENGTH vs LENGTH
- CAST and CONVERT for type conversion
- Combining multiple functions
Projects built:
- Username generator with string functions
- Grade calculator with numeric functions
- Data cleaning toolkit
Practice: Master 40 different MySQL functions

Date/Time Functions and Operations
Topics:
- Date and time data types: DATE, TIME, DATETIME, TIMESTAMP
- CURDATE(), CURTIME(), NOW()
- Date formatting with DATE_FORMAT
- Extracting parts: YEAR, MONTH, DAY, HOUR, MINUTE
- DAYNAME, MONTHNAME for readable output
- Date arithmetic: DATE_ADD, DATE_SUB
- DATEDIFF for calculating differences
- Working with time zones
- UNIX_TIMESTAMP and FROM_UNIXTIME
- Age calculations from birthdates
- Scheduling and recurring events concepts
- Best practices for storing dates
Projects built:
- Birthday reminder system
- Event scheduling database
- Time tracking application
Practice: Build 20 queries involving date/time calculations

Aggregate Functions and Grouping
Topics:
- COUNT: Counting records and values
- COUNT(*) vs COUNT(column) vs COUNT(DISTINCT)
- SUM for totaling numeric values
- AVG for calculating averages
- MIN and MAX for finding extremes
- GROUP BY clause explained
- Grouping by single and multiple columns
- HAVING clause for filtering groups
- HAVING vs WHERE: Key differences
- GROUP_CONCAT for combining grouped values
- Using aliases with AS
- Complex grouping scenarios
Projects built:
- Class grade analytics system
- Sales reporting database
- Game high scores leaderboard
Practice: Create 30 reports using aggregate functions

Subqueries and Nested Queries
Topics:
- Understanding subqueries concept
- Subqueries in WHERE clause
- Subqueries returning single values
- Subqueries returning multiple values
- IN, NOT IN with subqueries
- EXISTS and NOT EXISTS operators

- Subqueries in SELECT clause
- Subqueries in FROM clause (derived tables)
- Correlated vs non-correlated subqueries
- Performance considerations
- ANY, ALL, SOME operators
- Nested subqueries (multiple levels)

Projects built:
- Advanced student ranking system
- Product recommendation queries
- Social media analytics dashboard

Practice: Write 25 complex queries with subqueries

Assessment: Month 2 check: an aggregation-and-subquery challenge, with quiz questions reaching back to month 1

MONTH 3: REAL DATABASE DESIGN

The part that separates users from designers: relationships, joins, ER diagrams, normalization and constraints.

Table Relationships and JOINS

Topics:
- Understanding relationships: Why we need multiple tables
- One-to-One relationships explained
- One-to-Many relationships (most common)
- Many-to-Many relationships and junction tables
- Foreign keys: Linking tables together
- FOREIGN KEY constraints
- Referential integrity and CASCADE options
- Introduction to JOINs
- INNER JOIN: Matching records in both tables
- LEFT JOIN: Include all from left table
- RIGHT JOIN: Include all from right table
- JOIN with multiple tables

Projects built:
- School system with students, teachers, courses
- E-commerce with customers, orders, products
- Music app with artists, albums, songs

Practice: Create 20 different JOIN queries

Advanced JOINS and Set Operations

Topics:
- Self JOINs: Joining table to itself
- CROSS JOIN and Cartesian products
- Natural JOIN (and why to avoid it)
- Using aliases in JOINs
- Multiple JOIN conditions
- JOINs with aggregate functions
- UNION: Combining result sets
- UNION vs UNION ALL
- INTERSECT concept (workarounds in MySQL)
- EXCEPT/MINUS concept
- Complex JOIN scenarios
- Optimizing JOIN performance

Projects built:
- Employee hierarchy system
- Tournament bracket system
- Multi-store inventory system

Practice: Master complex JOIN operations with 30 exercises

Database Design & Normalization

Topics:
- Database design process overview
- Identifying entities and attributes
- Entity-Relationship (ER) diagrams
- Crow's foot notation
- Primary keys: Natural vs Surrogate
- Composite keys
- Database normalization: Why it matters
- First Normal Form (1NF): Eliminating repeating groups
- Second Normal Form (2NF): Removing partial dependencies
- Third Normal Form (3NF): Removing transitive dependencies
- Denormalization: When and why
- Common design patterns

Projects built:
- Design Instagram-like database from scratch
- Create online learning platform schema
- Design multiplayer game database

Practice: Normalize 10 poorly designed databases

  Constraints and Data Validation
    Topics:
      - PRIMARY KEY constraint deep dive
      - UNIQUE constraint for preventing duplicates
      - NOT NULL constraint
      - DEFAULT values and when to use them
      - CHECK constraints for data validation
      - FOREIGN KEY constraints and relationships
      - ON DELETE CASCADE, SET NULL, RESTRICT
      - ON UPDATE CASCADE
      - Adding constraints to existing tables
      - Dropping and modifying constraints
      - Constraint naming conventions
      - Data validation best practices
    Projects built:
      - User registration system with validations
      - Banking system with integrity constraints
      - Inventory system with business rules
    Practice: Implement 20 different constraint scenarios
    Assessment: Month 3 check: design a small schema live from a real-world brief, plus mixed
    review of months 1-2

MONTH 4: POWER FEATURES

What professionals actually lean on: views, stored procedures, transactions with ACID
honesty, and indexes that make queries fly.

  Views and Virtual Tables
    Topics:
      - What are views and why use them?
      - Creating views with CREATE VIEW
      - Simple vs complex views
      - Views for data security
      - Views for simplifying complex queries
      - Updatable views and restrictions
      - WITH CHECK OPTION for data integrity
      - Modifying views with ALTER VIEW
      - Dropping views
      - Views vs tables performance
      - Materialized views concept
      - Best practices for using views
    Projects built:
      - Create security layer with views
      - Report generation system using views
      - Multi-tenant system with view-based isolation
    Practice: Build 15 different views for various use cases

  Stored Procedures and Functions
    Topics:
      - Introduction to stored procedures
      - Benefits: security, performance, reusability
      - CREATE PROCEDURE syntax
      - Parameters: IN, OUT, INOUT
      - Variables and DECLARE statement
      - Control flow: IF-ELSE, CASE
      - Loops: WHILE, REPEAT, LOOP
      - Cursors for row-by-row processing
      - Error handling with HANDLERS
      - Stored functions vs procedures
      - CREATE FUNCTION syntax
      - Debugging stored procedures
    Projects built:
      - Banking transaction procedures
      - Automated report generation system
      - Game scoring calculation procedures
    Practice: Create 20 stored procedures for common operations

  Transactions and Concurrency
    Topics:
      - ACID properties explained for teens
      - Understanding transactions importance
      - START TRANSACTION, COMMIT, ROLLBACK
      - Autocommit mode
      - Savepoints in transactions
      - Isolation levels: READ UNCOMMITTED to SERIALIZABLE
      - Dirty reads, phantom reads, non-repeatable reads
      - Locking mechanisms in MySQL

- Table locks vs row locks
- Deadlocks: detection and prevention
- Optimistic vs pessimistic locking
- Transaction best practices

Projects built:
- Banking system with safe transactions
- Ticket booking system with concurrency handling
- Inventory management with locking

Practice: Handle 20 different transaction scenarios

Indexing and Query Optimization

Topics:
- What are indexes? Phone book analogy
- How indexes speed up queries
- Types of indexes: B-Tree, Hash, Full-text
- Creating indexes with CREATE INDEX
- Primary key and unique indexes
- Composite (multi-column) indexes
- Index selectivity and cardinality
- EXPLAIN statement for query analysis
- Reading execution plans
- Identifying slow queries
- Query optimization techniques
- When NOT to use indexes

Projects built:
- Optimize slow social media queries
- Create indexing strategy for e-commerce
- Performance tuning workshop

Practice: Optimize 25 slow queries with proper indexing

Assessment: Month 4 check: speed up a slow query live with an index and explain why it worked, plus mixed review

---

MONTH 5: REAL APPS AND THE FINAL EXAM

Securing the database, backing it up, driving it from Python, and the capstone defended at demo day.

Users, Security and Backups

Topics:
- MySQL user account management
- CREATE USER and DROP USER
- Understanding privileges system
- GRANT and REVOKE statements
- Database-level vs table-level privileges
- Column-level and procedure privileges
- Roles in MySQL 8.0+
- Password policies and expiration
- SSL/TLS connections
- Security best practices
- Preventing SQL injection
- Prepared statements for security
- Backups with mysqldump: the five-minute habit that saves projects

Projects built:
- Multi-user application security setup
- Role-based access control system
- Secure API database layer

Practice: Configure security for 10 different scenarios

MySQL from Python: Data Becomes an App

Topics:
- Connecting to MySQL from Python
- MySQL connectors and drivers
- Connection pooling importance
- Prepared statements in applications
- ORM concepts (Object-Relational Mapping)
- Building APIs with MySQL backend
- Handling database errors in code
- Async database operations
- Database abstraction layers
- Testing database code
- Migration scripts
- Database versioning

Projects built:
- Python MySQL admin tool
- RESTful API with MySQL
- Database migration system

Practice: Build 10 applications using MySQL

Capstone Build
Topics:
- Choosing the capstone: a database product for something real, a club, a collection, a game
- Designing first: ER diagram and constraints reviewed before any data
- Building the schema, seeding realistic data
- The query set: the ten questions your database can answer
- A small Python interface: menu-driven or web-lite
- Documentation another student could use
Projects built:
- The capstone: a designed, documented, Python-connected database project
Practice: Daily capstone progress; schema frozen by day 3

Demo Day and Final Exam
Topics:
- Presenting the capstone: schema, queries, interface, decisions
- A full-course spiral review before the exam
- Where this leads: Python, data science and full-stack roads
Projects built:
- Demo day presentation delivered to the batch and parents
Assessment: FINAL EXAM: a practical database build plus a written paper with questions mixed from every month. Passing earns the certificate; a student who falls short gets a focused revision plan and a free retest

PROJECTS THE STUDENT BUILDS AND KEEPS

- Month 1-2: personal databases queried daily: music libraries, game inventories, club registers
- Month 3: a properly designed multi-table schema with an ER diagram
- Month 4: views, procedures and transactions added to real projects
- Month 5: a secured, backed-up, Python-connected capstone defended at demo day

Total projects: 12+ real databases and query projects, crowned by a connected capstone

SKILLS THE STUDENT WILL HAVE AT THE END

- SQL fluency: SELECT to subqueries, written confidently and safely
- Aggregation and analysis: GROUP BY thinking that carries into data science
- Database design: relationships, ER diagrams, normalization and constraints
- Professional features: views, stored procedures, transactions, indexes
- Operations basics: users, privileges and backups
- Integration: MySQL driven from Python, database to application

HOW A TYPICAL WEEK IS SPLIT

Live classes: 2 live one-hour classes per week, querying along with the instructor
Homework: Homework after every class, and a mixed-review assignment at the end of every month so earlier skills stay sharp
Practice: 2-3 hours of query and design practice between classes
Review: Every submission reviewed with written feedback; recurring issues reopened in class

SUPPORT INCLUDED

Doubt support: WhatsApp doubt support between classes, for the JOIN that refuses to join
Progress updates: Regular progress notes to parents: what was built, what comes next, and where encouragement helps

CERTIFICATION DETAIL

Completion: Certificate from Modern Age Coders, awarded on passing the final exam. Fall short and there is focused revision and a free retest: the certificate certifies knowledge, not attendance

WHERE THIS CAN LEAD

- Python for Teens: the natural pairing, already begun in month 5
- Full-stack web development: every backend needs exactly this data layer
- Data science: aggregation thinking here becomes pandas thinking there
- App development: real apps stand on real schemas
- School and college projects that suddenly have proper data behind them

COMMON QUESTIONS ABOUT THIS COURSE

For anything about cost, use PART 4 and RULE 1. Do not quote two regions.

Q: Why should a teenager learn SQL and MySQL?
A: SQL turns a teen from someone who uses apps into someone who understands how apps remember, and it quietly powers every later path: web development, data science, app building and analytics.

  Q: How long does it take a teen to learn MySQL properly?
  A: Five months at 2 live classes a week plus 2 to 3 hours of practice: foundations, the query toolkit, real database design, professional features, and a Python-connected capstone. The course keeps a sixth month in hand for students who need more repetition, no rushing and no penalty. First real queries run in class one.

  Q: How is my teen assessed? Is the certificate just for attending?
  A: No. Homework follows every class, each month ends with a mixed assignment that deliberately revisits earlier topics, and the course ends with a final exam: a practical database build plus written questions from the whole syllabus. Passing earns the certificate; falling short earns focused revision and a free retest.

  Q: What will my teen actually build?
  A: A dozen real databases: music libraries, game inventories and club registers in the early months, then a properly designed multi-table schema with an ER diagram, and finally the capstone, a secured, documented database connected to a small Python interface, presented at demo day. Real data about things they care about, from week one.

  Q: Does this course cover connecting databases to apps and websites?
  A: Yes, that is the destination: month 5 drives MySQL from Python, turning the database into an application, and the capstone requires it.

  Q: Is any paid software required?
  A: No. MySQL Community Server, MySQL Workbench and Python are all free, and a standard computer runs everything comfortably. SQL is famously light on hardware.

  Q: Is there a free trial class?
  A: Yes, a free demo class with no commitment: book at learn.modernagecoders.com/contact or message us on WhatsApp at +91 91233 66161. Your teen will run real queries inside the demo itself. (Agent note: the free demo is a waiting list with no fixed date. The Priority Live Demo is a guaranteed class today or tomorrow, booked at https://learn.modernagecoders.com/priority-demo . Offer both, as RULE 3 says.)

  Q: Are classes live or recorded?
  A: Live, always: small interactive groups with a real instructor, never pre-recorded videos. SQL is learned by writing queries and being corrected in the moment, a video cannot see your WHERE clause.

  To enrol, message Shivam Sir on +91 9123366161 or send the parent this link: https://learn.modernagecoders.com/courses/mysql-mastery-for-teens
  For a demo: the Priority Live Demo (guaranteed, today or tomorrow) is booked at https://learn.modernagecoders.com/priority-demo . The free demo is a waiting list with no fixed date.

==========
COURSE 104 OF 137: NATIONAL 5 AND HIGHER MATHS COURSE ONLINE (SCOTLAND)
==========

Course link: https://learn.modernagecoders.com/courses/national-5-and-higher-maths-course
Subject area: Scottish Mathematics
Designed for: High school
Who can join: S3 to S6 learners and adults in Scotland taking National 5 or Higher Mathematics
Course length: About 6 months per level: National 5, then Higher (12 months for both)
Time needed: 2 live classes/week + 3-4 hours of practice, rising to full papers before the exams
Certificate: Course-completion certificate from Modern Age Coders

PRICE FOR THIS COURSE (quote only the one that applies to the person asking)
  In India, per month: group Rs 1,499, mini batch Rs 2,999, one to one Rs 4,999
  In Canada, per month: group CAD 140, one to one CAD 210
  Anywhere else, per month: group $100, one to one $150
  Classes: group and mini batch two live classes a week, eight a month; one to one in India one live class a week, four a month; one to one outside India two live classes a week, eight a month. Each class is one hour.

WHAT THIS COURSE IS

  National 5 and Higher Maths online for Scottish learners: C847 75 and C847 76 taught live, from algebra and trigonometry to calculus, ending in timed papers.

  In one line: The two Scottish maths courses most learners need, taught in order: National 5 for the algebra, geometry and trigonometry, then Higher for functions, vectors and calculus.

ABOUT THE PROGRAMME

  National 5 Mathematics (course code C847 75) and Higher Mathematics (C847 76) are the Scottish courses that open the door to most further study. Their course specifications, published by Qualifications Scotland on sqa.org.uk, give each a notional 160 hours of learning and two question papers. National 5 has a 40-mark non-calculator paper of 1 hour and a 50-mark paper of 1 hour 30 minutes. Higher has a 55-mark non-calculator paper of 1 hour 15

minutes and a 65-mark paper of 1 hour 30 minutes. Both courses are graded A to D on the total mark. This course teaches them in sequence. The National 5 half covers the numerical, algebraic, geometric, trigonometric and statistical skills the specification lists, from surds and indices to the sine and cosine rules. The Higher half builds the algebraic and trigonometric, geometric and calculus skills Higher adds: polynomials, logarithms and exponentials, the wave function, the straight line and the circle, vectors, recurrence relations, differentiation and integration. Learners who already hold National 5 start at the Higher half after a diagnostic. Each level ends with a month of full papers under real timing, marked against published marking instructions. Reasoning is taught throughout, because both specifications expect learners to interpret a situation and explain a solution, not just calculate. Classes are live and small, and they run at times that suit Scottish school days and exam leave.

WHAT MAKES THIS COURSE DIFFERENT

- Built from the National 5 and Higher Mathematics course specifications, version 3.0, valid from session 2023 to 24
- Non-calculator Paper 1 skills practised every week at both levels
- Reasoning taught explicitly: interpreting a situation and explaining a solution
- National 5 then Higher in one sequence, or Higher alone after a diagnostic
- A month of full papers per level, marked against published marking instructions
- Scottish terms and structure throughout: S3 to S6, prelims and the national exam diet

THE LEARNING PATH, STEP BY STEP

Phase 1: National 5 skills: numerical, algebraic, geometric, trigonometric and statistical skills, with reasoning throughout
Phase 2: National 5 papers: prelim-style and full papers under timing, marked and reviewed
Phase 3: Higher skills: algebraic and trigonometric, geometric and calculus skills, with reasoning throughout
Phase 4: Higher papers: prelim-style and full papers under timing, marked and reviewed

WHAT A STUDENT NEEDS BEFORE STARTING

Maths level: For National 5: the fourth curriculum level or National 4 Mathematics, as the course specification recommends. For Higher: National 5 Mathematics or equivalent. A diagnostic in the first week places every learner
Exam entry: Learners are entered by their school or college. Adults and private candidates arrange entry through a centre; we teach to the specification and paper style
Equipment: A scientific calculator, ruler, protractor, compasses, and a device with stable internet for live classes
Timing: Start National 5 in S3 or early S4, and Higher early in S5, so the papers month comes before the prelims. Later joiners get a catch-up plan

WHO THIS COURSE IS FOR

S3 s4 learners: S3 and S4 learners working towards National 5 Mathematics
S5 s6 learners: S5 and S6 learners taking Higher Mathematics
Learners needing support: Learners whose school class moves faster than they can follow and who want steady teaching alongside it
Adult learners: Adults in Scotland returning to National 5 or Higher Mathematics for college, university or work
International learners: Learners abroad following the Scottish curriculum who need live teaching across time zones

FULL CURRICULUM, WEEK BY WEEK

This is the complete teaching plan. Parents can ask about any week.

PHASE 1: NATIONAL 5 SKILLS (MONTHS 1-5, WEEKS 1-20)

The skills sampled in National 5 Mathematics, taught strand by strand with reasoning questions in every month.

Month 1: Numerical Skills (Weeks 1-4)
Weeks 1-2: Diagnostic, Surds and Indices
Topics:
- A diagnostic paper to place each learner
- Simplifying surds and rationalising denominators
- Indices, including negative and fractional indices
- Scientific notation
- Rounding to significant figures
- Setting out non-calculator working clearly

Projects built:
- Skills checklist started: every National 5 skill coloured by confidence

Practice: 15 non-calculator number questions a week
Weeks 3-4: Percentages, Fractions and Appreciation
Topics:

```
      - Reverse percentages
      - Appreciation and depreciation, including compound interest
      - Operations and combinations of operations on fractions
      - Mixed numbers without a calculator
      - Choosing a calculator method for repeated percentage change
      - Reasoning: explaining whether an offer is worth it
    Projects built:
      - Money file: interest and depreciation problems solved and explained
    Practice: 12 percentage and fraction problems a week
    Assessment: Month 1 check: a 30-minute non-calculator paper

Month 2: Algebraic Skills, Part One (Weeks 5-8)
  Weeks 5-6: Expressions and Factorising
    Topics:
      - Expanding brackets, including ax(bx + c) and products of binomials
      - Factorising: common factors, difference of two squares, trinomials
      - Completing the square
      - Algebraic fractions: simplifying and the four operations
      - Changing the subject of a formula
      - Checking by substitution
    Projects built:
      - Algebra method sheet: one worked example of every technique
    Practice: 20 algebra questions a week
  Weeks 7-8: Straight Lines and Equations
    Topics:
      - Gradient from two points and from a graph
      - The equation of a straight line in different forms
      - Linear equations and inequations
      - Simultaneous equations by graph and by algebra
      - Constructing equations from text
      - Reasoning: interpreting the solution in context
    Projects built:
      - Equation bank: simultaneous equation problems built from real contexts
    Practice: 15 equation problems a week
    Assessment: Month 2 check: a 40-minute algebra paper

Month 3: Algebraic Skills, Part Two (Weeks 9-12)
  Weeks 9-10: Quadratics
    Topics:
      - Quadratic functions and their graphs
      - Turning points and axes of symmetry
      - Solving quadratic equations by factorising and by formula
      - The discriminant and the nature of the roots
      - Sketching a parabola from its equation
      - Problems that lead to a quadratic
    Projects built:
      - Parabola file: six quadratics sketched with roots and turning points
    Practice: 15 quadratic problems a week
  Weeks 11-12: Functions and Mixed Algebra
    Topics:
      - Functional notation, f(x)
      - Finding a quadratic function from its graph
      - Reading information from graphs
      - Mixed algebra questions from past papers
      - Non-calculator algebra under time
      - Error log review
    Projects built:
      - Skills checklist updated after the first three months
    Practice: Two 25-minute mixed algebra sets a week
    Assessment: Month 3 check: a 45-minute mixed paper

Month 4: Geometric Skills (Weeks 13-16)
  Weeks 13-14: Shape, Area and Volume
    Topics:
      - Arc length and sector area
      - Volumes of prisms, cylinders, cones, pyramids and spheres
      - Pythagoras' theorem in complex situations, including 3D
      - Properties of quadrilaterals, triangles, polygons and circles
      - Similarity and scale factors for area and volume
      - Rounding volume and area answers sensibly
    Projects built:
      - Geometry sheet: every formula and property with a worked example
    Practice: 15 geometry problems a week
  Weeks 15-16: Vectors and Coordinates
    Topics:
      - Two-dimensional vectors: adding, subtracting and multiplying by a scalar
      - Vector pathways in shapes
      - Three-dimensional coordinates from a diagram
      - Magnitude of a vector
```

```
        - Reasoning: explaining a geometric result
        - Past paper geometry questions
      Projects built:
        - Vector diagram set: five shapes with pathways labelled
      Practice: 12 vector and coordinate problems a week
      Assessment: Month 4 check: a 45-minute geometry paper

  Month 5: Trigonometric and Statistical Skills (Weeks 17-20)
    Weeks 17-18: Trigonometry
      Topics:
        - Area of a triangle using trigonometry
        - The sine rule and the cosine rule
        - Bearings in problems
        - Graphs of trigonometric functions and their translations
        - Solving trigonometric equations
        - Trigonometric identities used at National 5
      Projects built:
        - Triangle casebook: when to use each rule, with a solved example
      Practice: 15 trigonometry problems a week
    Weeks 19-20: Statistics
      Topics:
        - Comparing data sets using statistics
        - Standard deviation and the semi-interquartile range
        - Scatter graphs and the line of fit
        - Writing a comparison in context
        - Mixed questions across all National 5 skills
        - Planning the papers month
      Projects built:
        - Skills checklist completed for National 5
      Practice: 12 statistics questions a week plus a mixed set
      Assessment: Month 5 check: a full mixed paper at National 5

----------------------------------------------------------------
PHASE 2: NATIONAL 5 PAPERS (MONTH 6, WEEKS 21-24)
----------------------------------------------------------------
Full National 5 papers under real timing: Paper 1 without a calculator, 40 marks in 1 hour,
and Paper 2, 50 marks in 1 hour 30 minutes.

  Month 6: Full National 5 Papers (Weeks 21-24)
    Weeks 21-22: Prelim-Style Papers
      Topics:
        - A full Paper 1 and Paper 2 under timing
        - Marking against published marking instructions
        - Sorting lost marks by skill and by habit
        - Re-teaching the weakest skills
        - Pacing Paper 1 without a calculator
        - Showing working that earns process marks
      Projects built:
        - Paper tracker started for National 5
      Practice: One full paper pair a week
    Weeks 23-24: Final Papers and Next Steps
      Topics:
        - A final paper pair under timing
        - Review of every lost mark
        - Exam-day routine and equipment
        - Bridging tasks for Higher: functions and further algebra
        - Planning Higher for those continuing
        - Revision plan up to the exam
      Projects built:
        - Completed National 5 paper tracker and error log
      Practice: Targeted sets from the error log
      Assessment: National 5 paper review, one to one

----------------------------------------------------------------
PHASE 3: HIGHER SKILLS (MONTHS 7-11, WEEKS 25-44)
----------------------------------------------------------------
The skills sampled in Higher Mathematics: algebraic and trigonometric, geometric and calculus
skills, with reasoning throughout. Learners joining at Higher start here after a diagnostic.

  Month 7: Algebra and Functions (Weeks 25-28)
    Weeks 25-26: Polynomials and Quadratic Theory
      Topics:
        - A diagnostic for learners joining at Higher
        - Factorising cubics and quartics with the factor theorem
        - Solving polynomial equations
        - Quadratic inequalities and the discriminant
        - Tangency and intersection of lines and curves
        - Completing the square at Higher depth
      Projects built:
```

```
      - Higher skills checklist started
    Practice: 15 polynomial and quadratic problems a week
  Weeks 27-28: Functions and Graphs
    Topics:
      - Composite and inverse functions
      - Domain and range
      - Related graphs and transformations
      - Exponential and logarithmic functions
      - Laws of logarithms and solving equations
      - Sketching the inverse of a logarithmic or exponential function
    Projects built:
      - Graph file: transformations and log graphs annotated
    Practice: 15 function and logarithm problems a week
    Assessment: Month 7 check: a 45-minute Higher algebra paper

Month 8: Trigonometry at Higher (Weeks 29-32)
  Weeks 29-30: Radians, Formulae and Identities
    Topics:
      - Radians and exact values
      - Addition formulae and double-angle formulae
      - Trigonometric identities
      - Solving trigonometric equations in degrees and radians
      - Graphs of trigonometric functions
      - Non-calculator trigonometry
    Projects built:
      - Trigonometry sheet: exact values, formulae and identities
    Practice: 15 trigonometry problems a week
  Weeks 31-32: The Wave Function
    Topics:
      - Converting a cos x + b sin x to k cos(x - a) and related forms
      - Maximum and minimum values
      - Solving equations using the wave function
      - Sketching the resulting graph
      - Applications in context
      - Past paper wave function questions
    Projects built:
      - Wave function casebook: four forms with a worked example each
    Practice: 10 wave function problems a week
    Assessment: Month 8 check: a 45-minute trigonometry paper

Month 9: Straight Line, Circle, Vectors and Recurrence (Weeks 33-36)
  Weeks 33-34: The Straight Line and the Circle
    Topics:
      - Gradients, perpendicular lines and collinearity
      - Medians, altitudes and perpendicular bisectors
      - Equations of a circle
      - Intersection of a line and a circle, and tangency
      - Intersection of two circles, and tangency problems
      - Coordinate geometry reasoning
    Projects built:
      - Coordinate geometry sheet with a solved past-paper style problem
    Practice: 15 straight line and circle problems a week
  Weeks 35-36: Vectors and Recurrence Relations
    Topics:
      - Vectors in three dimensions
      - The scalar product and the angle between vectors
      - Collinearity and dividing a line in a ratio
      - Recurrence relations and their limits
      - Modelling a situation with a recurrence relation
      - Interpreting a limit in context
    Projects built:
      - Recurrence model: a real situation modelled and its limit explained
    Practice: 12 vector and recurrence problems a week
    Assessment: Month 9 check: a 45-minute geometry paper

Month 10: Differentiation (Weeks 37-40)
  Weeks 37-38: Differentiating Functions
    Topics:
      - Differentiating algebraic functions
      - Differentiating k sin x and k cos x
      - The chain rule
      - Equations of tangents
      - Increasing and decreasing functions
      - Stationary points and their nature
    Projects built:
      - Calculus method sheet: one worked example per rule
    Practice: 20 differentiation problems a week
  Weeks 39-40: Applying Differentiation
    Topics:
```

```
        - Sketching curves from stationary points
        - Greatest and least values on an interval
        - Optimisation problems in context
        - Rates of change
        - Reasoning: justifying a maximum or minimum
        - Past paper optimisation questions
      Projects built:
        - Optimisation file: three context problems solved and explained
      Practice: 12 applied differentiation problems a week
      Assessment: Month 10 check: a 45-minute calculus paper

  Month 11: Integration (Weeks 41-44)
    Weeks 41-42: Integrating Functions
      Topics:
        - Integrating algebraic functions
        - Integrating sine and cosine
        - Integrating with the chain rule in reverse for linear inner functions
        - Definite integrals
        - Solving simple differential equations
        - Checking an integral by differentiating
      Projects built:
        - Calculus method sheet extended with integration
      Practice: 20 integration problems a week
    Weeks 43-44: Areas and Mixed Calculus
      Topics:
        - Area under a curve
        - Area between two curves
        - Mixed calculus questions
        - Mixed Higher questions across all skills
        - Non-calculator calculus under time
        - Planning the papers month
      Projects built:
        - Higher skills checklist completed
      Practice: Two 30-minute mixed sets a week
      Assessment: Month 11 check: a full mixed paper at Higher

---------------------------------------------------------------
PHASE 4: HIGHER PAPERS (MONTH 12, WEEKS 45-48)
---------------------------------------------------------------
Full Higher papers under real timing: Paper 1 without a calculator, 55 marks in 1 hour 15
minutes, and Paper 2, 65 marks in 1 hour 30 minutes.

  Month 12: Full Higher Papers (Weeks 45-48)
    Weeks 45-46: Prelim-Style Papers
      Topics:
        - A full Paper 1 and Paper 2 under timing
        - Marking against published marking instructions
        - Sorting lost marks by skill and by habit
        - Re-teaching the weakest skills
        - Pacing the non-calculator paper
        - Process marks and clear communication
      Projects built:
        - Paper tracker started for Higher
      Practice: One full paper pair a week
    Weeks 47-48: Final Papers and Next Steps
      Topics:
        - A final paper pair under timing
        - Review of every lost mark
        - Exam-day routine and equipment
        - A calm plan for exam leave
        - Looking ahead to Advanced Higher for those continuing
        - Revision plan up to the exam
      Projects built:
        - Completed Higher paper tracker and error log
      Practice: Targeted sets from the error log
      Assessment: Higher paper review, one to one

PROJECTS THE STUDENT BUILDS AND KEEPS

  - Skills checklists for National 5 and Higher, kept up to date
  - Method sheets for algebra, trigonometry, geometry and calculus
  - A money file, an equation bank and a parabola file
  - A triangle casebook and a wave function casebook
  - A recurrence model and an optimisation file
  - Paper trackers and error logs for both levels

  Total projects: A complete revision kit for National 5 and Higher: checklists, method sheets, casebooks and marked paper trackers

SKILLS THE STUDENT WILL HAVE AT THE END
```

- National 5 numerical, algebraic, geometric, trigonometric and statistical skills
- Higher algebraic and trigonometric skills, including logarithms and the wave function
- Higher geometric skills: straight line, circle and vectors
- Differentiation and integration with applications
- Reasoning: interpreting situations and explaining solutions
- Paper technique with and without a calculator

HOW A TYPICAL WEEK IS SPLIT

Live classes: 2 live one-hour classes per week; paper months include longer timed sittings
Practice: 3 to 4 hours a week of practice, rising before prelims and exams
Review: Practice marked with comments; papers marked against published marking instructions

SUPPORT INCLUDED

Doubt support: WhatsApp support between classes, with worked solutions for stuck questions
Progress updates: A monthly progress note to learners and parents with check scores and next steps

CERTIFICATION DETAIL

Completion: Course-completion certificate from Modern Age Coders

WHERE THIS CAN LEAD

- Advanced Higher Mathematics and other Advanced Higher maths courses after Higher
- College and university courses that ask for National 5 or Higher Mathematics; check each one's exact requirement
- Our statistics and programming courses, which put the mathematics to work

COMMON QUESTIONS ABOUT THIS COURSE

For anything about cost, use PART 4 and RULE 1. Do not quote two regions.

Q: What is in the National 5 Maths exam?
A: Two question papers. Paper 1 is non-calculator, 40 marks in 1 hour. Paper 2 is 50 marks in 1 hour 30 minutes.

Q: What is in the Higher Maths exam?
A: Two question papers. Paper 1 is non-calculator, 55 marks in 1 hour 15 minutes. Paper 2 is 65 marks in 1 hour 30 minutes. The course is graded A to D on the total mark.

Q: Can I do Higher Maths without National 5?
A: The Higher specification says entry is at the discretion of the centre and that candidates should have achieved National 5 Mathematics or equivalent. If you have not, we recommend the National 5 half of this course first; the diagnostic shows where you stand.

Q: How hard is the jump from National 5 to Higher Maths?
A: Higher adds new ideas rather than more of the same: logarithms, the wave function, vectors in three dimensions, recurrence relations, and differentiation and integration. Many learners find the pace the hardest part, which is why the course teaches Higher strand by strand with a check every month.

Q: Do you teach Applications of Mathematics?
A: This course follows National 5 and Higher Mathematics. Applications of Mathematics is a separate course with different content. Ask in the free demo and we will tell you honestly whether one-to-one support can cover it. (Agent note: the free demo is a waiting list with no fixed date. The Priority Live Demo is a guaranteed class today or tomorrow, booked at https://learn.modernagecoders.com/priority-demo . Offer both, as RULE 3 says.)

Q: When should I start?
A: For National 5, in S3 or early S4. For Higher, early in S5. Starting early means the full papers month comes before the prelims rather than after them.

Q: Can adults take National 5 or Higher Maths online?
A: The teaching can be fully online. The exams are sat in person through a centre, which makes the entry. We teach to the course specification and paper style.

Q: Is this the same as GCSE or A level maths?
A: No. National 5 and Higher are Scottish qualifications with their own specifications and papers. We also run GCSE and A Level courses for learners in England, Wales and Northern Ireland.

Q: How are the classes run?
A: Live online classes with a real teacher, in a group of 15 to 20 learners at a similar level or one to one. Current fees for your region are shown in the pricing section of this page.

  Q: Can I try a lesson first?
  A: Yes. Book a free demo class. The teacher works through some National 5 or Higher questions
  with you, finds where you are, and suggests where to start and whether group or one-to-one
  teaching fits better. There is no obligation to enrol. (Agent note: the free demo is a
  waiting list with no fixed date. The Priority Live Demo is a guaranteed class today or
  tomorrow, booked at https://learn.modernagecoders.com/priority-demo . Offer both, as RULE 3
  says.)

  To enrol, message Shivam Sir on +91 9123366161 or send the parent this link: https://learn.modernagecoders.com/courses/national-5-and-higher-maths-course
  For a demo: the Priority Live Demo (guaranteed, today or tomorrow) is booked at
  https://learn.modernagecoders.com/priority-demo . The free demo is a waiting list with no fixed date.

==
COURSE 105 OF 137: OLYMPIAD MATHEMATICS: IOQM, INMO AND AMC PREPARATION
==

Course link: https://learn.modernagecoders.com/courses/olympiad-mathematics-premium-course
Subject area: Olympiad Mathematics
Designed for: Teens
Who can join: Students roughly aged 12 to 18 who are strong at school maths and want genuine olympiad problem solving
Course length: 12 months (48 weeks), joinable any month
Time needed: 2 live classes/week + weekly problem sets and timed mocks
Certificate: Certificate from Modern Age Coders, awarded on passing the final assessment

PRICE FOR THIS COURSE (quote only the one that applies to the person asking)
  In India, per month: group Rs 1,499, mini batch Rs 2,999, one to one Rs 4,999
  In Canada, per month: group CAD 140, one to one CAD 210
  Anywhere else, per month: group $100, one to one $150
  Classes: group and mini batch two live classes a week, eight a month; one to one in India one
  live class a week, four a month; one to one outside India two live classes a week, eight a
  month. Each class is one hour.

WHAT THIS COURSE IS

  Live online olympiad mathematics for serious students: number theory, algebra, combinatorics
  and geometry taught as proof-based problem solving, aimed at IOQM and INMO in India and the
  AMC and AIME internationally.

  In one line: The four olympiad pillars taught as real proof-based problem solving, for students who have outgrown school maths.

ABOUT THE PROGRAMME

  Olympiad mathematics is a different subject from school mathematics wearing the same name.
  School maths asks you to apply a method you were just shown. Olympiad maths hands you a
  problem you have never seen, gives you no method, and asks you to construct an argument that
  is airtight. Students who top their class routinely struggle at first, and that is normal,
  because nothing in the school syllabus trains this. This course teaches the four pillars that
  every olympiad is built on: number theory, algebra, combinatorics and geometry. Each is
  taught for genuine understanding and then drilled on real past problems, because olympiad
  ability is built by attempting hard problems and failing productively, not by watching
  solutions. It is aimed at both the Indian and international ladders. In India the path runs
  through IOQM, the Indian Olympiad Qualifier in Mathematics, on to INMO and the training camp
  beyond it. Internationally students target the AMC 10 and AMC 12, then AIME. The formats
  differ, and we prepare for each specifically, but the underlying skill is the same: reading a
  problem properly, finding the idea, and writing an argument that survives scrutiny. Proof is
  taught explicitly from the start. Most students arrive able to find an answer but unable to
  justify it, and at INMO level the justification is the entire mark. We fix that early,
  because a correct answer with a hand-waving argument scores close to nothing.

WHAT MAKES THIS COURSE DIFFERENT

  - All four pillars taught properly: number theory, algebra, combinatorics and geometry, not
    just contest tricks
  - Proof writing taught explicitly from the start, because at INMO level the argument is the
    mark, not the answer
  - Prepared for both ladders: IOQM and INMO in India, AMC 10, AMC 12 and AIME internationally
  - Built on real past problems, since olympiad ability comes from productive failure on hard
    problems
  - Students are taught to sit with a problem instead of giving up after two minutes, which is
    the actual skill
  - Live, small batches where solutions are critiqued line by line for rigour, not just marked
    right or wrong

THE LEARNING PATH, STEP BY STEP

  Phase 1: Proof technique and number theory, the natural entry point into olympiad thinking
  Phase 2: Algebra and combinatorics, including inequalities and counting arguments

Phase 3: Geometry, then full contest simulation for IOQM, INMO and the AMC or AIME

WHAT A STUDENT NEEDS BEFORE STARTING

Title: What Your Child Needs to Start

WHO THIS COURSE IS FOR

Title: Who This Course Is For

FULL CURRICULUM, WEEK BY WEEK

This is the complete teaching plan. Parents can ask about any week.

PHASE 1: PROOF TECHNIQUE AND NUMBER THEORY

How to argue rigorously, then the pillar that best rewards it.

Months 1 to 2: Proof and Foundations (Weeks 1-8)
What Counts as a Proof
Topics:
- The difference between checking cases and proving a statement
- Direct proof, and writing it so every step is justified
- Proof by contradiction
- Proof by contrapositive, and when it is easier
- Reading a written solution critically and finding the gap
Projects built:
- Write five full proofs and have every line challenged in class
Practice: Prove supplied statements and rewrite them after critique
Induction and Invariants
Topics:
- Mathematical induction, including strong induction
- Common induction errors that void the proof
- Invariants and monovariants, and the problems that hide them
- Extremal arguments: taking the largest or smallest case
- Recognising which technique a problem is inviting
Projects built:
- Solve a set of invariant problems and articulate the invariant explicitly in each
Practice: 20 induction and invariant problems
Assessment: A proof-writing assessment marked on rigour, not just the final answer
Number Theory
Topics:
- Divisibility, GCD and the Euclidean algorithm
- Primes, factorisation and the fundamental theorem of arithmetic
- Modular arithmetic and congruences
- Fermat's little theorem and Euler's theorem
- Diophantine equations at olympiad level
Projects built:
- Solve a graded ladder of number theory problems from IOQM level upward
Practice: 40 number theory problems across the difficulty range
Assessment: Timed number theory paper under contest conditions

---
PHASE 2: ALGEBRA AND COMBINATORICS

The two pillars that most often decide an IOQM or AMC score.

Months 3 to 5: Algebra (Weeks 9-20)
Polynomials and Functional Equations
Topics:
- Polynomial roots, factorisation and Vieta's formulas
- Symmetric functions and their uses
- Functional equations and the standard substitution strategies
- Recognising the structure hidden in an ugly expression
- Writing algebraic arguments cleanly
Projects built:
- Work a set of Vieta and functional equation problems from past papers
Practice: 30 algebra problems building in difficulty
Inequalities
Topics:
- AM-GM and its many disguises
- Cauchy-Schwarz
- Rearrangement and Chebyshev
- Normalisation and substitution tactics
- Knowing when to stop searching for a slicker method
Projects built:
- Prove a graded set of inequalities, each with a fully justified argument
Practice: 30 inequality problems

Assessment: Timed algebra paper under contest conditions
Combinatorics
Topics:
- Counting properly: permutations, combinations and overcounting
- The pigeonhole principle and its surprisingly deep uses
- Inclusion and exclusion
- Bijections and counting the same set two ways
- Introductory graph theory and games
Projects built:
- Solve a counting problem two different ways and reconcile the results
Practice: 35 combinatorics problems
Assessment: Timed combinatorics paper

PHASE 3: GEOMETRY AND FULL CONTEST SIMULATION

The pillar students most often avoid, then the contests themselves rehearsed properly.

Months 6 to 9: Geometry (Weeks 21-36)
Synthetic Geometry
Topics:
- Angle chasing done systematically rather than hopefully
- Cyclic quadrilaterals and the power of a point
- Similar triangles and ratio arguments
- The classical centres and their properties
- Drawing an accurate diagram, which solves more problems than any theorem
Projects built:
- Solve a ladder of synthetic geometry problems with full written proofs
Practice: 35 geometry problems from contest papers
Advanced Geometry Techniques
Topics:
- Coordinate geometry as a fallback when synthetic stalls
- Trigonometric methods in geometry
- Homothety and transformations
- Choosing between synthetic, coordinate and trigonometric attacks
- Recognising when a problem is resisting the method rather than you
Projects built:
- Attack the same hard problem three ways and compare which was cleanest
Practice: 25 problems requiring a deliberate choice of method
Assessment: Timed geometry paper
Mixed Problem Solving
Topics:
- Problems that do not announce their topic
- Deciding quickly which pillar a problem belongs to
- Working when the first idea fails, and the second
- Managing frustration, which is a genuine competition skill
- Building a personal record of techniques that worked
Projects built:
- Weekly mixed problem sets with no topic labels
Practice: Mixed sets under time

Months 10 to 12: Contest Simulation (Weeks 37-48)
IOQM and AMC Format Training
Topics:
- The IOQM format and how to pace it
- AMC 10 and AMC 12 pacing, and the scoring implications of guessing
- Answer-extraction techniques for short-answer formats
- Knowing when to abandon a question and return
- Accuracy under time, where most marks are actually lost
Projects built:
- Full timed IOQM and AMC papers every week
Practice: Weekly full papers with question-by-question review
INMO and AIME Level, and Peak Form
Topics:
- The step up to full written proofs at INMO level
- AIME format and its particular demands
- Writing a complete solution under time pressure
- Partial credit: how to secure marks on a problem you cannot finish
- Contest-day routine, sleep and nerves
Projects built:
- Full INMO-style and AIME-style papers, marked on rigour
Practice: Continuous full-paper cycle with detailed feedback
Assessment: Final full mock contest, marked as an examiner would, with an honest readiness assessment

HOW A TYPICAL WEEK IS SPLIT

Homework: A task or problem set after every class, and a monthly mixed-review assignment that deliberately folds in earlier topics

CERTIFICATION DETAIL

  Completion: Certificate from Modern Age Coders, awarded on passing the final assessment. Fall
    short and there is focused revision and a free retest: the certificate certifies real
    learning, not attendance

WHERE THIS CAN LEAD

  - Readiness for IOQM, INMO, AMC and AIME
  - Proof-writing ability that makes university mathematics far less of a shock
  - A distinctive strength in competitive university applications
  - A foundation for research mathematics, physics or theoretical computer science
  - Problem-solving stamina that transfers to every quantitative field

COMMON QUESTIONS ABOUT THIS COURSE

  For anything about cost, use PART 4 and RULE 1. Do not quote two regions.

  Q: Which contests does this prepare for?
  A: In India the path runs through IOQM, the Indian Olympiad Qualifier in Mathematics, on to
  INMO and the training camp beyond it. Internationally we prepare students for AMC 10 and AMC
  12 and then AIME. The formats differ and we train for each specifically, but the underlying
  skill is identical, so the same course serves both ladders.

  Q: My child tops the class in maths. Will olympiad maths be easy for them?
  A: Almost certainly not at first, and that is completely normal. School maths asks you to
  apply a method you were just taught. Olympiad maths gives you an unfamiliar problem, no
  method, and expects a rigorous argument. Excellent school students often struggle for the
  first month. The ones who keep going usually become very strong, because the difficulty is
  trainable.

  Q: Why do you teach proof writing so early?
  A: Because at INMO level the argument is the mark. Most students arrive able to find the
  right answer but unable to justify it, and a correct answer with hand-waving reasoning scores
  close to nothing. Proof technique is taught in the first two months and then marked for
  rigour all year, which is also exactly what makes university mathematics manageable later.

  Q: How long does the course run?
  A: Twelve months across 48 weeks, with two live classes a week plus problem sets and timed
  mocks. That length is deliberate: olympiad ability is built by attempting hard problems over
  months, not by a crash course. You can join in any month and we place your child at the right
  point after the free demo class. (Agent note: the free demo is a waiting list with no fixed
  date. The Priority Live Demo is a guaranteed class today or tomorrow, booked at
  https://learn.modernagecoders.com/priority-demo . Offer both, as RULE 3 says.)

  Q: Is geometry really necessary?
  A: Yes, and it is the pillar students most often try to avoid. We spend four months on it,
  starting with systematic angle chasing rather than hoping, and we teach coordinate and
  trigonometric methods as deliberate fallbacks.

  Q: How am I assessed, and is the certificate just for showing up?
  A: No. A task follows every class with feedback, monthly reviews deliberately mix new
  material with earlier topics so nothing is forgotten, and the course ends with a full mock
  paper as the final assessment. Passing earns the certificate; falling short earns focused
  revision and a free retest. We measure real learning, not attendance.

  To enrol, message Shivam Sir on +91 9123366161 or send the parent this link: https://learn.modernagecoders.com/courses/olympiad-mathematics-premium-course
  For a demo: the Priority Live Demo (guaranteed, today or tomorrow) is booked at
  https://learn.modernagecoders.com/priority-demo . The free demo is a waiting list with no fixed date.

==
COURSE 106 OF 137: ONTARIO COMPUTER SCIENCE COMPANION: ICS3U AND ICS4U (PYTHON AND JAVA)
==

Course link: https://learn.modernagecoders.com/courses/ics3u-ics4u-computer-science-companion-course
Subject area: Ontario High School Computer Science
Designed for: High school
Who can join: Ontario students in Grades 11 and 12 (roughly ages 15 to 18) taking ICS3U or ICS4U at school, in Python or Java
Course length: 6 months (24 weeks) per plan, joinable any month and paced to your school course
Time needed: 2 live classes/week + short practice tasks between classes
Certificate: Certificate from Modern Age Coders, awarded on passing the final assessment (this is not an Ontario high school credit)

PRICE FOR THIS COURSE (quote only the one that applies to the person asking)
  In India, per month: group Rs 1,499, mini batch Rs 2,999, one to one Rs 4,999
  In Canada, per month: group CAD 140, one to one CAD 210
  Anywhere else, per month: group $100, one to one $150

Classes: group and mini batch two live classes a week, eight a month; one to one in India one live class a week, four a month; one to one outside India two live classes a week, eight a month. Each class is one hour.

WHAT THIS COURSE IS

Live online ICS3U and ICS4U help in Python or Java, taught alongside your Ontario school course. We teach the skills; we do not grant Ontario high school credits.

In one line: A second teacher for Grade 11 and Grade 12 computer science: problem solving first, then clean code in Python or Java, in step with your school course.

ABOUT THE PROGRAMME

ICS3U (Introduction to Computer Science, Grade 11, University Preparation) and ICS4U (Computer Science, Grade 12, University Preparation) are Ontario's university-preparation computer science courses, described in the ministry's Computer Studies curriculum for Grades 10 to 12 (2008). The ministry describes ICS3U this way: "Students will design software independently and as part of a team, using industry-standard programming tools and applying the software development life-cycle model". For ICS4U it says: "Students will use modular design principles to create complex and fully documented programs, according to industry standards". In each Grade 11 and 12 course, the curriculum document says, the first strand is Programming Concepts and Skills and the second is Software Development, and the fourth strand "deals with the role of computers in society". ICS3U has no prerequisite; ICS4U requires "Introduction to Computer Science, Grade 11, University Preparation", which is ICS3U. This course runs alongside the student's own ICS3U or ICS4U class. We teach in whichever language the school uses, Python or Java, and we follow the order of the student's school course outline, so what is learned here is used in class the same week. Every topic starts with the problem before the syntax: reading the task, breaking it into steps, writing the algorithm in plain words, then turning it into code and testing it. From there we build data types, control structures, lists and arrays, modular programming with functions or methods, string and file handling, sorting and searching, and for ICS4U students, recursion and object-oriented design. Assignments and the final project or exam are the student's own work: we explain, question and review, and the student writes the code. Please read this plainly: Modern Age Coders teaches alongside school and does not grant Ontario high school credits. ICS3U and ICS4U are each worth one credit, and families who need the credit take the course through their school or a ministry-inspected credit provider. What we add is understanding, practice and confidence, in live classes with a real teacher.

WHAT MAKES THIS COURSE DIFFERENT

- Built around Ontario's ICS3U and ICS4U, following the student's own school course outline week by week
- Python or Java, whichever the school uses, with the same concepts shown side by side when a student meets both
- Problem solving and algorithm design before syntax: plain-word steps, tracing tables and test cases come first
- Honest about credits: we teach alongside school and do not grant Ontario high school credits
- Assignments stay the student's own work: we explain and review, we never write school code for them
- Exam review technique taught directly: tracing code by hand, writing code on paper and planning answers under time

THE LEARNING PATH, STEP BY STEP

Phase 1: Problem solving and the ICS3U core: algorithms in plain words, data types, input and output, decisions and loops, in Python or Java
Phase 2: Completing ICS3U: lists and arrays, modular programming, string and file handling, sorting and searching, the software development life cycle and exam review
Phase 3: The ICS4U toolkit: recursion, object-oriented design, algorithm efficiency, large documented programs, the final project and exam review

WHAT A STUDENT NEEDS BEFORE STARTING

School course: Currently taking, or about to take, ICS3U or ICS4U at an Ontario school. ICS4U students should have completed ICS3U
Coding level: No coding experience needed for ICS3U students. ICS4U students should know the ICS3U basics, which we review quickly
Age: Roughly 15 to 18 (Grades 11 and 12)
Equipment: A computer with stable internet and the school's Python or Java editor installed
Timing: Weekdays or weekends, flexible: choose your batch, or for a very personalised plan choose 1-on-1 at your convenience, weekend mornings or weekdays

WHO THIS COURSE IS FOR

Grade 11 students: Grade 11 students meeting programming for the first time who want to understand it properly
Grade 12 students: Grade 12 students facing recursion, object-oriented design and a larger final project

Students who feel behind: Students who missed a unit or lost confidence and want to catch up calmly
Students aiming higher: Students who are doing well and want to write cleaner, better designed code
Future cs students: Students thinking about university computer science who want a strong, honest foundation

FULL CURRICULUM, WEEK BY WEEK

This is the complete teaching plan. Parents can ask about any week.

PHASE 1: PROBLEM SOLVING AND THE ICS3U CORE (MONTHS 1-2, WEEKS 1-8)

How a programmer thinks before typing, then the building blocks every ICS3U program uses, in Python or Java.

Month 1: Algorithms, Data Types and Input and Output (Weeks 1-4)

Weeks 1-2: Problem Solving Before Syntax

Topics:

- A starting conversation and short diagnostic: the school, the language, the course outline and the next assignment
- Reading a programming task and listing the inputs, outputs and rules
- Writing an algorithm as numbered plain-word steps, then as pseudocode
- Flowcharts for decisions and repetition, kept simple
- Tracing an algorithm by hand with a trace table
- Setting up the school's editor or IDE at home so practice matches class

Projects built:

- Three small problems solved twice: once as plain-word steps, once as working code

Practice: Write the algorithm for each practice task before opening the editor, and keep both

Weeks 3-4: Data Types, Variables and Expressions

Topics:

- Integers, decimals, text and true or false values, in Python and in Java
- Static types in Java and dynamic types in Python, and what each means for errors
- Arithmetic, integer division and remainder, and the rounding surprises they cause
- Reading input and converting it to the right type
- Formatting output neatly, as school assignments usually require
- Naming variables so a marker can follow the code

Projects built:

- A unit converter or bill splitter with clear prompts, checked input and formatted output

Practice: Short daily tracing questions: predict the output, then run the code to check

Assessment: Month 1 check: a short written trace plus one small program, reviewed with written feedback

Month 2: Control Structures (Weeks 5-8)

Weeks 5-6: Decisions

Topics:

- if, else if and else in Python and Java
- Boolean expressions with and, or and not
- Nested decisions and when to flatten them
- Testing every branch: choosing test cases on purpose
- Validating input so a program does not crash on a bad value
- Comparing text correctly, including the Java equals trap

Projects built:

- A rules-based program, such as a ticket pricing or grading-rules calculator, with a written test plan

Practice: For every decision program, list the test cases first and record the expected results

Weeks 7-8: Loops

Topics:

- Counted loops and condition-controlled loops
- Running totals, counters and finding the largest or smallest value
- Loops that validate input until it is correct
- Nested loops for tables and patterns
- Off-by-one errors and how a trace table catches them
- Choosing a for loop or a while loop for the job

Projects built:

- A number guessing game or a times-table quiz with scoring and replay

Practice: A loop tracing set: write the value of every variable after each pass

Assessment: Phase 1 assessment: a written tracing section and a short program, marked with comments

---

PHASE 2: COMPLETING ICS3U (MONTHS 3-4, WEEKS 9-16)

The data structures, modular design, files and classic algorithms that larger ICS3U programs need, plus the software development habits the course describes.

```
  Month 3: Lists, Arrays and Modular Programming (Weeks 9-12)
    Weeks 9-10: Lists and Arrays
      Topics:
        - Python lists, Java arrays and Java ArrayList, and how they differ
        - Looping through a collection by index and by value
        - Parallel lists and when a better structure is needed
        - Searching a list for a value, counting matches and filtering
        - Two-dimensional lists and arrays for grids and tables
        - Index errors: why they happen and how to prevent them
      Projects built:
        - A class marks analyzer: store scores, report the average, the highest and lowest, and a
          simple bar display
      Practice: Short list and array tasks, each with a trace of the indexes visited
    Weeks 11-12: Modular Programming with Functions and Methods
      Topics:
        - Breaking a program into functions in Python or static methods in Java
        - Parameters, return values and why a function should do one job
        - Local and global scope, and avoiding hidden shared state
        - Writing a short comment or docstring that says what a function does
        - Testing one function at a time
        - Refactoring a long program into clear modules
      Projects built:
        - Refactor an earlier project into well-named functions or methods, with a test for each
      Practice: For each new function, write its purpose, its inputs and its output before
      the body
      Assessment: Month 3 check: a modular program built from a given plan, reviewed for
      structure and clarity

  Month 4: Strings, Files, Sorting and Searching (Weeks 13-16)
    Weeks 13-14: String and File Handling
      Topics:
        - Strings as sequences: indexing, slicing or substring, and length
        - Common string tasks: counting letters, reversing, checking palindromes, simple ciphers
        - Splitting a line of text into fields and joining fields back together
        - Reading a text file line by line in Python and in Java
        - Writing results to a file and handling a missing file safely
        - Processing a small data file from start to finish
      Projects built:
        - A file report tool: read a data file, summarize it and write a tidy results file
      Practice: String puzzles and short file tasks, with the expected output written before
      running
    Weeks 15-16: Sorting, Searching and the Development Life Cycle
      Topics:
        - Linear search and binary search, and when binary search is allowed
        - Bubble, selection and insertion sort, traced pass by pass
        - Counting comparisons to see why some algorithms are faster
        - The software development life cycle: analysis, design, coding, testing and maintenance
        - Planning and documenting a larger program, and working on a team project with clear roles
        - ICS3U exam review: tracing questions, written code and longer design questions
      Projects built:
        - A searchable, sortable record list built from a file, with a short design document and test
          log
      Practice: Trace each sort on a new list by hand, then confirm with code
      Assessment: Phase 2 assessment: a mixed ICS3U-style review paper plus a program built
      from a written specification

---------------------------------------------------------------
PHASE 3: THE ICS4U TOOLKIT, FINAL PROJECT AND EXAM REVIEW (MONTHS 5-6, WEEKS 17-24)
---------------------------------------------------------------
What we teach for Grade 12: recursion, object-oriented design, efficiency and large, fully
documented programs, then the final project and exam review. ICS4U batches begin with a fast
review of Phases 1 and 2.

  Month 5: Recursion and Object-Oriented Design (Weeks 17-20)
    Weeks 17-18: Recursion
      Topics:
        - Base case and recursive case, explained with small examples
        - Tracing recursion with a call stack diagram
        - Recursive versions of factorial, sums, string reversal and power
        - Recursive binary search and an introduction to merge sort
        - When recursion is clearer than a loop, and when it is slower
        - Common recursion mistakes: a missing base case and a case that never shrinks
      Projects built:
        - Write three recursive solutions and their loop versions, and compare them in a short written
          note
      Practice: Draw the call stack for every recursion question before running the code
    Weeks 19-20: Classes and Object-Oriented Design
      Topics:
        - Classes and objects: attributes, methods and constructors in Java and Python
```

- Encapsulation: private data and public methods
- Designing classes from a description: nouns, responsibilities and relationships
- Lists of objects, and sorting objects by a chosen field
- Inheritance and when to use it, with a simple class diagram
- Documenting classes and methods so another programmer can use them

Projects built:
- An object-oriented library, inventory or game roster program with a class diagram and documentation

Practice: Design the classes on paper first, then build them one method at a time with tests

Assessment: Month 5 check: a recursion trace and a small class design, reviewed with written feedback

Month 6: Efficiency, the Final Project and Exam Review (Weeks 21-24)

Weeks 21-22: Efficiency and Large Documented Programs

Topics:
- Comparing algorithms by counting steps, with an introduction to big-O language
- Choosing data structures for the job: lists, dictionaries or maps, and sets
- Modular design for larger programs: files, classes and clear interfaces
- Version control basics with Git so work is never lost
- If your school sets a final project or culminating task: reading the brief, scoping it and planning milestones
- Writing user documentation, internal comments and a test log

Projects built:
- A project plan and working first version for the student's own final project, built by the student

Practice: Weekly milestone check-ins: what was built, what was tested, what is next

Weeks 23-24: Exam Review Technique

Topics:
- Making a one-page summary for each topic of the school course
- Tracing questions: working steadily with a trace table under time
- Writing code on paper: structure first, then details, then a quick self-check
- Design and explanation questions: answering exactly what is asked
- Timed review papers in the style of school exams, with careful review afterwards
- Reading the teacher's exam outline so revision matches what will be assessed

Projects built:
- A personal review pack: topic summaries, a mistakes list and two reviewed timed papers

Practice: A timed mixed review each week, with every mistake written up and fixed

Assessment: Final assessment: a timed review paper plus a short live walk-through of the student's own project code

PROJECTS THE STUDENT BUILDS AND KEEPS

- Plain-word algorithms and trace tables kept for every topic
- Unit converter, rules-based calculator and loop games
- Class marks analyzer using lists or arrays
- File report tool and a searchable, sortable record list
- Recursive and loop solutions compared in writing
- An object-oriented program with a class diagram and documentation
- A personal exam review pack

Total projects: A portfolio of small programs, a documented object-oriented program and a review pack, all the student's own work

SKILLS THE STUDENT WILL HAVE AT THE END

- Problem solving and algorithm design before code
- Data types, input and output, decisions and loops in Python or Java
- Lists, arrays and two-dimensional data
- Modular programming with functions or methods
- String and file handling
- Sorting and searching, traced by hand and in code
- Recursion and object-oriented design
- Testing, documentation and exam review technique

HOW A TYPICAL WEEK IS SPLIT

Live classes: 2 live one-hour classes per week, paced to the student's school course outline

Practice: Short practice tasks after every class, separate from school assignments

Review: Practice work reviewed with written comments, and a monthly check that mixes in earlier topics

SUPPORT INCLUDED

Doubt support: WhatsApp doubt support between classes, with hints and questions first so the student does the thinking

Progress updates: A monthly progress note to parents with what was covered, what is strong and what to practise next

CERTIFICATION DETAIL

Completion: Certificate from Modern Age Coders, awarded on passing the final assessment. It records real learning and is not an Ontario high school credit. Fall short and there is focused revision and a free retest

WHERE THIS CAN LEAD

- University computer science, software engineering or other programs that use programming
- College programs in programming and computer systems
- Contest programming, such as the Canadian Computing Competition, through our CCC preparation course
- Further Python or Java study in our teen and college courses
- Personal projects, clubs and open-source contributions built on solid fundamentals

COMMON QUESTIONS ABOUT THIS COURSE

For anything about cost, use PART 4 and RULE 1. Do not quote two regions.

Q: Does this course give my child an Ontario high school credit?
A: No. Modern Age Coders teaches alongside school and does not grant Ontario high school credits. ICS3U and ICS4U are each worth one credit, and a family who needs the credit takes the course through the student's school or a ministry-inspected credit provider. Our course helps the student understand and do well in the school course they are already taking.

Q: Is ICS3U hard?
A: It is often a student's first full programming course, so the early weeks can feel steep. The hard part is usually not the syntax but turning a problem into steps. That is why we teach problem solving and algorithm design before code, use trace tables, and practise little and often. Most of the difficulty eases once a student can plan a program before typing it.

Q: Does the course use Python or Java?
A: Whichever your school uses. Some ICS3U and ICS4U classes use Python, others use Java. We teach in the school's language so the work transfers straight back to class, and when it helps we show the same idea in the other language too.

Q: What do ICS3U and ICS4U cover?
A: The ministry describes ICS3U as a course where students "design software independently and as part of a team, using industry-standard programming tools and applying the software development life-cycle model", and ICS4U as one where students "use modular design principles to create complex and fully documented programs, according to industry standards". In each Grade 11 and 12 course the first strand is Programming Concepts and Skills, the second is Software Development, and the fourth deals with the role of computers in society. Your school's course outline gives the detail for your class.

Q: Does my child need to take ICS3U before ICS4U?
A: Yes. The ministry lists the ICS4U prerequisite as "Introduction to Computer Science, Grade 11, University Preparation", which is ICS3U. ICS3U itself has no prerequisite, so a student can start it without a Grade 10 computer course.

Q: What is the difference between ICS3U and ICS3C?
A: Both are Grade 11 computer courses and neither has a prerequisite. ICS3U is the University Preparation course, Introduction to Computer Science. ICS3C is the College Preparation course, Introduction to Computer Programming, which the ministry describes as introducing "computer programming concepts and practices". This companion course is built around ICS3U and ICS4U.

Q: How does ICS3U connect to university computer science?
A: Some programs name it directly. The University of Waterloo's Computer Science page lists "Grade 11 U Introduction to Computer Science", which is ICS3U, as a recommended course. The required courses on that page are mainly Grade 12 math and English, so a recommended course is an addition, not a replacement. Always check each university's current admission page. We make no admission promises; we help the student build real computer science understanding.

Q: Will you do my child's assignments or final project?
A: No. School work stays the student's own. We explain concepts, ask questions, review code the student has written and suggest how to improve it, and we follow the school's rules on outside help. That is also the only kind of help that lasts into the exam room.

Q: Can you help with exam review?
A: Yes. The course teaches exam technique directly: tracing code by hand, writing code on paper, answering design and explanation questions, and timed review papers with careful review afterwards. We also use the teacher's exam outline so revision matches what will actually be assessed.

Q: Can my child join partway through the school year?
A: Yes, the course is joinable any month. We start from the student's current unit and next assignment, fill gaps from earlier units as needed, and keep pace with the school course from then on. ICS4U students begin with a quick review of the ICS3U ideas they will rely on.

  Q: How are the classes run?
  A: Live online classes, twice a week, with a real teacher, in a group of 15 to 20 students, a mini batch of up to 6, or 1-on-1. Weekdays or weekends, flexible: choose your batch, or for a very personalised plan choose 1-on-1 at your convenience, weekend mornings or weekdays. Current fees for your region are shown in the pricing section of this page.

  Q: Can we try a class first?
  A: Yes. Book a free demo class. The teacher looks at where your child is in ICS3U or ICS4U, works through a short problem with them, and suggests whether group, mini batch or 1-on-1 classes fit best. There is no obligation to enrol. (Agent note: the free demo is a waiting list with no fixed date. The Priority Live Demo is a guaranteed class today or tomorrow, booked at https://learn.modernagecoders.com/priority-demo . Offer both, as RULE 3 says.)

  To enrol, message Shivam Sir on +91 9123366161 or send the parent this link: https://learn.modernagecoders.com/courses/ics3u-ics4u-computer-science-companion-course
  For a demo: the Priority Live Demo (guaranteed, today or tomorrow) is booked at https://learn.modernagecoders.com/priority-demo . The free demo is a waiting list with no fixed date.

==========
COURSE 107 OF 137: ONTARIO GRADE 12 UNIVERSITY MATH: ADVANCED FUNCTIONS AND CALCULUS AND VECTORS (MHF4U AND MCV4U)
==========

Course link: https://learn.modernagecoders.com/courses/ontario-grade-12-university-math-mhf4u-mcv4u-course
Subject area: Ontario High School Mathematics
Designed for: High school
Who can join: Ontario students in Grade 12 (roughly ages 16 to 18) taking MHF4U, MCV4U or both at school
Course length: 6 months (24 weeks) per plan, joinable any month and paced to your school course
Time needed: 2 live classes/week + short practice sets between classes
Certificate: Certificate from Modern Age Coders, awarded on passing the final assessment (this is not an Ontario high school credit)

PRICE FOR THIS COURSE (quote only the one that applies to the person asking)
  In India, per month: group Rs 1,499, mini batch Rs 2,999, one to one Rs 4,999
  In Canada, per month: group CAD 140, one to one CAD 210
  Anywhere else, per month: group $100, one to one $150
  Classes: group and mini batch two live classes a week, eight a month; one to one in India one live class a week, four a month; one to one outside India two live classes a week, eight a month. Each class is one hour.

WHAT THIS COURSE IS

  Live online MHF4U and MCV4U help for ages 16 to 18, taught alongside your Ontario school course: functions, trigonometry, logarithms, calculus and vectors. We do not grant Ontario credits.

  In one line: A second teacher for Grade 12 university math: functions understood properly, then the calculus and vectors built on them, in step with your school course.

ABOUT THE PROGRAMME

  MHF4U and MCV4U are Ontario's Grade 12 university-preparation math courses. In the ministry's course list, MHF4U is titled Advanced Functions and MCV4U is titled Calculus and Vectors, both issued in 2007. The ministry lists the MHF4U prerequisite as "Functions, Grade 11, University Preparation, or Mathematics for College Technology, Grade 12, College Preparation", and it says "The new Advanced Functions course (MHF4U) must be taken prior to or concurrently with Calculus and Vectors (MCV4U)". Both courses also appear in university admission requirements. The University of Waterloo's Computer Science page asks for "Six Grade 12 U and/or M courses including" Advanced Functions and Calculus and Vectors, and the University of Toronto lists MCV4U as a prerequisite for computer science on all three campuses, with MHF4U also listed at Mississauga and Scarborough. This course runs alongside the student's own MHF4U or MCV4U class, and many students take both in the same year. We follow the order of the student's school course outline, so what is learned here is used in class the same week. What our course teaches for MHF4U students: polynomial and rational functions, trigonometric functions in radians with identities and equations, exponential and logarithmic functions, combining functions, and rates of change. What it teaches for MCV4U students: limits and the derivative, the derivative rules, curve sketching and optimization, then vectors, lines and planes. Every topic starts from meaning, with graphs and small examples, before the algebra. Tests and assignments stay the student's own work: we explain, question and review, and the student does the math. Please read this plainly: Modern Age Coders teaches alongside school and does not grant Ontario high school credits. Families who need the credit take the course through their school or a ministry-inspected credit provider. What we add is understanding, practice and confidence, in live classes with a real teacher.

WHAT MAKES THIS COURSE DIFFERENT

  - Built around Ontario's MHF4U and MCV4U, following the student's own school course outline week by week
  - Taught for students taking one course or both at once, with MHF4U ideas reviewed exactly where calculus needs them

- Meaning before algebra: graphs, tables and small examples come first, then the rules and the proofs
- Honest about credits: we teach alongside school and do not grant Ontario high school credits
- Tests and assignments stay the student's own work: we explain and review, we never do school work for them
- Exam review technique taught directly: full written solutions, communication marks and timed practice papers

THE LEARNING PATH, STEP BY STEP

Phase 1: Advanced Functions, part 1: the function toolkit, polynomial functions, polynomial equations and inequalities, and rational functions
Phase 2: Advanced Functions, part 2: trigonometric functions in radians, identities and equations, exponential and logarithmic functions, combining functions and rates of change
Phase 3: Calculus and Vectors: limits and the derivative, derivative rules and applications, vectors in two and three dimensions, lines and planes, and exam review

WHAT A STUDENT NEEDS BEFORE STARTING

School course: Currently taking, or about to take, MHF4U, MCV4U or both at an Ontario school
Math level: The Grade 11 functions course or equivalent for MHF4U. MCV4U students should have MHF4U done or under way, which we support side by side
Age: Roughly 16 to 18 (Grade 12)
Equipment: A computer with stable internet, a scientific or graphing calculator, and a way to share photos of written work
Timing: Weekdays or weekends, flexible: choose your batch, or for a very personalised plan choose 1-on-1 at your convenience, weekend mornings or weekdays

WHO THIS COURSE IS FOR

Advanced functions students: Grade 12 students in MHF4U who want functions to make sense, not just to pass
Calculus and vectors students: Students in MCV4U meeting derivatives, optimization and three-dimensional vectors
Students taking both: Students taking MHF4U and MCV4U in the same year who want the two courses to fit together
Students who feel behind: Students who missed a unit or lost confidence and want to catch up calmly
Future stem students: Students heading toward computer science, engineering, mathematics or science at university

FULL CURRICULUM, WEEK BY WEEK

This is the complete teaching plan. Parents can ask about any week.

PHASE 1: ADVANCED FUNCTIONS, PART 1 (MONTHS 1-2, WEEKS 1-8)

The function toolkit every Grade 12 topic depends on, then polynomial and rational functions in depth.

Month 1: The Function Toolkit and Polynomial Functions (Weeks 1-4)
Weeks 1-2: Starting Point and the Function Toolkit
Topics:
- A starting conversation and short diagnostic: the school, the course outline, the next test and the Grade 11 ideas to refresh
- Function notation, domain and range, and reading a graph carefully
- Transformations of functions: shifts, stretches and reflections
- Inverse functions and what their graphs show
- Factoring review: common factors, trinomials and the difference of squares
- Setting up a clean notebook system for definitions, examples and mistakes

Projects built:
- A one-page function toolkit summary, with a sketch of each parent function and its transformations

Practice: Short daily sets that mix new work with one or two Grade 11 refresher questions

Weeks 3-4: Polynomial Functions
Topics:
- Degree, leading coefficient and end behaviour
- Zeros, their order, and how the graph behaves at each zero
- Sketching a polynomial from its factored form
- Finding an equation from a graph or from given zeros
- Even and odd functions and symmetry
- Finite differences and what they say about degree

Projects built:
- A polynomial sketch set: ten polynomials sketched by hand from factored form, then checked with graphing technology

Practice: For every sketch, write the end behaviour and the behaviour at each zero before drawing

Assessment: Month 1 check: a short written test on functions and polynomial graphs, reviewed with written feedback

Month 2: Polynomial Equations and Rational Functions (Weeks 5-8)
Weeks 5-6: Polynomial Equations and Inequalities
Topics:
- Polynomial long division and synthetic division
- The remainder theorem and the factor theorem
- Factoring cubics and quartics, including sums and differences of cubes
- Solving polynomial equations exactly
- Solving polynomial inequalities with a sign chart and a graph
- Families of polynomials and word problems

Projects built:
- A worked solutions file for factoring and inequalities, with every step justified in words

Practice: Mixed equation and inequality sets, with answers checked by substitution or graph

Weeks 7-8: Rational Functions
Topics:
- Reciprocal functions and their graphs
- Vertical and horizontal asymptotes, and holes
- Sketching rational functions from their factored form
- Solving rational equations and checking for restricted values
- Solving rational inequalities with a sign chart
- Average rate of change on a rational graph

Projects built:
- A rational function sketch set with asymptotes, intercepts and behaviour near each asymptote explained

Practice: For every rational function, list restrictions and asymptotes first, then sketch

Assessment: Phase 1 assessment: a timed test on polynomial and rational functions in the style of a school unit test, marked with comments

---
PHASE 2: ADVANCED FUNCTIONS, PART 2 (MONTHS 3-4, WEEKS 9-16)

Trigonometry in radians, exponential and logarithmic functions, combining functions and rates of change, with MHF4U exam review.

Month 3: Trigonometric Functions, Identities and Equations (Weeks 9-12)
Weeks 9-10: Radians and Trigonometric Functions
Topics:
- Radian measure and converting between radians and degrees
- Special angles and the unit circle, without memorizing tables
- Graphs of sine, cosine and tangent in radians
- Amplitude, period, phase shift and vertical shift
- Modelling periodic situations with sinusoidal functions
- Reciprocal trigonometric functions and their graphs

Projects built:
- A sinusoidal model of a real periodic situation, with the equation built from the data and explained

Practice: Unit circle and transformation sets, each answer checked against a quick sketch

Weeks 11-12: Identities and Trigonometric Equations
Topics:
- Proving identities: working one side, and writing each step clearly
- Compound angle formulas and double angle formulas
- Solving linear and quadratic trigonometric equations in radians
- Finding all solutions in a given interval
- Equivalent trigonometric expressions using related angles
- Common mistakes: dividing by a variable and losing solutions

Projects built:
- An identity proof file: ten identities proved in full, with the strategy for each written first

Practice: One identity proof and two equations every day, with every solution in the interval listed

Assessment: Month 3 check: a written test on trigonometric functions, identities and equations, reviewed with written feedback

Month 4: Exponential and Logarithmic Functions, Combining Functions and Rates of Change (Weeks 13-16)
Weeks 13-14: Exponential and Logarithmic Functions
Topics:
- Exponential functions and their graphs, growth and decay
- The logarithm as the inverse of an exponential function
- Laws of logarithms and when each one applies
- Solving exponential and logarithmic equations, and checking for extraneous roots
- Changing the base of a logarithm
- Applications: compound interest, half-life, sound and pH scales

Projects built:
- An applications pack: four real situations modelled with exponential or logarithmic functions

and solved in full
Practice: Mixed log law and equation sets, with each step named
Weeks 15-16: Combining Functions, Rates of Change and MHF4U Review
Topics:
- Sums, differences, products and quotients of functions, and their graphs
- Composition of functions and its domain
- Average rate of change over an interval
- Estimating instantaneous rate of change, the bridge to calculus
- Choosing a function family to model a situation
- MHF4U exam review: full solutions, communication and timed practice
Projects built:
- A personal MHF4U review pack: one-page summaries for each unit, a mistakes list and a reviewed timed paper
Practice: Trace the meaning of a rate of change on a graph before calculating it
Assessment: Phase 2 assessment: a mixed MHF4U-style review paper, marked with written comments

---
PHASE 3: CALCULUS AND VECTORS, AND EXAM REVIEW (MONTHS 5-6, WEEKS 17-24)

What we teach for MCV4U: limits and the derivative, derivative rules and applications, then vectors, lines and planes, ending with exam review. MCV4U batches begin with a quick review of the MHF4U ideas calculus relies on.

Month 5: Limits, Derivatives and Their Applications (Weeks 17-20)
Weeks 17-18: Rates of Change, Limits and the Derivative
Topics:
- From average rate of change to instantaneous rate of change
- Limits, explained with tables and graphs before algebra
- The derivative from first principles
- The power, constant multiple, sum and difference rules
- The product, quotient and chain rules
- The derivative as a slope and as a rate, in words and in units
Projects built:
- Three derivatives worked from first principles, then confirmed with the rules, with a short written explanation
Practice: Daily derivative sets, each with one question asking what the derivative means in context
Weeks 19-20: Curve Sketching, Optimization and Rates
Topics:
- Increasing and decreasing intervals, and local maxima and minima
- Concavity and points of inflection from the second derivative
- Sketching a curve from its derivatives
- Optimization problems: setting up the function, the domain and the check
- Derivatives of exponential and sinusoidal functions
- Rates of change in motion: position, velocity and acceleration
Projects built:
- An optimization pack: four real problems set up and solved in full, each with a domain check
Practice: For every optimization problem, write the function and its domain before differentiating
Assessment: Month 5 check: a written test on derivatives and their applications, reviewed with written feedback

Month 6: Vectors, Lines and Planes, and Exam Review (Weeks 21-24)
Weeks 21-22: Vectors in Two and Three Dimensions
Topics:
- Geometric vectors: magnitude, direction, addition and scalar multiples
- Cartesian vectors in two and three dimensions
- The dot product, angles between vectors and projections
- The cross product and what it measures
- Applications: force, velocity and work
- Drawing a clear diagram for every vector problem
Projects built:
- A vector applications set with a labelled diagram and a full written solution for each problem
Practice: Short vector sets mixing geometric and Cartesian forms
Weeks 23-24: Lines and Planes, and Exam Review Technique
Topics:
- Equations of lines in two and three dimensions: vector, parametric and symmetric forms
- Equations of planes and their normal vectors
- Intersections of lines and planes, and what each case looks like
- Making a one-page summary for each unit of the school course
- Full written solutions: showing reasoning so communication marks are earned
- Timed review papers in the style of school exams, with careful review afterwards
Projects built:
- A personal MCV4U review pack: unit summaries, a mistakes list and two reviewed timed papers
Practice: A timed mixed review each week, with every mistake written up and fixed
Assessment: Final assessment: a timed review paper plus a short live walk-through of two of the student's own solutions

PROJECTS THE STUDENT BUILDS AND KEEPS

- A function toolkit summary with parent functions and transformations
- Polynomial and rational function sketch sets
- An identity proof file for trigonometry
- Exponential and logarithmic applications pack
- Derivatives from first principles and an optimization pack
- Vector applications with labelled diagrams
- Personal MHF4U and MCV4U review packs

Total projects: A file of worked solutions, sketch sets, proofs and review packs, all the student's own work

SKILLS THE STUDENT WILL HAVE AT THE END

- Functions, transformations and inverses
- Polynomial and rational functions, equations and inequalities
- Trigonometric functions in radians, identities and equations
- Exponential and logarithmic functions and their applications
- Combining functions and rates of change
- Derivatives, curve sketching and optimization
- Vectors, lines and planes in three dimensions
- Full written solutions and exam review technique

HOW A TYPICAL WEEK IS SPLIT

Live classes: 2 live one-hour classes per week, paced to the student's school course outline
Practice: Short practice sets after every class, separate from school assignments
Review: Practice work reviewed with written comments, and a monthly check that mixes in earlier topics

SUPPORT INCLUDED

Doubt support: WhatsApp doubt support between classes, with hints and questions first so the student does the thinking
Progress updates: A monthly progress note to parents with what was covered, what is strong and what to practise next

CERTIFICATION DETAIL

Completion: Certificate from Modern Age Coders, awarded on passing the final assessment. It records real learning and is not an Ontario high school credit. Fall short and there is focused revision and a free retest

WHERE THIS CAN LEAD

- University computer science, engineering, mathematics or science programs
- First-year university calculus and linear algebra, on a solid base
- Math contests such as the Euclid, through our Waterloo math contests course
- School computer science such as ICS4U, through our Ontario computer science companion course
- Further study in data science and programming, where functions and calculus are used every day

COMMON QUESTIONS ABOUT THIS COURSE

For anything about cost, use PART 4 and RULE 1. Do not quote two regions.

Q: Does this course give my child an Ontario high school credit?
A: No. Modern Age Coders teaches alongside school and does not grant Ontario high school credits. A family who needs the MHF4U or MCV4U credit takes the course through the student's school or a ministry-inspected credit provider. Our course helps the student understand and do well in the school course they are already taking.

Q: What are MHF4U and MCV4U?
A: They are Ontario's Grade 12 university-preparation math courses. In the ministry's course list, MHF4U is titled Advanced Functions and MCV4U is titled Calculus and Vectors. Your school's course outline gives the detail for your class.

Q: What do I need before taking MHF4U?
A: The ministry lists the MHF4U prerequisite as "Functions, Grade 11, University Preparation, or Mathematics for College Technology, Grade 12, College Preparation". Functions, Grade 11, University Preparation is MCR3U. In the first two weeks we refresh the Grade 11 ideas that Grade 12 relies on most.

Q: Can my child take MHF4U and MCV4U at the same time?
A: Yes, and many students do. The ministry says "The new Advanced Functions course (MHF4U) must be taken prior to or concurrently with Calculus and Vectors (MCV4U)". When a student takes both at once, we follow both school course outlines and review each MHF4U idea just before calculus needs it.

Q: Is MCV4U hard?
A: It asks for more independence than earlier math courses, and it builds on everything in MHF4U, so a gap in functions shows up quickly in calculus. That is why we teach meaning before algebra, keep a mistakes list, and practise a little every day. Most of the difficulty eases once a student understands what a derivative means rather than only how to compute one.

Q: Do universities ask for MHF4U and MCV4U for computer science?
A: Many do. At the University of Toronto, St. George lists "MCV4U" as a computer science prerequisite, while Mississauga and Scarborough list both "MHF4U" and "MCV4U". Always check each university's current admission page. We make no admission promises; we help the student build real understanding.

Q: Does the course follow my school's order?
A: Yes. Schools order the units differently, so we use the student's own course outline and next test date to set the pace. The plan on this page shows our standard sequence, and each batch follows the order of its students' schools as closely as possible.

Q: Will you do my child's assignments or tests?
A: No. School work stays the student's own. We explain concepts, ask questions, review work the student has written and suggest how to improve it, and we follow the school's rules on outside help. That is also the only kind of help that lasts into the exam room.

Q: Can you help with exam review?
A: Yes. The course teaches exam technique directly: one-page unit summaries, full written solutions that show reasoning, and timed review papers with careful review afterwards. We also use the teacher's exam outline so revision matches what will actually be assessed.

Q: Can my child join partway through the school year?
A: Yes, the course is joinable any month. We start from the student's current unit and next test, fill gaps from earlier units as needed, and keep pace with the school course from then on.

Q: How are the classes run?
A: Live online classes, twice a week, with a real teacher, in a group of 15 to 20 students, a mini batch of up to 6, or 1-on-1. Weekdays or weekends, flexible: choose your batch, or for a very personalised plan choose 1-on-1 at your convenience, weekend mornings or weekdays. Current fees for your region are shown in the pricing section of this page.

Q: Can we try a class first?
A: Yes. Book a free demo class. The teacher looks at where your child is in MHF4U or MCV4U, works through a short problem with them, and suggests whether group, mini batch or 1-on-1 classes fit best. There is no obligation to enrol. (Agent note: the free demo is a waiting list with no fixed date. The Priority Live Demo is a guaranteed class today or tomorrow, booked at https://learn.modernagecoders.com/priority-demo . Offer both, as RULE 3 says.)

To enrol, message Shivam Sir on +91 9123366161 or send the parent this link: https://learn.modernagecoders.com/courses/ontario-grade-12-university-math-mhf4u-mcv4u-course
For a demo: the Priority Live Demo (guaranteed, today or tomorrow) is booked at https://learn.modernagecoders.com/priority-demo . The free demo is a waiting list with no fixed date.

==========
COURSE 108 OF 137: ORANGE DATA MINING COURSE FOR COLLEGE STUDENTS: MACHINE LEARNING AND ANALYTICS
==========

Course link: https://learn.modernagecoders.com/courses/orange-data-mining-machine-learning-course-for-college-students
Subject area: Data Science & Machine Learning
Designed for: College students
Who can join: Beginner to applied practitioner (college students and graduates), no prior machine learning required
Course length: 24 classes (12 weeks · 2 classes/week)
Time needed: 4-6 hours/week recommended
Certificate: Certificate from Modern Age Coders, awarded on passing the final assessment

PRICE FOR THIS COURSE (quote only the one that applies to the person asking)
In India, per month: group Rs 1,499, mini batch Rs 2,999, one to one Rs 4,999
In Canada, per month: group CAD 140, one to one CAD 210
Anywhere else, per month: group $100, one to one $150
Classes: group and mini batch two live classes a week, eight a month; one to one in India one live class a week, four a month; one to one outside India two live classes a week, eight a month. Each class is one hour.

WHAT THIS COURSE IS

Master Orange Data Mining in 24 live classes for college students: reproducible workflows, feature engineering, model selection with nested validation, explainability, clustering, text mining, time series and a defended analytics capstone, plus the Python bridge to pandas and scikit-learn.

In one line: Cover a full data mining syllabus on a visual canvas, then defend it: rigorous validation, feature engineering, explainability, clustering, text and time series, and a capstone that reproduces from raw data on someone else's machine.

ABOUT THE PROGRAMME

Data mining appears in almost every computer science, IT, statistics, business analytics and bioinformatics programme, and it is routinely taught as a list of algorithm names to memorise before an exam. This course teaches it as a practice. Orange is free, open source machine learning and data visualisation software developed at the Bioinformatics Laboratory, Faculty of Computer and Information Science, University of Ljubljana, released under the GNU GPL version 3 or later. It was built for teaching machine learning and data mining to university students, and it is used in real research work. You assemble analysis by connecting widgets on a canvas, which removes the syntax overhead and puts the entire course budget into method: how to prepare data defensibly, how to select a model without fooling yourself, and how to explain what the model did. Across 24 live classes you work through the six default widget sets, Data, Transform, Visualize, Model, Evaluate and Unsupervised, and then into the add-on ecosystem that makes Orange genuinely useful for project work: Text for corpus analysis, Time Series for temporal data, Explain for model interpretation, Associate for rule mining, Geo for spatial data, and Fairness for auditing. You will build classification and regression pipelines, use Preprocess inside the modelling loop so that scaling and imputation are fitted on training folds rather than leaked across them, compare learners under identical cross validation in Test and Score, tune with Parameter Fitter, read ROC, precision-recall and calibration properly, and use Explain Model and Permutation Importance to answer the question a viva always asks: why did it predict that? The course is deliberately not a dead end at the canvas. Orange is written in Python and installable from PyPI as Orange3, and the Python Script widget exposes real Python inside a workflow with the incoming data available in your namespace. Two classes are spent on that bridge, so students moving on to pandas and scikit-learn carry the concepts across rather than starting again. Every class is taught live in a small batch by a working practitioner, the same mentorship-first method Modern Age Coders has used since 2020 to teach 10,000+ students across 25+ countries. You finish with 24 reproducible workflows, a capstone that runs end to end from a raw file, and an exported report you can put in front of an examiner, a recruiter or a project guide.

WHAT MAKES THIS COURSE DIFFERENT

- Built for defensible work, not demos: reproducibility, leakage control and honest validation are graded requirements from Phase 1, not closing remarks.
- Covers a full university data mining syllabus, preprocessing, classification, regression, evaluation, clustering, dimensionality reduction, association rules, text and time series, with a running artefact for each.
- Explainability is a full class, not a mention: Explain Model, Explain Prediction, Permutation Importance and ICE, so you can answer why a prediction happened.
- The Python bridge is taught explicitly: Orange is a Python library, the Python Script widget runs real Python inside the canvas, and the same models exist in scikit-learn.
- Free and open source under the GNU GPL v3 or later, so nothing in your final year project depends on a licence you lose after graduation.
- Capstone standard is reproduction: your workflow must rerun from the raw file in a clean session, on a machine that is not yours.

WHAT A STUDENT NEEDS BEFORE STARTING

Device: A laptop or desktop running Windows, macOS or Linux capable of installing Orange, with a stable internet connection for live classes and for the server-based image and text embedders

Coding experience: None required. The entire course can be completed without writing code. Students who already know Python get more from Class 22, where the Python Script widget and the Orange to scikit-learn concept map are covered, but nothing earlier depends on it

Maths background: Comfort with school-level statistics, averages, percentages, basic probability and reading a graph. Every further concept, from cross validation to regularisation to silhouette scores, is taught in the course at the point it is needed

Accounts: No account is required. Orange is free and open source software you download and run locally, and the add-ons used in this course install free from inside the application

Mindset: Willingness to be wrong in public: to report that your model lost to the baseline, to state your limitations before someone else finds them, and to rerun your own work from scratch to prove it holds

WHO THIS COURSE IS FOR

Cs and engineering students: Undergraduates with a data mining, machine learning or data warehousing paper who want to actually practise the syllabus rather than memorise algorithm names for an exam

Final year project students: Students building a project, dissertation or research paper who need a defensible methodology and a workflow that reproduces under scrutiny

Non cs students with data: Students in statistics, economics, commerce, psychology, biology, biotechnology and public health who have real data and a real question but no interest in a six week detour through Python syntax

Career switchers and graduates: Graduates preparing for data analyst and junior data science interviews who need the method questions, validation, metrics, leakage and explainability, answered with confidence

Students who will learn python next: Anyone planning to learn pandas and scikit-learn who wants the modelling and evaluation concepts secure first, so only the syntax is new

FULL CURRICULUM, WEEK BY WEEK

This is the complete teaching plan. Parents can ask about any week.

PHASE 1: REPRODUCIBLE FOUNDATIONS

Classes 1 to 5. Set up Orange, learn the canvas properly, and build the habits that separate a project that survives a viva from one that falls apart when someone asks you to run it again. Everything in this phase is about data you can trust and workflows that reproduce.

Class 1: Orange, Visual Programming and Why It Is Taken Seriously

Topics:

- What Orange is: open source machine learning and data visualisation software from the Bioinformatics Laboratory, Faculty of Computer and Information Science, University of Ljubljana, first released in 1996 and under the GNU GPL version 3 or later
- Why a visual tool belongs in a serious course: it was built to teach machine learning and data mining to university students, and it runs the same algorithms you would call from code
- Installation paths: the standalone installer on Windows and macOS, and installing the Orange3 package from the Python Package Index into a Python environment
- The interface: widget toolbox, canvas, the six default widget sets Data, Transform, Visualize, Model, Evaluate and Unsupervised, and the status bar
- How data flows: output channels, input channels, and choosing which channel a connection uses when a widget offers several
- The mental model that prevents most beginner errors: a widget recomputes whenever anything upstream changes, so the canvas is a live pipeline, not a sequence of clicks
- Course standards announced up front: every deliverable is an .ows workflow that reruns from the raw data file with no manual editing anywhere

Projects built:

- Install Orange, build a File to Data Table to Distributions canvas on a bundled dataset, then deliberately change the upstream file and document exactly which downstream widgets recomputed

Practice: Open three example workflows from the official examples page and write one sentence on what each pipeline is doing.

Assessment: Your first canvas plus a short written explanation of the live-pipeline model in your own words.

Class 2: Data Sources, Types and Roles

Topics:

- The File widget across formats: .csv, .tsv, Excel and Orange's native .tab, including delimiter and encoding problems and how to diagnose them
- CSV File Import for awkward files: header rows, decimal separators, thousands separators and locale issues
- SQL Table: reading directly from a database rather than exporting an intermediate spreadsheet nobody can reproduce
- Datasets: the bundled and downloadable example datasets used throughout the course for controlled comparisons
- Variable types in Orange, numeric, categorical, text and datetime, and the downstream failures caused by each mistyped column
- Roles: feature, target and meta, and why identifiers, names and free text must be pushed to meta rather than fed to a learner
- Data Info and Column Statistics as a mandatory first look: instances, features, missing values, constant columns and near-duplicates

Projects built:

- Load one awkward real-world .csv, correct every mistyped column with Edit Domain, assign roles deliberately, and write a data dictionary describing every variable, its type and its role

Practice: Import the same file twice, once correctly and once with a wrong delimiter, and record what silently went wrong.

Assessment: Your data dictionary plus a Data Info screenshot with a written note on every quality problem you found.

Class 3: Missing Data, Outliers and Defensible Cleaning

Topics:

- The three kinds of missingness in plain language, and why the reason a value is missing changes what you are allowed to do about it
- The Impute widget in full: leave as is, average or most frequent, replace with a fixed value, remove instances, and model-based imputation
- The decision that gets challenged in every viva: dropping rows versus imputing, and how to state your choice with a defensible reason
- Select Rows for rule-based filtering, and why filters belong in the workflow rather than in a spreadsheet you edited by hand
- Outliers: detecting them, and the separate question of whether to remove, cap, flag or investigate them
- Duplicate detection with Unique, and the near-duplicate problem that silently inflates every cross validation score

- Documenting cleaning: annotating the canvas so a reader can see every judgement you made and disagree with it if they want

Projects built:

- Build a fully annotated cleaning pipeline on a messy dataset, recording instance counts before and after each step, and write a cleaning log justifying every decision

Practice: Compare model-based imputation against mean imputation on the same column and record how the distribution changed.

Assessment: Your cleaning log with before and after counts, plus a defence of your imputation strategy.

Class 4: Joins, Aggregation and Reshaping

Topics:

- Merge Data: inner, outer and left join behaviour on a shared key, and diagnosing the rows that silently disappear
- Concatenate for stacking sources, including what happens when the schemas do not quite agree
- Group by and Aggregate Columns: producing entity-level datasets from transaction-level records, the single most common real analytics task
- Pivot Table for cross-tabulation, and Transpose for datasets stored the wrong way round
- Formula: deriving ratios, differences, flags and interaction terms as genuine engineered features
- Select by Data Index and Data Sampler: reproducible sampling, stratified sampling, and holding out a set you genuinely do not look at
- Granularity discipline: knowing exactly what one row represents at every point in your pipeline

Projects built:

- Build an entity-level analysis dataset from at least two source tables using Merge Data and Group by, engineer three derived features with Formula, and document what one row represents at each stage

Practice: Perform the same join two ways and reconcile the row counts, explaining any difference.

Assessment: Your multi-table workflow plus the row-meaning documentation at each stage.

Class 5: Preprocess, Reproducibility and Workflow Engineering

Topics:

- The Preprocess widget as a single reusable block: normalisation, standardisation, imputation, feature selection, discretisation, continuisation and randomisation
- The leakage rule stated early and repeated all course: preprocessing that learns from data, such as scaling or imputation, must be fitted inside the validation loop, not applied to the whole dataset first
- How Orange helps: connecting Preprocess into a learner so the preprocessing is fitted per training fold during cross validation
- Purge Domain and Randomize: cleaning unused categories, and shuffling a target deliberately as a sanity check that your pipeline cannot score well on noise
- Saving workflows as .ows files: XML describing widgets, their settings and their connections, saving the workflow and settings but not the data
- Consequences for sharing: an .ows file needs its data file alongside it, so a shareable project is a folder, not a single file
- Workflow engineering standards: left to right layout, renamed widgets, canvas notes, and a README describing how to rerun the analysis

Projects built:

- Package everything from Classes 2 to 4 as a reproducible project folder: annotated .ows workflow, raw data file and a README, then have a classmate rerun it from scratch and report any step they could not reproduce

Practice: Run the shuffled-target sanity check on your pipeline and confirm performance collapses to baseline as it should.

Assessment: A project folder a classmate successfully reran, plus their written reproduction report.

PHASE 2: EXPLORATORY ANALYSIS AND FEATURE ENGINEERING

Classes 6 to 10. Model performance is decided long before the learner widget. This phase covers reading a dataset properly and then constructing the features that make the difference, along with the diagnostics that tell you when a feature is helping and when it is cheating.

Class 6: Distributions, Dispersion and Group Comparison

Topics:

- Distributions: shape, skew, modality and the long tail, and what each implies for the models available to you
- Box Plot and Violin Plot: comparing groups on a numeric variable, including unequal group sizes and what that does to a visual comparison
- Central tendency and dispersion together: why reporting a mean without a spread is an incomplete claim
- Detecting distributional problems that break specific models, such as heavy skew for distance-based methods
- Transformations in plain terms, and when a log-style transformation genuinely helps versus when it just hides the problem
- Target distribution first: class imbalance diagnosed before any model is trained, using

Distributions on the target
- Stating an exploratory finding as a hypothesis to test rather than a conclusion to announce

Projects built:
- Produce a full univariate profile of your dataset, every numeric variable charted and described, every categorical variable tabulated, ending with three written hypotheses worth testing

Practice: Identify one variable whose mean misrepresents it and justify a better summary statistic.

Assessment: Your univariate profile document plus the three hypotheses with the evidence that prompted each.

Class 7: Bivariate Analysis and Informative Projections

Topics:
- Scatter Plot with class colouring, point size and shape used as genuine extra dimensions
- Find Informative Projections: ranking variable pairs by how well they separate the target classes
- Rank: scoring features by information gain, gain ratio, gini, chi square, ReliefF and FCBF, and reading the disagreements between scores as information
- Sieve Diagram and Mosaic Display for categorical against categorical relationships
- Linear Projection, Radviz and FreeViz for looking at many variables at once in a single plane
- Selecting subsets directly from a plot and sending them downstream for inspection, the fastest way to interrogate a suspicion
- The discipline of the alternative explanation: for every relationship you find, write the confounder that could produce it

Projects built:
- Rank every feature by at least three scoring methods, reconcile the disagreements in writing, and build the informative projection that best separates your target classes

Practice: Take your strongest bivariate relationship and write two plausible confounders for it.

Assessment: Your multi-method feature ranking with a written reconciliation, plus the projection and its interpretation.

Class 8: Correlation, Multicollinearity and Distance

Topics:
- Correlations: ranking every numeric pair, and reading the coefficient without over-claiming what it establishes
- Multicollinearity: what happens to a linear model's coefficients when two features carry the same information, and why the model can still predict well while its explanation becomes worthless
- Heat Map with row and column clustering for whole-dataset structure at a glance
- Distances: Euclidean, Manhattan, cosine, Jaccard and others, and choosing a measure that matches the data type and the question
- Distance Map, Distance Matrix and Distance Transformation as the shared foundation under clustering and nearest neighbour methods
- Why normalisation must precede distance, demonstrated by breaking it deliberately with one large-scale feature
- Feature selection versus dimensionality reduction: dropping features versus combining them, and when each is appropriate

Projects built:
- Diagnose multicollinearity in a numeric dataset, decide which features to drop with a written justification, and demonstrate the effect on a linear model's coefficients before and after

Practice: Compute the same distance matrix under three distance measures and describe how the neighbourhood structure changed.

Assessment: Your multicollinearity report including the coefficient comparison and your retained feature set.

Class 9: Feature Engineering, Discretisation and Encoding

Topics:
- Feature engineering as the highest-leverage work in applied machine learning, with worked examples of features that transformed a weak model
- Formula: ratios, differences, flags, counts and interaction terms built inside the workflow, and Create Instance for testing a model on a hand-specified case
- Discretize: equal width, equal frequency and entropy-based binning, and what each does to the information in a variable
- Continuize: one-hot and ordinal treatment of categorical variables, and matching the encoding to the model that will consume it
- Create Class: deriving a target variable from raw columns, and the leakage danger that this step invites
- Domain knowledge as a feature source: interviewing the person who understands the data before engineering anything
- Testing whether a feature earned its place: rerun the cross validated comparison with and without it

Projects built:
- Engineer at least five new features from domain reasoning, then run a cross validated with-and-without comparison for each and keep only the ones that measurably earned their place

Practice: Compare equal-frequency and entropy-based discretisation of the same variable and note the difference in downstream model performance.

Assessment: Your feature engineering log showing each candidate feature, its rationale,

its measured effect and your keep or drop decision.

Class 10: Communicating Analysis with the Orange Report
Topics:
- The Report system: most widgets carry a report button in the status bar that appends the current view to a running report
- Which widgets do not report, and why the ones that only transmit or display data are excluded
- Structuring an analytical report the way a reader needs it: question, data and its limits, method, evidence, result, threats to validity
- Adding written commentary to report sections so the argument, not just the output, is preserved
- Exporting as .html or .pdf for submission, and as .report so a reader can reopen the exact workflow behind each section
- Reopening reports through File then Open Report, and the report view via Shift and R
- Presenting to a non-technical audience: what to cut, what to keep, and how to state uncertainty without losing the room

Projects built:
- Produce a complete exploratory data analysis report on your project dataset: question, data dictionary, univariate and bivariate evidence, engineered features, and a stated set of limitations, exported as PDF

Practice: Cut your report to a three minute verbal summary and note what you were forced to drop.
Assessment: Your exported EDA report, graded on whether every claim in it is supported by a visible piece of evidence.

PHASE 3: MODELLING AND RIGOROUS EVALUATION

Classes 11 to 16. The modelling half of a data mining syllabus, taught with the validation rigour that distinguishes a result from a coincidence. Classification and regression, simple models and ensembles, and tuning that does not quietly contaminate the test set.

Class 11: The Modelling Frame, Baselines and Validation Design
Topics:
- Supervised learning framed properly: a hypothesis space, a loss, and an estimate of generalisation error, all in plain language
- Classification versus regression, decided by the target variable, and the metrics that come with each
- The Orange modelling shape: data into learner into Test and Score, with Preprocess attached to the learner rather than the data
- Constant as the mandatory baseline, and Feature as Predictor as a second reference point using a single variable
- Choosing a validation design: train and test split, k-fold cross validation, stratified folds, leave one out, and repeated sampling, with the cost and reliability of each
- Class imbalance: what accuracy hides, and why AUC, F1, precision and recall exist
- Declaring your evaluation protocol before you look at any result, and writing it into the project README

Projects built:
- Write and register your evaluation protocol for the course project, then establish both baselines with stratified 10-fold cross validation and record the numbers every later model must beat

Practice: Run the same model under three validation designs and record how much the estimate moves.
Assessment: Your registered evaluation protocol plus a baseline results table with the validation design justified.

Class 12: Trees, Rules and Interpretable Models
Topics:
- Decision tree induction: impurity measures, the greedy split search, and stopping criteria as the practical control on complexity
- The Tree widget's parameters, minimum instances in a leaf, maximum depth, and splitting thresholds, mapped to bias and variance
- Tree Viewer, Pythagorean Tree and Pythagorean Forest for reading structure rather than guessing at it
- CN2 Rule Induction and CN2 Rule Viewer: learning an ordered or unordered rule set you can read as if-then statements
- Scoring Sheet and Scoring Sheet Viewer: producing the kind of simple point-based model that regulated domains actually accept
- Overfitting demonstrated live: growing a tree until training accuracy is perfect and cross validated accuracy collapses
- The interpretability and accuracy trade-off, and the domains where an interpretable model is a requirement rather than a preference

Projects built:
- Train a tuned decision tree and a CN2 rule set on the same problem, extract the decision logic from both as written rules, and compare their cross validated performance against your baselines

Practice: Sweep maximum depth across five values and tabulate training against cross validated accuracy to locate the overfitting point.
Assessment: Your extracted rule set in plain English plus the overfitting curve with the

depth you chose and why.

Class 13: Distance and Probability Models, Regression Begins
Topics:
- k Nearest Neighbours: the choice of k, distance measure and weighting, and its total dependence on feature scaling
- Naive Bayes: the conditional independence assumption, why it is usually false, and why the model often works anyway
- Linear Regression in Orange: predicting a continuous target, with ridge and lasso regularisation and what each penalty does
- Regression metrics and how to read them: MSE, RMSE, MAE and R squared, and what R squared does not tell you
- PLS and Curve Fit for the cases where ordinary linear regression is the wrong shape
- Stochastic Gradient Descent as a learner, and the intuition of iterative optimisation without the calculus
- Choosing a model family from the data and the requirement, not from familiarity

Projects built:
- Build a full regression pipeline on a continuous target, compare linear regression with and without regularisation against kNN regression, and report RMSE and R squared under identical cross validation

Practice: Run kNN with and without normalisation inside the Preprocess block and quantify the difference.
Assessment: Your regression comparison table with metrics defined in your own words and a justified model choice.

Class 14: Evaluation in Depth, from Confusion Matrix to Calibration
Topics:
- Test and Score read properly: comparing learners under identical folds, and the meaning of the variation between folds
- Confusion Matrix: the four cells expressed as real costs in the actual application domain
- Precision, recall, specificity and F1 derived from that matrix rather than memorised
- ROC Analysis: the curve as every threshold at once, AUC interpreted as a ranking probability, and reading multiple models on one plot
- Performance Curve for the operational question of how many cases you must action to capture a given share of positives
- Calibration Plot: whether predicted probabilities behave like probabilities, and Calibrated Learner as the fix
- Choosing the operating threshold from the cost of each error type rather than accepting 0.5 by default

Projects built:
- Evaluate every model built so far on one problem with a full evaluation dossier: metrics table, confusion matrices with stated costs, ROC comparison, calibration plot, and a recommended operating threshold with its justification

Practice: Take a poorly calibrated model, apply Calibrated Learner, and document the change in the calibration plot.
Assessment: Your evaluation dossier, graded on whether the threshold recommendation follows from stated error costs.

Class 15: Ensembles and Neural Networks
Topics:
- Random Forest: bagging plus random feature subsets, why decorrelated trees generalise better, and the parameters that matter
- Gradient Boosting: sequential correction of residuals, and the learning rate and depth interaction that governs overfitting
- AdaBoost: reweighting the examples the ensemble keeps getting wrong
- Support Vector Machines: margins, the kernel trick explained without the algebra, and the cost parameter
- Neural Network in Orange: hidden layer sizes, activation functions, the solver, and realistic expectations on tabular data of student scale
- Stacking: combining several learners with a meta-learner, and the extra validation care it demands
- The honest finding that a well tuned simple model frequently matches an ensemble, and why reporting that is good work

Projects built:
- Run a full learner tournament, baseline through neural network and stacking, under one fixed cross validation, and write a model selection memo that justifies your winner on grounds beyond the top accuracy figure

Practice: Vary the gradient boosting learning rate and depth together and record where performance stops improving.
Assessment: Your model selection memo, which must address performance, variance across folds, interpretability and runtime.

Class 16: Tuning, Deployment and the Traps That Invalidate Results
Topics:
- Parameter Fitter: searching a learner's parameters systematically instead of by intuition
- The tuning trap named precisely: selecting parameters using the same data you then report performance on inflates your result
- Nested validation in principle, and the practical discipline of a genuinely held-out set that is opened exactly once

- Permutation Plot and the shuffled-target sanity check as evidence that your pipeline is not learning noise
- Predictions: scoring new unlabelled data, reading class probabilities, and exporting results with Save Data
- Save Model and Load Model: persisting a fitted model so scoring does not require retraining
- The leakage catalogue, target leakage, temporal leakage, group leakage and preprocessing leakage, each with the symptom that gives it away

Projects built:
- Tune your chosen model with Parameter Fitter, evaluate the tuned model on a held-out set you have not previously touched, run the shuffled-target check, and write a leakage audit against all four leakage types

Practice: Deliberately introduce a leaking feature, observe the implausible score, and document how you would have caught it.
Assessment: Your held-out result with the tuning protocol described, plus your completed four-point leakage audit.

PHASE 4: UNSUPERVISED, EXPLAINABLE AND SPECIALISED DATA

Classes 17 to 21. The rest of a data mining syllabus, taught to the same standard: clustering with validity measures rather than eyeballing, dimensionality reduction, association rules, model explainability, and the two data types that dominate project work, text and time series.

Class 17: Clustering and Cluster Validity

Topics:
- Unsupervised learning framed honestly: no ground truth, so validity has to be argued rather than measured against an answer key
- k Means: the algorithm step by step, initialisation sensitivity, and scoring a range of k automatically
- Silhouette score and Silhouette Plot: evaluating cohesion and separation, and finding the points that were forced into the wrong cluster
- Hierarchical Clustering: linkage methods, reading a dendrogram, and choosing the cut height defensibly
- DBSCAN: density-based clusters of arbitrary shape, the epsilon and minimum points parameters, and the ability to label points as noise
- Louvain Clustering and Self-Organizing Map as further approaches, and Interactive k-Means from the Educational add-on for stepping through the algorithm
- Profiling clusters into an interpretation: describing each group by its distinguishing features so the result means something to a domain reader

Projects built:
- Cluster one dataset with k means, hierarchical clustering and DBSCAN, justify your chosen k or cut with silhouette evidence, and write a business-readable profile of every cluster you keep

Practice: Run k means on uniformly random data and write the paragraph explaining why its clusters are meaningless.
Assessment: Your three-method comparison with silhouette evidence, plus interpretable profiles for each final cluster.

Class 18: Dimensionality Reduction, Outliers and Association Rules

Topics:
- PCA: principal components as ordered directions of maximum variance, and using explained variance to choose how many to keep
- The interpretability cost of PCA, and when a loading is still readable enough to explain
- t-SNE, MDS and Manifold Learning for visualisation, with an explicit warning about over-reading distances between separated clusters in a t-SNE plot
- Correspondence Analysis for categorical structure
- Outliers: detection methods and the analyst's decision about whether an outlier is an error, a rare event, or the entire point of the study
- The Associate add-on: frequent itemsets and association rules, with support, confidence and lift defined precisely
- Reading association rules critically: high confidence with low lift is usually just a popular item, not a relationship

Projects built:
- Reduce a wide dataset with PCA, visualise it with t-SNE, then mine association rules on a transactional dataset and identify three rules that are genuinely informative by lift rather than merely frequent

Practice: Cluster on raw features and on PCA components and compare silhouette scores and cluster interpretability.
Assessment: Your dimensionality reduction analysis plus three association rules with support, confidence and lift interpreted correctly.

Class 19: Explainability and Fairness

Topics:
- Why explainability is now a requirement: examiners, regulators, clinicians and clients all ask why, and a score is not an answer
- The Explain add-on: Explain Model for global feature attribution across the dataset
- Explain Prediction and Explain Predictions: why this specific instance received this specific output

- Permutation Importance: measuring a feature's contribution by breaking it and observing the damage
- ICE plots for seeing how a prediction responds as one feature is varied across its range
- Nomogram for logistic regression as a fully transparent alternative to post-hoc explanation
- The Fairness add-on: auditing model behaviour across a sensitive attribute, and the fact that a fairness problem is usually a data problem

Projects built:
- Take your best model, produce a global explanation and three individual prediction explanations, run a permutation importance check, and audit the model across one sensitive attribute with a written finding

Practice: Find one instance your model got confidently wrong and explain, from its attribution, why it failed.
Assessment: Your explainability report including global attribution, three instance-level explanations, and the fairness audit finding.

Class 20: Text Mining and Document Analysis

Topics:
- Installing add-ons through Options then Add-ons, and what the Text add-on contributes to the toolbox
- Corpus, Import Documents and Create Corpus: loading documents as data, including a folder of your own files
- Preprocess Text in detail: transformation, tokenisation, normalisation with stemming or lemmatisation, stop word and lexicon filtering, and n-grams
- Bag of Words with term frequency and TF-IDF weighting, and what a bag of words representation discards
- Document Embedding as the modern alternative, and when it beats a bag of words
- Analysis widgets: Word Cloud, Concordance, Statistics, Word Enrichment, Extract Keywords and Duplicate Detection
- Topic Modelling and Corpus Viewer, plus Sentiment Analysis with an honest account of its failure modes on sarcasm, negation and mixed-language text

Projects built:
- Build an end to end text pipeline: load a corpus, preprocess it deliberately, represent it with both bag of words and embeddings, classify or topic-model it, and evaluate the two representations against each other under identical validation

Practice: Rerun your pipeline with stemming, with lemmatisation and with neither, and tabulate the effect on your metric.
Assessment: Your text mining report comparing both representations, with named topics or a validated classifier and its limitations.

Class 21: Time Series and Spatial Data

Topics:
- The Time Series add-on: As Timeseries for converting a table, Line Chart, and Yahoo Finance for pulling market data
- Why time series breaks the rules you learned: rows are not independent, so ordinary shuffled cross validation leaks the future into the past
- Interpolate, Moving Transform and Seasonal Adjustment: filling gaps, computing rolling statistics, and separating trend, seasonality and remainder
- Correlogram and Periodogram: autocorrelation and periodicity, and finding the cycle length in real data
- ARIMA Model and VAR Model: univariate and multivariate forecasting, with Model Evaluation for out-of-sample assessment
- Granger Causality read carefully: predictive precedence is not causation, whatever the widget is called
- The Geo add-on and the Network add-on named and demonstrated for spatial and relational project data

Projects built:
- Take a real time series, decompose it, identify its dominant period, fit an ARIMA model, evaluate it out of sample against a naive last-value baseline, and state honestly whether the model beat the baseline

Practice: Demonstrate the leakage caused by shuffled cross validation on time series data and quantify how much it inflates the score.
Assessment: Your forecasting workflow with an out-of-sample evaluation and an explicit comparison against the naive baseline.

PHASE 5: THE PYTHON BRIDGE AND CAPSTONE

Classes 22 to 24. Leave the course able to work in both worlds. Orange is a Python library, so the last phase connects the canvas to code, sets the ethical standard for the work, and produces a capstone that reproduces on a machine that is not yours.

Class 22: The Python Script Widget and Orange as a Library

Topics:
- Orange3 as a Python package installable from the Python Package Index, with a current Python version required for the pip installation route
- The Python Script widget: running real Python inside the canvas when no existing widget does what you need
- The widget's namespace: in_data, in_distance, in_learner, in_classifier and in_object arrive from the input signals, and are None when nothing is connected

- Returning results to the canvas so a script sits in the middle of a workflow rather than at the end of it
- The Orange.data.Table object and how it maps onto the pandas DataFrame most students will meet next
- The concept map from Orange to scikit-learn: learner to estimator, Test and Score to cross_val_score, Preprocess to Pipeline, Parameter Fitter to GridSearchCV
- Choosing the right tool honestly: canvas for exploration, comparison and communication, code for automation, scale and version control

Projects built:
- Insert a Python Script widget into an existing workflow to compute something no widget provides, pass the result downstream, and write the equivalent scikit-learn outline for one pipeline you built earlier in the course

Practice: Map five widgets you used this course onto their scikit-learn equivalents in a written table.
Assessment: Your working Python Script integration plus the Orange to scikit-learn concept map.

Class 23: Build and Defend Your Capstone
Topics:
- Scoping a capstone that is answerable: a specific question, an obtainable dataset, a defined target and a stated success criterion
- Sourcing data responsibly: open government portals, research repositories, Kaggle and institutional data, with the licence and any consent conditions checked and recorded
- Applying the full pipeline discipline: data dictionary, cleaning log, engineered feature log, registered evaluation protocol, held-out set
- Beating the baseline, and the professional willingness to report that the sophisticated approach did not win
- Threats to validity written before the conclusion: sample bias, leakage, confounding, temporal drift and generalisation limits
- Mentor review checkpoint: an instructor interrogates your canvas the way an examiner will, step by step
- Assembling the deliverable folder: .ows workflow, raw data, README with rerun instructions, and the report

Projects built:
- Build your complete capstone from raw data to evaluated model and written conclusion, defended live in a mentor review that challenges every methodological choice

Practice: Have a classmate rerun your capstone folder on their own machine and log every step that failed.
Assessment: A capstone that reproduces from raw data in a clean session on someone else's machine, plus your threats-to-validity section.

Class 24: Report, Present and Continue
Topics:
- Assembling the final report: question, data and provenance, method, evidence, results with uncertainty, threats to validity, and conclusion
- Exporting for the audience you have: PDF for submission, and .report so a reviewer can reopen the workflow behind every figure
- Presenting under questioning: leading with the question and the answer, defending the method, and saying clearly when something is unknown
- The interview and viva questions this course prepares you for: why that validation design, why that metric, how did you rule out leakage, why should the model be believed
- Portfolio assembly: 24 reproducible workflows plus the capstone, organised so a reviewer can open any one and follow it
- Continuing paths: Python with pandas and scikit-learn, statistics and experimental design, and further Orange add-ons including Bioinformatics, Single-Cell, Spectroscopy, Survival Analysis and Network
- Staying current with the tool: the official Orange documentation, workflow examples and video lessons, and the open source repository itself

Projects built:
- Present your capstone under live questioning, submit the exported report and complete portfolio, and receive written feedback plus your certificate assessment

Practice: Write the one page project proposal for your next analysis, including its question, data source, evaluation protocol and baseline.
Assessment: Your defended presentation, exported report and 24-workflow portfolio, assessed on methodological rigour as much as on results.

PROJECTS THE STUDENT BUILDS AND KEEPS

- Phase 1: a live-pipeline demonstration, a corrected dataset with a full data dictionary, an annotated cleaning log with before and after counts, a multi-table entity-level dataset, and a reproducible project folder a classmate reran successfully
- Phase 2: a complete univariate profile with three testable hypotheses, a multi-method feature ranking with reconciled disagreements, a multicollinearity report with coefficient evidence, a measured feature engineering log, and an exported EDA report
- Phase 3: a registered evaluation protocol with dual baselines, a tuned tree and CN2 rule set with extracted logic, a regularised regression comparison, a full evaluation dossier with a cost-justified threshold, a learner tournament with a model selection memo, and a held-out tuned result with a four-point leakage audit
- Phase 4: a three-method clustering study with silhouette evidence and readable cluster

profiles, a PCA and t-SNE reduction with lift-interpreted association rules, an explainability report with a fairness audit, a two-representation text mining comparison, and an out-of-sample ARIMA forecast tested against a naive baseline
- Phase 5: a Python Script widget integrated mid-workflow with an Orange to scikit-learn concept map, and the capstone: reproducible folder, threats to validity, exported report and a presentation defended under questioning
- Total: 24 reproducible workflows plus a capstone that survives being rerun by someone else

Total projects: 24 reproducible workflows, one per class, plus a capstone project that reruns from raw data on another person's machine

SKILLS THE STUDENT WILL HAVE AT THE END

- Reproducible Workflow Engineering: canvas discipline, channel selection, annotated .ows workflows, project folders with README rerun instructions
- Data Engineering in Orange: File and CSV File Import, SQL Table, Edit Domain, Impute, Select Columns and Rows, Merge Data, Concatenate, Group by, Aggregate Columns, Pivot Table and Formula
- Exploratory Analysis: Distributions, Box and Violin Plot, Scatter Plot with informative projections, Rank across multiple scoring methods, Correlations, Heat Map, Distances and Distance Map
- Feature Engineering: derived and interaction features, Discretize, Continuize, Create Class, and measured with-and-without validation of every candidate feature
- Classification and Regression: Constant and Feature as Predictor baselines, Tree, CN2 Rule Induction, Scoring Sheet, kNN, Naive Bayes, Linear and Logistic Regression with regularisation, PLS, SVM, Random Forest, Gradient Boosting, AdaBoost, Neural Network and Stacking
- Rigorous Evaluation: Test and Score validation designs, Confusion Matrix with stated error costs, ROC Analysis, Performance Curve, Calibration Plot and Calibrated Learner, Parameter Fitter tuning, Permutation Plot, and a working catalogue of leakage types
- Unsupervised Learning: k Means with silhouette selection, Hierarchical Clustering, DBSCAN, Louvain, Self-Organizing Map, PCA, t-SNE, MDS, Manifold Learning, Correspondence Analysis, Outliers and association rule mining
- Explainability and Fairness: Explain Model, Explain Prediction, Permutation Importance, ICE, Nomogram, and auditing across a sensitive attribute
- Specialised Data: Corpus, Preprocess Text, Bag of Words with TF-IDF, Document Embedding, Topic Modelling, Sentiment Analysis, As Timeseries, Seasonal Adjustment, Correlogram, Periodogram, ARIMA and VAR
- The Python Bridge: the Python Script widget with its in_data namespace, Orange3 as a Python package, and the concept map onto pandas and scikit-learn

HOW A TYPICAL WEEK IS SPLIT

Live classes: 2 live classes per week, about 1 hour each, across 12 weeks
Hands on canvas work: 2 hours rebuilding each class workflow on your own project dataset, not only on the class example
Project time: 1.5 hours on the class deliverable, from cleaning logs and evaluation dossiers to the capstone build
Review and doubts: 1 hour reviewing results against your registered protocol, checking for leakage, and clearing doubts before the next class
Homework: A task or problem set after every class, and a monthly mixed-review assignment that deliberately folds in earlier topics

SUPPORT INCLUDED

Doubt support: WhatsApp doubt support between classes for installation, add-on, dataset and workflow problems
Small batches: Small batches, with mini-batch and 1-on-1 options, so your own project dataset gets attention every week
Mentor guidance: Live guidance from mentors who build and evaluate models professionally, including an interrogation-style capstone review
Project feedback: Feedback on every deliverable, graded on methodology, reproducibility and honest reporting as much as on performance
Living syllabus: Curriculum updated as Orange ships new versions, widgets and add-ons, at no extra cost

CERTIFICATION DETAIL

Completion: Certificate from Modern Age Coders, awarded on passing the final assessment. Fall short and there is focused revision and a free retest: the certificate certifies real learning, not attendance

WHERE THIS CAN LEAD

- Data Analyst and Business Analyst roles, where cleaning, exploration, validation and clear reporting are the daily work
- Junior Data Scientist and Machine Learning Analyst positions, entered with genuine evaluation and explainability discipline
- Research Assistant and academic project work in bioinformatics, public health, social

science, economics and environmental science
- Business Intelligence and Reporting Analyst roles, building on the aggregation, visualisation and reporting work in this course
- A prepared transition into Python-based data science, since every concept maps directly onto pandas and scikit-learn

EARNING POTENTIAL (share only if asked, and never promise it)

Market context: The ranges below are general market salary bands for these roles in India and abroad, drawn from public industry data. They are shown for career context only and are not a promise or guarantee of income. Actual pay depends on your skills, experience, location, and the job market.
Early career roles: Rs 3-5 LPA (Junior Analyst); Rs 5-8 LPA (Data Analyst)
Growing roles: Rs 8-15 LPA (Senior Analyst)
Other roles: Rs 15-25+ LPA (Lead/Manager)
Freelance: Rs 500-2,000/hour
International: $50k-100k+ USD

COMMON QUESTIONS ABOUT THIS COURSE

For anything about cost, use PART 4 and RULE 1. Do not quote two regions.

Q: Is Orange serious enough for a college level data mining course?
A: Yes. Orange is developed at the Bioinformatics Laboratory, Faculty of Computer and Information Science, University of Ljubljana, has been in development since 1996, and was built in part for teaching machine learning and data mining to university students. It runs standard algorithms including trees, kNN, naive Bayes, SVM, random forests, gradient boosting and neural networks, evaluates them with proper cross validation and ROC analysis, and is written in Python so the same models are available as code. It is also citable, which matters for project reports.

Q: Do I need to know Python before starting?
A: No. The full 24 classes can be completed without writing a line of code, because analysis is built by connecting widgets. Class 22 is dedicated to the Python bridge, where the Python Script widget runs real Python inside a workflow and every Orange concept is mapped onto its scikit-learn equivalent, so students who already code get extra value there and students who do not are not disadvantaged anywhere else.

Q: Will this cover my university data mining syllabus?
A: It covers the standard ground: data preprocessing and cleaning, exploratory analysis, feature engineering, classification, regression, model evaluation, clustering, dimensionality reduction, association rule mining, text mining and time series, plus explainability and fairness which many syllabi have only recently added. It teaches these as practice rather than as definitions, so it complements exam preparation rather than replacing your notes. Bring your syllabus to the free demo class and we will map it against the 24 classes. (Agent note: the free demo is a waiting list with no fixed date. The Priority Live Demo is a guaranteed class today or tomorrow, booked at https://learn.modernagecoders.com/priority-demo . Offer both, as RULE 3 says.)

Q: Can I use this for my final year project or dissertation?
A: That is exactly what Phase 5 is built for. Classes 23 and 24 take you from scoping a defensible question through data sourcing with licence checks, a registered evaluation protocol, a held-out set, a threats-to-validity section, and a mentor review conducted like a viva. The standard for the capstone is that it reproduces from the raw data file in a clean session on a machine that is not yours.

Q: How is this different from a Python data science course?
A: A Python course spends its early weeks on syntax, environments and library APIs, which is necessary but expensive. This course removes that overhead and spends the time on method instead, so it goes further into validation design, leakage, explainability, association rules and time series than a first code course usually reaches. It is designed to be taken before or alongside Python, not instead of it, and Class 22 exists specifically to make the transition short.

Q: Is Orange free, and does anything expire?
A: Orange is free and open source software released under the GNU General Public License version 3 or later. There is no subscription, no trial clock and no student licence. It runs on Windows, macOS and Linux, and the add-ons used in this course install free from inside the application under Options then Add-ons. Everything you build keeps working after the course ends.

Q: What add-ons does the course install, and are they hard to set up?
A: We install them together in class from Options then Add-ons. The course uses Text for corpus analysis, Image Analytics where relevant, Time Series for temporal data, Explain for model interpretation, Associate for rule mining, and introduces Educational, Geo, Network and Fairness. All are free. The text and image embedders that run on a server need a working internet connection, which we flag before those classes.

Q: Do I need my own dataset?

A: Not to start. Orange ships with example datasets and the Datasets widget offers more, and every class provides a working dataset. From Phase 2 onward we strongly encourage you to run each class a second time on a dataset from your own field or project, because the course is far more useful when the capstone is something you actually needed to answer.

Q: What will I be able to do in an interview after this?
A: Answer the method questions that separate candidates: why that validation design, what the confusion matrix costs in this domain, how you ruled out leakage, why you chose that operating threshold, which features drove the prediction and how you know. You will also have a portfolio of 24 reproducible workflows plus a defended capstone to show, rather than a certificate on its own.

Q: How am I assessed, and is the certificate just for showing up?
A: No. A task follows every class with feedback, monthly reviews deliberately mix new material with earlier topics so nothing is forgotten, and the course ends with a final project defended live, plus a written assessment. Passing earns the certificate; falling short earns focused revision and a free retest. We measure real learning, not attendance.

To enrol, message Shivam Sir on +91 9123366161 or send the parent this link: https://learn.modernagecoders.com/courses/orange-data-mining-machine-learning-course-for-college-students
For a demo: the Priority Live Demo (guaranteed, today or tomorrow) is booked at https://learn.modernagecoders.com/priority-demo . The free demo is a waiting list with no fixed date.

==========

COURSE 109 OF 137: ORANGE DATA MINING COURSE FOR TEENS: MACHINE LEARNING WITHOUT CODE

==========

Course link: https://learn.modernagecoders.com/courses/orange-data-mining-visual-machine-learning-course-for-teens
Subject area: Data Science & Machine Learning
Designed for: Teens
Who can join: Beginner-friendly (ages 13-18), no programming experience required
Course length: 24 classes (12 weeks · 2 classes/week)
Time needed: 3-4 hours/week recommended
Certificate: Certificate from Modern Age Coders, awarded on passing the final assessment

PRICE FOR THIS COURSE (quote only the one that applies to the person asking)
In India, per month: group Rs 1,499, mini batch Rs 2,999, one to one Rs 4,999
In Canada, per month: group CAD 140, one to one CAD 210
Anywhere else, per month: group $100, one to one $150
Classes: group and mini batch two live classes a week, eight a month; one to one in India one live class a week, four a month; one to one outside India two live classes a week, eight a month. Each class is one hour.

WHAT THIS COURSE IS

Learn Orange Data Mining in 24 live classes for teens 13-18: build machine learning workflows by connecting widgets on a canvas, visualise real datasets, train and honestly evaluate models, mine text and images, and finish with a shareable data project.

In one line: Build real machine learning by dragging widgets onto a canvas: load a dataset, clean it, chart it, train a model, test whether it is actually any good, and present the whole thing as a project you can defend.

ABOUT THE PROGRAMME

Most teenagers meet machine learning as a black box: an app that guesses the filter, a chatbot that answers, a recommendation that appears. This course opens the box, without asking anyone to learn Python first. Orange is free, open source data mining software built by the Bioinformatics Laboratory at the Faculty of Computer and Information Science, University of Ljubljana, and released under the GNU GPL version 3 or later. Instead of writing code, you place widgets on a canvas, connect them with lines, and watch data flow through the pipeline you designed. That visual canvas is not a toy version of machine learning: underneath, Orange runs the same well established algorithms a data scientist would use, and it is written in Python so the exact same models are available in code later. Across 24 live classes for ages 13 to 18 you work through the six widget sets Orange ships with by default, Data, Transform, Visualize, Model, Evaluate and Unsupervised, and then push into the Text and Image Analytics add-ons. You will load and repair messy files, read a dataset honestly before touching a model, build scatter plots and heat maps that actually answer a question, train decision trees, k nearest neighbours, logistic regression, random forests and neural networks, and then, most importantly, learn to test them properly with cross validation, confusion matrices and ROC curves instead of trusting a single flattering number. You will cluster data with k means and hierarchical clustering, shrink hundreds of columns with PCA and t-SNE, mine a corpus of text into a word cloud and a sentiment score, and train an image classifier using image embeddings. Every class is taught live by a real instructor in a small batch, the same mentorship-first method Modern Age Coders has used since 2020 to teach 10,000+ students across 25+ countries. Nothing here is a pre-recorded video. You finish with 24 saved workflows, a capstone data project of your own choosing, and an Orange report you can hand to a science fair judge, a school teacher, or a college admissions reader who asks what you actually built.

WHAT MAKES THIS COURSE DIFFERENT

- No programming prerequisite, and no pretending: you build genuine machine learning pipelines from Class 1, using the real algorithms, not simplified imitations.
- Free software, forever: Orange is open source under the GNU GPL v3 or later, so there is no subscription, no trial clock, and nothing to cancel when the course ends.
- Honest evaluation is taught as a core skill, not an afterthought: cross validation, confusion matrices, ROC curves and baseline comparison start in Phase 3 and never stop.
- Real datasets, not tidy classroom toys: you clean missing values, fix wrong variable types, and deal with data that argues back.
- Every class ends with a saved .ows workflow, so by Class 24 you own a portfolio of 24 pipelines you can reopen, edit, and explain.
- A bridge to code, not a dead end: Orange is written in Python, and the Python Script widget lets you drop into real Python inside the canvas whenever you are ready.

WHAT A STUDENT NEEDS BEFORE STARTING

Device: A laptop or desktop running Windows, macOS or Linux, with enough room to install Orange, plus a stable internet connection for live classes and the image embedding classes

Coding experience: None. This course is deliberately built for teens who have never written a line of code, and everything is done by connecting widgets on a canvas. Students who already know some Python are not held back, since the Python Script widget lets them extend any workflow

Maths background: School-level comfort with averages, percentages and reading a graph is enough. Every statistical idea used, from distributions to probability thresholds, is taught inside the course when it is needed

Accounts: No account is required to use Orange, which is free and open source software you download and run on your own machine

Mindset: Curiosity about a real question you would like answered with data, and willingness to accept an answer you did not expect, including the answer that the data does not support your hunch

WHO THIS COURSE IS FOR

Curious teens without coding: Ages 13-18 who are interested in AI and data but have not learned to program yet, and do not want to wait a year before touching real machine learning

Science fair and project students: Students preparing a science fair entry, school research project or IB-style investigation who need genuine analysis behind the poster rather than a spreadsheet chart

Future data and cs applicants: Teens aiming at computer science, data science, statistics, economics or biology at university who want the concepts before the syntax

Students already learning python: Young coders who can write Python but have never evaluated a model honestly, and want to learn cross validation, ROC and leakage properly on a visual canvas first

Students with a dataset and a question: Anyone who runs a club, a team, a channel or a small project and already has data they suspect is hiding something worth knowing

FULL CURRICULUM, WEEK BY WEEK

This is the complete teaching plan. Parents can ask about any week.

PHASE 1: THE CANVAS AND YOUR DATA

Classes 1 to 5. Install Orange, learn how visual programming actually works, and get genuinely good at the unglamorous part every real analyst spends most of their time on: loading, reading, repairing and reshaping a dataset before a single model is trained.

Class 1: What Data Mining Is, and Meeting Orange

Topics:

- What data mining means in plain language: finding patterns in data that are too large or too tangled for a person to spot by reading rows
- Where you already meet it every day: spam filters, recommendation feeds, fraud alerts, medical screening, and school analytics dashboards
- Meet Orange: free and open source machine learning and data visualisation software from the Bioinformatics Laboratory, Faculty of Computer and Information Science, University of Ljubljana
- Why it is free forever: Orange is released under the GNU General Public License version 3 or later, so there is no subscription and no trial period
- Installing Orange on your own machine: the standalone installer for Windows and macOS, package options on Linux, and confirming the version under Help then About
- The anatomy of the window: the widget toolbox on the left, the canvas in the middle, and the six default widget sets Data, Transform, Visualize, Model, Evaluate and Unsupervised
- Visual programming in one sentence: place widgets on the canvas, connect them with lines, and data flows along those lines from one widget to the next

Projects built:

- Install Orange on your own computer, open a blank canvas, place a File widget and a Data Table widget, connect them, and take a screenshot proving data flowed from one to the other

Practice: Open every one of the six default widget sets in the toolbox and write down one widget from each that you cannot yet explain.
Assessment: A screenshot of your Orange version from Help then About, plus your two-widget canvas with data visible in the Data Table.

Class 2: Loading Data and Reading It Honestly
Topics:
- The File widget: opening .csv, .tsv, Excel files and Orange's own .tab format, and what happens when a file will not load cleanly
- The Datasets widget: browsing the bundled example datasets so you always have something real to practise on
- Data Table: sorting, selecting rows, and actually looking at your data before assuming anything about it
- Data Info: how many instances, how many features, how many missing values, and why that last number changes everything you do next
- Variable types in Orange and why they matter: numeric, categorical, text, and datetime, and what breaks when a type is guessed wrong
- Roles: feature, target and meta attribute, and why choosing the target is the single most important click in a supervised workflow
- The habit that separates good analysts from lucky ones: describe your dataset in one paragraph before you build anything on top of it

Projects built:
- Load a real .csv you care about (school marks, cricket or football statistics, weather, a game leaderboard), inspect it in Data Table and Data Info, and write a one paragraph description of what each column means

Practice: Deliberately load a file with a wrongly typed column, find it in Data Info, and note exactly which widget downstream would have failed.
Assessment: Your dataset description paragraph plus a Data Info screenshot showing instance count, feature count and missing values.

Class 3: Fixing the Data Nobody Wants to Fix
Topics:
- Edit Domain: renaming variables, changing a variable's type, merging categories, and reordering values so charts read in a sensible order
- Color: assigning meaningful colours to categories once, so every chart downstream stays consistent
- Column Statistics: spotting the columns that are almost entirely empty, constant, or secretly duplicated
- Select Columns: choosing features, setting the target variable, and pushing identifiers into the meta section instead of feeding them to a model
- Select Rows: filtering with conditions to isolate the part of the data you actually want to study
- Impute: what to do about missing values, and the honest trade-off between removing rows, filling with an average, and modelling the missing value
- The rule that saves projects: never delete data silently, always leave the original file untouched and do your fixing inside the workflow

Projects built:
- Take a deliberately messy dataset provided in class, and build a five widget repair pipeline that renames variables, fixes types, filters bad rows and imputes missing values, ending in a clean Data Table

Practice: Rebuild the same repair pipeline on your own dataset from Class 2 and record how many rows survived.
Assessment: Your repair workflow plus a two-line note on every judgement call you made and why.

Class 4: Reshaping, Combining and Summarising Data
Topics:
- Merge Data: joining two tables on a shared column, and what happens to rows that have no match on the other side
- Concatenate: stacking datasets that share the same columns, for example three months of records in three files
- Group by and Aggregate Columns: turning thousands of rows into the handful of summary numbers a question actually needs
- Pivot Table: cross-tabulating two categorical variables to see the shape of the relationship immediately
- Transpose, Unique and Select by Data Index: the small tools that rescue a badly shaped table
- Data Sampler: taking a random subset for fast experiments, and the idea of a held-out sample you do not look at
- Formula: creating a new calculated column from existing ones, for example a ratio or a difference

Projects built:
- Combine two related datasets with Merge Data, create one new calculated column with Formula, and produce a Pivot Table that answers a specific question you write down first

Practice: Use Group by to produce three summary statistics from your own dataset and check each one by hand on a few rows.
Assessment: Your combined dataset workflow plus the question you set and the pivot table that answers it.

Class 5: Preprocess, Save and Share Your Workflow

Topics:
- The Preprocess widget: normalisation, scaling, discretisation and continuisation collected into one reusable block
- Why preprocessing choices belong inside the workflow, not in a spreadsheet you edited by hand and cannot reproduce
- Randomize and Purge Domain: shuffling values to test assumptions, and cleaning out unused categories
- Save Data: exporting a cleaned dataset so other tools can read it
- Saving the workflow itself as an .ows file: an XML description of your widgets, their settings and their connections
- The crucial detail about .ows files: they save the workflow and widget settings but not the data, so a shared workflow needs its data file alongside it
- Workflow hygiene: naming widgets, laying out the canvas left to right, and adding notes so a reader can follow your reasoning

Projects built:
- Turn your Class 3 and Class 4 work into one tidy, annotated, left-to-right workflow, save it as an .ows file, and swap it with a classmate to check that they can rerun it with the data file

Practice: Reopen a classmate's .ows file and write down the first moment you were confused; that is a labelling problem to fix in yours.

Assessment: A shared .ows file that a classmate successfully reran, plus the feedback note they wrote.

PHASE 2: SEEING THE DATA

Classes 6 to 10. Charts are not decoration, they are how you find the question worth modelling. This phase turns you into someone who can look at an unfamiliar dataset and, within ten minutes, produce the three visuals that explain what is going on.

Class 6: Distributions, Box Plots and Violin Plots

Topics:
- Distributions: the shape of a single variable, and why the average alone hides almost everything interesting
- Reading a histogram properly: bin width, skew, gaps, and the long tail that contains the exceptions
- Splitting a distribution by a categorical variable to compare groups in the same chart
- Box Plot: median, quartiles, whiskers and outliers, and how to read five numbers at a glance
- Violin Plot: when the shape of the distribution matters more than the summary statistics
- Comparing groups fairly: unequal group sizes, and why a difference in medians is not automatically a finding
- Choosing between the three: what question each chart is genuinely the best answer to

Projects built:
- Build a three-chart comparison of one numeric variable across one categorical group in your dataset, using Distributions, Box Plot and Violin Plot, and write which chart told you the most

Practice: Find one variable in a bundled dataset whose average is actively misleading and explain why using its distribution.

Assessment: Your three-chart workflow plus a short paragraph on what the shape of the data revealed.

Class 7: Scatter Plots and Finding Informative Projections

Topics:
- Scatter Plot: two numeric variables, one point per instance, and colouring points by the target variable
- Reading relationships: positive, negative, none, clustered, curved, and the difference between a pattern and a coincidence
- Using size, shape and colour as extra dimensions without making the chart unreadable
- Find Informative Projections: letting Orange rank which pairs of variables separate your classes best
- Rank: scoring individual features by how much information they carry about the target
- Selecting points directly on the chart and sending that selection to a Data Table for inspection
- The trap to name out loud: a strong scatter relationship is correlation, and correlation is not causation

Projects built:
- Use Find Informative Projections to identify the two most separating variables in a classification dataset, then build the scatter plot it suggests and select the most interesting cluster of points into a Data Table

Practice: Rank the features of your own dataset and write down whether the top-ranked feature surprised you.

Assessment: Your scatter plot plus a written interpretation naming one relationship and one alternative explanation for it.

Class 8: Bar Plots, Line Plots and Categorical Relationships

Topics:
- Bar Plot: comparing categories honestly, including the axis choices that quietly exaggerate a difference
- Line Plot: showing values across an ordered sequence, and when a line implies a continuity

that does not exist
- Sieve Diagram: seeing whether two categorical variables are independent, using the size of the gaps between observed and expected
- Mosaic Display: reading a whole contingency table as areas rather than numbers
- Venn Diagram: comparing overlapping selections from different parts of your workflow
- Chart honesty: truncated axes, cherry-picked ranges, and misleading aggregation, with real examples to critique
- Choosing the chart from the question, not from the chart menu

Projects built:
- Build a two-variable categorical analysis using Sieve Diagram and Mosaic Display, then present the same finding once honestly and once misleadingly with a Bar Plot, and explain exactly what you changed

Practice: Find a chart in a news article or an advertisement and list every choice that shapes how it is read.
Assessment: Your honest and misleading chart pair, plus a written explanation of the manipulation.

Class 9: Heat Maps, Correlations and Distance Maps
Topics:
- Heat Map: hundreds of rows and dozens of columns compressed into one image you can actually scan
- Clustering rows and columns inside the heat map so similar things sit next to each other
- Correlations: ranking every pair of numeric variables by how strongly they move together
- Reading a correlation coefficient without over-claiming: strength, direction, and what it says nothing about
- Distances and Distance Map: what it means for two rows to be near each other, and why the distance measure you pick changes the answer
- Normalisation before distance: why an unscaled column with big numbers can dominate every comparison
- Multicollinearity in plain language: two features saying the same thing, and why that matters later when you model

Projects built:
- Build a Correlations and Heat Map pair on a numeric dataset, identify one pair of variables that are effectively duplicates, and justify which one you would keep

Practice: Run the same Distance Map with and without normalisation and describe how the picture changed.
Assessment: Your heat map workflow plus the duplicate-feature decision with your reasoning.

Class 10: Telling the Story with the Orange Report
Topics:
- The Report system: most widgets have a report button in the status bar that sends the current view into a running report
- Which widgets cannot report, and why: the ones that only pass data along rather than showing a result
- Building a report in the order a reader needs it: question, data description, evidence, and only then the conclusion
- Adding your own comments to report sections so the reader follows the reasoning, not just the pictures
- Saving the report as .html or .pdf to hand in, and as .report so a reader can reopen the workflow that produced each section
- Opening a saved report through File then Open Report, and showing the report view with Shift and R
- Presenting a data finding out loud in two minutes without a single unsupported claim

Projects built:
- Produce a complete visual story on your own dataset: one question, three charts chosen deliberately, written commentary on each, exported as a PDF report

Practice: Give your two minute presentation to someone at home and note every question they asked that your report did not answer.
Assessment: Your exported PDF report plus the list of questions your audience asked.

PHASE 3: YOUR FIRST MACHINE LEARNING MODELS

Classes 11 to 16. Training a model in Orange takes about thirty seconds. Knowing whether the model is any good takes the rest of this phase, and it is the part that actually matters. Every model you build here is tested properly before you are allowed to be impressed by it.

Class 11: Supervised Learning and the Baseline You Must Beat
Topics:
- Supervised learning defined: you have examples where the answer is already known, and you want a model that generalises to examples where it is not
- Classification versus regression: predicting a category versus predicting a number, and how the target variable decides which you are doing
- Setting the target with Select Columns, and the discipline of checking your target before every model
- The standard Orange modelling shape: data, then a learner widget, then Test and Score, then results
- The Constant widget: a deliberately stupid model that always predicts the most common class,

and why it is the most useful widget in the toolbox
- Why a baseline is non-negotiable: a model that is 92 percent accurate on data that is 92 percent one class has learned nothing at all
- Class imbalance in one picture, using Distributions on the target variable before you model

Projects built:
- Take a classification dataset, chart its target distribution, run the Constant baseline through Test and Score, and write down the accuracy number that every later model in this course must beat

Practice: Find a dataset where the majority class is above 80 percent and state what accuracy would prove nothing.
Assessment: Your baseline score plus a written explanation of why accuracy alone can be a dishonest metric.

Class 12: Decision Trees, the Model You Can Actually Read
Topics:
- How a decision tree learns: repeatedly finding the split that best separates the classes, then repeating on each side
- The Tree widget and its settings: minimum instances in a leaf, maximum depth, and when to stop splitting
- Tree Viewer: walking the actual tree your data produced, node by node, and reading the rule at each branch
- Pythagorean Tree and Pythagorean Forest: seeing tree structure and forest diversity as shapes
- Overfitting explained through trees: a tree deep enough to memorise every training row is useless on new data
- Why interpretability matters: a model a human can read is a model a human can argue with, correct and trust
- Reading a tree back as plain English rules you can say out loud

Projects built:
- Train a decision tree on your dataset, open Tree Viewer, and write out the three clearest decision rules in plain English, then deliberately overfit by removing the depth limit and describe what changed

Practice: Change minimum instances in a leaf across three values and record the tree size each time.
Assessment: Your three written rules plus a before and after comparison of the limited and overfitted trees.

Class 13: k Nearest Neighbours, Naive Bayes and Preprocessing That Matters
Topics:
- k Nearest Neighbours: classify a new point by looking at the k closest known points and taking a vote
- Choosing k, and what happens at the extremes: k of one memorises noise, a very large k predicts the majority every time
- Why kNN is the model that most needs normalisation, connecting straight back to the distance work in Class 9
- Naive Bayes: probability-based classification, and the naive independence assumption stated honestly
- Where Naive Bayes shines despite that assumption, especially on text-like data with many features
- Building preprocessing into the model pipeline with the Preprocess widget so the same treatment applies at training and prediction
- Discretize and Continuize: converting between numeric and categorical when a model requires it

Projects built:
- Compare kNN with and without normalisation in the same Test and Score, add Naive Bayes as a third learner, and write a paragraph explaining the accuracy gap that normalisation caused

Practice: Sweep k across five values and plot or tabulate how accuracy moves.
Assessment: Your three-learner comparison table plus the normalisation explanation.

Class 14: Testing Honestly with Cross Validation and Confusion Matrices
Topics:
- The cardinal sin of machine learning: scoring a model on the same data it was trained on
- Train and test split: holding data back so the model faces genuinely unseen examples
- Cross validation explained simply: split the data into k folds, train on k minus one, test on the one held out, repeat, then average
- Test and Score in practice: comparing several learners side by side under identical conditions
- Reading the metrics without cherry-picking: classification accuracy, AUC, F1, precision and recall, and what each one is blind to
- Confusion Matrix: true positives, false positives, true negatives and false negatives as a table of real consequences
- Precision versus recall through a real dilemma: a disease screening test that misses cases versus one that raises false alarms

Projects built:
- Run every model you have built so far through Test and Score with 10-fold cross validation against the Class 11 baseline, then open Confusion Matrix and describe, in consequences rather than numbers, what each type of error would mean

Practice: Take the same model, score it on training data and on cross validation, and record the difference.
Assessment: Your comparison table including the baseline, plus the written consequence

analysis of your confusion matrix.

Class 15: Logistic Regression, ROC Curves and Nomograms
Topics:
- Logistic Regression: predicting a probability rather than a bare label, and what a probability of 0.7 actually commits you to
- The decision threshold: why 0.5 is a default, not a law, and how moving it trades precision against recall
- ROC Analysis: reading the curve as every possible threshold plotted at once
- AUC in one sentence: the chance that the model ranks a random positive case above a random negative one
- Performance Curve and Calibration Plot: whether the predicted probabilities can be trusted as probabilities
- Nomogram: reading a logistic regression model as a visual scoring sheet showing which features push a prediction which way
- Regularisation in plain language: penalising complexity so the model does not chase noise

Projects built:
- Train logistic regression alongside your decision tree, compare them in ROC Analysis, then use the Nomogram to write down the three features that most influence the prediction and in which direction

Practice: Move the classification threshold and record how precision and recall trade off at three settings.
Assessment: Your ROC comparison plus the nomogram feature explanation in plain English.

Class 16: Ensembles, Neural Networks and Making Predictions
Topics:
- Random Forest: many decision trees trained on different samples, voting together, and why a crowd of weak trees beats one strong one
- Gradient Boosting: building trees in sequence where each one corrects the previous one's mistakes
- Support Vector Machines: finding the widest possible boundary between classes
- Neural Network in Orange: hidden layers, activation, and honest expectations about small datasets
- The bias and variance trade-off explained with the models you have already trained
- Predictions: feeding brand new unlabelled data into a trained model and reading the output with its probabilities
- Save Model and Load Model: keeping a trained model so you do not retrain every time

Projects built:
- Build a six-model showdown, baseline, tree, kNN, logistic regression, random forest and neural network, in one Test and Score, then take the winner, save it, and run genuinely new rows through Predictions

Practice: Note which model won on accuracy and which won on AUC, and explain why they can disagree.
Assessment: Your six-model comparison table plus a paragraph defending your model choice on grounds other than the top accuracy number.

PHASE 4: FINDING HIDDEN STRUCTURE, TEXT AND IMAGES

Classes 17 to 21. Not every dataset comes with answers attached. This phase covers unsupervised learning, where the model finds structure nobody labelled, and then applies the same canvas to two data types that do not look like spreadsheets at all: text and images.

Class 17: k Means Clustering and Silhouette Scores
Topics:
- Unsupervised learning: no target column, no right answers, just structure waiting to be found
- How k means works step by step: pick k centres, assign every point to the nearest, move each centre to the middle of its group, repeat
- The k Means widget, including the option to score a range of k values and let the silhouette guide the choice
- Silhouette score explained: how well each point sits inside its own cluster compared to the nearest other cluster
- Silhouette Plot: spotting the individual points that were forced into the wrong group
- Interactive k-Means from the Educational add-on: stepping through the algorithm one iteration at a time and watching the centres move
- The honest limitation: k means will happily produce clusters even when the data has no real groups at all

Projects built:
- Cluster a dataset with k means across a range of k, choose k using the silhouette score rather than intuition, then colour a Scatter Plot by cluster and describe each group in plain words

Practice: Run k means on deliberately random data and explain why the clusters it returns mean nothing.
Assessment: Your silhouette-justified choice of k plus a written description of what each cluster represents.

Class 18: Hierarchical Clustering, DBSCAN and Distance
Topics:
- Hierarchical Clustering: building a tree of nested groups instead of committing to a fixed

number
    - Reading a dendrogram: where to cut it, and how the cut height decides how many clusters you get
    - Linkage methods, single, average, complete and Ward, and how the choice changes the shape of the result
    - The Distances widget: Euclidean, Manhattan, cosine and others, and matching the measure to the data
    - Distance Map and Distance Matrix: seeing similarity between every pair of rows as an image
    - DBSCAN: density-based clustering that finds arbitrary shapes and, unlike k means, is allowed to call a point noise
    - Louvain clustering and Self-Organizing Map named as further options for later exploration
  Projects built:
    - Cluster the same dataset three ways, k means, hierarchical and DBSCAN, put the results side by side, and write which method matched the structure you can see in the scatter plot and why
  Practice: Cut the same dendrogram at three different heights and record how the cluster count and meaning change.
  Assessment: Your three-method comparison plus a justified recommendation of one method for this dataset.

Class 19: PCA, t-SNE and Outliers
  Topics:
    - The curse of dimensionality in one example: why fifty columns can be harder to work with than five
    - PCA: building new combined axes that capture as much of the variation as possible, in order
    - Reading the explained variance curve to decide how many components are enough
    - What you lose with PCA: components are combinations, so individual feature meaning becomes harder to interpret
    - t-SNE and MDS: squeezing high-dimensional data into two dimensions for visualisation, and why the distances between separate clusters in a t-SNE plot should not be over-read
    - Outliers: detecting the rows that do not belong, and deciding case by case whether they are errors or the most interesting thing in the file
    - Using PCA output as the input to clustering, and comparing the result against clustering the raw features
  Projects built:
    - Take a wide dataset, reduce it with PCA, visualise it with t-SNE coloured by a known label, run Outliers, and write about the three most unusual rows you found
  Practice: Compare clustering on raw features against clustering on PCA components and note any difference in silhouette.
  Assessment: Your t-SNE visualisation plus a written investigation of the outliers you detected.

Class 20: Text Mining, from Words to Sentiment
  Topics:
    - Installing add-ons through Options then Add-ons, and what the Text add-on adds to the toolbox
    - Corpus and Import Documents: loading a collection of documents as data, from bundled corpora to your own folder of text files
    - Preprocess Text: tokenisation, lowercasing, stop word removal, normalisation and filtering, and how each step changes what the model sees
    - Bag of Words: turning documents into numbers by counting words, and what that representation throws away
    - Word Cloud and Concordance: the quick overview and the close reading, used together
    - Sentiment Analysis: scoring documents as positive or negative, with an honest discussion of sarcasm, context and language limits
    - Topic Modelling: letting the algorithm propose themes across a corpus, and the human judgement needed to name them
  Projects built:
    - Build a full text pipeline on a corpus you choose, book reviews, song lyrics, news headlines or your own writing, ending in a word cloud, a sentiment distribution and a set of topics you name yourself
  Practice: Rerun your pipeline with stop words switched off and describe how the word cloud degraded.
  Assessment: Your text workflow plus your named topics with a one line justification for each name.

Class 21: Image Analytics and Your First Image Classifier
  Topics:
    - The Image Analytics add-on: Import Images, Image Viewer, Image Grid, Image Embedding and Save Images
    - Import Images: pointing Orange at a folder of pictures and getting a dataset where each row is an image
    - Image Embedding explained without maths: a pretrained network converts each picture into a list of numbers describing what it contains
    - Why embeddings matter: once an image is a row of numbers, every classifier and clustering widget you already know works on it unchanged
    - Building the classifier: embeddings into logistic regression or a neural network, then straight into Test and Score
    - Image Grid and clustering images by similarity, so you can see what the model thinks looks alike
    - The practical warning: embedding needs a working internet connection for the server-based

embedders, and small unbalanced image sets produce flattering, fragile results
Projects built:
- Collect or use a provided set of images in at least three labelled folders, embed them, train and cross validate a classifier, then test it on pictures you took yourself and honestly report where it failed

Practice: Cluster your images without labels and describe what visual property the clusters actually captured.
Assessment: Your image classification workflow with cross validated scores plus a written account of its failure cases.

PHASE 5: ETHICS, CAPSTONE AND SHOWCASE

Classes 22 to 24. A model that is technically correct and socially careless is still a bad model. You finish the course by learning what can go wrong, then building and presenting an end to end project of your own from raw data to defended conclusion.

Class 22: Bias, Leakage and Honest Conclusions

Topics:
- Where bias enters: who collected the data, who is missing from it, and which outcome someone chose to call success
- Data leakage in plain terms: a feature that secretly contains the answer, producing a model that scores brilliantly and fails completely in the real world
- How to hunt leakage: a suspiciously perfect score is a bug report, not a celebration
- Correlation versus causation, revisited with your own charts from Phase 2 as the examples
- The Fairness add-on named as a real tool for auditing models on sensitive attributes
- The Explain add-on named as a way to ask which features drove a specific prediction
- Writing conclusions that survive scrutiny: state the finding, state the uncertainty, state what would disprove you

Projects built:
- Audit one of your own earlier workflows for leakage and bias, write a short honest report on what you found, and correct the workflow if the audit demands it

Practice: Take any published claim based on data and write down the three questions you would now ask about it.
Assessment: Your written audit, including at least one limitation of your own work stated plainly.

Class 23: Build Your Capstone

Topics:
- Choosing a capstone question that is specific, answerable with data you can actually obtain, and interesting to someone other than you
- Sourcing a dataset responsibly: open government portals, Kaggle, school or club records used with permission, and checking the licence
- Planning the pipeline on paper before touching the canvas: load, clean, explore, model, evaluate, conclude
- Building the workflow with the discipline of Phase 1: named widgets, left to right layout, nothing edited by hand outside the canvas
- Beating your baseline, and being willing to report that a fancy model did not beat a simple one
- Mentor review checkpoint: an instructor walks your canvas with you and pushes on every unjustified step
- Preparing the artefacts: the .ows file, the data file, and the report skeleton

Projects built:
- Build your complete capstone workflow end to end, from raw file to evaluated model and written conclusion, reviewed live with your mentor

Practice: Rerun your capstone from a clean Orange session to prove it reproduces without hidden manual steps.
Assessment: A working capstone .ows file that reproduces from raw data, plus your stated baseline comparison.

Class 24: Present, Publish and Where Data Takes You Next

Topics:
- Assembling the final Orange report: question, data, method, evidence, result, limitations
- Exporting for different audiences: PDF for a teacher or judge, and .report so another analyst can reopen your workflows
- Presenting in five minutes: leading with the question, showing two charts, giving the number, and naming what you are unsure about
- Handling hard questions honestly, including how to say that you do not know
- Publishing your work: a portfolio folder of 24 workflows plus the capstone, ready for a science fair, a school submission or a college application
- The bridge to code: Orange is written in Python, so the Python Script widget lets you run real Python inside the canvas, and every model here exists as a Python library too
- Where to go next: Python with pandas, statistics, further Orange add-ons like Time Series, Geo, Network and Explain, and the official Orange video tutorials and workflow examples

Projects built:
- Deliver your five minute capstone presentation to the batch, hand in the exported report, and receive written feedback plus your certificate assessment

Practice: Write a one page plan for the next data project you will build on your own, with its question, data source and baseline.

Assessment: Your final presentation, exported report and complete 24-workflow portfolio, reviewed for reasoning as much as for results.

PROJECTS THE STUDENT BUILDS AND KEEPS

- Phase 1: your first two-widget canvas, a described real dataset, a five widget messy-data repair pipeline, a merged and pivoted multi-table analysis, and a shared annotated .ows workflow a classmate successfully reran
- Phase 2: a three-chart distribution comparison, an informative-projection scatter plot with selected points, an honest versus misleading chart pair, a correlation and heat map duplicate-feature investigation, and a full exported PDF visual story
- Phase 3: a baseline accuracy every later model must beat, a readable decision tree written out as plain English rules, a kNN normalisation experiment, a 10-fold cross validated model comparison with confusion matrix consequences, an ROC and nomogram analysis, and a six-model showdown with saved model and live predictions
- Phase 4: a silhouette-justified k means clustering, a three-method clustering comparison, a PCA and t-SNE reduction with outlier investigation, a complete text mining pipeline with named topics, and an image classifier trained on your own labelled photos
- Phase 5: a leakage and bias audit of your own earlier work, the full capstone workflow reproducing from raw data, and a five minute presentation with an exported report
- Total: 24 saved workflows plus one capstone, every one reopenable, editable and explainable

Total projects: 24 hands-on workflows, one per class, finishing with an end to end capstone project and an exported Orange report

SKILLS THE STUDENT WILL HAVE AT THE END

- Visual Programming in Orange: canvas, widget sets, connections, channel selection, and saving reproducible .ows workflows
- Data Preparation: File and Datasets, Data Table, Data Info, Edit Domain, Column Statistics, Select Columns and Rows, Impute, and honest handling of missing values
- Data Wrangling: Merge Data, Concatenate, Group by, Aggregate Columns, Pivot Table, Transpose, Formula, Data Sampler and Preprocess
- Data Visualisation: Distributions, Box Plot, Violin Plot, Scatter Plot with informative projections, Bar and Line Plot, Sieve Diagram, Mosaic Display, Heat Map, Correlations and Distance Map
- Supervised Learning: Constant baselines, Tree with Tree Viewer, kNN, Naive Bayes, Logistic Regression with Nomogram, Random Forest, Gradient Boosting, SVM and Neural Network
- Honest Model Evaluation: Test and Score with cross validation, Confusion Matrix, ROC Analysis, Performance Curve, Calibration Plot, precision and recall trade-offs, overfitting and leakage detection
- Unsupervised Learning: k Means with silhouette selection, Hierarchical Clustering and dendrograms, DBSCAN, Distances, PCA, t-SNE, MDS and Outliers
- Text and Image Mining: Corpus, Preprocess Text, Bag of Words, Word Cloud, Concordance, Sentiment Analysis, Topic Modelling, Import Images, Image Embedding and Image Grid
- Communicating Results: the Orange Report system, exporting to PDF and .report, and presenting a finding with its limitations stated

HOW A TYPICAL WEEK IS SPLIT

Live classes: 2 live classes per week, about 1 hour each, across 12 weeks
Hands on canvas work: 1-1.5 hours rebuilding each class workflow on your own machine with your own data
Project time: 1 hour completing each class deliverable, from cleaned datasets to evaluated models and reports
Review and doubts: 30-60 minutes reviewing your workflows, checking your conclusions against your evidence, and clearing doubts before the next class
Homework: A task or problem set after every class, and a monthly mixed-review assignment that deliberately folds in earlier topics

SUPPORT INCLUDED

Doubt support: WhatsApp doubt support between classes for installation problems, add-on issues, and workflows that will not behave
Small batches: Small batches, with mini-batch and 1-on-1 options, so every student gets individual attention on their own canvas
Mentor guidance: Live guidance from mentors who build and evaluate real models, including a personal review of your capstone workflow
Project feedback: Feedback on every class deliverable, judged on reasoning and honest evaluation as much as on results
Living syllabus: Curriculum updated as Orange ships new versions and widgets, at no extra cost

CERTIFICATION DETAIL

Completion: Certificate from Modern Age Coders, awarded on passing the final assessment. Fall short and there is focused revision and a free retest: the certificate certifies real learning, not attendance

WHERE THIS CAN LEAD

- Data-literate student who can take a raw dataset from file to defended conclusion without waiting for anyone to write code
- Strong entrant for science fairs, school research competitions and project-based coursework that rewards genuine method
- Prepared starting point for Python, pandas and scikit-learn, since the modelling and evaluation concepts are already understood
- Early groundwork for university study and later roles in data analysis, machine learning, research, bioinformatics and business analytics
- A portfolio of 24 reproducible workflows and one capstone that demonstrate reasoning and honesty, not just tool use

COMMON QUESTIONS ABOUT THIS COURSE

For anything about cost, use PART 4 and RULE 1. Do not quote two regions.

Q: Does my child need to know programming before this course?
A: No. Orange is visual programming software: you build analysis by placing widgets on a canvas and connecting them, so no code is required at any point in the 24 classes. Students who already know Python can go further using the Python Script widget, which runs real Python inside the workflow, but it is entirely optional.

Q: What exactly is Orange, and is it really free?
A: Orange is open source machine learning and data visualisation software developed at the Bioinformatics Laboratory, Faculty of Computer and Information Science, University of Ljubljana. It is released under the GNU General Public License version 3 or later and is free to download and use on Windows, macOS and Linux. There is no subscription, no trial period, and no student licence to renew.

Q: Is this real machine learning, or a simplified version for children?
A: It is real machine learning. The visual canvas changes how you assemble the pipeline, not what the pipeline does.

Q: What age is this course for?
A: It is designed for teens aged 13 to 18. Orange itself requires no account and has no age restriction, so the age range reflects the reading level, the statistical reasoning and the project expectations of the curriculum rather than any restriction in the software. Younger students who are strong in maths can join after a free demo class where we check the fit. (Agent note: the free demo is a waiting list with no fixed date. The Priority Live Demo is a guaranteed class today or tomorrow, booked at https://learn.modernagecoders.com/priority-demo . Offer both, as RULE 3 says.)

Q: What kind of computer is needed?
A: Any reasonably modern Windows, macOS or Linux laptop or desktop that can install Orange, plus a stable internet connection for the live classes. Most classes run comfortably on modest hardware because the datasets are student sized. The image analytics class in Phase 4 also needs a working internet connection, since the image embedders run on a server.

Q: How is this different from your Python data science course for teens?
A: The Python course teaches you to write the analysis in code with pandas and Python libraries, which means you spend the early weeks on syntax. This course removes the syntax barrier so students reach models, evaluation and clustering in the first month, and it goes deeper on honest evaluation and visual exploration. Many students take Orange first and then move to Python, arriving with the concepts already in place.

Q: Will my child be able to use this for a school or science fair project?
A: Yes, and Class 23 and Class 24 are built specifically for that. Students choose their own question, source a dataset responsibly, build a reproducible workflow, compare against a baseline, and export an Orange report as PDF for a teacher or judge, or as a .report file so another analyst can reopen the underlying workflows. The whole capstone is designed to be defended out loud.

Q: What are add-ons, and are they included?
A: Add-ons are optional widget packs installed from inside Orange through Options then Add-ons. This course installs and uses the Text add-on in Class 20 and the Image Analytics add-on in Class 21, and introduces the Educational, Explain and Fairness add-ons where they are relevant. They are free, like Orange itself, and we install them together in class.

Q: What does my child actually walk away with?
A: Twenty four saved .ows workflows they can reopen and edit, a capstone project built from raw data to written conclusion, an exported report, a Modern Age Coders completion certificate, and, more usefully than any of those, the habit of asking how a model was tested before believing what it claims.

Q: How am I assessed, and is the certificate just for showing up?
A: No. A task follows every class with feedback, monthly reviews deliberately mix new material with earlier topics so nothing is forgotten, and the course ends with a final project defended live, plus a written assessment. Passing earns the certificate; falling short earns focused revision and a free retest. We measure real learning, not attendance.

To enrol, message Shivam Sir on +91 9123366161 or send the parent this link: https://learn.modernagecoders.com/courses/orange-data-mining-visual-machine-learning-course-for-teens

For a demo: the Priority Live Demo (guaranteed, today or tomorrow) is booked at https://learn.modernagecoders.com/priority-demo . The free demo is a waiting list with no fixed date.

==========

COURSE 110 OF 137: PCAP CERTIFICATION PREP: CERTIFIED ASSOCIATE IN PYTHON PROGRAMMING

==========

Course link: https://learn.modernagecoders.com/courses/pcap-python-certification-prep-course
Subject area: Python Certification
Designed for: Working professionals
Who can join: Anyone with basic Python (PCEP level or equivalent) preparing for the PCAP associate certification
Course length: 4 months (16 weeks), joinable any month
Time needed: 2 live classes/week + weekly coding practice and mock questions
Certificate: Certificate from Modern Age Coders, awarded on passing the final assessment

PRICE FOR THIS COURSE (quote only the one that applies to the person asking)

In India, per month: group Rs 1,499, mini batch Rs 2,999, one to one Rs 4,999
In Canada, per month: group CAD 140, one to one CAD 210
Anywhere else, per month: group $100, one to one $150
Classes: group and mini batch two live classes a week, eight a month; one to one in India one live class a week, four a month; one to one outside India two live classes a week, eight a month. Each class is one hour.

WHAT THIS COURSE IS

Live online PCAP-31-03 preparation covering every exam objective: modules and packages, exceptions, strings, object-oriented Python, generators, closures and file processing, with full timed mock exams.

In one line: Every exam objective taught properly, then drilled against the real format, so you sit the exam already knowing you will pass.

ABOUT THE PROGRAMME

PCAP, the Certified Associate in Python Programming, is the Python Institute's associate-level credential and the natural step up from PCEP. It is a genuine test of Python fluency rather than a quiz: the current PCAP-31-03 exam is 40 questions in single-choice and multiple-choice form, taken in 65 minutes, with a pass mark of 70 percent, which means at least 28 correct answers. It is delivered through Pearson VUE test centres or OnVUE online proctoring, and the exam fee is set by the Python Institute (currently around USD 295), paid directly to them. What makes PCAP harder than it looks is that it examines the parts of Python most self-taught programmers skip. Modules and packages. Exception handling done properly, not a bare try block. String methods in detail. Object-oriented Python including class variables and inheritance. Generators, closures and list comprehensions. File processing. Plenty of working developers write Python daily and still miss these, because everyday scripting never forces them. This course covers every objective in that list and treats the exam format as a skill of its own. You write real code every week, then answer questions in the exact style the exam uses, including the ones designed to punish a guess. The last month is full timed mocks with question-by-question review, so by the time you book the test you already know your score range.

WHAT MAKES THIS COURSE DIFFERENT

- Built around the current PCAP-31-03 objectives: modules and packages, exceptions, strings, OOP, generators and closures, and file processing
- Taught as real Python first and exam technique second, so the knowledge survives after the certificate
- The exam format is practised deliberately: 40 questions in 65 minutes at a 70 percent pass mark leaves no room for slow reading
- Covers the topics self-taught programmers usually miss, which is exactly where PCAP candidates fail
- Full timed mock exams with question-by-question review and an error log, so weak areas are fixed before test day
- Live, small batches where your code is reviewed on the spot, not recorded videos watched alone

THE LEARNING PATH, STEP BY STEP

Phase 1: Modules, packages, strings and exception handling done to exam depth
Phase 2: Object-oriented Python: classes, class variables, inheritance, polymorphism and special methods
Phase 3: Generators, closures, comprehensions, file processing, then full timed mock exams

WHAT A STUDENT NEEDS BEFORE STARTING

  Title: What You Need to Start

WHO THIS COURSE IS FOR

  Title: Who This Course Is For

FULL CURRICULUM, WEEK BY WEEK

  This is the complete teaching plan. Parents can ask about any week.

  PHASE 1: MODULES, PACKAGES, STRINGS AND EXCEPTIONS

  The first block of exam objectives, taught as real Python and drilled in exam form.

    Month 1: Modules, Packages and the Standard Library (Weeks 1-4)
      Importing and Module Basics
        Topics:
          - import, from-import, and aliasing, and how each affects the namespace
          - What actually happens when Python imports a module
          - The __name__ variable and the main guard
          - Where Python looks for modules, and sys.path
          - Exam traps around name collisions and shadowing
        Projects built:
          - Write a small multi-module program and import across it every supported way
        Practice: 20 exam-style questions on imports and namespaces
      Standard Library Essentials
        Topics:
          - math, random, platform and datetime as the exam uses them
          - Reading the documentation quickly and correctly
          - Predicting output from unfamiliar standard-library calls
          - Common function signatures worth memorising
          - Where the exam prefers a specific idiom
        Projects built:
          - Solve a set of tasks using only the standard library, no third-party packages
        Practice: 20 output-prediction questions on standard-library calls
      Packages, __init__ and Distribution
        Topics:
          - How a package differs from a module
          - The role of __init__.py
          - Nested packages and relative versus absolute imports
          - pip and dependency basics at exam depth
          - Structuring a small package correctly
        Projects built:
          - Build a small package with nested sub-packages and import from it correctly
        Practice: 15 package-structure and import questions
        Assessment: Timed section test on modules and packages
      Strings in Depth
        Topics:
          - Strings as immutable sequences, and what that implies
          - Slicing, including negative indices and steps
          - The string methods the exam actually tests, in detail
          - Escape sequences, raw strings and formatting
          - Comparing strings, and the ordering rules
        Projects built:
          - Write a text-processing utility using only string methods, no regular expressions
        Practice: 25 string-method and slicing questions, mostly output prediction

    Month 2: Exception Handling and Consolidation (Weeks 5-8)
      The Exception Hierarchy
        Topics:
          - try, except, else and finally, and the exact order they run in
          - The built-in exception hierarchy and why the order of except clauses matters
          - Catching specific exceptions instead of bare except
          - raise, and re-raising inside a handler
          - Predicting which handler catches what
        Projects built:
          - Take a fragile script and make it robust with correctly ordered handlers
        Practice: 20 exception-flow questions, mostly trace-the-output
      Custom Exceptions and Defensive Code
        Topics:
          - Defining your own exception classes
          - Inheriting from the right base exception
          - assert and where it belongs
          - Exception chaining and context
          - Writing code that fails clearly rather than silently
        Projects built:
          - Design a small exception hierarchy for a described domain and use it properly
        Practice: 15 custom-exception questions

```
      Assessment: Timed section test on exception handling
    Data Aggregates Refresher
      Topics:
        - Lists, tuples, dictionaries and sets, and the exam-relevant differences
        - Mutability and the aliasing traps the exam loves
        - Copying: assignment versus shallow versus deep
        - Dictionary methods and safe key access
        - Sorting with keys and reverse
      Projects built:
        - Solve a data-shaping task choosing the right structure at each step and justifying it
      Practice: 25 questions on aggregates, heavy on mutability traps
    Functions, Scope and Arguments
      Topics:
        - Positional, keyword and default arguments
        - *args and **kwargs and how they bind
        - Scope, the LEGB rule, and the global and nonlocal keywords
        - The mutable-default-argument trap
        - Recursion at exam depth
      Projects built:
        - Write functions exercising every argument form, then predict their behaviour before running
          them
      Practice: 25 scope and argument-binding questions
      Assessment: End-of-phase test across everything so far, in exam format

----------------------------------------------------------------
PHASE 2: OBJECT-ORIENTED PYTHON
----------------------------------------------------------------
The block that decides most PCAP results, taught until class behaviour is predictable rather
than surprising.

  Month 3: Classes, Inheritance and Special Methods (Weeks 9-12)
    Classes, Instances and Attributes
      Topics:
        - Defining classes, __init__, and instance attributes
        - Instance variables versus class variables, the single biggest PCAP trap
        - How attribute lookup actually resolves
        - Name mangling and the single and double underscore conventions
        - Adding attributes dynamically and what that does
      Projects built:
        - Build a class where class and instance variables are deliberately contrasted, then predict
          every output
      Practice: 25 questions on class versus instance attributes
    Inheritance and Polymorphism
      Topics:
        - Single and multiple inheritance
        - Method resolution order and how Python decides
        - Overriding, and calling the parent with super()
        - isinstance and issubclass, and when each is correct
        - Polymorphism in practice
      Projects built:
        - Design a class hierarchy with overriding and demonstrate the resolution order
      Practice: 25 inheritance and MRO questions
    Special Methods and Introspection
      Topics:
        - __str__ and __repr__ and the difference the exam tests
        - Operator overloading with special methods
        - __dict__, and inspecting objects at runtime
        - Properties and controlled attribute access
        - Composition versus inheritance
      Projects built:
        - Write a class with operator overloading and full introspection support
      Practice: 20 special-method questions
      Assessment: Timed OOP section test in exam format
    OOP Consolidation
      Topics:
        - Working through the OOP question styles the exam repeats
        - Reading unfamiliar class code quickly and accurately
        - Spotting the deliberate misdirection in the options
        - Common wrong answers and why they look right
        - Building speed without losing accuracy
      Projects built:
        - A full OOP-only mock section, reviewed question by question
      Practice: 40 mixed OOP questions under time

----------------------------------------------------------------
PHASE 3: GENERATORS, CLOSURES, FILE PROCESSING AND FULL MOCKS
----------------------------------------------------------------
The last objectives, then the exam itself rehearsed until the result is predictable.
```

Month 4: Advanced Python and Exam Rehearsal (Weeks 13-16)
Comprehensions, Generators and Iterators
Topics:
- List, dictionary and set comprehensions, including conditions
- The iterator protocol: __iter__ and __next__
- Generator functions and the yield keyword
- Generator expressions and lazy evaluation
- Why a generator is not a list, and what breaks if you forget
Projects built:
- Rewrite an eager data pipeline as a lazy generator pipeline and compare behaviour
Practice: 25 comprehension and generator output questions
Closures, Lambdas and Functional Tools
Topics:
- Lambda functions and their limits
- Closures, and what a nested function captures
- nonlocal in a closure
- map, filter and sorted with key functions
- Functions as first-class objects
Projects built:
- Build a small closure-based counter and function factory
Practice: 20 closure and lambda questions
Assessment: Timed section test on generators and closures
File Processing
Topics:
- Opening files: modes, and text versus binary
- Reading with read, readline and readlines, and iterating a file
- Writing and appending safely
- The with statement and why it is the correct idiom
- Handling file exceptions properly, tying back to Phase 1
Projects built:
- Write a program that reads, transforms and writes files with full error handling
Practice: 20 file-processing questions
Full Timed Mock Exams
Topics:
- Full mocks at the real format: 40 questions in 65 minutes
- Pacing so no question is left unread, since there is no penalty for answering
- Eliminating options systematically on multiple-response questions
- Turning the error log into a final revision list
- Booking the exam: Pearson VUE test centre or OnVUE online proctoring
Projects built:
- Three complete timed mock exams, each reviewed question by question
Practice: Repeated full mocks until you clear 70 percent consistently with margin
Assessment: Final full mock scored against the 70 percent pass mark, with a go or no-go recommendation

HOW A TYPICAL WEEK IS SPLIT

Homework: A task or problem set after every class, and a monthly mixed-review assignment that deliberately folds in earlier topics

CERTIFICATION DETAIL

Completion: Certificate from Modern Age Coders, awarded on passing the final assessment. Fall short and there is focused revision and a free retest: the certificate certifies real learning, not attendance

WHERE THIS CAN LEAD

- PCAP certification, a vendor-recognised associate-level Python credential
- Junior Python developer, automation engineer or QA automation roles
- A solid base for data analysis and backend development
- A credible step toward the professional-level Python certifications
- Genuine intermediate Python fluency that outlives the certificate

COMMON QUESTIONS ABOUT THIS COURSE

For anything about cost, use PART 4 and RULE 1. Do not quote two regions.

Q: What exactly is the PCAP exam?
A: PCAP is the Certified Associate in Python Programming from the Python Institute. The current version, PCAP-31-03, is 40 questions in single-choice and multiple-choice form, taken in 65 minutes, with a pass mark of 70 percent, meaning at least 28 correct answers. It is delivered through Pearson VUE test centres or OnVUE online proctoring.

Q: How am I assessed, and is the certificate just for showing up?
A: No. A task follows every class with feedback, monthly reviews deliberately mix new material with earlier topics so nothing is forgotten, and the course ends with a full mock paper as the final assessment. Passing earns the certificate; falling short earns focused revision and a free retest. We measure real learning, not attendance.

  Q: What does PCAP actually test?
  A: The objectives cover modules and packages, exception handling, strings, object-oriented
  programming including class variables and inheritance, generators and closures, list
  comprehensions, and file processing, along with data aggregates like tuples and dictionaries.
  It is precisely the intermediate Python that self-taught programmers tend to skip, which is
  why candidates who write Python daily still fail it.

  Q: Do I need PCEP first?
  A: No. PCEP is helpful but not required. What you do need is working basic Python: variables,
  conditionals, loops and simple functions. If you have that, this course takes you from there
  to PCAP standard. If you are starting from zero, begin with a foundational Python course
  first and come to this one after.

  Q: How long does it take to be ready?
  A: The course runs four months across 16 weeks with two live classes a week plus weekly
  practice. Readiness depends on your starting point and how much you code between classes. We
  do not guess: the final month is full timed mocks, and we recommend booking the exam only
  once you are consistently clearing 70 percent with margin.

  To enrol, message Shivam Sir on +91 9123366161 or send the parent this link: https://learn.modernagecoders.com/courses/pcap-python-certification-prep-course
  For a demo: the Priority Live Demo (guaranteed, today or tomorrow) is booked at
  https://learn.modernagecoders.com/priority-demo . The free demo is a waiting list with no fixed date.

==========
COURSE 111 OF 137: PCEP AND PCAP PYTHON CERTIFICATION COURSE
==========

Course link: https://learn.modernagecoders.com/courses/pcep-pcap-python-certification-course
Subject area: Python Certification
Designed for: College students
Who can join: Anyone from about 13 upward, including working adults; no prior programming required for the PCEP half
Course length: 5 months (20 weeks) for PCEP then PCAP, joinable any month
Time needed: 2 live classes/week + weekly programming practice and timed question sets
Certificate: Certificate from Modern Age Coders, awarded on passing the final assessment

PRICE FOR THIS COURSE (quote only the one that applies to the person asking)
  In India, per month: group Rs 1,499, mini batch Rs 2,999, one to one Rs 4,999
  In Canada, per month: group CAD 140, one to one CAD 210
  Anywhere else, per month: group $100, one to one $150
  Classes: group and mini batch two live classes a week, eight a month; one to one in India one
  live class a week, four a month; one to one outside India two live classes a week, eight a
  month. Each class is one hour.

WHAT THIS COURSE IS

  Live online preparation for the Python Institute PCEP and PCAP certifications, built so that
  the repository a student finishes with is worth more than the certificate, and the
  certificate still passes.

ABOUT THE PROGRAMME

  Python Institute certifications are useful in specific situations and oversold in most
  others. They give a self-taught learner an external checkpoint, they satisfy some employers
  and some institutions that want a named credential, and they impose a syllabus on someone who
  would otherwise wander. What they do not do is demonstrate that a person can build anything,
  because a multiple-choice exam cannot show that. So this course prepares both certifications
  properly and insists on something the exams do not require: a public repository of working
  programs built along the way. Students who finish have PCEP and PCAP if they want them, and
  something a reader can open either way. PCEP-30-02 is the entry-level exam and PCAP-31-03 the
  associate one; both are sat through the Python Institute rather than through us, and the
  current blueprint should be confirmed at pythoninstitute.org before booking.

WHAT A STUDENT NEEDS BEFORE STARTING

  Title: What a Student Needs to Start

WHO THIS COURSE IS FOR

  Title: Who This Course Is For

FULL CURRICULUM, WEEK BY WEEK

  This is the complete teaching plan. Parents can ask about any week.

  PHASE 1: PCEP FOUNDATIONS (MONTHS 1-2)

Entry-level Python taught properly rather than as exam trivia, with every topic implemented
before it is tested.

  Month 1: Syntax, Data Types and Control Flow (Weeks 1-4)
    The Interpreter, Literals and Variables
      Topics:
        - How Python actually runs a file, which the exam asks about indirectly
        - Literals, numeral systems and the operators students misjudge
        - Variables, naming rules and the shadowing that trips people up
        - Reading an error message properly rather than rerunning and hoping
    Operators, Precedence and Type Conversion
      Topics:
        - Arithmetic, bitwise and logical operators with precedence rules
        - Integer division, modulo and the negative-number cases
        - Implicit and explicit type conversion, a reliable exam topic
        - Predicting the output of an expression rather than running it
    Conditionals and Loops
      Topics:
        - if, elif and else, and the nested conditions exams favour
        - while and for, with break, continue and the else clause on loops
        - The loop-else construct, which almost every candidate gets wrong first
        - Tracing loops on paper before running them
    Lists, Tuples, Dictionaries and Sets
      Topics:
        - Mutability, which underlies a large share of PCEP questions
        - Slicing, and the negative-index cases
        - Dictionaries and sets, with the operations the syllabus names
        - Copying against referencing, and why it matters in the exam

  Month 2: Functions, Scope and Exceptions (Weeks 5-8)
    Functions and Parameters
      Topics:
        - Positional, keyword and default parameters
        - Return values, and functions that return nothing
        - Recursion at the level PCEP expects
        - Writing a function to a stated specification
    Scope, Shadowing and the global Keyword
      Topics:
        - Local and global scope, and how Python resolves a name
        - The global keyword and when using it is a mistake
        - Shadowing, which produces the exam's favourite trick questions
        - Predicting output across nested scopes
    Exceptions and Data Handling
      Topics:
        - try, except, else and finally in the order they execute
        - The exception hierarchy at PCEP depth
        - Raising exceptions deliberately, and when to
        - Basic input and output handling
    PCEP Timed Practice and the First Repository
      Topics:
        - Full timed question sets under exam conditions
        - Reviewing every wrong answer with the reason named
        - Committing the first real program to a public repository
        - Deciding whether to sit PCEP now or go straight on

PHASE 2: PCAP ASSOCIATE MATERIAL (MONTHS 3-4)

Modules, packages, object-oriented programming, exceptions in depth, and the standard library
the associate exam assumes.

  Month 3: Modules, Packages and Classes (Weeks 9-12)
    Modules, Packages and the Import System
      Topics:
        - import in its several forms, and what each actually binds
        - Writing your own module and then your own package
        - The standard library modules the syllabus names
        - Why the import questions are free marks for anybody who has written a package
    Classes, Objects and Attributes
      Topics:
        - Instance against class attributes, a heavily examined distinction
        - Constructors, methods and self
        - Introspection: examining an object at runtime
        - Building a class from a written specification
    Inheritance and Polymorphism
      Topics:
        - Single and multiple inheritance, and method resolution
        - Overriding, and calling the parent implementation

- isinstance and issubclass, which the exam uses constantly
- Designing a small hierarchy that is not over-engineered

Exceptions as Objects

Topics:

- The exception hierarchy in full at PCAP depth
- Defining your own exception classes
- Chaining, and what finally guarantees
- Deliberately breaking a program to see how it reports

Month 4: Files, Strings and the Standard Library (Weeks 13-16)

File Handling and Streams

Topics:

- Text and binary streams, opened and closed properly
- Reading and writing patterns the exam expects
- The with statement and why it exists
- Handling a file that is not there

Strings in Depth

Topics:

- String methods the syllabus names, used rather than memorised
- Escape sequences and formatting
- Character encoding at the level PCAP asks for
- String questions that are really about immutability

List Comprehensions, Lambdas and Closures

Topics:

- Comprehensions, including nested and conditional forms
- Lambda functions, map and filter
- Closures, which are the topic candidates most often fail
- Reading a comprehension aloud as a loop and back again

PCAP Timed Practice and the Portfolio

Topics:

- Full timed question sets under exam conditions
- Reviewing every wrong answer with the reason named
- A second, larger program committed to the repository
- A README that states what the program does and where it fails

---

PHASE 3: EXAM READINESS AND REAL EVIDENCE (MONTH 5)

The final stretch: passing the exam, and finishing with something worth more than the certificate.

Month 5: Final Preparation (Weeks 17-20)

Full Mock Exams

Topics:

- Timed papers in the exam's format and question style
- Pacing, since both exams are short relative to their question count
- Eliminating options rather than searching for the right one
- Identifying the two or three topics still costing marks

Targeted Repair

Topics:

- Rebuilding the weakest topics rather than revising everything
- Closures, scope and mutability, which is where most candidates lose
- Predicting output as a drill rather than as an exercise
- Short daily retrieval instead of long revision blocks

The Repository That Outlasts the Certificate

Topics:

- Three finished programs, running, documented and committed
- A README a stranger can follow without the author present
- One honest paragraph on where each program fails
- Why this is the part an employer or admissions reader can actually assess

Booking, Sitting and What Comes After

Topics:

- How the exam is booked and delivered through the Python Institute
- Confirming the current blueprint at pythoninstitute.org before booking
- What to do in the first two minutes of the exam
- Whether PCPP is worth attempting, discussed honestly

HOW A TYPICAL WEEK IS SPLIT

Homework: A task or problem set after every class, and a monthly mixed-review assignment that deliberately folds in earlier topics

CERTIFICATION DETAIL

Completion: Certificate from Modern Age Coders, awarded on passing the final assessment. Fall short and there is focused revision and a free retest: the certificate certifies real learning, not attendance

WHERE THIS CAN LEAD

  - PCEP and, if taken, PCAP certification from the Python Institute
  - A public repository of finished, documented, running programs
  - Genuine Python fluency including object-oriented programming and the standard library
  - A foundation for data science, automation or backend development
  - The habit of committing work as it is written, which outlives any certificate

COMMON QUESTIONS ABOUT THIS COURSE

  For anything about cost, use PART 4 and RULE 1. Do not quote two regions.

  Q: What is the difference between PCEP and PCAP?
  A: PCEP-30-02 is the entry-level certification, covering fundamentals: data types, control flow, functions, basic data structures and exceptions. PCAP-31-03 is the associate level and adds modules and packages, object-oriented programming, exceptions in depth, file handling, string processing and functional features like comprehensions, lambdas and closures. Most students take them in that order, and some go straight to PCAP.

  Q: Do you sell the exam voucher?
  A: No, and we take no commission on one. You book and sit the exam through the Python Institute directly. We would rather teach you than resell you a voucher, and it also means our advice about whether to sit it at all is not affected by whether we get paid when you do.

  Q: How long does it take?
  A: Roughly twenty weeks at two classes a week for both certifications, joinable in any month. A student aiming only at PCEP normally finishes the first eight to ten weeks. Adults with existing programming experience often go considerably faster one to one, since much of the PCEP material is revision for them.

  Q: What is the hardest part of PCAP?
  A: Closures, scope resolution and mutability, consistently. They are the topics where candidates who can write working Python still fail exam questions, because the questions test prediction rather than production. The final phase of this course drills predicting output specifically, which is a different exercise from writing code.

  Q: Can a school student take these?
  A: Yes, from about thirteen, and several of ours have. It works well as an external checkpoint alongside a school curriculum that does not offer one, and the repository built along the way is more useful for university applications than the certificate itself. We say that to families before they enrol rather than afterwards.

  Q: How am I assessed, and is the certificate just for showing up?
  A: No. A task follows every class with feedback, monthly reviews deliberately mix new material with earlier topics so nothing is forgotten, and the course ends with a full mock paper as the final assessment. Passing earns the certificate; falling short earns focused revision and a free retest. We measure real learning, not attendance.

==
COURSE 112 OF 137: PRINCESS CODERS: CODING COURSE FOR GIRLS AND WOMEN
==

Course link: https://learn.modernagecoders.com/courses/princess-coders-complete-coding-masterclass
Subject area: Women in Tech
Designed for: Girls only batches
Who can join: Complete beginner; school girls, college students and women switching careers
Course length: 9-11 months (36-44 weeks)
Time needed: 2 live classes/week + 3-4 hours practice
Certificate: Certificate from Modern Age Coders, awarded on passing the final exam

PRICE FOR THIS COURSE (quote only the one that applies to the person asking)
  In India, per month: group Rs 1,499, mini batch Rs 2,999, one to one Rs 4,999
  In Canada, per month: group CAD 140, one to one CAD 210
  Anywhere else, per month: group $100, one to one $150
  Classes: group and mini batch two live classes a week, eight a month; one to one in India one live class a week, four a month; one to one outside India two live classes a week, eight a month. Each class is one hour.

WHAT THIS COURSE IS

  Coding course for girls and women: HTML, CSS, JavaScript, React and backend basics in supportive live online classes, zero to full-stack in 9-11 months.

  In one line: A supportive room changes everything: girls and women learning to code together, from first tag to a deployed full-

stack project in nine honest months.

ABOUT THE PROGRAMME

Women remain outnumbered in tech for reasons that have nothing to do with ability and a lot to do with rooms. Princess Coders fixes the room: live online batches of girls and women learning together, taught the complete beginner-to-builder arc: HTML, CSS and JavaScript foundations, modern React with TypeScript, backend basics with Node and databases, and a deployed capstone, with a dedicated week on women-in-tech community, mentorship and visibility. The teaching is rigorous and the tone is warm; those were never opposites. Homework follows every class, monthly assignments mix new material with earlier topics so skills compound, each phase ends with an exam, and the course ends with a final exam that decides the certificate, with a free retest after revision. Nine months at two live classes a week plus three to four hours of practice, with two more months in hand when needed. Real code, real support, real momentum.

WHAT MAKES THIS COURSE DIFFERENT

- The room is the feature: girls and women learning together, taught by instructors who take them seriously
- The complete arc: foundations to React to backend basics to a deployed capstone, not a taster
- Modern stack throughout: JavaScript, React, TypeScript, Node and real deployment
- A women-in-tech week that is practical: community, mentorship and visibility, not slogans
- An honest 9-month arc with 2 months in hand: nobody is rushed
- Real assessment: weekly homework, monthly mixed reviews, and a final exam that decides the certificate, with a free retest

THE LEARNING PATH, STEP BY STEP

Phase 1: Foundations (Months 1-3): HTML, CSS and JavaScript learned properly, ending with creative deployed projects
Phase 2: Modern frontend (Months 4-6): React, state, UI craft, TypeScript and testing
Phase 3: Backend basics (Months 7-8): Node, Express, databases, auth and deployment
Phase 4: The finale (Month 9): the signature capstone, the women-in-tech week, and the final exam

WHAT A STUDENT NEEDS BEFORE STARTING

Coding experience: None. The course starts at the first tag
Equipment: A computer with a stable internet connection; every tool used is free
Audience: Girls and women: school students (13+), college students and career switchers
Time commitment: 2 live classes plus 3-4 hours of practice a week

WHO THIS COURSE IS FOR

Students: School and college girls exploring tech seriously for the first time
Career switchers: Women moving into tech from any field, wanting a complete, supported arc
Restarters: Women returning after a career break, rebuilding skills in a friendly room
Builders: Women with a product idea who want the ability to build it
Community seekers: Anyone for whom the right room is the missing ingredient

FULL CURRICULUM, WEEK BY WEEK

This is the complete teaching plan. Parents can ask about any week.

PHASE 1: FOUNDATIONS (MONTHS 1-3, WEEKS 1-12)

HTML, CSS and JavaScript built properly, with creative projects deployed from the first months.

Month 1: First Steps (Weeks 1-4)
Welcome: Your Tech Journey Begins
Topics:
- Welcome to the sisterhood: meet your cohort
- Famous women in tech: inspiration and role models
- How technology shapes our world
- Setting up your princess coding workspace
- Choosing your coding avatar and username
- Introduction to computers and how they think
- Your first line of code: 'Hello, Princess Coder!'
- Visual programming with Scratch (for younger cohort)
- Introduction to problem-solving like a programmer
- Creating your first digital art with code
- Building your coder confidence journal
- Princess Coders community guidelines and support
Projects built:
- Create your Princess Coder profile page
- Design your digital business card

```
      - Build an 'About Me' interactive story
    Practice: Daily: 30 min creative coding challenges, 1 hour guided tutorials
  HTML: Real Structure
    Topics:
      - HTML as the structure of the web
      - Creating your first webpage from scratch
      - Text elements: telling your story online
      - Images: adding visual magic to pages
      - Links: connecting your digital world
      - Lists: organizing information beautifully
      - Tables: presenting data elegantly
      - Forms: collecting information from users
      - Semantic HTML: writing meaningful code
      - Accessibility: making web inclusive for all
      - HTML5: modern web capabilities
      - Best practices for clean, organized code
    Projects built:
      - Personal blog about your interests
      - Recipe collection website
      - Digital diary or journal
      - Online portfolio for your hobbies
    Practice: Create 5 different themed webpages
    Assessment: Month 1 check: a page built live from a sketch, plus a take-home mixing
    everything so far

Month 2: Style and Logic (Weeks 5-8)
  CSS: Design That Holds
    Topics:
      - CSS: the art of web design
      - Colors: creating beautiful palettes
      - Fonts: typography that speaks
      - Spacing: the importance of breathing room
      - Backgrounds: setting the mood
      - Borders and shadows: adding depth
      - CSS animations: bringing pages to life
      - Responsive design: mobile-friendly sites
      - CSS Grid: magazine-style layouts
      - Flexbox: flexible arrangements
      - Design principles for non-designers
      - Creating your personal style guide
    Projects built:
      - Fashion lookbook website
      - Interactive greeting card creator
      - Photo gallery with filters
      - Animated story presentation
    Practice: Style 10 different page components creatively
  JavaScript: First Interactivity
    Topics:
      - JavaScript: the language of interaction
      - Variables: storing information
      - Data types: numbers, text, true/false
      - Functions: creating reusable magic
      - Events: responding to user actions
      - Conditionals: making decisions in code
      - Loops: repeating with efficiency
      - Arrays: organizing collections
      - Objects: grouping related data
      - DOM: controlling page elements
      - Creating interactive forms
      - Building simple games and quizzes
    Projects built:
      - Interactive quiz about your favorite topic
      - Simple drawing application
      - To-do list with style
      - Mood tracker application
    Practice: Build 5 interactive mini-apps
    Assessment: Month 2 check: an interactive feature built live, plus mixed review

Month 3: JavaScript Depth (Weeks 9-12)
  Advanced JavaScript Concepts
    Topics:
      - Advanced functions and callbacks
      - Working with APIs: getting real data
      - JSON: the language of data exchange
      - Local storage: saving user preferences
      - Error handling: graceful failures
      - Asynchronous programming basics
      - Promises and modern JavaScript
      - ES6 features: arrow functions, destructuring
```

- Array methods: map, filter, reduce
- Creating reusable components
- Code organization and best practices
- Debugging like a detective

Projects built:
- Weather app with real data
- Quote generator with API
- Currency converter tool
- Personal finance tracker

Practice: Master 20 JavaScript challenges

Creative Coding & Visual Projects

Topics:
- Introduction to p5.js for creative coding
- Drawing with code: shapes and colors
- Animation principles in programming
- Interactive art installations
- Generative art: code that creates
- Sound and music with code
- Data visualization basics
- Creating infographics programmatically
- Game development fundamentals
- Physics in animations
- Particle systems and effects
- Sharing your creative work online

Projects built:
- Interactive art piece
- Music visualizer
- Simple platformer game
- Data story visualization

Practice: Create 5 artistic coding projects

Assessment: Phase 1 exam: a creative project deployed and defended, plus a written mixed paper

---

PHASE 2: MODERN FRONTEND (MONTHS 4-6, WEEKS 13-24)

React the way it is written now, with UI craft, TypeScript and testing.

Month 4: React Foundation (Weeks 13-16)

React.js Foundation

Topics:
- Understanding why React revolutionized web development
- Setting up your React development environment
- Components: thinking in reusable pieces
- JSX: the perfect blend of HTML and JavaScript
- Props: component communication made simple
- State: managing dynamic data
- React Hooks: modern React development
- useState for component state
- useEffect for side effects
- Building interactive user interfaces
- Component composition patterns
- React ecosystem overview

Projects built:
- Instagram-style photo grid
- Pinterest-inspired board creator
- Spotify playlist manager UI
- Fashion e-commerce product page

Practice: Build 15 reusable React components

Advanced React Patterns

Topics:
- Advanced hooks: useContext for global state
- useReducer for complex state logic
- Custom hooks: creating your own
- React Router: multi-page applications
- Protected routes and authentication flows
- Form handling and validation
- API integration and data fetching
- Error boundaries and error handling
- Performance optimization techniques
- React.memo and useMemo
- Code splitting for faster apps
- Testing React applications

Projects built:
- Multi-page blog with authentication
- Task management app like Notion
- Real-time chat application UI
- Online learning platform interface

Practice: Master 10 advanced React patterns

```
    Assessment: Month 4 check: a component set built live, plus mixed review

Month 5: State and UI Craft (Weeks 17-20)
  State Management & Data Flow
    Topics:
      - Understanding application state
      - Context API for state sharing
      - Redux: predictable state management
      - Redux Toolkit: modern Redux
      - Actions, reducers, and store
      - Async operations with Redux Thunk
      - Zustand: lightweight alternative
      - React Query for server state
      - Optimistic UI updates
      - Caching strategies
      - Real-time data synchronization
      - State management best practices
    Projects built:
      - Shopping cart with global state
      - Social media feed with Redux
      - Collaborative workspace app
      - Analytics dashboard with real-time data
    Practice: Implement state management in 5 apps
  UI/UX Design for Developers
    Topics:
      - Design principles every developer should know
      - Color theory and creating palettes
      - Typography and readability
      - Spacing and visual hierarchy
      - User experience (UX) fundamentals
      - User interface (UI) best practices
      - Design tools: Figma basics for developers
      - Wireframing and prototyping
      - Design systems and component libraries
      - Accessibility standards (WCAG)
      - Responsive and adaptive design
      - Micro-interactions and animations
    Projects built:
      - Complete design system creation
      - Redesign existing website
      - Mobile-first application design
      - Accessible form system
    Practice: Design and implement 5 UI concepts
    Assessment: Month 5 check: a stateful mini-app live, plus mixed review

Month 6: TypeScript and Quality (Weeks 21-24)
  TypeScript in Practice
    Topics:
      - TypeScript fundamentals
      - Types and interfaces
      - Generics and utility types
      - TypeScript with React
      - Type-safe API calls
      - Advanced TypeScript patterns
      - TypeScript configuration
      - Migration strategies
      - Type guards and assertions
      - Declaration files
      - TypeScript best practices
      - Team collaboration with TypeScript
    Projects built:
      - Full TypeScript React app
      - Type-safe API client
      - Component library in TypeScript
    Practice: Convert all projects to TypeScript
  Testing and Quality
    Topics:
      - Why testing matters
      - Unit testing with Jest
      - React Testing Library
      - Integration testing strategies
      - End-to-end testing with Cypress
      - Test-driven development (TDD)
      - Debugging techniques
      - Browser DevTools mastery
      - Performance testing
      - Accessibility testing
      - Visual regression testing
      - Continuous Integration setup
```

```
      Projects built:
        - Add tests to existing projects
        - TDD project from scratch
        - E2E test suite creation
        - Automated testing pipeline
      Practice: Write comprehensive tests for 5 projects
      Assessment: Phase 2 exam: a typed, tested feature defended, plus a cumulative paper

------------------------------------------------------------
PHASE 3: BACKEND BASICS (MONTHS 7-8, WEEKS 25-32)
------------------------------------------------------------
The other half: Node, Express, databases, authentication and a real deployment.

  Month 7: Node and APIs (Weeks 25-28)
    Backend Fundamentals with Node
      Topics:
        - What happens behind the scenes of websites
        - Client-server architecture explained simply
        - Introduction to Node.js: JavaScript everywhere
        - Setting up your backend development environment
        - Your first Node.js program
        - Understanding modules and packages
        - NPM: the world's largest software registry
        - File system operations with Node.js
        - Working with JSON data
        - Environment variables and configuration
        - Debugging Node.js applications
        - Backend best practices for beginners
      Projects built:
        - Personal note-taking system
        - File organizer application
        - JSON data processor
        - Command-line diary app
      Practice: Build 8 Node.js utilities
    Building APIs with Express.js
      Topics:
        - What are APIs and why they matter
        - Express.js: the Node.js framework
        - Creating your first Express server
        - Routing: handling different URLs
        - HTTP methods: GET, POST, PUT, DELETE
        - Middleware: the Express superpower
        - Handling JSON data and forms
        - Error handling done right
        - Organizing code with routers
        - Static file serving
        - Template engines for server-side rendering
        - API testing with Postman
      Projects built:
        - Recipe sharing API
        - Personal blog backend
        - Todo list API
        - Quiz application server
      Practice: Create 6 different Express APIs
      Assessment: Month 7 check: a small API built live, plus mixed review

  Month 8: Data and Auth (Weeks 29-32)
    Databases - Storing Your Data
      Topics:
        - Why we need databases
        - Types of databases explained
        - MongoDB: the document database
        - Setting up MongoDB locally and cloud
        - CRUD operations in MongoDB
        - Mongoose: making MongoDB easier
        - Designing database schemas
        - Relationships between data
        - Data validation and sanitization
        - Database security basics
        - Backup and recovery strategies
        - Performance optimization tips
      Projects built:
        - User management database
        - Product inventory system
        - Social media data model
        - Event planning database
      Practice: Design 8 different database schemas
    Authentication and Deployment
      Topics:
```

- Why authentication is crucial
- Passwords: hashing vs encryption
- Building a registration system
- Login functionality with sessions
- JWT tokens: modern authentication
- Remember me functionality
- Password reset via email
- Social login with Google/Facebook
- Role-based permissions
- Protecting API routes
- Security best practices
- GDPR and user data privacy
- Deploying the full stack to a public URL

Projects built:
- Complete user auth system
- Multi-role application
- Social login integration
- Secure member-only site

Practice: Implement auth in all previous projects

Assessment: Phase 3 exam: an authenticated app walkthrough from schema to URL, plus a cumulative paper

---

PHASE 4: THE FINALE (MONTH 9, WEEKS 33-36)

The signature capstone, the women-in-tech week, and the final exam at demo day.

Month 9: Capstone and Community (Weeks 33-36)

The Signature Capstone

Topics:
- Identifying problems worth solving
- Project ideation for social impact
- User research and validation
- Creating project roadmaps
- Agile development methodology
- Sprint planning and execution
- Building MVPs (Minimum Viable Products)
- User testing and feedback
- Iterative development process
- Project documentation standards
- Creating compelling demos
- Storytelling for developers

Projects built:
- THE CAPSTONE: a full-stack project of her own design, deployed and documented

Practice: Complete weekly sprints on signature project

Women in Tech: Community, Mentorship, Visibility

Topics:
- History of women in technology
- Current landscape and opportunities
- Building confidence in tech spaces
- Imposter syndrome and overcoming it
- Public speaking for developers
- Technical writing and blogging
- Mentorship: finding and being one
- Building your professional network
- Women in tech communities
- Negotiation skills for women
- Work-life balance in tech
- Leading technical teams

Projects built:
- Write technical blog series
- Give a tech talk
- Mentor another student
- Join women in tech community

Practice: Weekly leadership challenges

Demo Day and the Final Exam

Topics:
- Presenting the capstone: live demo plus the hardest bug story
- A full-course spiral review before the exam
- Where each path leads: full-stack depth, DSA, AI, or Queen Coders as experience grows

Projects built:
- Demo day presentation delivered to the batch

Assessment: FINAL EXAM: a practical build plus a written paper mixed from every phase. Passing earns the certificate; falling short earns focused revision and a free retest

PROJECTS THE STUDENT BUILDS AND KEEPS

- Phase 1: deployed creative pages and interactive JavaScript projects
- Phase 2: React apps with state, TypeScript and tests

- Phase 3: APIs, databases and an authenticated deployed app
- Phase 4: the signature full-stack capstone at demo day

Total projects: 20+ real builds, crowned by a deployed full-stack capstone

SKILLS THE STUDENT WILL HAVE AT THE END

- Web foundations: HTML, CSS and JavaScript to real depth
- Modern frontend: React, state, TypeScript and testing
- Backend basics: Node, Express, databases and auth
- Shipping: deployment as a habit from phase 1
- Community: mentorship and visibility skills that open doors

HOW A TYPICAL WEEK IS SPLIT

Live classes: 2 live one-hour classes per week
Homework: Homework after every class, and a mixed-review assignment at the end of every month
Practice: 3-4 hours of practice between classes
Review: Every submission reviewed with written feedback; recurring gaps reopened in class

SUPPORT INCLUDED

Doubt support: WhatsApp doubt support between classes
Progress updates: Honest monthly progress reviews: what is solid, what is wobbly, and the plan

CERTIFICATION DETAIL

Completion: Certificate from Modern Age Coders, awarded on passing the final exam. Fall short and there is focused revision and a free retest: the certificate certifies knowledge, not attendance

WHERE THIS CAN LEAD

- Full-stack depth: our dedicated full-stack course continues the road
- Data Structures and Algorithms: the interview muscle
- AI and generative AI courses: the modern layer
- Queen Coders: advanced engineering and technical leadership as experience grows
- Real projects now: sites and tools for work, family and community

COMMON QUESTIONS ABOUT THIS COURSE

For anything about cost, use PART 4 and RULE 1. Do not quote two regions.

Q: What is Princess Coders, and who is it for?
A: A complete beginner-to-builder coding course taught in batches of girls and women: school students (13+), college students and career switchers learning together in a supportive, serious room. The arc runs HTML, CSS and JavaScript foundations, modern React with TypeScript, backend basics with Node and databases, and ends with a deployed full-stack capstone and a final exam.

Q: Why a women-only coding course?
A: Because rooms matter. Women are still outnumbered in most tech classrooms, and many learn faster and speak up more in a batch where that pressure is gone. The syllabus is identical in rigor to any of our courses, the exams are real, and the community that forms tends to outlast graduation.

Q: How long does it take to go from zero to building real applications?
A: Nine months at 2 live classes a week plus 3 to 4 hours of practice, with two more months in hand for learners who need them. The first deployed project ships within phase 1; the full-stack capstone lands at month nine.

Q: How is progress assessed? Is the certificate just for attending?
A: No. Homework follows every class, each month ends with an assignment that deliberately mixes new questions with earlier topics, every phase closes with a cumulative exam, and the course ends with a final exam. Passing earns the certificate; falling short earns focused revision and a free retest.

Q: What comes after Princess Coders?
A: The capstone and portfolio built here carry into all of them.

Q: Is there a free trial class?
A: Yes, a free demo class with no commitment: book at learn.modernagecoders.com/contact or message us on WhatsApp at +91 91233 66161. (Agent note: the free demo is a waiting list with no fixed date. The Priority Live Demo is a guaranteed class today or tomorrow, booked at https://learn.modernagecoders.com/priority-demo . Offer both, as RULE 3 says.)

Q: Are classes live or recorded?
A: Live, always: small groups with a real instructor, never pre-recorded videos.

To enrol, message Shivam Sir on +91 9123366161 or send the parent this link: https://learn.modernagecoders.com/courses/princess-coders-complete-coding-masterclass
For a demo: the Priority Live Demo (guaranteed, today or tomorrow) is booked at https://learn.modernagecoders.com/priority-demo . The free demo is a waiting list with no fixed date.

==========

COURSE 113 OF 137: PROBLEM SOLVING AND COMPUTATIONAL THINKING FOR KIDS

==========

Course link: https://learn.modernagecoders.com/courses/problem-solving-and-computational-thinking-for-kids
Subject area: Kids Coding
Designed for: Kids
Who can join: Complete beginner, ages 7 to 12
Course length: 6-8 months (26-32 weeks)
Time needed: 2 live classes/week + 2-3 hours practice
Certificate: Certificate from Modern Age Coders, awarded on passing the final exam

PRICE FOR THIS COURSE (quote only the one that applies to the person asking)
In India, per month: group Rs 1,499, mini batch Rs 2,999, one to one Rs 4,999
In Canada, per month: group CAD 140, one to one CAD 210
Anywhere else, per month: group $100, one to one $150
Classes: group and mini batch two live classes a week, eight a month; one to one in India one live class a week, four a month; one to one outside India two live classes a week, eight a month. Each class is one hour.

WHAT THIS COURSE IS

Problem solving course for kids aged 7-12: computational thinking, logic puzzles and real-world challenges in live online classes, in 6-8 months.

In one line: The skill under every other skill: children taught to break problems down, spot patterns and think in steps, six months that change how school feels.

ABOUT THE PROGRAMME

Before coding, before advanced maths, before every exam technique, sits one meta-skill: knowing what to do when you do not know what to do. This live online course builds it deliberately in children aged 7 to 12: decomposition (breaking big problems into small ones), pattern recognition, abstraction and algorithmic thinking, the four pillars of computational thinking, trained through puzzles, games, unplugged activities and real-world challenges children genuinely enjoy. The transfer is the point: the same thinking that cracks a logic puzzle organizes a school project, plans a science experiment and later makes coding feel natural. Parents most often report the change in homework: less "I can't", more "let me break it down". Six months at two live classes a week plus two to three hours of playful practice, with two more months in hand when needed. Homework after every class, a mixed challenge every month, and a final exam, a challenge gauntlet plus a friendly viva, that decides the certificate with a free retest. Real thinking, really trained.

WHAT MAKES THIS COURSE DIFFERENT

- The four pillars trained explicitly: decomposition, patterns, abstraction, algorithms, named and practiced
- Unplugged first: much of the best thinking training happens away from screens, by design
- Transfer is engineered: every skill is bridged to school work out loud
- Puzzles children actually like: games, mysteries and build-challenges, not worksheets
- An honest 6-month arc with 2 months in hand
- Real assessment, gently done: monthly mixed challenges and a final exam with a free retest

THE LEARNING PATH, STEP BY STEP

Phase 1: Thinking foundations (Months 1-2): logic, patterns and the art of breaking problems down
Phase 2: Applied problem solving (Months 3-4): strategies used on real challenges, from puzzles to projects
Phase 3: Advanced challenges and the finale (Months 5-6): harder problems, team challenges, and the exam gauntlet

WHAT A STUDENT NEEDS BEFORE STARTING

Experience: None. Curiosity is the entry requirement
Reading: Comfortable reading simple instructions
Equipment: A computer or tablet with internet; paper, pencil and household objects do much of the work
Age: 7 to 12. Batches are grouped by age
Time commitment: 2 live classes plus 2-3 hours of playful practice a week

WHO THIS COURSE IS FOR

Easily stuck: Children who say "I can't" before trying, this course rewires that moment
Puzzle lovers: Kids who already adore riddles and want real training
Pre coders: Children headed for coding who will arrive with the thinking already built
Exam bound: Kids facing reasoning sections in school and scholarship tests
Bright and bored: Quick children who need harder, better problems than school provides

FULL CURRICULUM, WEEK BY WEEK

This is the complete teaching plan. Parents can ask about any week.

THE COURSE: THINKING, TRAINED (MONTHS 1-6, WEEKS 1-26)

Logic and patterns, applied problem solving, then advanced challenges and the exam gauntlet.

Months 1-2: Logic and Pattern Recognition (Weeks 1-8)
Introduction to Problem Solving
Topics:
- What is problem solving?
- The problem-solving process
- Understanding the problem (The 5 W's and How)
- Breaking big problems into small pieces
- Pattern recognition basics
- Sequence and order
- Following instructions precisely
- Logic puzzles introduction
- Sudoku for beginners (4x4)
- Tangram puzzles
- Tower of Hanoi introduction
- Growth mindset: mistakes help us learn
Projects built:
- Create a puzzle book
- Design a treasure hunt
- Solve 20 logic puzzles
- Build pattern art
Practice: Daily: 15-minute puzzle time, pattern journaling
Algorithmic Thinking Unplugged
Topics:
- What is an algorithm?
- Recipes as algorithms
- Creating step-by-step instructions
- Flowcharts with shapes and arrows
- Decision trees
- If-then thinking
- Loops in daily life
- Debugging: finding mistakes
- Optimization: finding better ways
- Parallel vs sequential thinking
- Human robot game
- Algorithm art and music
Projects built:
- Write algorithms for daily tasks
- Create a board game with rules
- Design a flowchart adventure
- Program a 'human robot'
Practice: Create 10 real-life algorithms
Assessment: Month 1 check: a small build or challenge live, plus a fun take-home mixing everything so far
Introduction to Code.org
Topics:
- Code.org Course A basics
- Drag and drop programming
- Sequence of commands
- Loops to repeat actions
- Events and triggers
- Debugging practice
- Angry Birds puzzles
- Maze solving strategies
- Artist drawings with code
- Pattern creation with loops
- Harvester game logic
- Certificate achievements
Projects built:
- Complete Code.org Course A
- Create digital art with code
- Solve 50 coding puzzles
- Design custom maze challenges
Practice: Daily Code.org challenges

```
  Mathematical Problem Solving
    Topics:
      - Number patterns and sequences
      - Fibonacci in nature
      - Magic squares
      - Mathematical puzzles
      - Estimation strategies
      - Mental math tricks
      - Geometric patterns
      - Symmetry and reflection
      - Fraction puzzles
      - Time and scheduling problems
      - Money and budgeting challenges
      - Data collection and graphs
    Projects built:
      - Math puzzle collection
      - Create a math game
      - Budget planning project
      - Data investigation project
    Practice: Solve 5 math problems daily
    Assessment: Month 2 check: a live challenge with questions reaching back to month 1

Months 3-4: Applied Problem Solving (Weeks 9-17)
  Scratch Problem Solving
    Topics:
      - Scratch as a problem-solving tool
      - Decomposition: breaking down projects
      - Variables for storing information
      - Conditional logic (if-then-else)
      - Loops for efficiency
      - Creating functions (My Blocks)
      - Debugging with Scratch
      - Testing and iteration
      - Coordinate system problems
      - Random number challenges
      - List manipulation
      - Algorithm visualization
    Projects built:
      - Calculator with Scratch
      - Sorting algorithm visualization
      - Maze solver program
      - Pattern generator
    Practice: Daily Scratch challenges
  Game Strategy & Logic
    Topics:
      - Strategy game thinking
      - Chess basics and tactics
      - Checkers strategies
      - Tic-tac-toe perfect play
      - Connect Four winning strategies
      - Card game probability
      - Board game design
      - Winning vs learning mindset
      - Analyzing opponent moves
      - Planning ahead
      - Risk assessment
      - Decision making under pressure
    Projects built:
      - Design a strategy game
      - Chess puzzle solver
      - Create game AI
      - Tournament organization
    Practice: Play and analyze strategy games
  Real-World Problem Solving
    Topics:
      - Identifying problems around us
      - Research and information gathering
      - Brainstorming techniques
      - Mind mapping
      - SCAMPER method for kids
      - Design thinking process
      - Prototyping solutions
      - Testing and feedback
      - Iteration and improvement
      - Presentation skills
      - Team problem solving
      - Environmental challenges
    Projects built:
      - School problem solution
```

- Community helper app
- Recycling game design
- Invention prototype

Practice: Identify and solve one problem weekly

Coding Challenges Platform

Topics:

- Introduction to coding challenges
- Blockly Games complete
- Lightbot puzzle game
- CodeCombat basics
- Algorithm challenges
- Time complexity basics
- Space optimization
- Code efficiency
- Common algorithms
- Sorting visualization
- Search algorithms
- Competition preparation

Projects built:

- Complete 100 coding challenges
- Algorithm portfolio
- Challenge leaderboard
- Peer challenge creation

Practice: 3 coding challenges daily

Mid-Course Review and Showcase

Topics:

- Problem-solving portfolio review
- Skills assessment
- Logic test completion
- Project presentations
- Peer review process
- Reflection and goal setting

Projects built:

- Comprehensive problem-solving project
- Skills demonstration video
- Teaching someone else
- Progress documentation

Assessment: Mid-course check: a showcase build plus a mixed challenge spanning months 1-4

Months 5-6: Advanced Problem Solving (Weeks 18-26)

Advanced Algorithms

Topics:

- Recursion concepts for kids
- Divide and conquer strategy
- Greedy algorithms explained
- Dynamic programming basics
- Graph problems introduction
- Shortest path problems
- Optimization challenges
- Scheduling algorithms
- Data structure basics
- Stack and queue concepts
- Tree structures in life
- Algorithm complexity

Projects built:

- Pathfinding visualizer
- Scheduling optimizer
- Recursive art generator
- Data structure game

Practice: Implement 5 algorithms weekly

Robotics Problem Solving

Topics:

- Robot logic basics
- Sensor data processing
- Decision making for robots
- Path planning
- Obstacle avoidance
- Line following algorithms
- Maze solving robots
- Virtual robotics with VEXcode
- Robot simulation
- Real-world robot applications
- AI in robotics basics
- Future of robotics

Projects built:

- Virtual robot programmer
- Maze solving algorithm
- Robot rescue simulation

- Automated system design
    Practice: Daily robot challenges
  Data and Logic Problems
    Topics:
      - Data analysis for kids
      - Survey design and analysis
      - Spreadsheet problem solving
      - Database thinking
      - Information organization
      - Logical operators (AND, OR, NOT)
      - Truth tables
      - Venn diagrams
      - Set theory basics
      - Probability problems
      - Statistics fundamentals
      - Data visualization
    Projects built:
      - School data analysis
      - Survey project
      - Probability game
      - Infographic creation
    Practice: Analyze data sets daily
  Creative Problem Solving
    Topics:
      - Lateral thinking puzzles
      - TRIZ for kids
      - Biomimicry solutions
      - Reverse engineering
      - Constraint-based creativity
      - Random input technique
      - Six thinking hats simplified
      - Morphological analysis
      - SCAMPER advanced
      - Innovation frameworks
      - Failure analysis
      - Future problem solving
    Projects built:
      - Innovation challenge
      - Redesign everyday object
      - Future city design
      - Creative solution showcase
    Practice: Daily creative challenges
  Capstone and the Final Exam
    Topics:
      - Project selection
      - Problem identification
      - Research and planning
      - Solution development
      - Testing and refinement
      - Documentation
      - Presentation preparation
      - Peer review
    Projects built:
      - THE CAPSTONE: a chosen grand challenge solved end to end, documented in steps, presented at
        demo day
    Assessment: FINAL EXAM: capstone demo plus a friendly viva and a mixed quiz from the
    whole course. Passing earns the certificate; a child who falls short gets focused
    revision and a free retest

PROJECTS THE STUDENT BUILDS AND KEEPS

- Months 1-2: logic puzzle sets, pattern hunts and first algorithm games
- Months 3-4: real-world challenges solved with named strategies
- Months 5-6: team challenges, harder gauntlets, and the capstone challenge at demo day

Total projects: 60+ solved challenges and a documented capstone problem

SKILLS THE STUDENT WILL HAVE AT THE END

- Decomposition: breaking big scary problems into small friendly ones
- Pattern recognition: spotting the shape of a problem seen before
- Abstraction: keeping what matters, dropping what does not
- Algorithmic thinking: solutions written as clear steps anyone could follow
- Grit mechanics: what to try when stuck, taught as an actual method

HOW A TYPICAL WEEK IS SPLIT

Live classes: 2 live one-hour classes per week, solving along with the teacher
Homework: A small challenge after every class, and a mixed gauntlet at the end of every month

  Practice: 2-3 hours of playful puzzle practice between classes
  Review: Every solution reviewed for thinking, not just answers

SUPPORT INCLUDED

  Doubt support: WhatsApp doubt support between classes
  Progress updates: Regular notes to parents: which thinking skills grew this month, and how to
    feed them at home

CERTIFICATION DETAIL

  Completion: Certificate from Modern Age Coders, awarded on passing the final exam, a
    challenge gauntlet plus a friendly viva. A child who falls short gets focused revision and a
    free retest

WHERE THIS CAN LEAD

  - Kids Coding: block coding feels natural once the thinking is trained
  - Mental Maths Mastery: speed built on top of structure
  - Olympiad Mathematics: for children who found the puzzles delicious
  - School reasoning sections: NSO, IMO and scholarship tests get easier
  - Everyday life: homework, projects and plans, all broken down calmly

COMMON QUESTIONS ABOUT THIS COURSE

  For anything about cost, use PART 4 and RULE 1. Do not quote two regions.

  Q: What exactly does a problem-solving course teach?
  A: The four pillars of computational thinking, decomposition, pattern recognition,
  abstraction and algorithmic thinking, trained through puzzles, games, unplugged activities
  and real-world challenges. Children learn named strategies for what to do when stuck, and
  every skill is deliberately bridged to school work: maths word problems, science projects and
  even planning homework.

  Q: How is this different from a coding course?
  A: It is the layer underneath coding. Coding courses teach a language; this course teaches
  the thinking every language assumes, which is why children who take it first find our coding
  courses dramatically easier. It is equally valuable for children who never code: the same
  skills power maths, science and exam reasoning.

  Q: How long does the course take?
  A: Six months at 2 live classes a week plus 2 to 3 hours of playful practice takes a child
  from zero to the demo-day capstone in trained thinking. The course keeps two more months in
  hand for children who need more repetition, no rushing and no penalty.

  Q: How is my child assessed? Is the certificate just for attending?
  A: No, and it is all gentle: classwork in every session, a small homework build after every
  class, a mixed challenge at the end of every month that revisits earlier skills, and a final
  exam, a capstone demo plus a friendly viva and short quiz. Passing earns the certificate; a
  child who falls short gets focused revision and a free retest.

  Q: Will this help with school and competitive exams?
  A: Directly: reasoning sections in school assessments, NSO/IMO-style olympiad questions and
  scholarship tests all draw on exactly these skills, and parents usually notice the homework
  difference within the first two months, less avoidance, more calm breaking-down of tasks.

  Q: Is there a free trial class?
  A: Yes, a free demo class with no commitment: book at learn.modernagecoders.com/contact or
  message us on WhatsApp at +91 91233 66161. Parents are welcome to sit in. (Agent note: the
  free demo is a waiting list with no fixed date. The Priority Live Demo is a guaranteed class
  today or tomorrow, booked at https://learn.modernagecoders.com/priority-demo . Offer both, as
  RULE 3 says.)

  Q: Are classes live or recorded?
  A: Live, always: small groups with a real teacher, never pre-recorded videos. Children build
  during class and get unstuck on the spot.

  To enrol, message Shivam Sir on +91 9123366161 or send the parent this link: https://learn.modernagecoders.com/courses/problem-solving-and-computational-thinking-for-kids
  For a demo: the Priority Live Demo (guaranteed, today or tomorrow) is booked at
  https://learn.modernagecoders.com/priority-demo . The free demo is a waiting list with no fixed date.

==========
COURSE 114 OF 137: PROBLEM SOLVING FOR TEENS: LOGIC, DATA STRUCTURES & ALGORITHMS
==========

Course link: https://learn.modernagecoders.com/courses/problem-solving-dsa-masterclass-teens
Subject area: Programming

Designed for: Teens
Who can join: Teenagers 13-18; no prior experience needed
Course length: 10-12 months (44-52 weeks)
Time needed: 2 live classes/week + 3-5 hours practice
Certificate: Certificate from Modern Age Coders, awarded on passing the final exam

PRICE FOR THIS COURSE (quote only the one that applies to the person asking)
  In India, per month: group Rs 1,499, mini batch Rs 2,999, one to one Rs 4,999
  In Canada, per month: group CAD 140, one to one CAD 210
  Anywhere else, per month: group $100, one to one $150
  Classes: group and mini batch two live classes a week, eight a month; one to one in India one live class a week, four a month; one to one outside India two live classes a week, eight a month. Each class is one hour.

WHAT THIS COURSE IS

  Problem-solving course for teenagers: logic and programming foundations, core data structures and algorithms, then dynamic programming and problem-solving techniques, built the way it sticks, in 10-12 months.

  In one line: The thinking behind the code: logic, data structures and algorithms taught until a teenager can face an unseen problem and actually solve it.

ABOUT THE PROGRAMME

  The hardest, most valuable thing in programming is not syntax, it is looking at a problem you have never seen and finding your way to a solution. This live online course builds exactly that in a teenager, step by step and at a teen pace: logic and programming foundations first, conditionals, loops, functions, the core structures (arrays, strings, hash maps, stacks, queues, linked lists, recursion), then the real data structures and algorithms, trees, heaps, graphs, sorting and searching, algorithm-design paradigms, and finally dynamic programming and the problem-solving techniques that separate confident solvers from stuck ones. Every topic is taught through problems, not lectures, and the emphasis is always on the pattern, so a new problem is solvable, not a memorized answer. A finale month builds a problem-solving portfolio and sits a final exam. The pace is honest and teen-friendly: ten teaching months at two live classes a week plus three to five hours of practice, with two more in hand. Problem sets after every class, monthly mixed reviews, phase exams, and a final exam that decides the certificate with a free retest.

WHAT MAKES THIS COURSE DIFFERENT

  - Taught through problems, not lectures: teens solve from day one
  - Patterns over memorization: the skill is solving unseen problems
  - A real teen pace: depth without the burnout of an adult bootcamp
  - The foundation serious students build on: olympiads, contests and later interviews
  - An honest 10-month arc with 2 months in hand
  - Real assessment: weekly problem sets, monthly mixed reviews, phase exams and a final exam with a free retest

THE LEARNING PATH, STEP BY STEP

  Phase 1: Foundations and logic (Months 1-3): programming logic and the core structures
  Phase 2: Data structures and algorithms (Months 4-6): trees, graphs, sorting, algorithm design
  Phase 3: Dynamic programming and techniques (Months 7-9): DP in depth plus counting and geometry basics
  Phase 4: The finale (Month 10): a problem-solving portfolio and the final exam

WHAT A STUDENT NEEDS BEFORE STARTING

  Coding experience: None. Everything is taught from the first line
  Equipment: Any computer with a stable internet connection; every tool used is free
  Age: 13-18 (teenagers)
  Time commitment: 2 live classes plus 3-5 hours of practice a week

WHO THIS COURSE IS FOR

  Curious teens: Teenagers who like puzzles and want to think like a programmer
  Olympiad hopefuls: Students aiming for coding olympiads and contests later
  Strong students: Teens who have dabbled in coding and want real depth
  Future cs students: Students who want a head start on university-level computer science
  Interview bound later: Teens building the foundation that future coding interviews assume

FULL CURRICULUM, WEEK BY WEEK

  This is the complete teaching plan. Parents can ask about any week.

  PHASE 1: FOUNDATION & LOGIC BUILDING (MONTHS 1-3, WEEKS 1-13)

Build unshakeable foundations. Learn to think like a programmer, master basic syntax, and
solve your first 200+ problems.

  Month 1: Programming Fundamentals & First Steps (Weeks 1-4)
    Introduction to Problem Solving & Setup
      Topics:
        - What is problem solving? Why it matters for your future
        - How computers think: Binary and logic gates
        - Introduction to algorithms in daily life
        - Setting up your coding environment (VS Code)
        - Introduction to Python: Why Python for beginners
        - Your first program: Hello World explained
        - Variables and data types: int, float, string, boolean
        - Input and output operations
        - Comments and code readability
        - Basic arithmetic operations
        - Type conversion and casting
        - Problem solving methodology: UMPIRE (Understand, Match, Plan, Implement, Review, Evaluate)
      Projects built:
        - Calculator for homework problems
        - Age calculator with fun facts
        - Simple chatbot that responds to inputs
      Practice: Daily: 10 basic problems on HackerRank Easy
    Conditional Logic & Decision Making
      Topics:
        - If-else statements: Making decisions in code
        - Comparison operators: ==, !=, <, >, <=, >=
        - Logical operators: and, or, not
        - Nested conditions and elif chains
        - Switch case alternatives in Python
        - Ternary operators for clean code
        - Common patterns: min/max, odd/even, divisibility
        - Edge cases and boundary conditions
        - Debugging techniques with print statements
        - Flowcharts for visualizing logic
        - Truth tables and boolean algebra basics
        - Real-world applications: Game logic, grading systems
      Projects built:
        - Grade calculator with letter grades
        - Rock-Paper-Scissors game
        - Simple adventure game with choices
        - Password strength checker
      Practice: Solve 30 conditional logic problems on CodeChef
    Loops & Iteration Mastery
      Topics:
        - For loops: Counting and ranges
        - While loops: Conditional repetition
        - Loop control: break and continue
        - Nested loops and patterns
        - Common patterns: Triangles, pyramids, diamonds
        - Iteration through sequences
        - Loop optimization techniques
        - Infinite loops and how to avoid them
        - Do-while concept using Python
        - Enumerate and range functions
        - List comprehensions introduction
        - Time complexity introduction: Big O notation basics
      Projects built:
        - Pattern printer (20+ patterns)
        - Multiplication table generator
        - Prime number checker and generator
        - Number guessing game with attempts
      Practice: Complete 40 loop problems on LeetCode Easy
    Functions & Modular Programming
      Topics:
        - Functions: Why break code into pieces?
        - Function definition and calling
        - Parameters vs arguments
        - Return values and void functions
        - Scope: Local vs global variables
        - Default parameters and keyword arguments
        - Recursive thinking introduction
        - Simple recursion: Factorial, Fibonacci
        - Helper functions and code organization
        - Lambda functions basics
        - Function documentation and docstrings
        - Testing functions with assert statements
      Projects built:

- Math helper library (GCD, LCM, factorial)
- Text analyzer (word count, character frequency)
- Recursive art generator
- Unit converter with functions

Practice: Build 25 reusable functions for common tasks

Month 2: Data Structures Basics & Problem Patterns (Weeks 5-8)

Lists/Arrays Fundamentals

Topics:

- Lists in Python: Dynamic arrays explained
- Creating and initializing lists
- Indexing and slicing operations
- List methods: append, insert, remove, pop
- List iteration patterns
- 2D lists (matrices) basics
- List comprehensions deep dive
- Common operations: reverse, sort, search
- Memory and lists: References vs copies
- Shallow vs deep copy
- Time complexity of list operations
- When lists are not optimal

Projects built:

- Student gradebook system
- Tic-tac-toe game
- Matrix operations calculator
- Todo list manager

Practice: Solve 50 array problems on various platforms

Strings & Text Processing

Topics:

- Strings as character arrays
- String immutability in Python
- String methods: split, join, strip, replace
- String formatting techniques
- Regular expressions basics
- Pattern matching in strings
- Palindromes and anagrams
- String manipulation algorithms
- ASCII values and character arithmetic
- Unicode and encoding basics
- String building efficiency
- Common string problem patterns

Projects built:

- Word game (Hangman/Wordle clone)
- Text encryption/decryption tool
- Palindrome checker with multiple rules
- String parser for math expressions

Practice: Master 40 string manipulation problems

Dictionaries/Hash Maps & Sets

Topics:

- Dictionary/HashMap concept
- Key-value pairs and hashing basics
- Dictionary operations: add, update, delete
- Iterating through dictionaries
- Nested dictionaries
- Sets and set operations
- Union, intersection, difference
- When to use sets vs lists
- Frequency counting patterns
- Two-pointer technique introduction
- Sliding window basics
- Counter and defaultdict

Projects built:

- Phone book application
- Word frequency analyzer
- Inventory management system
- Duplicate finder tool

Practice: Solve 35 hashmap/set problems

Basic Algorithms & Complexity

Topics:

- Algorithm analysis: Time and space
- Big O notation deep dive
- Best, average, worst case analysis
- Linear search implementation
- Binary search on sorted arrays
- Bubble sort understanding
- Selection sort algorithm
- Insertion sort and when to use it
- Counting sort for specific cases
- Algorithm visualization techniques

- Debugging complex algorithms
- Introduction to greedy algorithms

Projects built:
- Sorting visualizer with animations
- Search engine for local files
- Algorithm complexity analyzer
- Custom sorting for specific data

Practice: Implement and optimize 10 basic algorithms

Month 3: Advanced Basics & Contest Preparation (Weeks 9-13)

Stack & Queue Mastery

Topics:
- Stack data structure and LIFO principle
- Stack implementation using list
- Stack applications: Parentheses matching
- Expression evaluation using stacks
- Queue data structure and FIFO principle
- Queue implementation methods
- Circular queue concept
- Deque (double-ended queue)
- Priority queue introduction
- Real-world applications of stacks/queues
- Monotonic stack patterns
- BFS preview with queues

Projects built:
- Browser history navigator
- Expression calculator with precedence
- Task scheduler with priorities
- Undo-redo functionality

Practice: Master 30 stack/queue problems

Recursion & Backtracking Basics

Topics:
- Recursion deep dive: How it really works
- Call stack and recursion visualization
- Base case and recursive case design
- Multiple recursion: Fibonacci trees
- Recursion vs iteration trade-offs
- Memoization introduction
- Backtracking paradigm explained
- N-Queens problem approach
- Sudoku solver logic
- Permutations and combinations
- Subset generation algorithms
- Pruning in backtracking

Projects built:
- Sudoku solver with GUI
- N-Queens visualizer
- Maze solver with path finding
- Permutation generator tool

Practice: Solve 25 recursion/backtracking problems

Mathematics for Programming

Topics:
- Number theory basics: Primes, factors
- GCD and LCM algorithms (Euclidean)
- Modular arithmetic and properties
- Fast exponentiation (Binary exponentiation)
- Sieve of Eratosthenes for primes
- Combinatorics: nCr, nPr calculations
- Probability basics in programming
- Geometric algorithms introduction
- Matrix operations and applications
- Number systems and conversions
- Bit manipulation preview
- Mathematical proof techniques

Projects built:
- Prime factorization tool
- Probability simulator
- Geometric calculator
- Cryptography basics implementation

Practice: Solve 40 math-based programming problems

Linked Lists Introduction

Topics:
- Linked list concept and need
- Node structure and pointers
- Singly linked list implementation
- Insertion: Beginning, end, middle
- Deletion operations
- Searching in linked lists
- Reversing a linked list

- Detecting cycles (Floyd's algorithm)
- Doubly linked lists
- Circular linked lists
- Linked list vs array comparison
- Common interview patterns

Projects built:
- Music playlist manager
- Train route simulator
- Memory manager simulation
- LRU cache basic implementation

Practice: Implement 20 linked list operations

Phase 1 Final Project

Topics:
- Project planning and design
- Algorithm selection strategies
- Code structure and organization
- Testing and debugging approaches
- Documentation best practices

Projects built:
- MAJOR PROJECT: Console-based puzzle game platform
- Include: Multiple game modes, scoring system, leaderboard
- Alternative: Algorithm visualizer web app
- Alternative: Competitive programming practice tool

Assessment: Phase 1 exam: a practical build defended live, plus a written paper mixing this phase with everything before it

---

PHASE 2: CORE DATA STRUCTURES & ALGORITHMS (MONTHS 4-6, WEEKS 14-26)

Master essential data structures, dive deep into algorithms, and start solving medium-level competitive programming problems.

Month 4: Trees & Advanced Sorting (Weeks 14-19)

Binary Trees Fundamentals

Topics:
- Tree terminology: Root, leaf, height, depth
- Binary tree structure and properties
- Tree representation methods
- Tree traversals: Inorder, Preorder, Postorder
- Level order traversal (BFS on trees)
- Recursive tree algorithms
- Tree construction from traversals
- Binary tree properties and validation
- Complete and perfect binary trees
- Tree serialization and deserialization
- Common tree patterns
- Parent pointers and their uses

Projects built:
- Family tree visualizer
- Expression tree evaluator
- Directory structure navigator
- Tree-based calculator

Practice: Solve 40 binary tree problems

Binary Search Trees (BST)

Topics:
- BST property and invariants
- Insertion in BST
- Searching efficiently in BST
- Deletion cases in BST
- Inorder predecessor and successor
- Minimum and maximum finding
- BST validation algorithms
- Balanced vs unbalanced BSTs
- AVL trees introduction
- Red-Black trees concept
- Self-balancing importance
- BST to sorted array conversions

Projects built:
- Dictionary with BST backend
- Autocomplete system
- Range query processor
- Database index simulator

Practice: Master 35 BST problems

Advanced Sorting Algorithms

Topics:
- Merge sort: Divide and conquer
- Quick sort and partitioning
- Heap sort introduction
- Counting sort deep dive

```
      - Radix sort for integers
      - Bucket sort applications
      - Sorting algorithm comparison
      - Stability in sorting
      - External sorting basics
      - Partial sorting techniques
      - Custom comparators
      - Sorting in linear time
    Projects built:
      - Sorting algorithm race visualizer
      - Large file sorter
      - Leaderboard system
      - Multi-criteria sorting tool
    Practice: Implement and optimize 15 sorting variations
  Heaps & Priority Queues
    Topics:
      - Heap data structure concept
      - Max heap and min heap properties
      - Heap implementation with arrays
      - Heapify operation (sift up/down)
      - Building heap from array
      - Priority queue operations
      - Heap sort algorithm
      - K-th largest/smallest problems
      - Median finding with two heaps
      - Merge K sorted arrays
      - Dijkstra's algorithm preview
      - Custom priority functions
    Projects built:
      - Task scheduler with priorities
      - Emergency room triage system
      - Event simulation system
      - Real-time median tracker
    Practice: Solve 30 heap/priority queue problems
  Tries & String Algorithms
    Topics:
      - Trie data structure motivation
      - Trie node structure
      - Insert and search in trie
      - Prefix search and autocomplete
      - Word dictionary with wildcards
      - Longest common prefix
      - String matching algorithms
      - KMP algorithm basics
      - Rabin-Karp rolling hash
      - Z-algorithm introduction
      - Suffix arrays concept
      - Applications in text processing
    Projects built:
      - Spell checker implementation
      - T9 predictive text
      - Word search puzzle solver
      - DNA sequence matcher
    Practice: Build 20 trie-based solutions

Month 5: Graphs & Network Algorithms (Weeks 20-23)
  Graph Fundamentals
    Topics:
      - Graph theory introduction
      - Graph terminology: Vertices, edges, degree
      - Directed vs undirected graphs
      - Weighted vs unweighted graphs
      - Graph representations: Adjacency matrix
      - Adjacency list representation
      - Edge list representation
      - Graph properties: Connected, cyclic
      - Special graphs: Trees, DAGs, complete
      - Bipartite graphs
      - Graph coloring basics
      - Real-world graph applications
    Projects built:
      - Social network analyzer
      - City map navigator
      - Game state explorer
      - Dependency resolver
    Practice: Model 15 real-world problems as graphs
  Graph Traversal Algorithms
    Topics:
      - Depth-First Search (DFS) deep dive
```

- DFS applications: Path finding, cycle detection
- Breadth-First Search (BFS) mastery
- BFS applications: Shortest path, level order
- Connected components finding
- Topological sorting with DFS
- Kahn's algorithm for topological sort
- Detecting cycles in directed graphs
- Strongly connected components intro
- Bridge finding in graphs
- Articulation points
- Graph traversal optimizations

Projects built:
- Maze generator and solver
- Course prerequisite validator
- Island counter in grid
- Web crawler simulator

Practice: Solve 40 graph traversal problems

Shortest Path Algorithms

Topics:
- Shortest path problem variants
- Dijkstra's algorithm in detail
- Implementation with priority queue
- Bellman-Ford for negative weights
- Floyd-Warshall all-pairs shortest path
- A* search algorithm basics
- Shortest path in unweighted graphs
- Path reconstruction techniques
- Single source vs all-pairs
- Handling negative cycles
- Applications in real world
- Optimizations and variations

Projects built:
- GPS navigation system
- Network routing simulator
- Game pathfinding AI
- Flight connection finder

Practice: Implement 5 shortest path variations

Minimum Spanning Trees

Topics:
- Spanning tree concept
- Minimum spanning tree (MST) problem
- Kruskal's algorithm with union-find
- Prim's algorithm implementation
- Union-Find data structure deep dive
- Path compression optimization
- Union by rank optimization
- MST uniqueness
- Maximum spanning tree
- Applications: Network design, clustering
- Steiner tree introduction
- Online MST algorithms

Projects built:
- Network cable optimizer
- Cluster analysis tool
- Maze generator using MST
- Circuit board router

Practice: Solve 20 MST and Union-Find problems

Month 6: Phase 2 Completion & Integration (Weeks 24-26)

Algorithm Design Paradigms

Topics:
- Brute force and when it's okay
- Greedy algorithm design
- Proving greedy correctness
- Divide and conquer mastery
- Transform and conquer
- Decrease and conquer
- Problem reduction techniques
- Algorithm paradigm selection
- Hybrid approaches
- Approximation algorithms intro
- Randomized algorithms basics
- Online vs offline algorithms

Projects built:
- Algorithm strategy selector
- Greedy algorithm visualizer
- Problem classifier tool
- Algorithm comparison framework

Practice: Apply different paradigms to 30 problems

```
    Space & Time Optimization
      Topics:
        - Space-time tradeoffs
        - Memory optimization techniques
        - Cache-friendly algorithms
        - Bit manipulation for space saving
        - Rolling arrays technique
        - In-place algorithms
        - Stream processing algorithms
        - External memory algorithms
        - Parallel algorithm basics
        - MapReduce introduction
        - Distributed algorithms overview
        - Quantum algorithms preview
      Projects built:
        - Memory-efficient data processor
        - Stream analytics engine
        - Large data sorter
        - Optimization analyzer tool
      Practice: Optimize 20 solutions for space/time
    Testing & Debugging Mastery
      Topics:
        - Test case design strategies
        - Edge case identification
        - Stress testing techniques
        - Random test generation
        - Debugging complex algorithms
        - Using debuggers effectively
        - Print debugging strategies
        - Assertion-based debugging
        - Performance profiling
        - Memory leak detection
        - Code coverage analysis
        - Continuous testing practices
      Projects built:
        - Test case generator framework
        - Algorithm debugger tool
        - Performance profiler
        - Bug tracker system
      Practice: Debug 30 algorithmic bugs
      Assessment: Phase 2 exam: a practical build defended live, plus a written paper mixing
      this phase with everything before it

----------------------------------------------------------------
PHASE 3: ADVANCED ALGORITHMS & TECHNIQUES (MONTHS 7-9, WEEKS 27-39)
----------------------------------------------------------------
Master dynamic programming, advanced data structures, computational geometry, and complex
problem-solving techniques.

  Month 7: Dynamic Programming Mastery (Weeks 27-31)
    DP Fundamentals
      Topics:
        - Dynamic programming introduction
        - Overlapping subproblems concept
        - Optimal substructure property
        - Memoization (top-down approach)
        - Tabulation (bottom-up approach)
        - Space optimization in DP
        - 1D DP problems: Fibonacci, climbing stairs
        - Classic problems: Coin change, rod cutting
        - DP state definition
        - Recurrence relation formulation
        - Base cases identification
        - DP vs greedy vs divide-conquer
      Projects built:
        - DP problem solver framework
        - Fibonacci calculator (all methods)
        - Optimal game strategy simulator
        - Resource allocation optimizer
      Practice: Solve 50 basic DP problems
    String DP Problems
      Topics:
        - Longest Common Subsequence (LCS)
        - Longest Common Substring
        - Edit distance (Levenshtein distance)
        - Longest Palindromic Subsequence
        - Longest Palindromic Substring
        - String interleaving
        - Wildcard pattern matching
```

```
      - Regular expression matching
      - Distinct subsequences count
      - String compression DP
      - Word break problems
      - Palindrome partitioning
    Projects built:
      - Diff tool implementation
      - DNA sequence aligner
      - Spell checker with corrections
      - Text similarity analyzer
    Practice: Master 30 string DP problems
  Grid & Matrix DP
    Topics:
      - Grid traversal problems
      - Unique paths counting
      - Minimum path sum
      - Maximum path sum variants
      - Dungeon game type problems
      - Cherry pickup problem
      - Matrix chain multiplication
      - Maximal rectangle in binary matrix
      - Largest square in matrix
      - 2D range sum queries
      - DP on grids with obstacles
      - Multi-dimensional DP
    Projects built:
      - Pathfinding game with obstacles
      - Matrix optimizer tool
      - Grid-based puzzle solver
      - 2D resource collector game
    Practice: Solve 35 grid DP problems
  Knapsack & Subset Problems
    Topics:
      - 0/1 Knapsack problem
      - Unbounded knapsack
      - Fractional knapsack (greedy)
      - Subset sum problem
      - Partition equal subset sum
      - Target sum with +/- operators
      - Minimum subset sum difference
      - Count of subset sum
      - Coin change variations
      - Rod cutting variations
      - Job scheduling with profits
      - Knapsack with multiple constraints
    Projects built:
      - Backpack optimizer for games
      - Budget allocation system
      - Partition optimizer
      - Investment portfolio selector
    Practice: Master all knapsack variations
  Tree DP
    Topics:
      - DP on trees concept
      - Tree diameter using DP
      - Maximum path sum in tree
      - Tree balancing problems
      - Subtree problems with DP
      - Re-rooting technique
      - Binary tree cameras problem
      - Tree coloring with constraints
      - Maximum independent set in tree
      - Tree matching problems
      - DP with tree traversal
      - Optimizing tree recursions
    Projects built:
      - Tree optimization visualizer
      - Network optimizer with DP
      - Tree game strategies
      - Hierarchical resource distributor
    Practice: Solve 25 tree DP problems

Month 8: Advanced DP & Optimization (Weeks 32-36)
  DP with Bitmasks
    Topics:
      - Bitmask representation basics
      - Bit manipulation operations review
      - DP with bitmask states
      - Traveling Salesman with DP
```

```
    - Hamiltonian path with bitmasks
    - Assignment problems with masks
    - Subset iteration with bitmasks
    - Profile optimization technique
    - Broken profile DP
    - SOS (Sum over Subsets) DP
    - Bitmask DP optimizations
    - Memory optimization with masks
  Projects built:
    - TSP solver with visualization
    - Task assignment optimizer
    - Board game AI with bitmask DP
    - Subset analyzer tool
  Practice: Master 20 bitmask DP problems
Interval DP & Games
  Topics:
    - Interval DP pattern
    - Matrix chain multiplication revisited
    - Burst balloons problem
    - Palindrome partitioning minimum cuts
    - Optimal binary search tree
    - Game theory basics: Nim game
    - Minimax algorithm
    - Alpha-beta pruning
    - Sprague-Grundy theorem
    - Combinatorial game theory
    - DP in game strategies
    - Winning and losing positions
  Projects built:
    - Game strategy analyzer
    - Optimal BST builder
    - Nim game variations player
    - Two-player game framework
  Practice: Solve 25 interval DP and game problems
DP Optimizations
  Topics:
    - Convex hull trick
    - Divide and conquer optimization
    - Knuth-Yao speedup
    - Monotone queue optimization
    - Slope trick introduction
    - CHT (Convex Hull Trick) applications
    - Li Chao tree basics
    - Matrix exponentiation for DP
    - DP on DAGs
    - Rolling hash with DP
    - Digit DP technique
    - DP with data structures
  Projects built:
    - DP optimizer tool
    - Performance comparison framework
    - Convex hull visualizer
    - Advanced DP solver
  Practice: Apply optimizations to 20 DP problems
Probability & Expected Value DP
  Topics:
    - Probability basics review
    - Expected value concept
    - DP with probabilities
    - Dice problems with DP
    - Random walk problems
    - Markov chains introduction
    - Expected value optimization
    - Monte Carlo methods basics
    - Linearity of expectation
    - Probabilistic algorithms
    - DP in stochastic processes
    - Applications in games and simulations
  Projects built:
    - Dice game simulator
    - Probability calculator
    - Random process analyzer
    - Expected value optimizer
  Practice: Solve 20 probability DP problems
State Space Reduction
  Topics:
    - State space explosion problem
    - State compression techniques
    - Symmetry reduction
```

```
      - Equivalence class reduction
      - Meet in the middle technique
      - Bidirectional search
      - State space pruning
      - Heuristic state reduction
      - Memory-efficient DP
      - External memory DP
      - Parallel DP basics
      - DP state design patterns
    Projects built:
      - State space optimizer
      - Memory-efficient solver
      - Large-scale DP processor
      - State reduction analyzer
    Practice: Optimize 15 DP solutions for memory

Month 9: Computational Geometry & Number Theory (Weeks 37-39)
  Computational Geometry Basics
    Topics:
      - Points, lines, and vectors
      - Distance calculations
      - Orientation of three points
      - Collinearity check
      - Line intersection detection
      - Segment intersection
      - Point in polygon test
      - Convex hull algorithms
      - Graham scan implementation
      - Jarvis march (Gift wrapping)
      - Area of polygon
      - Closest pair of points
    Projects built:
      - Geometry calculator suite
      - Convex hull visualizer
      - Collision detection system
      - Polygon area calculator
    Practice: Solve 30 basic geometry problems
  Advanced Number Theory
    Topics:
      - Extended Euclidean algorithm
      - Modular multiplicative inverse
      - Chinese Remainder Theorem
      - Fermat's little theorem
      - Euler's totient function
      - Miller-Rabin primality test
      - Pollard rho factorization
      - Baby-step giant-step
      - Discrete logarithm
      - Quadratic residues
      - Primitive roots
      - Number theoretic transforms
    Projects built:
      - RSA encryption implementation
      - Prime number toolkit
      - Cryptographic hash function
      - Number theory calculator
    Practice: Solve 25 number theory problems
  Combinatorics & Counting
    Topics:
      - Advanced permutation generation
      - Combination with repetition
      - Catalan numbers applications
      - Stirling numbers
      - Bell numbers
      - Derangements
      - Inclusion-exclusion principle
      - Generating functions basics
      - Recurrence solving techniques
      - Burnside's lemma
      - Polya enumeration
      - Advanced counting techniques
    Projects built:
      - Combinatorics calculator
      - Sequence generator tool
      - Counting problem solver
      - Pattern enumeration system
    Practice: Master 20 combinatorics problems
    Assessment: Phase 3 exam: a practical build defended live, plus a written paper mixing
    this phase with everything before it
```

PHASE 4: THE FINALE (MONTH 10, WEEKS 40-44)

The capstone month: spec, build, ship and defend, then the final exam that decides the certificate.

Month 10: Capstone and the Final Exam (Weeks 40-44)
Capstone Spec and Setup
Topics:
- Choosing the capstone: a problem-solving portfolio: a set of hard, multi-part challenges solved, documented and explained clearly
- A one-page spec: scope, milestones, stack
- Repository and skeleton ready on day one
- Instructor sign-off before the build begins
Projects built:
- Approved capstone spec plus the running skeleton
Practice: Pitch the spec to the batch and absorb one hard question
Capstone Build
Topics:
- Two focused weeks in vertical slices
- Instructor checkpoints and honest scope cuts
- Using the whole course: every structure and technique learned, chosen to fit each problem
- Daily commits and an always-working build
Projects built:
- The capstone, feature-complete with version control
Practice: A working build at the end of every session
Ship and Polish
Topics:
- The finishing pass: edge cases, errors, documentation
- Solutions explained, not just submitted: correct, reasoned and communicated
- A README worth reading and a demo worth watching
- A full-course spiral review before the exam
Projects built:
- The capstone shipped, documented and rehearsed
Practice: Two mock demos, each tighter than the last
Demo Day and the Final Exam
Topics:
- Presenting the capstone: live demo plus the hardest bug story
- The honest map of next roads: our competitive programming course for contests, and our DSA course for interview-grade depth
- Where our other courses continue the journey
Projects built:
- Demo day presentation delivered to the batch
Assessment: FINAL EXAM: a practical build plus a written paper with questions mixed from every phase. Passing earns the certificate; falling short earns a focused revision plan and a free retest

PROJECTS THE STUDENT BUILDS AND KEEPS

- Phase 1: logic and core-structure problem sets
- Phase 2: data-structure and algorithm challenges
- Phase 3: dynamic-programming and technique problem sets
- Phase 4: the problem-solving portfolio capstone

Total projects: 200+ problems solved and every core structure implemented, crowned by a portfolio capstone

SKILLS THE STUDENT WILL HAVE AT THE END

- Programming logic: conditionals, loops, functions and clean decomposition
- Core structures: arrays, strings, hash maps, stacks, queues, linked lists, recursion
- Data structures and algorithms: trees, heaps, graphs, sorting, searching
- Dynamic programming: the topic that unlocks the hardest problems
- Problem-solving patterns that transfer to unseen problems

HOW A TYPICAL WEEK IS SPLIT

Live classes: 2 live one-hour classes per week, coding along with the instructor
Homework: A problem set after every class, and a mixed-review assignment at the end of every month
Practice: 4-6 hours of building between classes
Review: Every submission reviewed with written feedback; recurring gaps reopened in class

SUPPORT INCLUDED

Doubt support: WhatsApp doubt support between classes
Progress updates: Honest monthly progress reviews: what is solid, what is wobbly, and the plan for the wobble

CERTIFICATION DETAIL

  Completion: Certificate from Modern Age Coders, awarded on passing the final exam. Fall short
    and there is focused revision and a free retest: the certificate certifies knowledge, not
    attendance

WHERE THIS CAN LEAD

  - Our competitive programming course for contest speed and technique
  - Our DSA course for interview-grade depth and communication
  - Any language course here pairs with this problem-solving spine
  - Coding olympiads and contests, with a real foundation behind you

COMMON QUESTIONS ABOUT THIS COURSE

  For anything about cost, use PART 4 and RULE 1. Do not quote two regions.

  Q: What does this problem-solving course for teens cover?
  A: Logic and programming foundations first (conditionals, loops, functions, arrays, strings,
  hash maps, stacks, queues, linked lists, recursion), then core data structures and algorithms
  (trees, heaps, graphs, sorting, searching, algorithm design), then dynamic programming and
  problem-solving techniques with counting and geometry basics. Everything is taught through
  problems, focusing on transferable patterns. A finale month builds a problem-solving
  portfolio and sits the final exam.

  Q: How long does it take to learn problem solving properly?
  A: Ten months of teaching at 2 live classes a week plus 4 to 6 hours of practice, with two
  more months in hand for learners who need them. The three teaching phases build the skill and
  its real-world application; the finale month ships a capstone and sits the final exam.

  Q: How am I assessed? Is the certificate just for attending?
  A: No. Problem sets follow every class with written feedback, monthly reviews deliberately
  mix new material with earlier topics, each phase ends with a cumulative exam, and the course
  ends with a final exam: a practical build plus written questions from the whole syllabus.
  Passing earns the certificate; falling short earns focused revision and a free retest.

  Q: Does my teenager need coding experience to start?
  A: No. The course begins with programming logic from scratch and builds up. What matters is
  curiosity and a willingness to sit with a hard problem, which is exactly the habit the course
  trains. Any language works; we most often use Python because it keeps the focus on the
  thinking.

  Q: Is this the same as your competitive programming course?
  A: No, and the difference is deliberate. This teens course builds the foundation, logic, data
  structures, algorithms and problem-solving patterns at a teen pace. Our competitive
  programming course is the intense, contest-focused next step (advanced techniques, speed,
  olympiad and ICPC preparation), and our DSA course is the interview-focused one. Teens who
  finish this and want more are perfectly placed for either.

  Q: Can I try a class before enrolling?
  A: Yes, a free demo class with no commitment: book at learn.modernagecoders.com/contact or
  message us on WhatsApp at +91 91233 66161. (Agent note: the free demo is a waiting list with
  no fixed date. The Priority Live Demo is a guaranteed class today or tomorrow, booked at
  https://learn.modernagecoders.com/priority-demo . Offer both, as RULE 3 says.)

  Q: Are classes live or recorded?
  A: Live, always: small groups with a real instructor reading your actual code, never
  pre-recorded videos.

  To enrol, message Shivam Sir on +91 9123366161 or send the parent this link: https://learn.modernagecoders.com/courses/problem-solving-dsa-masterclass-teens
  For a demo: the Priority Live Demo (guaranteed, today or tomorrow) is booked at
  https://learn.modernagecoders.com/priority-demo . The free demo is a waiting list with no fixed date.

==
COURSE 115 OF 137: PSLE MATHS: MODEL METHOD, PROBLEM SUMS & MOE SYLLABUS
==

Course link: https://learn.modernagecoders.com/courses/psle-maths-mastery
Subject area: Exam Board Mathematics
Designed for: Elementary school
Who can join: Primary 4-6 students on the MOE syllabus, PSLE-bound
Course length: 12 months (52 weeks)
Time needed: 2 live one-hour classes per week + short practice sets
Certificate: Certificate from Modern Age Coders, awarded on passing the final assessment

PRICE FOR THIS COURSE (quote only the one that applies to the person asking)
  In India, per month: group Rs 1,499, mini batch Rs 2,999, one to one Rs 4,999

In Canada, per month: group CAD 140, one to one CAD 210
Anywhere else, per month: group $100, one to one $150
Classes: group and mini batch two live classes a week, eight a month; one to one in India one live class a week, four a month; one to one outside India two live classes a week, eight a month. Each class is one hour.

WHAT THIS COURSE IS

Live online PSLE maths on the MOE syllabus: model method taught as thinking, problem-sum families, no-calculator Paper 1 craft, Singapore evening slots.

In one line: Problem sums are a teachable skill. We teach it, 1-on-1, without the centre queue.

ABOUT THE PROGRAMME

A 12-month live program aimed squarely at PSLE mathematics, taught on the MOE syllabus at Singapore-friendly evening hours. The PSLE separates thinkers from drillers: multi-step problem sums, a no-calculator Paper 1, and AL scoring where consistency is everything. This course teaches the model method as a thinking tool rather than a template, names and trains the heuristics explicitly, builds calculator-free fluency in every class, and closes with paper craft, time discipline, working presentation and the mark-banking habits that protect AL bands.

WHAT MAKES THIS COURSE DIFFERENT

- The model method taught as reasoning, part-whole, comparison, before-after and re-cutting, not as a ritual the school demands
- Problem sums taught by structure family, so new problems look like old friends in disguise
- MOE heuristics named and trained explicitly: work backwards, guess-and-check with discipline, restate, spot patterns
- Paper 1 fluency drills open every class, because AL bands are lost one careless mark at a time
- 1-on-1 attention no centre batch of fifteen can give, at Singapore evening hours
- Understanding-first: a child who can draw what the numbers are doing owns the problem
- One dedicated mentor tracking exactly where your child's reasoning thins
- Honest AL guidance from real timed-paper evidence, never invented promises

THE LEARNING PATH, STEP BY STEP

Phase 1: The method rebuilt properly: number fluency, model drawing as thinking, and the first problem-sum families
Phase 2: The P5-P6 canon: fractions of remainder, ratio, percentage, speed and geometry, family by family
Phase 3: Exam craft: Paper 1 and 2 technique, timed papers, mark-banking discipline and the calm P6 runway to the PSLE

WHAT A STUDENT NEEDS BEFORE STARTING

Education: Primary 4-6 on the MOE syllabus (or equivalent international students using Singapore-style curricula)
Math background: Any, the diagnostic finds the real stage and the method phase rebuilds from there
Equipment: Computer with stable internet, notebook and pencil; calculator for Paper 2 work
Time commitment: 2 live hours plus 1-2 practice hours weekly
English: Course taught in English
Motivation: A child willing to draw and explain, the method does the rest

WHO THIS COURSE IS FOR

Problem sum strugglers: Children whose computation is fine but whose problem sums produce blank stares
Template drawers: Children who draw models as ritual without the bars carrying the reasoning
Paper 1 leakers: Children losing careless marks to calculator-free arithmetic
Centre switchers: Families whose centre batch is not teaching their child
P4 planners: P4 families starting the method work early, when it is cheapest

FULL CURRICULUM, WEEK BY WEEK

This is the complete teaching plan. Parents can ask about any week.

PHASE 1: THE METHOD, REBUILT PROPERLY (MONTHS 1-4)

The gap behind most PSLE struggles is a model method learned as template instead of thinking. This phase rebuilds number fluency and model drawing from meaning, then applies both to the first problem-sum families.

Month 1: Diagnostic + Number Fluency, Bare-Handed (Weeks 1-4)
Diagnostic and the Honest AL Baseline

    Topics:
      - Model-method depth check across part-whole and comparison bars
      - Paper 1 non-calculator fluency screen
      - Locating exactly where problem sums break down
      - Honest Achievement Level (AL) baseline from timed questions
      - Whole-number, fraction and decimal accuracy audit
      - Reading-the-question and working-presentation habits
    Practice: A short mixed diagnostic of Paper 1 items and two problem sums, marked to expose the real starting stage.
    Assessment: Baseline AL estimate plus a written map of which problem-sum families and Paper 1 skills need the most work.
    Detail: Full diagnostic: model-method depth, Paper 1 fluency, and exactly where problem sums break, with an honest AL baseline
  Whole-Number Operations at Paper 1 Tempo
    Topics:
      - Addition, subtraction, multiplication and division fluency
      - Long multiplication and long division without a calculator
      - Order of operations in multi-step calculations
      - Estimation and rounding as a checking habit
      - Mental strategies for speed on Paper 1 items
      - Place value and number sense to catch slips
    Practice: A timed whole-number drill set plus five estimation checks on given answers.
    Detail: Whole-number operations at Paper 1 tempo; estimation as a checking habit
  Fractions as Numbers, From Pictures First
    Topics:
      - Fractions on a number line as genuine quantities
      - Equivalent fractions and simplifying
      - Comparing and ordering fractions
      - Adding and subtracting unlike fractions
      - Multiplying and dividing fractions with meaning
      - Bar and area pictures behind every rule
    Practice: A fractions set moving from picture-drawn answers to fluent written computation.
    Detail: Fractions as numbers: equivalence, comparison and operations from pictures first
  Decimals and the Fraction-Decimal-Percentage Bridge
    Topics:
      - Decimal place value and the four operations
      - Converting fractions to decimals and back
      - Linking decimals, fractions and percentages
      - Rounding decimals and estimating results
      - Money and measurement contexts
      - Fluency drills across all three forms
    Practice: Conversion drills and mixed decimal calculations at Paper 1 pace.
    Detail: Decimals and the fraction-decimal-percentage bridge, to fluency

Months 2-3: Model Drawing as Thinking (Weeks 5-12)
  Part-Whole Models as Reasoning
    Topics:
      - Part-whole bar model as a picture of the numbers
      - Drawing the unknown before computing
      - Total, part and missing-part relationships
      - Translating word phrases into bar segments
      - The child draws first, the mentor questions
      - Checking the model against the story
    Practice: Six part-whole problem sums where the bar is drawn before any calculation.
    Detail: Part-whole models: the child draws, the mentor questions, never the reverse
  Comparison Models Made Visible
    Topics:
      - Comparison bars for more-than and less-than
      - Times-as-many and multiplicative comparison
      - Aligning bars to reveal the difference
      - Two-quantity and three-quantity comparisons
      - Choosing comparison over part-whole
      - Defending the chosen model aloud
    Practice: A comparison-model set mixing additive and multiplicative relationships.
    Detail: Comparison models: more-than, less-than and times-as-many, made visible
  Unit Thinking and Re-Cutting Bars
    Topics:
      - Treating one unit as the engine of a model
      - Deciding how many parts to cut a bar into
      - Re-cutting a bar when the story changes
      - Finding unit value then scaling up
      - Flexibility that templates cannot supply
      - Common-part reasoning across quantities
    Practice: Problems requiring the student to choose the cut, then re-cut when stuck.
    Detail: Unit thinking: when to cut a bar into parts, and the re-cutting flexibility templates cannot supply
  First Structure Families: Sum-and-Difference

```
      Topics:
        - Sum-and-difference problem family
        - Equal-stage and equal-value problems
        - Recognising the skeleton under the wording
        - Matching model shape to family
        - Solving then explaining the reasoning aloud
        - Extending a solved problem to a variant
      Practice: A family-sorted set of sum-and-difference and equal-stage problem sums.
      Detail: First structure families: sum-and-difference and equal-stage problems, solved
      by model and defended aloud

  Month 4: Heuristics, Named and Trained (Weeks 13-16)
    Work Backwards Heuristic
      Topics:
        - Recognising end-state problems
        - Reversing each operation in turn
        - Undoing add, subtract, multiply and divide
        - Model support for backward reasoning
        - Checking by working forwards again
        - When work-backwards beats other methods
      Practice: A set of end-state problems solved by unwinding step by step.
      Detail: Work backwards: end-state problems unwound step by step
    Disciplined Guess-and-Check
      Topics:
        - Setting up an organised guess-and-check table
        - Choosing a sensible first guess
        - Using each result to steer the next guess
        - Column headings that show the reasoning
        - Knowing when guess-and-check is efficient
        - Presenting the table for method marks
      Practice: Guess-and-check problems recorded in a clean, columned table.
      Detail: Guess-and-check with discipline: the organised table, not wild stabs
    Restate and Simplify
      Topics:
        - Stripping a wordy problem to its core
        - Restating in the student's own words
        - Identifying the quantity actually asked for
        - Turning sentences into a drawable model
        - Removing distracting detail
        - Simplify-then-solve as a habit
      Practice: Wordy problems rewritten in one line, then drawn and solved.
      Detail: Restate and simplify: turning wordy problems into drawable ones
    Phase 1 Checkpoint
      Topics:
        - Mixed problem-sum set across all Phase 1 families
        - Model choice under mixed conditions
        - Explaining each solution aloud
        - Extending problems to harder variants
        - Heuristics applied without prompting
        - Error log started from checkpoint mistakes
      Practice: A mixed timed problem-sum set covering every Phase 1 family.
      Assessment: Phase 1 checkpoint marked for method and reasoning, feeding the first
      error-log entries.
      Detail: Phase checkpoint: mixed problem-sum set solved, explained and extended

---------------------------------------------------------------
PHASE 2: THE P5-P6 CANON, FAMILY BY FAMILY (MONTHS 5-9)
---------------------------------------------------------------
The problem-sum territory where the PSLE decides its top bands, taught by structure family so
your child recognises the skeleton under every costume: fractions of remainder, ratio and its
changes, percentage, speed and geometry.

  Month 5: Fractions of Remainder and Branch Models (Weeks 17-20)
    Remainder Concept and Branch Models
      Topics:
        - Fraction of a remainder made visible
        - Branch models for successive fractions
        - Re-cutting into common parts
        - Tracking what is left after each stage
        - Restoring the whole from a known part
        - Two-stage remainder reasoning
      Practice: Branch-model problems working from a remainder back to the whole.
      Detail: The remainder concept made visible: branch models and the re-cut into common
      parts
    Multi-Stage Remainder Problems
      Topics:
        - Classic PSLE remainder problem sums
        - Three-stage and multi-stage remainders
        - Combining branch models with unit value
```

      - Fraction-of-remainder with a given amount
      - Spotting the common-part cut quickly
      - Presenting long working clearly
    Practice: A set of exam-standard remainder problems, including multi-stage versions.
    Detail: Classic remainder problems at PSLE standard, including the multi-stage versions
    that humble adults

Month 6: Ratio, and Ratio That Changes (Weeks 21-24)
  Ratio as Units
    Topics:
      - Ratio read as units
      - Equivalent ratios and simplifying
      - Sharing a quantity in a given ratio
      - The unit-value engine for ratio problems
      - Two-term and three-term ratios
      - Ratio bars linked to fractions
    Practice: Ratio problems solved through the unit-value method with bar support.
    Detail: Ratio as units: equivalent ratios, sharing and the unit-value engine
  Before-and-After Ratio Problems
    Topics:
      - Before-and-after ratio changes
      - Constant-total problems
      - Constant-difference problems
      - Constant one-quantity problems
      - Choosing the invariant to anchor units
      - The PSLE signature ratio family
    Practice: Before-and-after ratio sets sorted by which quantity stays constant.
    Detail: Before-and-after problems: changed ratios, constant totals and constant
    differences, the PSLE's signature family

Month 7: Percentage in Every Costume (Weeks 25-28)
  Percentage Of, Increase and Decrease
    Topics:
      - Finding a percentage of a quantity
      - Percentage increase and decrease
      - GST and discount calculations
      - Chained percentage changes
      - Percentage with bar-model support
      - Everyday money contexts
    Practice: Percentage problems including discount-then-GST chains.
    Detail: Percentage of, increase and decrease, and GST-and-discount chains
  Reverse Percentage at Exam Standard
    Topics:
      - Reverse percentage: finding the original
      - Distinguishing part, whole and percentage
      - Percentage combined with bar models
      - Multi-step percentage problem sums
      - Checking answers against the original
      - Exam-standard presentation
    Practice: Reverse-percentage and percentage-with-model problems at PSLE level.
    Detail: Reverse percentage and percentage-with-model problems at exam standard

Month 8: Speed, Rate and the Journey Problems (Weeks 29-32)
  Speed as a Rate With Meaning
    Topics:
      - Speed understood as distance per unit time
      - Distance-time reasoning before formulas
      - Deriving the speed, distance, time triangle
      - Units and conversions in rate problems
      - Constant-speed situations
      - Reading a journey from a description
    Practice: Distance-time problems solved by reasoning, then confirmed by formula.
    Detail: Speed as a rate with meaning: distance-time reasoning before formulas
  Journey Problems and Average Speed
    Topics:
      - Meeting problems on journey diagrams
      - Catching-up and overtaking problems
      - Average speed over multiple legs
      - Total distance over total time
      - Two-object motion drawn to scale
      - Common average-speed traps
    Practice: Meeting, catching-up and average-speed problems on drawn journey diagrams.
    Detail: Meeting, catching-up and average-speed problems, drawn on journey diagrams

Month 9: Geometry, Area and the Visual Problems (Weeks 33-36)
  Angles and Figures With Justification
    Topics:
      - Angle facts for lines and triangles
      - Angle properties of quadrilaterals

        - Justifying each step with a reason
        - Composite and overlapping figures
        - Unknown angles in multi-shape diagrams
        - Clear geometric working
      Practice: Angle problems requiring a stated reason for every step.
      Detail: Angles, triangles and quadrilaterals with justification language; composite
      figures
    Area, Perimeter and Shaded Regions
      Topics:
        - Area and perimeter of composite shapes
        - Shaded-region classic problems
        - Subtracting and combining areas
        - Circle area and circumference at P6 standard
        - Fractions of a circle and semicircles
        - Presenting area working clearly
      Practice: Shaded-region and circle problem sums at PSLE standard.
      Detail: Area and perimeter problem sums including the shaded-region classics; circles
      at P6 standard

PHASE 3: PAPER CRAFT AND THE PSLE RUNWAY (MONTHS 10-12)

Understanding becomes AL bands here: Paper 1 speed without a calculator, Paper 2 working
discipline, timed full papers with review rituals, and a peak plan that walks into the PSLE
calm.

  Month 10: Paper 1 and Paper 2 as Different Skills (Weeks 37-40)
    Paper 1 Craft and Mental Strategies
      Topics:
        - Mental strategies for Paper 1 speed
        - No-calculator discipline under time
        - Banking one-mark and two-mark questions fast
        - Common Paper 1 question types
        - Avoiding careless-mark leaks
        - Order of attack on Paper 1
      Practice: A full Paper 1 section timed, focused on banking the short questions.
      Detail: Paper 1 craft: mental strategies, no-calculator discipline and the one-mark
      questions banked fast
    Paper 2 Craft and Method Marks
      Topics:
        - Presentation of working for method marks
        - Calculator use that saves time
        - Structuring multi-step Paper 2 answers
        - Showing enough working to secure marks
        - Units and final-answer discipline
        - Choosing when the calculator helps
      Practice: Paper 2 questions written up to full method-mark presentation standard.
      Detail: Paper 2 craft: presentation of working, method marks, and calculator use that
      helps instead of wastes time

  Month 11: Timed Papers and Mark Banking (Weeks 41-44)
    Full Timed Papers and Mark Banking
      Topics:
        - Full papers at true exam pacing
        - Banking secure marks first
        - Leaving the hardest problems for last
        - Time budgeting across Paper 1 and Paper 2
        - Managing pressure and pacing
        - Flagging and returning to hard items
      Practice: A complete timed paper sat under exam conditions with a pacing plan.
      Detail: Full timed papers at exam pacing; the banking discipline, secure marks first,
      wrestle the monsters last
    Review Rituals and the Error Log
      Topics:
        - Reviewing why each mark was lost
        - Naming the specific fix for each error
        - Sorting errors by type and frequency
        - Beginning error-log closure
        - Turning mistakes into targeted practice
        - Splitting careless from conceptual errors
      Practice: Each lost mark logged with a named fix and a follow-up practice item.
      Detail: Review rituals: why each mark was lost, and the named fix; error-log closure
      begins

  Month 12: The Calm Runway (Weeks 45-52)
    Weakest-Family Rotations
      Topics:
        - Rotations targeting the weakest families
        - Priority set by the error log

- Confidence work on nearly-mastered problems
- Revisiting problem-sum families that slip
- Spaced return to fixed errors
- Building momentum into the final weeks

Practice: Rotating problem sets aimed at the top error-log priorities each week.
Detail: Weakest-family rotations by error-log priority; confidence work through problems your child can nearly do, then can

Final Cycles and the Peak-Week Plan

Topics:

- Final full paper cycles
- Documented AL-trend progression
- Peak-week light-practice plan
- Rest and routine before the exam
- Exam-day rehearsal and timing
- The PSLE met as a rehearsed place

Practice: Final timed papers with progression recorded, tapering into light peak-week practice.
Assessment: Final timed PSLE-format papers scored and charted to confirm AL-trend progression before the exam.
Detail: Final paper cycles with documented progression; peak-week plan, light practice, rest, and the exam met as a rehearsed place

PROJECTS THE STUDENT BUILDS AND KEEPS

- Personal error log and problem-sum family map
- The child's own model-method handbook, drawn not copied
- Heuristics card set: each strategy named with a worked example
- Timed paper cycles with documented AL-trend progression
- Peak-week plan rehearsed before the real PSLE

Total projects: 5+ exam artifacts plus the child's own handbooks

SKILLS THE STUDENT WILL HAVE AT THE END

- Model drawing as a thinking tool
- All major problem-sum structure families
- MOE heuristics, named and applied
- Paper 1 calculator-free fluency
- Paper 2 working and method-mark discipline
- Fractions, ratio, percentage and speed at PSLE depth
- Geometry and shaded-region craft
- Time discipline and mark banking

HOW A TYPICAL WEEK IS SPLIT

Live classes: 2 one-hour live classes at Singapore evening hours
Practice: Short purposeful sets, never another assessment-book stack
Fluency: Paper 1-style warm-up in every class
Total per week: About 3-4 focused hours
Homework: A problem set after every class, and a monthly mixed-review assignment that deliberately folds in earlier topics

SUPPORT INCLUDED

Live sessions: 8 live one-hour classes every month, 2 per week
Mentorship: One dedicated mentor across the whole run
Recordings: Every class recorded for revision
Progress tracking: Timed-paper progression shared with parents
Flexibility: Slots move around school exams and family plans

CERTIFICATION DETAIL

Completion: Certificate from Modern Age Coders, awarded on passing the final assessment. Fall short and there is focused revision and a free retest: the certificate certifies mastery, not attendance

WHERE THIS CAN LEAD

- An AL band that reflects real ability, opening posting options
- Secondary-ready: the algebra handover met with model-method understanding underneath
- E Maths and A Maths readiness through Secondary
- Ready for GEP/DSA-style stretch via competition mathematics

COMMON QUESTIONS ABOUT THIS COURSE

For anything about cost, use PART 4 and RULE 1. Do not quote two regions.

Q: Is this course aligned to the MOE syllabus and the actual PSLE format?
A: Yes, the MOE primary mathematics syllabus is the spine, and exam work uses the real

format: the no-calculator Paper 1, Paper 2 with calculator, and AL scoring awareness throughout. We verify current SEAB formats for your child's cohort rather than assuming.

Q: How do the class timings work from Singapore?
A: You pick two weekly slots and they stay yours.

Q: My child computes well but freezes on problem sums. Can this be fixed?
A: Yes, problem sums are the most teachable 'talent' in Singapore maths. They break into structure families, each with a model shape and heuristic. We teach the families, then the re-cutting flexibility that separates thinkers from template-followers. A term of that work changes what your child sees when they read a problem.

Q: My child already attends a tuition centre. Why switch?
A: Sometimes you should not, a child thriving near the top of a good batch should stay. The switch wins when the batch pace is wrong in either direction: the struggling child whose specific gaps never get airtime, or the capable child rehearsing what they already know. Here, every minute of the hour aims at your child.

Q: When should PSLE prep start?
A: The full 12-month arc suits P5, finishing on the P6 runway; P6 students join a compressed version prioritised by the diagnostic. Earlier starts (P4) spend longer in the method phase, which is the highest-return work there is.

Q: What AL improvement can we expect?
A: We will not invent a number. What you get: an honest baseline in week one, the highest-value families attacked first, and timed-paper evidence you can track yourself. AL bands reward consistency, and consistency is a trainable behaviour.

Q: How am I assessed, and is the certificate just for showing up?
A: No. A problem set follows every class with written feedback, monthly reviews deliberately mix new material with earlier topics so nothing is forgotten, and the course ends with a full mock PSLE-style paper as the final assessment. Passing earns the certificate; falling short earns focused revision and a free retest. We measure real understanding, not attendance.

Q: Can we try it before paying?
A: Yes. Every child starts with a free live demo class at a Singapore evening hour that doubles as the diagnostic, no card details, no obligation.

To enrol, message Shivam Sir on +91 9123366161 or send the parent this link: https://learn.modernagecoders.com/courses/psle-maths-mastery
For a demo: the Priority Live Demo (guaranteed, today or tomorrow) is booked at https://learn.modernagecoders.com/priority-demo . The free demo is a waiting list with no fixed date.

==========
COURSE 116 OF 137: PYTHON AND AI FOR KIDS: GAMES, TURTLE ART AND SMART PROJECTS
==========

Course link: https://learn.modernagecoders.com/courses/python-ai-kids-masterclass
Subject area: Kids Coding
Designed for: Kids
Who can join: Complete beginner, ages 9 to 12
Course length: 8-10 months (32-40 weeks)
Time needed: 2 live classes/week + 2-3 hours practice
Certificate: Certificate from Modern Age Coders, awarded on passing the final exam

PRICE FOR THIS COURSE (quote only the one that applies to the person asking)
In India, per month: group Rs 1,499, mini batch Rs 2,999, one to one Rs 4,999
In Canada, per month: group CAD 140, one to one CAD 210
Anywhere else, per month: group $100, one to one $150
Classes: group and mini batch two live classes a week, eight a month; one to one in India one live class a week, four a month; one to one outside India two live classes a week, eight a month. Each class is one hour.

WHAT THIS COURSE IS

Python course for kids aged 9-12: live online classes from first code to turtle art, Pygame games and kid-safe AI projects, in 8-10 months.

In one line: Real typed Python at 9 to 12: turtle art that wows, games with Pygame, and AI understood the kid-safe way, by training models, not chatting with bots.

ABOUT THE PROGRAMME

Python is the friendliest real language a child can type, and this live online course makes the most of it for ages 9 to 12: from the first print statement to turtle graphics that draw spirals and snowflakes, real logic and loops, functions, files, first object-oriented thinking, and complete games built in Pygame that friends actually want to play. The AI phase is deliberately kid-safe and hands-on: children learn what AI is by building it small,

rules-based smart programs, data detective work on real (fun) datasets, and camera-based projects in the Teachable Machine style, where they train and test models themselves. There are no chatbot accounts and no AI-writes-the-code shortcuts, the major AI chat tools are 13+ by their own rules, and this course says so plainly while building the skills that will make such tools genuinely useful later. The pace is honest and kid-sized: eight months at two live classes a week plus two to three hours of playful practice, with two more months in hand when needed. Homework after every class, a mixed challenge at the end of every month, and a final exam, a capstone demo plus a friendly viva, that decides the certificate, with a free retest after revision. Real Python, real games, real understanding.

WHAT MAKES THIS COURSE DIFFERENT

- Real typed Python from day one, at a pace built for 9 to 12 year olds
- Turtle graphics as the hook: art a child can print and stick on the fridge, powered by loops
- Complete Pygame games: finished, playable, shared with family, not half-built demos
- Kid-safe AI: models trained by the child, rules-based smart programs, no chatbot accounts (those tools are 13+, and we say so)
- An honest 8-month arc with 2 months in hand: nobody is rushed, nobody coasts
- Real assessment, gently done: monthly mixed challenges and a final capstone exam with a free retest

THE LEARNING PATH, STEP BY STEP

Phase 1: Python basics (Months 1-2): print to loops, taught through jokes, quizzes and games
Phase 2: Turtle and data powers (Months 3-4): turtle art, lists and functions, the coder toolkit
Phase 3: Real games (Months 5-6): files, first OOP, and complete Pygame games with scores and sounds
Phase 4: Kid-safe AI and the finale (Months 7-8): what AI really is, data detective work, camera projects, and the capstone exam

WHAT A STUDENT NEEDS BEFORE STARTING

Coding experience: None. Python is taught from the very first line
Reading typing: Comfortable reading; typing grows quickly inside the course
Equipment: A computer or laptop with a stable internet connection; Python and every tool used are free
Age: 9 to 12. Younger children start better in our Scratch-first Kids Coding course
Time commitment: 2 live classes plus 2-3 hours of playful practice a week

WHO THIS COURSE IS FOR

Ready typists: Children 9-12 ready for real typed code, often straight from Scratch
Game lovers: Kids who will move mountains to build a game their friends can play
Ai curious: Children asking how Alexa and recommendations actually work, ready for honest answers
Puzzle minds: Kids who love logic puzzles and want a language that rewards them
Future teens: Children who will roll into our teen Python and AI courses years ahead

FULL CURRICULUM, WEEK BY WEEK

This is the complete teaching plan. Parents can ask about any week.

PHASE 1: PYTHON BASICS (MONTHS 1-2, WEEKS 1-8)

The first real language, learned through play: printing, variables, decisions and loops, every week ending with something funny or clever to show at home.

Month 1: First Code (Weeks 1-4)
Welcome to Programming & Setup
Topics:
- What is programming? How do computers understand us?
- Why Python? The language that powers YouTube, Instagram, and AI
- Installing Python - making your computer ready to code
- Using IDLE - Python's friendly coding environment
- Your first program: Making Python say 'Hello World!'
- Using print() to display messages
- Creating colorful text outputs
- Comments - leaving notes in your code
- Making Python do math - calculator programs
- Common errors and how to fix them
- Saving and running Python files
- Organizing your coding projects
Projects built:
- Personalized greeting program
- Magic calculator with special messages
- Story generator with your name
Practice: Daily: Create 3 different print programs, solve 5 math problems with Python

```
    Variables & Data Types - Teaching Python to Remember
      Topics:
        - Variables - giving names to information
        - Choosing good variable names
        - Numbers in Python: integers and decimals
        - Text in Python: strings and how to use them
        - True or False: boolean values
        - Changing variable values
        - Getting input from users with input()
        - Converting between different types
        - Fun with strings: uppercase, lowercase, length
        - String concatenation - joining words together
        - Special characters and escape sequences
        - Creating Mad Libs games with variables
      Projects built:
        - Interactive story with user input
        - Age calculator with birthday messages
        - Mad Libs game generator
        - Personal quiz about yourself
      Practice: Create 5 programs using different variable types
      Assessment: Month 1 check: build a talking mini-program live, plus a fun take-home
      challenge

  Month 2: Decisions and Loops (Weeks 5-8)
    Making Decisions with If-Else
      Topics:
        - If statements - teaching Python to make choices
        - Comparison operators: ==, !=, <, >, <=, >=
        - Else statements - what to do otherwise
        - Elif - checking multiple conditions
        - Combining conditions with and, or, not
        - Nested if statements - decisions within decisions
        - Creating quiz games with scoring
        - Password checker programs
        - Age-appropriate content filters
        - Random module - adding surprises to programs
        - Making a magic 8-ball program
        - Building simple AI decision makers
      Projects built:
        - Adventure game with choices
        - Grade calculator with feedback
        - Virtual pet mood checker
        - Rock, Paper, Scissors game
      Practice: Build 5 decision-making programs
    Loops - Making Python Repeat
      Topics:
        - For loops - counting and repeating
        - Range() function - controlling loop counts
        - While loops - repeat until something happens
        - Breaking out of loops with break
        - Skipping with continue
        - Nested loops - loops inside loops
        - Creating patterns with loops
        - Drawing ASCII art with loops
        - Countdown and timer programs
        - Multiplication table generator
        - Password attempt limiters
        - Animation basics with loops and time.sleep()
      Projects built:
        - Pattern art generator
        - Guessing game with attempts
        - Countdown timer with effects
        - ASCII art animation
      Practice: Create 10 different loop patterns and animations
      Assessment: Month 2 check: a guessing game built live, with quiz questions reaching
      back to month 1

------------------------------------------------------------
PHASE 2: TURTLE ART AND CODER POWERS (MONTHS 3-4, WEEKS 9-16)
------------------------------------------------------------
The famous turtle draws what the child commands: spirals, stars and snowflakes, then lists
and functions turn scripts into real programs.

  Month 3: The Turtle Awakens (Weeks 9-12)
    Introduction to Turtle Graphics
      Topics:
        - What is Turtle Graphics? Your drawing robot
        - Setting up the turtle screen
        - Basic movements: forward, backward, left, right
```

- Drawing shapes: squares, triangles, circles
- Changing turtle appearance and speed
- Colors in turtle: pen color and fill color
- Lifting and putting down the pen
- Going to specific positions
- Drawing with coordinates
- Creating custom shapes
- Saving turtle drawings
- Multiple turtles on screen

Projects built:
- Geometric art generator
- House drawing program
- Rainbow spiral creator
- Name writer in turtle

Practice: Draw 10 different shapes and patterns

Advanced Turtle Projects

Topics:
- Using loops with turtle for complex patterns
- Creating functions for repeated shapes
- Building a drawing app with keyboard control
- Mouse events in turtle
- Creating simple games with turtle
- Collision detection basics
- Score keeping in turtle games
- Creating mazes with turtle
- Animating turtle movements
- Fractal patterns with recursion basics
- Turtle race game
- Building a paint program

Projects built:
- Controllable turtle game
- Turtle race simulator
- Maze solver with turtle
- Digital spirograph

Practice: Create 5 interactive turtle programs

Assessment: Month 3 check: a turtle art commission drawn live from a family request, plus mixed review

Month 4: Lists and Functions (Weeks 13-16)

Lists & Collections

Topics:
- Lists - storing multiple items
- Accessing list items with indexes
- Adding items: append, insert
- Removing items: remove, pop, clear
- List slicing - getting parts of lists
- Sorting and reversing lists
- Finding items in lists
- List comprehensions - the Python superpower
- 2D lists - lists inside lists
- Tuples - lists that can't change
- Sets - unique item collections
- Dictionaries - key-value pairs

Projects built:
- Todo list manager
- High score tracker
- Inventory system for games
- Contact book application

Practice: Build 5 programs using different list operations

Functions - Reusable Code Blocks

Topics:
- What are functions? Why use them?
- Creating simple functions with def
- Parameters - giving information to functions
- Return values - getting answers from functions
- Multiple parameters and default values
- Local vs global variables
- Function documentation with docstrings
- Lambda functions - tiny functions
- Recursion - functions calling themselves
- Building a function library
- Importing and using modules
- Creating your own modules

Projects built:
- Calculator with function menu
- Text adventure with function rooms
- Utility function collection
- Math game with scoring functions

Practice: Create 10 useful functions for future projects

```
      Assessment: Month 4 check: refactor a messy script into functions live, plus mixed
      review

------------------------------------------------------------
PHASE 3: REAL GAMES (MONTHS 5-6, WEEKS 17-24)
------------------------------------------------------------
Programs that remember and games that feel real: files and saving, first object thinking,
then Pygame from the game loop to finished, shareable games.

  Month 5: Memory and Objects (Weeks 17-20)
    File Handling & Data
      Topics:
        - Reading from text files
        - Writing to text files
        - Append mode vs write mode
        - Working with CSV files
        - Creating save files for games
        - Loading game progress
        - Simple encryption for files
        - Creating a diary application
        - Managing high scores
        - Building a note-taking app
        - File organization programs
        - Backup utilities
      Projects built:
        - Personal diary with password
        - Quiz game with saved scores
        - File organizer utility
        - Simple database system
      Practice: Build 5 file-based applications
    Object-Oriented Programming Basics
      Topics:
        - What are objects and classes?
        - Creating your first class
        - Attributes - what objects know
        - Methods - what objects can do
        - Creating multiple objects from one class
        - The __init__ method
        - Self - referring to the object itself
        - Class vs instance variables
        - Inheritance - classes having children
        - Making a pet class system
        - Building game characters with OOP
        - Real-world object modeling
      Projects built:
        - Virtual pet simulator
        - RPG character creator
        - School management system
        - Zoo animal hierarchy
      Practice: Create 5 different class systems
      Assessment: Month 5 check: a save-and-load app built live, plus mixed review

  Month 6: Pygame (Weeks 21-24)
    Introduction to Pygame
      Topics:
        - What is Pygame? Making real games!
        - Installing and setting up Pygame
        - Creating game windows
        - Game loop concept
        - Drawing shapes and colors
        - Loading and displaying images
        - Sprite basics
        - Moving objects on screen
        - Keyboard input in games
        - Mouse control in games
        - Frame rate and smooth movement
        - Coordinate system in games
      Projects built:
        - Bouncing ball animation
        - Simple drawing program
        - Moving character demo
        - Click the target game
      Practice: Create 5 simple Pygame demos
    Building Complete Games
      Topics:
        - Collision detection in games
        - Score keeping and lives
        - Game states: menu, playing, game over
        - Sound effects and music
```

- Creating game levels
- Power-ups and bonuses
- Enemy AI basics
- Particle effects
- High score saving
- Pause functionality
- Full screen mode
- Packaging games for sharing

Projects built:
- Snake game remake
- Space shooter game
- Platform jumper game
- Puzzle matching game

Practice: Add features to existing games

Assessment: Phase check: a complete small game demoed live, plus a mixed challenge spanning phases 1-3

PHASE 4: KID-SAFE AI AND THE FINALE (MONTHS 7-8, WEEKS 25-32)

AI learned the honest way for this age: built small, trained by the child, tested for mistakes, and finished with a capstone at demo day.

Month 7: AI, Discovered Properly (Weeks 25-28)

What is Artificial Intelligence?

Topics:
- AI in everyday life - Siri, Alexa, YouTube recommendations
- How do computers learn? Simple explanation
- Difference between programming and AI
- Types of AI: narrow vs general
- Machine Learning basics for kids
- Supervised vs unsupervised learning
- Training data concept
- Making predictions
- Pattern recognition
- AI ethics - using AI responsibly
- Famous AI applications
- Future of AI
- Why the famous AI chat tools are 13+, said plainly
- Building a rules-based smart helper in pure Python

Projects built:
- AI concept presentation
- Design your dream AI assistant
- AI in daily life tracker
- Simple pattern recognizer

Practice: Research and present 5 AI applications

Data Detective Work

Topics:
- What is data? Why is it important?
- Collecting and organizing data
- NumPy basics - working with numbers
- Pandas basics - data tables
- Reading data from files
- Cleaning messy data
- Finding patterns in data
- Basic statistics: mean, median, mode
- Creating charts with Matplotlib
- Bar charts, pie charts, line graphs
- Making data tell stories
- Data visualization projects

Projects built:
- Class survey analyzer
- Weather data explorer
- Sports statistics dashboard
- Personal habit tracker

Practice: Analyze 5 different datasets

Assessment: Month 7 check: answer three questions from a fun dataset live, plus mixed review

Month 8: Camera Magic and the Capstone (Weeks 29-32)

Camera Magic: Train Your Own Model

Topics:
- How computers see images
- Pixels and image data
- OpenCV introduction
- Loading and displaying images
- Image manipulation: resize, rotate, flip
- Color spaces: RGB, grayscale
- Image filters and effects

- Edge detection
- Shape detection
- Color detection
- Face detection with OpenCV
- Drawing on images
- Training an image model the Teachable Machine way, with your own examples
- Testing fairly: when does your model get confused?

Projects built:
- Photo editor with filters
- Face detection app
- Color tracker game
- Shape identifier

Practice: Create 5 image processing programs

Capstone and the Final Exam

Topics:
- Choosing the capstone: a game, a smart helper, a turtle-art collection or a camera project
- Planning with a checklist, building in small steps
- Using everything: logic, functions, files, maybe Pygame, maybe a trained model
- Testing with a real player or user
- Rehearsing the demo: what it does, how it works, what was hard

Projects built:
- THE CAPSTONE: a complete Python project presented at demo day

Practice: A little building every day; keep it always working

Assessment: FINAL EXAM: capstone demo plus a friendly viva and a mixed quiz from the whole course. Passing earns the certificate; a child who falls short gets focused revision and a free retest

PROJECTS THE STUDENT BUILDS AND KEEPS

- Phase 1: talking programs, joke machines, quizzes and guessing games
- Phase 2: turtle art worth printing, list-powered tools and a personal function library
- Phase 3: save-file apps, first classes, and complete Pygame games with scores and sounds
- Phase 4: a rules-based smart helper, data detective findings, a self-trained camera model, and the capstone

Total projects: 30+ typed Python projects, crowned by a capstone presented at demo day

SKILLS THE STUDENT WILL HAVE AT THE END

- Real Python: variables, decisions, loops, lists, functions, files and first classes
- Turtle graphics: loops turned into art
- Pygame: the game loop, sprites, collisions, scores and sounds
- Kid-safe AI: rules-based smarts, data detective work, and models trained by the child
- Coder habits: debugging patiently, naming clearly, finishing what you start

HOW A TYPICAL WEEK IS SPLIT

Live classes: 2 live one-hour classes per week, typing along with the teacher
Homework: A small build after every class, and a mixed challenge at the end of every month
Practice: 2-3 hours of playful practice between classes
Review: Every project reviewed with teacher feedback; wobbly skills reopened in class

SUPPORT INCLUDED

Doubt support: WhatsApp doubt support between classes, so no child stays stuck and discouraged
Progress updates: Regular progress notes to parents: what was built, what comes next, and how to encourage practice

CERTIFICATION DETAIL

Completion: Certificate from Modern Age Coders, awarded on passing the final exam, a capstone demo plus a friendly viva. A child who falls short gets focused revision and a free retest: the certificate certifies skills, not attendance

WHERE THIS CAN LEAD

- Python for Teens: the direct continuation at 13, entered with real fluency
- AI and Machine Learning for Teens: the honest next step for the AI spark
- Web Development for Kids: a second builder skill while Python settles
- School maths and logic, quietly upgraded by a year of real programming
- The family tech helper: automations and tools for the household

COMMON QUESTIONS ABOUT THIS COURSE

For anything about cost, use PART 4 and RULE 1. Do not quote two regions.

Q: What will my child build in this Python course?
A: More than 30 typed Python projects across eight months: joke machines and quiz games in

the first weeks, turtle art worth printing, list-powered tools, save-file apps, complete Pygame games with scores and sounds, and in the AI phase a rules-based smart helper, data detective findings and a camera model the child trains personally. It all ends with a capstone presented at demo day.

Q: What age is right for this course?
A: Ages 9 to 12: old enough for real typing and abstract-enough thinking, young enough that the playful pace fits perfectly. Younger children thrive better in our Scratch-first Kids Coding course, which builds toward exactly this. Batches are grouped by age.

Q: How long does it take a child to learn Python?
A: Eight months at 2 live classes a week plus 2 to 3 hours of playful practice takes a child from first line to a demo-day capstone with games and a trained model behind them. The course keeps two more months in hand for children who need more repetition, no rushing, no penalty.

Q: How is my child assessed? Is the certificate just for attending?
A: No, and it is all gentle: classwork every session, a small build after every class, a monthly mixed challenge that revisits earlier skills so they stop fading, and a final exam, a capstone demo plus a friendly viva and short quiz. Passing earns the certificate; a child who falls short gets focused revision and a free retest.

Q: How is AI taught to children this young?
A: By building it small and honest. Children write rules-based smart programs in pure Python, do data detective work on fun datasets, and train camera models Teachable-Machine style with their own examples, then hunt for the model's mistakes. There are no chatbot accounts: the major AI chat tools are 13+ by their own rules, and we say that plainly while building the skills that will make such tools truly useful later.

Q: Python or Scratch first for my child?
A: Scratch first for ages 6-8, Python from around 9 when typing and patience are ready. Children who arrive from Scratch fly here: the logic transfers instantly and the "real code" feeling is a powerful motivator. Our placement check settles it honestly either way.

Q: Is any paid software needed?
A: No. Python, the editor, Pygame and every tool used are free, and any reasonably recent computer runs them comfortably. No AI subscriptions exist in this course by design.

Q: Is there a free trial class?
A: Yes, a free demo class with no commitment: book at learn.modernagecoders.com/contact or message us on WhatsApp at +91 91233 66161. Your child will write and run real Python inside the demo. (Agent note: the free demo is a waiting list with no fixed date. The Priority Live Demo is a guaranteed class today or tomorrow, booked at https://learn.modernagecoders.com/priority-demo . Offer both, as RULE 3 says.)

Q: Are classes live or recorded?
A: Live, always: small groups with a real teacher watching the child's actual code, never pre-recorded videos. At this age the missing colon is the whole battle, and live eyes win it kindly.

To enrol, message Shivam Sir on +91 9123366161 or send the parent this link: https://learn.modernagecoders.com/courses/python-ai-kids-masterclass
For a demo: the Priority Live Demo (guaranteed, today or tomorrow) is booked at https://learn.modernagecoders.com/priority-demo . The free demo is a waiting list with no fixed date.

==========
COURSE 117 OF 137: PYTHON AUTOMATION COURSE: SCRIPTING, SCRAPING & APPLIED AI
==========

Course link: https://learn.modernagecoders.com/courses/python-ai-automation-masterclass-college
Subject area: AI & Automation
Designed for: College students
Who can join: Complete beginner (18+); college students, graduates and working professionals
Course length: 10-12 months (44-52 weeks)
Time needed: 2 live classes/week + 4-6 hours practice
Certificate: Certificate from Modern Age Coders, awarded on passing the final exam

PRICE FOR THIS COURSE (quote only the one that applies to the person asking)
In India, per month: group Rs 1,499, mini batch Rs 2,999, one to one Rs 4,999
In Canada, per month: group CAD 140, one to one CAD 210
Anywhere else, per month: group $100, one to one $150
Classes: group and mini batch two live classes a week, eight a month; one to one in India one live class a week, four a month; one to one outside India two live classes a week, eight a month. Each class is one hour.

WHAT THIS COURSE IS

Python automation course for college students and professionals: Python core, web scraping, browser automation and RPA, then applied AI for documents, text and forecasts, in 10-12

months.

In one line: Make the computer do the work: Python properly, then scraping, browser automation and RPA, then applied AI that reads documents, text and time series.

ABOUT THE PROGRAMME

The most immediately useful programming skill in any office is automation: the report that assembles itself, the data that collects itself, the document pile that processes itself overnight. This live online masterclass builds that skill honestly: Python learned properly first, then the automation core, web scraping done right, Selenium and browser automation, RPA patterns, APIs and scheduled pipelines with testing and security habits, then the applied AI layer that multiplies it: computer vision for documents and images, NLP and transformers for text, time series for forecasts, cloud AI services used with judgment, and the honest ethics of automating decisions. A finale month ships an end-to-end automation capstone and sits the final exam. The pace is honest: ten teaching months at two live classes a week plus four to six hours of practice, with two more in hand. Problem sets, monthly mixed reviews, phase exams, and a final exam that decides the certificate with a free retest.

WHAT MAKES THIS COURSE DIFFERENT

- Automation-first, not research-first: every AI topic earns its place by automating real work
- Scraping taught responsibly: robots.txt, rate limits and terms, the professional way
- Applied AI with judgment: when a cloud API beats a hand-built model, we say so
- Pipelines that run unattended: scheduling, logging and failure handling as first-class topics
- An honest 10-month arc with 2 months in hand
- Real assessment: weekly problem sets, monthly mixed reviews, phase exams and a final exam with a free retest

THE LEARNING PATH, STEP BY STEP

Phase 1: Python foundations (Months 1-3): the language, data handling, databases and APIs
Phase 2: The automation core (Months 4-6): scraping, browser automation, RPA and practical ML
Phase 3: Applied AI (Months 7-9): vision for documents, NLP, time series and cloud AI services
Phase 4: The finale (Month 10): an end-to-end automation capstone and the final exam

WHAT A STUDENT NEEDS BEFORE STARTING

Coding experience: None. Everything is taught from the first line
Equipment: Any computer with a stable internet connection; every tool used is free
Age: 18+; college students, graduates and working professionals
Time commitment: 2 live classes plus 4-6 hours of practice a week

WHO THIS COURSE IS FOR

Working professionals: Professionals drowning in repetitive computer work
College students: Students who want the most demonstrably useful Python specialization
Ops and analysts: Operations and analyst roles ready to automate their own jobs upward
Career switchers: Newcomers who want visible, useful results from month one
Business owners: Owners who want their processes to run without them

FULL CURRICULUM, WEEK BY WEEK

This is the complete teaching plan. Parents can ask about any week.

PHASE 1: PYTHON FOUNDATION & CORE PROGRAMMING (MONTHS 1-3, WEEKS 1-13)

Build rock-solid Python fundamentals. Learn programming concepts, master Python syntax, and create your first automation projects.

Month 1: Python Fundamentals & Programming Logic (Weeks 1-5)
Introduction to Python & Setup
Topics:
- What is Python? History and why it's perfect for automation
- Python ecosystem: CPython, PyPy, Anaconda
- Installing Python 3.x on Windows, Mac, Linux
- IDE setup: VS Code, PyCharm, Jupyter Notebook
- Virtual environments: venv, virtualenv, conda
- Package management with pip
- Your first Python program
- Python interactive shell and REPL
- Basic input/output operations
- Comments and documentation
- Python code style guide (PEP 8)
- Introduction to Python's philosophy
Projects built:
- Set up complete Python development environment

- Simple calculator program
- Personal information collector

Practice: Daily: 30 min coding exercises, 1 hour Python basics

Variables, Data Types & Operations

Topics:

- Variables and naming conventions
- Dynamic typing in Python
- Basic data types: int, float, str, bool
- Type conversion and casting
- Numbers: integers, floats, complex
- Arithmetic operators and precedence
- String creation and manipulation
- String methods: upper, lower, strip, split, join
- String formatting: f-strings, format(), %
- String slicing and indexing
- Boolean operations and truth values
- Comparison and logical operators

Projects built:

- Temperature converter (C/F/K)
- Text analyzer and formatter
- Simple encryption/decryption tool

Practice: Complete 50 string manipulation exercises

Control Flow & Loops

Topics:

- If-elif-else statements
- Nested conditional statements
- Ternary operators
- While loops and break/continue
- For loops and range() function
- Iterating through sequences
- Nested loops and patterns
- Loop else clause
- List comprehensions introduction
- Common loop patterns
- Debugging techniques
- Error messages and troubleshooting

Projects built:

- Number guessing game
- Pattern generator (pyramids, diamonds)
- Prime number calculator
- Password strength validator

Practice: Solve 40 loop and condition problems

Data Structures in Python

Topics:

- Lists: creation, indexing, slicing
- List methods: append, extend, insert, remove, pop
- List comprehensions advanced
- Tuples: immutable sequences
- Sets: unique elements, set operations
- Dictionaries: key-value pairs
- Dictionary methods and operations
- Nested data structures
- Copying: shallow vs deep copy
- Memory management basics
- Collections module: defaultdict, Counter, deque
- Data structure performance comparison

Projects built:

- Student management system
- Shopping cart application
- Contact book with search
- Data structure performance analyzer

Practice: Build 10 programs using different data structures

Month 2: Functions, Modules & OOP (Weeks 6-9)

Functions & Functional Programming

Topics:

- Function definition and calling
- Parameters and arguments
- Default parameters and keyword arguments
- *args and **kwargs
- Return values and multiple returns
- Scope and LEGB rule
- Global and nonlocal keywords
- Lambda functions
- Map, filter, and reduce
- Decorators basics
- Generators and yield
- Recursion and recursive algorithms

Projects built:

```
      - Modular calculator with functions
      - Recursive file system explorer
      - Function library for text processing
      - Custom decorator collection
    Practice: Create 30 reusable utility functions
  Object-Oriented Programming
    Topics:
      - Classes and objects
      - Attributes and methods
      - Constructor (__init__)
      - Instance vs class variables
      - Inheritance and polymorphism
      - Method overriding
      - Multiple inheritance and MRO
      - Abstract classes and interfaces
      - Magic methods (dunder methods)
      - Property decorators
      - Static and class methods
      - SOLID principles in Python
    Projects built:
      - Bank account management system
      - Employee hierarchy system
      - Game character classes
      - Library management OOP
    Practice: Design 10 real-world systems using OOP
  Modules, Packages & Error Handling
    Topics:
      - Modules and import statements
      - Creating custom modules
      - Package structure and __init__.py
      - Relative and absolute imports
      - The Python Standard Library tour
      - Exception handling: try, except, finally
      - Raising custom exceptions
      - Exception hierarchy
      - Logging module usage
      - Debugging with pdb
      - Unit testing with unittest
      - Test-driven development basics
    Projects built:
      - Custom package for utilities
      - Error handling framework
      - Logging system implementation
      - Test suite for previous projects
    Practice: Add proper error handling to all previous projects
  File Handling & Data Processing
    Topics:
      - File operations: open, read, write, close
      - Context managers (with statement)
      - Text file processing
      - CSV file handling
      - JSON data manipulation
      - XML parsing basics
      - Binary file operations
      - Path manipulation with pathlib
      - Directory operations
      - Regular expressions with re module
      - Pattern matching and extraction
      - Data serialization with pickle
    Projects built:
      - Log file analyzer
      - CSV to JSON converter
      - Bulk file renamer
      - Text search and replace tool
    Practice: Process 20 different file formats

Month 3: Advanced Python & Automation (Weeks 10-13)
  Advanced Python Concepts
    Topics:
      - Iterators and iteration protocol
      - Creating custom iterators
      - Generator expressions
      - Coroutines and async basics
      - Context managers and contextlib
      - Metaclasses introduction
      - Descriptors and properties
      - Abstract base classes
      - Multiple inheritance patterns
      - Mixin classes
```

```
        - Design patterns in Python
        - Performance optimization techniques
      Projects built:
        - Custom data structure library
        - Async task processor
        - Plugin system architecture
        - Performance monitoring tool
      Practice: Implement 10 design patterns in Python
    Database Programming
      Topics:
        - SQLite with Python
        - SQL basics: CREATE, INSERT, SELECT, UPDATE, DELETE
        - Database connections and cursors
        - Parameterized queries and SQL injection prevention
        - PostgreSQL with psycopg2
        - MySQL with PyMySQL
        - MongoDB with pymongo
        - SQLAlchemy ORM basics
        - Database migrations
        - Connection pooling
        - Redis for caching
        - Database backup and restore
      Projects built:
        - Inventory management system
        - Blog platform backend
        - User authentication system
        - Data migration tool
      Practice: Build 5 database-driven applications
    Web Development with Python
      Topics:
        - HTTP protocol basics
        - Flask framework introduction
        - Routes and views in Flask
        - Templates with Jinja2
        - Forms and validation
        - Session management
        - RESTful API design
        - FastAPI framework
        - Django basics
        - MVC/MVT architecture
        - Authentication and authorization
        - Deployment basics
      Projects built:
        - Personal blog with Flask
        - REST API for todo app
        - FastAPI microservice
        - Django admin panel
      Practice: Create 5 different web applications
    Network Programming & APIs
      Topics:
        - Sockets programming basics
        - TCP and UDP protocols
        - Creating client-server applications
        - HTTP requests with requests library
        - Consuming REST APIs
        - API authentication methods
        - GraphQL with Python
        - WebSocket connections
        - Email automation with smtplib
        - SSH connections with paramiko
        - FTP operations
        - Network security basics
      Projects built:
        - Chat application (client-server)
        - API aggregator service
        - Email automation system
        - Network monitoring tool
      Practice: Integrate with 10 different APIs
      Assessment: Phase 1 exam: a practical build defended live, plus a written paper mixing
      this phase with everything before it

---------------------------------------------------------------
PHASE 2: WEB SCRAPING & AUTOMATION TOOLS (MONTHS 4-6, WEEKS 14-26)
---------------------------------------------------------------
Master web scraping, browser automation, task automation, and building robust automation
frameworks.

  Month 4: Web Scraping & Browser Automation (Weeks 14-18)
    Web Scraping Fundamentals
```

```
  Topics:
    - HTML/CSS basics for scraping
    - BeautifulSoup library
    - Parsing HTML documents
    - Finding elements: find, find_all
    - CSS selectors in BeautifulSoup
    - Navigating the parse tree
    - Extracting text and attributes
    - Handling dynamic content basics
    - robots.txt and ethical scraping
    - User-Agent headers
    - Rate limiting and delays
    - Scraping best practices
  Projects built:
    - News article scraper
    - Product price monitor
    - Job listing aggregator
    - Wikipedia data extractor
  Practice: Scrape 20 different websites
Advanced Web Scraping
  Topics:
    - Scrapy framework introduction
    - Scrapy spiders and items
    - Scrapy pipelines
    - Handling pagination
    - Following links recursively
    - Handling forms and CSRF tokens
    - Session management in scraping
    - Proxy rotation
    - Handling CAPTCHAs
    - Scraping JavaScript-rendered pages
    - API reverse engineering
    - Data cleaning and validation
  Projects built:
    - E-commerce site scraper with Scrapy
    - Social media data collector
    - Real estate listing scraper
    - Multi-site comparison tool
  Practice: Build 10 production-ready scrapers
Selenium & Browser Automation
  Topics:
    - Selenium WebDriver setup
    - Browser drivers: Chrome, Firefox, Edge
    - Finding elements with Selenium
    - Interacting with elements: click, send_keys
    - Waiting strategies: implicit, explicit, fluent
    - Expected conditions
    - Handling popups and alerts
    - Frame and window switching
    - JavaScript execution
    - Screenshots and video recording
    - Headless browser mode
    - Selenium Grid for parallel execution
  Projects built:
    - Automated form filler
    - Social media bot
    - Web testing automation suite
    - Booking automation system
  Practice: Automate 15 web workflows
Alternative Automation Tools
  Topics:
    - Playwright introduction
    - Playwright vs Selenium comparison
    - Puppeteer with Pyppeteer
    - Requests-HTML for JavaScript sites
    - MechanicalSoup for simple automation
    - AutoGUI for desktop automation
    - Keyboard and mouse control
    - Screen capture and OCR
    - Task scheduling with schedule library
    - Cron jobs and task schedulers
    - Windows Task Scheduler integration
    - Building automation frameworks
  Projects built:
    - Desktop automation suite
    - Cross-browser testing tool
    - Automated report generator
    - System administration automator
  Practice: Create 10 different automation workflows
```

```
  Data Processing & Analysis
    Topics:
      - NumPy arrays and operations
      - Pandas DataFrames basics
      - Data loading and saving
      - Data cleaning with Pandas
      - Data transformation and aggregation
      - Merge, join, and concatenate
      - GroupBy operations
      - Time series data handling
      - Data visualization with Matplotlib
      - Seaborn for statistical plots
      - Plotly for interactive visualizations
      - Creating automated reports
    Projects built:
      - Sales data analysis dashboard
      - Stock market analyzer
      - Survey data processor
      - Automated reporting system
    Practice: Analyze 10 real-world datasets

Month 5: Enterprise Automation & Integration (Weeks 19-23)
  RPA & Process Automation
    Topics:
      - Robotic Process Automation concepts
      - Python RPA libraries
      - UiPath integration with Python
      - Email automation advanced
      - Excel automation with openpyxl
      - Word document automation
      - PDF processing and generation
      - PowerPoint automation
      - Calendar and scheduling automation
      - Database automation workflows
      - File system monitoring
      - Process orchestration
    Projects built:
      - Invoice processing system
      - HR onboarding automation
      - Report generation pipeline
      - Document management system
    Practice: Automate 10 business processes
  API Development & Microservices
    Topics:
      - RESTful API design principles
      - FastAPI advanced features
      - API versioning strategies
      - Authentication: JWT, OAuth2
      - Rate limiting and throttling
      - API documentation with Swagger
      - GraphQL API development
      - Microservices architecture
      - Message queues: RabbitMQ, Celery
      - Event-driven architecture
      - Service discovery
      - API gateway patterns
    Projects built:
      - Complete REST API with auth
      - Microservices e-commerce backend
      - Real-time notification service
      - API gateway implementation
    Practice: Build 5 production APIs
  Cloud Automation & DevOps
    Topics:
      - AWS SDK for Python (boto3)
      - EC2 instance management
      - S3 operations and automation
      - Lambda functions with Python
      - SQS and SNS integration
      - Google Cloud Platform basics
      - Azure SDK for Python
      - Infrastructure as Code with Python
      - Docker containerization
      - Kubernetes with Python client
      - CI/CD pipeline automation
      - Monitoring and alerting
    Projects built:
      - Cloud resource manager
      - Serverless data processor
```

```
      - Auto-scaling application
      - Infrastructure automation tool
    Practice: Deploy 10 applications to cloud
  Testing & Quality Assurance
    Topics:
      - Unit testing with pytest
      - Test fixtures and parametrization
      - Mocking and patching
      - Integration testing strategies
      - API testing with pytest
      - Selenium for test automation
      - Performance testing with Locust
      - Load testing strategies
      - Security testing basics
      - Code coverage analysis
      - Continuous testing
      - Test reporting and documentation
    Projects built:
      - Complete test suite for API
      - E2E testing framework
      - Performance testing suite
      - Automated regression tests
    Practice: Write tests for all previous projects
  Security & Best Practices
    Topics:
      - Security in Python applications
      - Input validation and sanitization
      - SQL injection prevention
      - XSS and CSRF protection
      - Password hashing with bcrypt
      - Encryption with cryptography library
      - Secure API development
      - Environment variables and secrets
      - Security scanning tools
      - OWASP Top 10 for Python
      - Audit logging
      - Compliance and regulations
    Projects built:
      - Security audit tool
      - Encryption utility suite
      - Secure authentication system
      - Compliance checker tool
    Practice: Security audit all projects

Month 6: Practical Machine Learning (Weeks 24-26)
  Machine Learning Fundamentals
    Topics:
      - What is Machine Learning?
      - Types: Supervised, Unsupervised, Reinforcement
      - ML workflow and pipeline
      - Data preprocessing techniques
      - Feature engineering basics
      - Train-test split
      - Cross-validation
      - Evaluation metrics
      - Overfitting and underfitting
      - Bias-variance tradeoff
      - Scikit-learn introduction
      - Model selection strategies
    Projects built:
      - Iris classification project
      - House price prediction
      - Customer segmentation
      - Basic recommendation system
    Practice: Complete 10 ML tutorials
  Supervised Learning Algorithms
    Topics:
      - Linear regression
      - Logistic regression
      - Decision trees
      - Random forests
      - Support Vector Machines
      - K-Nearest Neighbors
      - Naive Bayes
      - Gradient Boosting (XGBoost, LightGBM)
      - Ensemble methods
      - Hyperparameter tuning
      - Grid search and random search
      - Feature importance analysis
```

```
      Projects built:
        - Credit risk assessment
        - Sales forecasting model
        - Email spam classifier
        - Disease prediction system
      Practice: Implement all algorithms from scratch
    Unsupervised Learning & Deep Learning Intro
      Topics:
        - K-Means clustering
        - Hierarchical clustering
        - DBSCAN
        - Principal Component Analysis
        - Dimensionality reduction
        - Anomaly detection
        - Association rules
        - Introduction to neural networks
        - Perceptron and backpropagation
        - Activation functions
        - TensorFlow basics
        - Keras API
      Projects built:
        - Customer segmentation advanced
        - Anomaly detection system
        - Market basket analysis
        - Simple neural network from scratch
      Practice: Solve 15 unsupervised learning problems
      Assessment: Phase 2 exam: a practical build defended live, plus a written paper mixing
      this phase with everything before it

----------------------------------------------------------------
PHASE 3: APPLIED AI FOR AUTOMATION (MONTHS 7-9, WEEKS 27-39)
----------------------------------------------------------------
Master advanced AI techniques, computer vision, natural language processing, and production
AI systems.

  Month 7: Computer Vision & Image Processing (Weeks 27-35)
    Image Processing Fundamentals
      Topics:
        - Digital image basics
        - OpenCV installation and setup
        - Image loading and display
        - Color spaces: RGB, HSV, LAB
        - Image transformations
        - Geometric transformations
        - Image filtering and blurring
        - Edge detection: Canny, Sobel
        - Morphological operations
        - Histogram equalization
        - Image thresholding
        - Contour detection
      Projects built:
        - Image enhancement tool
        - Document scanner
        - Photo editor with filters
        - Edge detection application
      Practice: Process 100 different images
    Advanced Computer Vision
      Topics:
        - Feature detection: SIFT, SURF, ORB
        - Feature matching
        - Object detection basics
        - Haar Cascades
        - Face detection and recognition
        - Object tracking algorithms
        - Optical flow
        - Background subtraction
        - Template matching
        - Image segmentation
        - Panorama stitching
        - 3D reconstruction basics
      Projects built:
        - Face recognition system
        - Object tracking application
        - Motion detection security system
        - Augmented reality basics
      Practice: Build 10 computer vision applications
    Deep Learning for Computer Vision
      Topics:
        - CNN architectures: LeNet, AlexNet, VGG
```

- ResNet and skip connections
- Object detection: YOLO, R-CNN
- Semantic segmentation
- Instance segmentation
- Face recognition with deep learning
- Pose estimation
- Image generation: GANs basics
- Style transfer
- Image super-resolution
- Video analysis with deep learning
- Real-time processing optimization

Projects built:
- Custom object detector
- Real-time face mask detector
- Pose estimation fitness app
- Style transfer application

Practice: Train 15 vision models

Natural Language Processing

Topics:
- NLP fundamentals
- Text preprocessing: tokenization, stemming
- Lemmatization and POS tagging
- Named Entity Recognition
- Bag of Words and TF-IDF
- Word embeddings: Word2Vec, GloVe
- Sentiment analysis techniques
- Topic modeling: LDA
- Text classification
- Sequence-to-sequence models
- Attention mechanisms
- BERT and Transformers introduction

Projects built:
- Sentiment analysis API
- Text summarization tool
- Named entity extraction system
- Language detection service

Practice: Process 50 text datasets

Advanced NLP with Transformers

Topics:
- Transformer architecture deep dive
- Hugging Face library
- Pre-trained models: BERT, GPT, RoBERTa
- Fine-tuning transformers
- Text generation with GPT
- Question answering systems
- Text translation
- Chatbot development
- Document similarity
- Information extraction
- Multi-lingual NLP
- NLP model deployment

Projects built:
- AI chatbot with transformers
- Document Q&A system
- Multi-language translator
- Content generation tool

Practice: Fine-tune 10 transformer models

Month 8: Time Series, Ethics & Production AI (Weeks 36-38)

Time Series & Forecasting

Topics:
- Time series analysis basics
- Trend and seasonality
- Stationarity testing
- ARIMA models
- Seasonal ARIMA (SARIMA)
- Exponential smoothing
- Prophet library
- LSTM for time series
- Multi-variate time series
- Anomaly detection in time series
- Real-time forecasting
- Evaluation metrics for forecasting

Projects built:
- Stock price predictor
- Weather forecasting system
- Sales forecasting tool
- Anomaly detection for IoT

Practice: Forecast 20 different time series

```
    AI Ethics & Explainable AI
      Topics:
        - AI bias and fairness
        - Ethical considerations in AI
        - Privacy-preserving ML
        - Federated learning basics
        - Model interpretability
        - LIME and SHAP
        - Feature importance visualization
        - Model debugging techniques
        - Adversarial attacks and defense
        - Responsible AI practices
        - AI governance
        - Regulatory compliance (GDPR, etc.)
      Projects built:
        - Bias detection tool
        - Model explainability dashboard
        - Privacy-preserving ML system
        - AI audit framework
      Practice: Audit 10 AI models for bias and fairness
    MLOps & Production Systems
      Topics:
        - MLOps principles and practices
        - Model versioning with DVC
        - Experiment tracking: MLflow, Weights & Biases
        - Model registry and management
        - Continuous integration for ML
        - Model monitoring in production
        - A/B testing for ML
        - Model retraining pipelines
        - Feature stores
        - Model serving: REST, gRPC
        - Kubernetes for ML workloads
        - Cost optimization for ML
      Projects built:
        - Complete MLOps pipeline
        - Model monitoring dashboard
        - Automated retraining system
        - ML experiment tracker
      Practice: Set up MLOps for 5 projects

  Month 9: Cloud AI Services in Automation (Week 39)
    Cloud AI Services & Deployment
      Topics:
        - AWS SageMaker
        - Google Cloud AI Platform
        - Azure Machine Learning
        - Model deployment strategies
        - Serverless AI with Lambda
        - Container deployment for ML
        - Model serving with TorchServe
        - TensorFlow Serving
        - API Gateway for ML models
        - Load balancing for ML
        - Auto-scaling ML services
        - Cost management for cloud AI
      Projects built:
        - Deploy model to all major clouds
        - Serverless ML API
        - Auto-scaling ML service
        - Multi-cloud AI deployment
      Practice: Deploy 15 models to production
      Assessment: Phase 3 exam: a practical build defended live, plus a written paper mixing
      this phase with everything before it

----------------------------------------------------------------
PHASE 4: THE FINALE (MONTH 10, WEEKS 40-44)
----------------------------------------------------------------
The capstone month: spec, build, ship and defend, then the final exam that decides the
certificate.

  Month 10: Capstone and the Final Exam (Weeks 40-44)
    Capstone Spec and Setup
      Topics:
        - Choosing the capstone: an end-to-end automation: a scraping-to-report pipeline, a document AI
          processor or a business workflow bot
        - A one-page spec: scope, milestones, stack
        - Repository and skeleton ready on day one
        - Instructor sign-off before the build begins
```

Projects built:
- Approved capstone spec plus the running skeleton

Practice: Pitch the spec to the batch and absorb one hard question

Capstone Build

Topics:
- Two focused weeks in vertical slices
- Instructor checkpoints and honest scope cuts
- Using the whole course: Python depth, scraping and browser automation, applied AI and scheduled pipelines
- Daily commits and an always-working build

Projects built:
- The capstone, feature-complete with version control

Practice: A working build at the end of every session

Ship and Polish

Topics:
- The finishing pass: edge cases, errors, documentation
- Scheduled and unattended: the automation running on its own, with logging you can trust
- A README worth reading and a demo worth watching
- A full-course spiral review before the exam

Projects built:
- The capstone shipped, documented and rehearsed

Practice: Two mock demos, each tighter than the last

Demo Day and the Final Exam

Topics:
- Presenting the capstone: live demo plus the hardest bug story
- The honest map of next roads: automation engineering, data engineering, or deeper machine learning
- Where our other courses continue the journey

Projects built:
- Demo day presentation delivered to the batch

Assessment: FINAL EXAM: a practical build plus a written paper with questions mixed from every phase. Passing earns the certificate; falling short earns a focused revision plan and a free retest

PROJECTS THE STUDENT BUILDS AND KEEPS

- Phase 1: Python programs, database-backed tools and API clients
- Phase 2: scrapers, browser bots and RPA pipelines with tests
- Phase 3: document AI, text and forecasting automations
- Phase 4: the end-to-end capstone automation, running unattended

Total projects: 20+ real automations, crowned by an unattended end-to-end capstone

SKILLS THE STUDENT WILL HAVE AT THE END

- Python to real depth: data structures, OOP, files, databases and APIs
- Web scraping done responsibly, at production quality
- Browser automation and RPA: Selenium and modern tooling
- Applied AI: document vision, NLP with transformers, time series forecasting
- Pipeline craft: scheduling, logging, testing and failure handling

HOW A TYPICAL WEEK IS SPLIT

Live classes: 2 live one-hour classes per week, coding along with the instructor
Homework: A problem set after every class, and a mixed-review assignment at the end of every month
Practice: 4-6 hours of building between classes
Review: Every submission reviewed with written feedback; recurring gaps reopened in class

SUPPORT INCLUDED

Doubt support: WhatsApp doubt support between classes
Progress updates: Honest monthly progress reviews: what is solid, what is wobbly, and the plan for the wobble

CERTIFICATION DETAIL

Completion: Certificate from Modern Age Coders, awarded on passing the final exam. Fall short and there is focused revision and a free retest: the certificate certifies knowledge, not attendance

WHERE THIS CAN LEAD

- Automation and scripting roles across every industry
- Data engineering: pipelines are the shared craft
- Our AI/ML course for model depth beyond the applied layer
- Backend Python: from automation scripts to full services

EARNING POTENTIAL (share only if asked, and never promise it)

  Market context: The ranges below are general market salary bands for these roles in India and abroad, drawn from public industry data. They are shown for career context only and are not a promise or guarantee of income. Actual pay depends on your skills, experience, location, and the job market.
  Growing roles: Rs 4-6 LPA (Python Developer)
  Experienced roles: Rs 8-15 LPA (AI/ML Engineer); Rs 15-25 LPA (Senior AI Engineer); Rs 20-40+ LPA (AI Architect/Lead)
  Freelance: Rs 1,000-5,000/hour
  International: $60k-150k USD based on location and experience

COMMON QUESTIONS ABOUT THIS COURSE

  For anything about cost, use PART 4 and RULE 1. Do not quote two regions.

  Q: What does this Python automation course cover?
  A: Python properly first: core language, OOP, files, databases and APIs. Then the automation core: web scraping done responsibly, Selenium and browser automation, RPA patterns, testing and security for pipelines, plus practical machine learning. A finale month ships an end-to-end automation capstone and sits the final exam.

  Q: How long does it take to learn Python automation properly?
  A: Ten months of teaching at 2 live classes a week plus 4 to 6 hours of practice, with two more months in hand for learners who need them. The three teaching phases build the skill and its real-world application; the finale month ships a capstone and sits the final exam.

  Q: How am I assessed? Is the certificate just for attending?
  A: No. Problem sets follow every class with written feedback, monthly reviews deliberately mix new material with earlier topics, each phase ends with a cumulative exam, and the course ends with a final exam: a practical build plus written questions from the whole syllabus. Passing earns the certificate; falling short earns focused revision and a free retest.

  Q: How is this different from your AI/ML and data science courses?
  A: By what the AI is for. The AI/ML course builds model depth: the mathematics, training and evaluation of learning systems. This course is automation-first: AI appears as a tool that reads documents, classifies text and forecasts demand inside pipelines that do real work unattended. If you want to build models, take AI/ML; if you want work to do itself, this is the course.

  Q: Is web scraping legal to learn and use?
  A: Scraping is a standard professional skill used by search engines, price trackers and researchers everywhere, and like any powerful tool it has rules. We teach it responsibly from the first week: respecting robots.txt and rate limits, reading terms of service, preferring official APIs when they exist, and never touching credentials or private data. That judgment is part of the syllabus, not a footnote.

  Q: Can I try a class before enrolling?
  A: Yes, a free demo class with no commitment: book at learn.modernagecoders.com/contact or message us on WhatsApp at +91 91233 66161. (Agent note: the free demo is a waiting list with no fixed date. The Priority Live Demo is a guaranteed class today or tomorrow, booked at https://learn.modernagecoders.com/priority-demo . Offer both, as RULE 3 says.)

  Q: Are classes live or recorded?
  A: Live, always: small groups with a real instructor reading your actual code, never pre-recorded videos.

  To enrol, message Shivam Sir on +91 9123366161 or send the parent this link: https://learn.modernagecoders.com/courses/python-ai-automation-masterclass-college
  For a demo: the Priority Live Demo (guaranteed, today or tomorrow) is booked at https://learn.modernagecoders.com/priority-demo . The free demo is a waiting list with no fixed date.

==========
COURSE 118 OF 137: PYTHON FOR TEENS: COMPLETE COURSE FROM BEGINNER TO ADVANCED
==========

Course link: https://learn.modernagecoders.com/courses/python-complete-masterclass-teens
Subject area: Python Programming
Designed for: Teens
Who can join: Absolute beginner, ages 13 to 18
Course length: 10-12 months (40-48 weeks)
Time needed: 2 live classes/week + 3-4 hours practice
Certificate: Certificate from Modern Age Coders, awarded on passing the final exam

PRICE FOR THIS COURSE (quote only the one that applies to the person asking)
  In India, per month: group Rs 1,499, mini batch Rs 2,999, one to one Rs 4,999
  In Canada, per month: group CAD 140, one to one CAD 210
  Anywhere else, per month: group $100, one to one $150
  Classes: group and mini batch two live classes a week, eight a month; one to one in India one

live class a week, four a month; one to one outside India two live classes a week, eight a month. Each class is one hour.

WHAT THIS COURSE IS

Python course for teens aged 13-18. Live online classes, 30+ projects: games, web apps, automation, data and AI. Beginner to advanced in 10-12 months.

In one line: One language carries a teenager from a first print statement to games, web apps, automation and AI projects. This is that road, walked properly in 10 months.

ABOUT THE PROGRAMME

Python is the language teenagers can grow with: simple enough that a working program exists by the end of class one, serious enough that it runs Instagram's backend and most of modern AI. This live online course takes students aged 13 to 18 from zero to genuinely advanced, with every concept practiced through projects a teen actually wants to build and keep. The first three months build real foundations: variables to functions, the core data structures, files and JSON, algorithms, and object-oriented programming taught with patience instead of jargon. The middle months turn skill into products: 2D games with Pygame that get shared online, desktop apps, automation scripts that do real chores, web scraping done politely, and a first taste of data analysis with pandas. The final months put Python on the web with Flask, databases, user accounts and a real deployment, then finish with machine learning fundamentals, AI-powered features built on modern AI APIs, and a capstone shipped like a real product. The pace is honest: two live classes a week plus three to four hours of practice, and the syllabus fits ten months of that rhythm. Students who need longer take up to twelve months, the class adapts instead of rushing ahead. Learning is checked the honest way too: homework after every class, monthly assignments that mix new questions with earlier topics, and a final exam that decides the certificate. Real knowledge, real work, real projects, depth over dopamine. By the end, a student owns a portfolio of 30+ projects, a web app on a public URL, and the kind of understanding that makes the next step, whether AI, data science or competitive programming, feel natural.

WHAT MAKES THIS COURSE DIFFERENT

- Projects teens choose to keep: games, bots, automations and apps they actually use, not textbook exercises
- An honest 10-month arc with 2 months of margin built in: students who need more practice time take up to 12, nobody is rushed
- Modern Python throughout: the latest Python 3, VS Code, pytest, pandas and real AI APIs, the same tools working developers use
- Every submitted project comes back with written feedback, and recurring gaps are reopened in class instead of left behind
- A deployed capstone: the course ends with an app on the public internet, not screenshots on a laptop
- Live batches capped at 20 students, with mini-batch and 1-on-1 options for closer attention
- Real assessment: weekly homework, mixed-review assignments every month, and a final exam that decides the certificate, with focused revision and a free retest for students who fall short

THE LEARNING PATH, STEP BY STEP

Phase 1: Foundations and OOP (Months 1-3): from first program to data structures, algorithms and classes, practiced through weekly builds
Phase 2: Games, apps and automation (Months 4-6): Pygame games, desktop tools, scrapers, and a first taste of data analysis with pandas
Phase 3: Python on the web (Months 7-8): Flask, SQL databases, user accounts, and a real deployment to a public URL
Phase 4: AI and the capstone (Months 9-10): machine learning fundamentals, AI-powered features, Git, testing, and a shipped final project

WHAT A STUDENT NEEDS BEFORE STARTING

Coding experience: None. The course starts from the very first line of code
Computer skills: Comfortable typing and managing files and folders
Equipment: A computer with a stable internet connection; every tool used in the course is free
Age: 13 to 18. Batches are grouped by age and pace so the room always fits
Time commitment: 2 live classes plus 3-4 hours of practice a week

WHO THIS COURSE IS FOR

Complete beginners: Teens starting from zero who want a structured road instead of a pile of scattered tutorials
Game builders: Students who learn best when the output is a game they can hand to a friend
Future engineers: Teens eyeing engineering or computer science who want the real foundation under the grades
Automators: The kind of student who would rather write a script than do a boring task twice
Ai curious: Teens who want to build with AI and understand it, not just chat with it

FULL CURRICULUM, WEEK BY WEEK

This is the complete teaching plan. Parents can ask about any week.

PHASE 1: PYTHON FOUNDATIONS AND OOP (MONTHS 1-3, WEEKS 1-12)

From the first line of code to data structures, algorithms and object-oriented programming.
Every week ends with something built.

Month 1: First Programs (Weeks 1-4)
Introduction and Setup
Topics:
- Why Python? The language that runs Instagram, YouTube, and NASA
- Installing the latest Python 3 and understanding versions
- VS Code setup with Python extensions
- Terminal basics: running programs like a developer
- Understanding Python's philosophy: The Zen of Python
- Variables and memory: How Python stores data
- Data types deep dive: int, float, str, bool, None
- Input/Output: Building interactive programs
- Comments and documentation: Writing readable code

Projects built:
- A personal greeting bot that asks questions and answers back
- Calculator with memory
- Mad libs story generator

Practice: Short daily challenges: 15 mini-programs in the first week

Control Flow and Logic
Topics:
- If-elif-else: Teaching computers to make decisions
- Boolean logic: and, or, not, and De Morgan's laws
- Comparison operators and chaining
- Match-case statements (Python 3.10+)
- Ternary operators for elegant code
- Truthy and falsy values in Python
- Short-circuit evaluation
- Exception handling basics: try, except, finally

Projects built:
- Rock-Paper-Scissors-Lizard-Spock game
- Password strength analyzer with rules
- Choose-your-own-adventure text game

Practice: 20 logic puzzles, build 5 decision-based programs

Loops and Iteration
Topics:
- For loops: Automating repetitive tasks
- While loops: Conditional repetition
- Nested loops and performance implications
- Loop control: break, continue, else with loops
- Range() function secrets and memory efficiency
- Enumerate() for index tracking
- Zip() for parallel iteration
- List comprehensions: Python's superpower
- Generator expressions for memory efficiency
- Performance: When to use which loop

Projects built:
- Pattern generator (ASCII art)
- Prime number visualizer
- Multiplication table game
- Progress bar implementation

Practice: 25 loop challenges, then rebuild 3 earlier programs with less code

Functions
Topics:
- Functions: Building blocks of programs
- Parameters vs arguments: The complete guide
- Return values and multiple returns
- Default arguments and keyword arguments
- *args and **kwargs: Flexible functions
- Scope and LEGB rule
- Closures and their power
- Lambda functions and when to use them
- Function annotations and type hints
- Docstrings: writing functions someone else can use
- Breaking a big program into small functions

Projects built:
- Homework helper library of reusable functions
- Unit converter covering 20+ conversions
- Menu-driven mini app assembled from functions

Practice: Build a personal library of 15 reusable functions
Assessment: Month 1 check: build a small menu-driven program live using input,

```
    conditionals, loops and functions, then a take-home assignment mixing everything from
    month 1

Month 2: The Data Structures Every Program Uses (Weeks 5-8)
  Lists and Tuples
    Topics:
      - Lists: Python's Swiss Army knife
      - List methods: the ones you will actually use, and how to look up the rest
      - Slicing notation mastery [start:stop:step]
      - List comprehensions with conditions
      - Nested list comprehensions
      - Tuples: Immutable sequences
      - Named tuples for readable code
      - List vs Tuple: Performance and use cases
      - Unpacking and starred expressions
      - Deep vs shallow copy issues
    Projects built:
      - Spotify playlist manager
      - Tic-tac-toe with AI opponent
      - Matrix calculator
      - Todo list with priorities
    Practice: 40 list and tuple drills, build 3 small data managers
  Dictionaries and Sets
    Topics:
      - Dictionaries: Key-value mastery
      - Dictionary methods and operations
      - Dictionary comprehensions
      - Nested dictionaries and JSON
      - OrderedDict, defaultdict, Counter
      - Sets: Unique collections
      - Set operations: union, intersection, difference
      - Frozen sets for immutable sets
      - When to use sets vs lists
      - Hash tables: How dictionaries work internally
      - Performance characteristics and Big O
    Projects built:
      - Contact manager with search
      - Word frequency analyzer
      - Inventory system for game
      - Social network graph analyzer
    Practice: 30 dictionary and set challenges, refactor 2 earlier projects to use them
  Strings and Text
    Topics:
      - Strings: More than just text
      - String methods: the toolkit you will actually reach for
      - F-strings: Modern string formatting
      - Regular expressions with re module
      - Unicode and encoding: UTF-8, ASCII
      - Text processing techniques
      - String algorithms: searching, matching
      - Template strings for safe substitution
      - Textwrap for formatting
    Projects built:
      - Wordle game clone
      - Text encryption tool
      - Markdown to HTML converter
      - Plagiarism checker
    Practice: 30 string problems, build 3 text tools
  Files, JSON and Errors
    Topics:
      - Reading and writing text files: programs that remember
      - The with statement, and why it protects your files
      - Working with paths using pathlib
      - CSV files: reading and writing spreadsheet-style data
      - JSON: saving structured data the way real apps do
      - Exceptions in practice: try, except, else, finally
      - Raising your own errors with clear messages
      - Designing a save-and-load feature for any program
      - Where real programs keep their data
    Projects built:
      - Journal app that saves entries between runs
      - Quiz game with its question bank stored in JSON
      - Expense tracker that writes and reads CSV
    Practice: Add save and load to three of your earlier projects
    Assessment: Month 2 check: build a small app that loads data, changes it and saves it
    back, live, with quiz questions that reach back to month 1

Month 3: Algorithms and Objects (Weeks 9-12)
  Power Collections
```

```
      Topics:
        - Collections module deep dive
        - Deque: Double-ended queue
        - Heapq: Priority queues in Python
        - Bisect: Maintaining sorted lists
        - Dataclasses for structured data
        - Enum for constants
        - Queue and stack implementations
        - Linked lists in Python
        - Trees and graphs: the intuition, drawn before coded
      Projects built:
        - LRU cache implementation
        - Task scheduler with priorities
        - Undo-redo system using stacks
      Practice: Implement a stack, a queue and a linked list from scratch
    Algorithms and Problem Solving
      Topics:
        - Algorithm complexity and Big O
        - Searching algorithms: Binary, jump, interpolation
        - Sorting algorithms: Quick, merge, heap, radix
        - Recursion and memoization
        - Greedy algorithms
        - Algorithm visualization
        - Problem-solving strategies
        - A taste of competitive programming, and where our DSA course goes deeper
        - Practicing on HackerRank and LeetCode without drowning
        - Breadth-first and depth-first search, on a maze you can see
      Projects built:
        - Sorting visualizer with Pygame
        - Pathfinding algorithm demo
        - Sudoku solver with GUI
        - Algorithm complexity analyzer
      Practice: Solve 25 algorithm problems, implement 8 classic algorithms
    Object-Oriented Programming
      Topics:
        - Classes and objects: Building blueprints
        - Attributes and methods
        - __init__ and object initialization
        - self: The magic first parameter
        - Class vs instance attributes
        - Property decorators for getters/setters
        - Method types: instance, class, static
        - __str__ and __repr__ for object representation
        - Encapsulation and information hiding
        - Documentation with docstrings
        - Type hints in classes
      Projects built:
        - Bank account system
        - RPG character creator
        - School management system
        - E-commerce cart system
      Practice: Design and build 8 classes for things you know: players, playlists, pets,
      plans
    Inheritance and Polymorphism
      Topics:
        - Inheritance: Building class hierarchies
        - super() and method resolution order (MRO)
        - Multiple inheritance and mixins
        - Abstract base classes (ABC)
        - Polymorphism and duck typing
        - Method overriding and extending
        - Composition vs inheritance
        - Interface design in Python
      Projects built:
        - Game entity system with players, enemies and items
        - Shape hierarchy that draws itself
        - School management system with people who share behavior
      Practice: Design 5 class hierarchies, defend each design choice in one sentence
      Assessment: Phase 1 exam: build a small OOP system live and explain the design
      decisions

----------------------------------------------------------------
PHASE 2: GAMES, APPS AND AUTOMATION (MONTHS 4-6, WEEKS 13-24)
----------------------------------------------------------------
Skills become products: real Pygame games shared online, desktop apps, automation that does
actual chores, and a first honest look at data.

  Month 4: Build Real Games (Weeks 13-16)
    Pythonic Objects
```

```
    Topics:
      - Magic methods (dunder methods) complete guide
      - Operator overloading with magic methods
      - Container protocols: __len__, __getitem__, __setitem__
      - Iterator protocol: __iter__, __next__
      - Context managers: __enter__, __exit__
      - Arithmetic magic methods
      - Comparison magic methods
      - Callable objects with __call__
      - Properties for safe attributes
      - Building a class other code enjoys using
    Projects built:
      - Vector class with real operator overloading
      - Deck-of-cards class ready for any card game
      - Smart inventory that validates what goes in
    Practice: Give three earlier classes proper __str__, __repr__ and comparison behavior
  Pygame: The Game Loop
    Topics:
      - How every game works: the loop, events, update, draw
      - Setting up Pygame and the game window
      - Drawing shapes, images and sprites
      - Keyboard and mouse input that feels responsive
      - Movement, velocity and frame rate
      - Collision detection: rectangles first
      - Sprite groups for clean game code
      - Keeping score and rendering text
      - Structuring a game file a friend could read
    Projects built:
      - Pong from scratch
      - Dodge-the-asteroids arcade game
      - Collect-the-coins game with a timer
    Practice: Build one tiny game variant on your own between classes
  Pygame: Juice and Polish
    Topics:
      - Sprite sheets and animation
      - Simple physics: gravity, jumping, bouncing
      - Sound effects and music
      - Game states: menu, playing, game over
      - Particle effects with restraint
      - Scrolling levels and a simple camera
      - Saving high scores to a file (month 2 pays off)
      - Difficulty curves: making a game fair but tense
      - Playtesting: watching someone else play your game
    Projects built:
      - Platformer with gravity, jumps and levels
      - Space shooter with waves, sounds and a menu
    Practice: Add sound, a menu and a high-score table to your month 4 games
  Game AI and Shipping Your Game
    Topics:
      - AI for enemies: state machines that chase, patrol and flee
      - Pathfinding on a grid: BFS first, then a look at A*
      - Min-max for turn games: an unbeatable tic-tac-toe
      - Procedural content generation
      - Packaging a game so someone else can run it
      - Publishing on itch.io and writing the game page
    Projects built:
      - Tic-tac-toe with an unbeatable AI opponent
      - Enemy AI pack for your platformer: patrol, chase, flee
      - Your best game published on itch.io
    Practice: Ship it: publish one finished game and send the link to three people
    Assessment: Game demo: present a finished, published game and explain one system inside
    it, plus a mixed-review assignment covering months 1-4

Month 5: Programs That Do Your Chores (Weeks 17-20)
  Desktop Apps with Tkinter
    Topics:
      - Tkinter: windows, widgets and layouts
      - CustomTkinter for apps that look like this decade
      - GUI design principles
      - Event-driven programming
      - Packaging desktop apps
      - Connecting buttons to your own functions
      - Saving app data with JSON (your month 2 skills)
      - Packaging a desktop app with PyInstaller
    Projects built:
      - Pomodoro study timer
      - Flashcards app for any school subject
      - Notes app with save and search
    Practice: Design and build one desktop tool you will personally use this term
```

```
  Automation: Files, Sheets and Documents
    Topics:
      - The automation mindset: never do a boring task three times
      - Organizing folders and files with pathlib and shutil
      - Renaming, sorting and de-duplicating hundreds of files safely
      - Excel automation with openpyxl
      - Reading and creating PDFs with pypdf
      - Resizing and watermarking images with Pillow
      - Sending yourself email reports from Python
      - Scheduling scripts to run on their own
      - Dry runs and undo plans: automating without disasters
    Projects built:
      - Downloads-folder organizer that runs on a schedule
      - School timetable to calendar converter
      - Photo batch resizer and watermarker
    Practice: Automate 5 real chores from your own computer
  Web Scraping, Politely
    Topics:
      - How web pages are structured: HTML through a scraper's eyes
      - Downloading pages with requests
      - Parsing with BeautifulSoup: find, select, extract
      - Scraping tables and lists into CSV
      - Being polite: robots.txt, delays and identifying yourself
      - When scraping is the wrong tool: finding the site's API instead
      - Handling pages that change or break
      - A look at Playwright for JavaScript-heavy pages
      - Legal and ethical lines, in plain language
    Projects built:
      - Book or game price tracker with history
      - Sports statistics collector into CSV
      - News headline digest that emails itself to you
    Practice: Build one scraper for a site you actually check every week
  Automation Capstone
    Topics:
      - Choosing an automation worth building: your most boring hour
      - Breaking a chore into steps a script can do
      - Combining skills: files, scraping, email, scheduling
      - Logging: knowing what your script did while you slept
      - Handling failure gracefully instead of silently
      - Writing a README so future-you can maintain it
      - Presenting an automation: before, after, time saved
    Projects built:
      - The personal automation suite: one real multi-step chore, fully automated, scheduled and
        logged
    Practice: Run your automation for a full week and fix what reality breaks
    Assessment: Automation review: demonstrate the suite running end to end and walk
    through the code, alongside a quiz that revisits earlier months

Month 6: Data Tells Stories (Weeks 21-24)
  NumPy and pandas Foundations
    Topics:
      - NumPy arrays: why they beat lists for numbers
      - pandas DataFrames: loading, filtering, sorting, grouping
      - Data cleaning and preprocessing
      - Exploratory data analysis (EDA)
      - Dealing with missing data
      - Outlier detection
      - Reading CSVs from the real world, mess included
      - Asking a dataset questions and trusting the answers
    Projects built:
      - Class marks analyzer with honest averages
      - Personal screen-time or sports data breakdown
      - Music streaming history explorer
    Practice: Explore 3 real datasets and write down 5 true findings from each
  Data Visualization
    Topics:
      - Matplotlib: the chart types that cover 90% of real needs
      - Seaborn for statistical plots
      - Plotly for interactive visualizations
      - Animation creation
      - Design for honesty: labels, scales and not misleading people
      - Plotly for charts you can hover and zoom
    Projects built:
      - A visual report on a dataset you care about
      - Interactive chart set built with Plotly
    Practice: Make 10 charts, then rework the 3 weakest until they explain themselves
  A Real Data Project
    Topics:
      - Choosing a dataset and a question worth asking
```

- Cleaning: missing values, weird rows, wrong types
- Exploratory analysis: distributions, groups, trends
- Correlation and the classic causation trap
- Building the story: from table to chart to sentence
- What data cannot tell you, said out loud
- Packaging analysis in a clean, rerunnable script

Projects built:
- Full analysis of a real public dataset: cleaned, explored, visualized and written up

Practice: Trade datasets with a classmate and check each other's conclusions

Phase 2 Capstone and Review

Topics:
- Portfolio thinking: choosing your best work so far
- Refactoring old code with new skills
- Code review: reading each other's projects kindly and usefully
- Filling gaps: a targeted review week shaped by the batch
- Writing project descriptions people understand
- Planning phase 3: what the web changes

Projects built:
- Polish pass on your two best phase 2 projects, README included

Practice: Publish your top 3 projects in a personal portfolio folder

Assessment: Phase 2 review: portfolio walkthrough of the term's builds, plus a written mixed review spanning phases 1 and 2

PHASE 3: PYTHON ON THE WEB (MONTHS 7-8, WEEKS 25-32)

How the web really works, then Flask: routes, templates, forms, a database, user accounts, and a deployment to a public URL.

Month 7: From Requests to Flask (Weeks 25-28)

How the Web Works

Topics:
- What happens when you visit a URL: DNS, HTTP, servers, browsers
- HTTP methods and status codes developers actually meet
- HTML and CSS: a working crash course for Python developers
- What JSON is doing in every modern app
- APIs: how programs talk to other programs
- Reading API documentation without fear
- The client-server picture, drawn until it sticks
- Developer tools: watching real traffic in the network tab

Projects built:
- A hand-built personal page in HTML and CSS
- HTTP explorer: a script that inspects any site's responses

Practice: Map the requests behind 3 sites you use daily

Consuming APIs

Topics:
- Calling real APIs with requests
- API keys, and keeping them out of your code with .env files
- Parsing JSON responses into useful Python objects
- Handling errors, timeouts and rate limits like a professional
- Pagination: getting all the data, not just page one
- Building a small client library around an API
- Command-line tools people can actually use
- Free public APIs worth building on

Projects built:
- Weather dashboard in the terminal
- Currency converter with live rates
- Trivia game powered by a public API

Practice: Build clients for 3 different public APIs

Flask: Your First Web App

Topics:
- Flask: a real web server in seven lines
- Routes and view functions
- Templates with Jinja2
- Static files handling
- Request and response objects
- Debug mode and reading Flask errors calmly
- Passing data from Python into pages

Projects built:
- Personal site served by Flask
- Dice-roller and random-picker web tools
- Quote-of-the-day site with rotating content

Practice: Build 3 tiny Flask apps from scratch without notes

Templates, Forms and Sessions

Topics:
- Jinja templates: loops and conditionals inside HTML
- Template inheritance: one layout, many pages
- Forms: getting data from the visitor safely
- Validating input, and never trusting the browser

- Redirects and flash messages
- Sessions and cookies: remembering visitors
- Organizing a Flask project as it grows
- Styling with a lightweight CSS framework

Projects built:
- Multi-page site with one shared layout
- Feedback form that validates and thanks properly
- Mini poll app that remembers your vote

Practice: Convert two phase 2 tools into small web apps
Assessment: Month 7 check: build and explain a small Flask feature live, plus a mixed quiz reaching back to earlier phases

Month 8: Databases, Users and Deployment (Weeks 29-32)
Databases with SQLite and SQLAlchemy
Topics:
- SQL fundamentals: select, insert, update, delete, join
- SQLite for development
- SQLAlchemy models: tables as Python classes
- Query optimization and indexing
- Transactions and ACID properties
- Designing tables for a real app before coding it
- When a spreadsheet stops being enough

Projects built:
- Book or game library app backed by SQLite
- Class notice board with posts stored properly

Practice: Design and build 3 small database schemas
User Accounts and Web Safety
Topics:
- Sign up and log in with Flask-Login
- Password hashing: why plain text is never stored, ever
- Protecting pages: login required
- Each user sees their own data: ownership in queries
- Web security awareness: SQL injection and XSS, shown safely
- CSRF protection with Flask-WTF
- Secrets and settings kept in environment variables
- A security checklist for every app you ship

Projects built:
- To-do app with real accounts, where every user has their own list

Practice: Add accounts to your week 29 app, then try to break your own login
Deploying to the Real Internet
Topics:
- What deployment actually means: your laptop is not a server
- Preparing an app: requirements.txt, gunicorn, configuration
- Deploying to Render step by step
- Environment variables in production
- Keeping secrets out of GitHub, permanently
- Custom domains and HTTPS, demystified
- Reading production logs when something breaks
- The deploy checklist you will reuse for years

Projects built:
- Your accounts app deployed to a public URL anyone can visit

Practice: Deploy a second app solo, using only your own checklist
Web Capstone
Topics:
- Scoping a web app you can finish in a week
- Building in slices: one working feature at a time
- Testing your app the way a stranger uses it
- Polish: empty states, error pages, small screens
- A mid-week review with the instructor
- Shipping and sharing the link

Projects built:
- The web capstone: a Flask app with a database, accounts and a live URL. Classic picks: link shortener, study planner, club site with sign-ups, or your own idea

Practice: Collect feedback from 3 real users and ship one improvement
Assessment: Web capstone review: live walkthrough from route to database to deployed URL, with cumulative questions from phases 1-3

PHASE 4: AI, QUALITY AND THE CAPSTONE (MONTHS 9-10, WEEKS 33-40)

Machine learning done honestly, AI features built on modern APIs, professional habits with Git and pytest, and a final capstone shipped like a product.

Month 9: AI and Real-World Tools (Weeks 33-36)
Machine Learning with scikit-learn
Topics:
- What machine learning actually is: functions learned from data
- Supervised learning algorithms
- Unsupervised learning techniques

- Evaluating honestly: train/test splits and why accuracy can lie
- Overfitting: the model that memorized the homework
- Reading what a model learned, and its limits

Projects built:
- Movie or game rating predictor
- Handwritten digit classifier
- Spam detector trained on real messages

Practice: Train 5 models, and for each write one sentence on where it fails

Building on AI APIs

Topics:
- Calling a modern AI model from Python (accounts set up with a parent where required)
- Structured output with Pydantic
- Function calling: giving the model real tools
- The agent loop: plan, act, observe, repeat
- Retrieval over your own documents
- Vector search basics, and when it is overkill
- Guardrails: validating what comes back
- When the agent is confidently wrong
- Cost control: tokens, caching, spend caps
- Automating a real, boring task end to end
- Evaluating an agent: does it actually work?

Projects built:
- Tool-using research helper
- Document Q&A over your own class notes
- Automate one real weekly chore with an AI step

Practice: Build 3 small AI-powered scripts and note where each one is confidently wrong

An AI Feature in a Real App

Topics:
- Designing an AI feature people would actually use
- Adding an AI endpoint to your Flask app
- Prompts as code: versioned, tested, improved
- Streaming responses so the app feels alive
- Caching to control cost and speed
- Failure modes: timeouts, refusals and nonsense, handled
- Simple evaluation: is the feature actually good?
- AI ethics for builders, in plain terms

Projects built:
- Study-buddy feature added to your deployed web app: ask questions, get grounded answers

Practice: Run 20 real queries through your feature and grade the answers yourself

Git and GitHub for Real Projects

Topics:
- Why every developer uses version control
- The core loop: status, add, commit, log
- Branches: experimenting without fear
- GitHub: pushing your work to the world
- READMEs that make a project understandable in a minute
- Undoing mistakes: the calm guide
- .gitignore and never committing secrets
- Your GitHub profile as a living portfolio
- Where our full Git and GitHub course goes further

Projects built:
- Course portfolio pushed to GitHub: best projects, clean READMEs, pinned repositories

Practice: Commit daily for two weeks; make the history readable

Assessment: Month 9 check: a mixed assignment spanning machine learning, AI features and Git, with questions revisiting earlier phases

Month 10: Quality, Capstone and Demo Day (Weeks 37-40)

Testing and Code Quality

Topics:
- pytest: your first real test suite
- Test-first thinking on one small feature
- Fixtures and factories
- API testing strategies
- Black and flake8: code that reads like it was written on purpose
- Reading tracebacks like a detective, not a victim
- Debugging with breakpoints instead of print spam

Projects built:
- Test suite for your web capstone's core logic
- Bug hunt: find and fix 5 planted bugs using the debugger

Practice: Write 25 tests across your three best projects

Final Capstone Build

Topics:
- Choosing the capstone: a game with an AI opponent, a full web app with an AI feature, or an automation product
- Writing a one-page spec before any code
- Milestones: working core by day 4, feature-complete by day 10
- Instructor checkpoints and course corrections
- Using everything: OOP, files, web, data, AI, Git, tests
- Cutting scope without cutting quality

- Preparing the demo: story, not feature list
Projects built:
- The final capstone, built over two weeks with version control, tests on the core logic, and a README worth reading
Practice: Daily commits; a working build at the end of every session

Demo Day and What Comes Next
Topics:
- Presenting the capstone: live demo plus the hardest bug story
- Portfolio final pass: GitHub profile, project pages, screenshots
- An honest skills inventory: strong, shaky, next
- Where each path leads: AI and machine learning, data structures and algorithms, deeper web development
- How school and board computer science connect to what you now know
- Staying sharp: projects, communities and healthy practice habits
Projects built:
- Demo day presentation delivered to the batch and parents
Assessment: FINAL EXAM: a practical build plus a written paper with questions mixed from every phase. Passing earns the certificate; a student who falls short gets a focused revision plan and a free retest

PROJECTS THE STUDENT BUILDS AND KEEPS

- Phase 1: quiz and adventure games, a journal app with save files, an expense tracker, classic algorithms built by hand
- Phase 2: two finished Pygame games published on itch.io, desktop apps, a personal automation suite, a real-dataset analysis
- Phase 3: API clients, then a Flask web app with a database and user accounts, deployed to a public URL
- Phase 4: honest machine learning experiments, an AI-powered study tool, and a final capstone with tests and version control

Total projects: 30+ real projects, ending with a deployed web app and an AI-powered capstone

SKILLS THE STUDENT WILL HAVE AT THE END

- Core Python: syntax, data structures, files, errors and object-oriented programming, to genuine fluency
- Games: Pygame from the game loop to finished, published, shareable games
- Automation: scripts for files, spreadsheets, PDFs and the web, written politely and safely
- Data: pandas, matplotlib and honest exploratory analysis of real datasets
- Web development: Flask, SQL databases, user accounts and deployment to a live URL
- AI foundations: scikit-learn fundamentals plus real features built on modern AI APIs
- Developer habits: Git and GitHub, pytest, debugging and code review

HOW A TYPICAL WEEK IS SPLIT

Live classes: 2 live one-hour classes per week, coding along with the instructor
Homework: Homework after every class, and a mixed-review assignment at the end of every month so earlier skills stay sharp
Practice: 3-4 hours of projects and challenges between classes
Review: Every submitted project reviewed with written feedback; recurring issues reopened in class

SUPPORT INCLUDED

Doubt support: WhatsApp doubt support between classes, so nobody stays stuck on a bug for days
Progress updates: Regular progress notes to parents: what was built, what comes next, and where encouragement at home helps

CERTIFICATION DETAIL

Completion: Certificate from Modern Age Coders, awarded on passing the final exam. Fall short and there is focused revision and a free retest: the certificate certifies knowledge, not attendance

WHERE THIS CAN LEAD

- AI and Machine Learning Masterclass: the natural next step once Python is fluent
- Data Structures and Algorithms: competitive programming and interview-style problem solving
- Deeper web development: from Flask into Django, React and production-grade apps
- School exams: a serious head start for CBSE, ICSE and AP-level computer science
- Real small projects: sites, tools and automations for family, school clubs and local teams

COMMON QUESTIONS ABOUT THIS COURSE

For anything about cost, use PART 4 and RULE 1. Do not quote two regions.

Q: What will my teen build in this Python course?

A: Every project is built by the student and reviewed with written feedback.

Q: How long does it take a teenager to learn Python properly?
A: Most students reach a genuinely advanced level in 10 months at 2 live classes a week plus 3 to 4 hours of practice. The syllabus deliberately keeps 2 months of margin in hand: students who need more repetition take up to 12 months, with no rushing and no penalty. Progress is visible early, the first playable text game appears within the first month.

Q: How is my teen assessed? Is the certificate just for attending?
A: No. Classwork runs inside every session, homework follows every class, and each month ends with an assignment that deliberately mixes new questions with earlier topics so knowledge compounds instead of fading. Every phase closes with a cumulative check, and the course ends with a final exam: a practical build plus written questions drawn from the whole syllabus. Passing earns the certificate; falling short earns a focused revision plan and a free retest. We optimize for real knowledge and real depth, not a stream of feel-good badges.

Q: Does my teen need maths or prior coding experience?
A: No prior coding at all, and ordinary school maths is plenty. Teens who already know some Python simply move faster through the early months.

Q: Is Python the right first language for a teenager?
A: For most teens, yes. Python reads close to English, produces a working program in the first class, and then scales all the way up: it is the language of choice in AI, data science and automation, and one of the two languages accepted in most school-level computer science exams. Nothing learned here has to be unlearned later.

Q: What software is needed, and is it free?
A: Everything is free: Python itself, the VS Code editor, and open-source libraries like Pygame, Flask, pandas and scikit-learn. Any reasonably modern computer with a stable internet connection can run the full course. Where an AI service needs an account, it is set up together with a parent.

Q: How is AI taught in this course?
A: In two honest layers. First, machine learning fundamentals with scikit-learn, where students train real models and learn to evaluate them without fooling themselves. Second, modern AI APIs, where they build features like a study-buddy that answers questions over their own notes. The goal is a teen who builds with AI and understands its limits, not one who just chats with it.

Q: Where does this lead after the course?
A: Three natural roads: our AI and Machine Learning Masterclass for teens who caught the AI spark, the Data Structures and Algorithms course for competitive programming, or deeper web development from Flask into Django and React. The portfolio built here, games, a deployed app, an AI capstone, carries directly into school projects and college applications.

Q: Is a trial class available?
A: Yes, a free demo class with no commitment; book at learn.modernagecoders.com/contact or message us on WhatsApp at +91 91233 66161. Parents are welcome to observe the demo and ask the teacher questions afterwards. (Agent note: the free demo is a waiting list with no fixed date. The Priority Live Demo is a guaranteed class today or tomorrow, booked at https://learn.modernagecoders.com/priority-demo . Offer both, as RULE 3 says.)

Q: How are the classes taught?
A: Through live 1-hour online sessions with a real teacher, never pre-recorded videos. Classes are interactive and small; students write and run code during class, not just watch someone else do it. Group batches are capped at 20, with mini-batch and 1-on-1 options for closer attention.

Q: Does the course include a certificate?
A: Yes, and it is earned, not handed out: the certificate is awarded on passing the final exam, with a free retest after revision if the first attempt falls short. Alongside it stands the portfolio, 30+ projects, published games, a deployed web app and an AI capstone, which shows exactly what your teen can build, not just what they sat through.

To enrol, message Shivam Sir on +91 9123366161 or send the parent this link: https://learn.modernagecoders.com/courses/python-complete-masterclass-teens
For a demo: the Priority Live Demo (guaranteed, today or tomorrow) is booked at https://learn.modernagecoders.com/priority-demo . The free demo is a waiting list with no fixed date.

==========

COURSE 119 OF 137: PYTHON MASTERCLASS: ZERO TO ADVANCED, LIVE ONLINE

==========

Course link: https://learn.modernagecoders.com/courses/python-programming-masterclass-zero-to-advanced-college
Subject area: Python Programming
Designed for: College students
Who can join: Complete beginner (18+); college students, graduates and professionals
Course length: 9-11 months (36-44 weeks)

Time needed: 2 live classes/week + 4-6 hours practice
Certificate: Certificate from Modern Age Coders, awarded on passing the final exam

PRICE FOR THIS COURSE (quote only the one that applies to the person asking)
  In India, per month: group Rs 1,499, mini batch Rs 2,999, one to one Rs 4,999
  In Canada, per month: group CAD 140, one to one CAD 210
  Anywhere else, per month: group $100, one to one $150
  Classes: group and mini batch two live classes a week, eight a month; one to one in India one live class a week, four a month; one to one outside India two live classes a week, eight a month. Each class is one hour.

WHAT THIS COURSE IS

  Python masterclass for college students and professionals: core to advanced Python, testing, Git, APIs, automation and a guided taste of web, data and AI roads in 9-11 months.

  In one line: One language, learned to professional depth: core Python, the working toolkit, and an honest guided taste of the three roads beyond.

ABOUT THE PROGRAMME

  Python is the most useful single language a professional can learn, and the most commonly half-learned. This live online masterclass fixes the half: nine months from zero to genuinely advanced Python, the kind that reads stdlib source without fear, plus the professional toolkit, testing, Git, virtual environments, APIs, automation and concurrency, that turns language skill into working capability. The scope is deliberately honest. Web frameworks, data science and machine learning are each their own multi-month disciplines, and this course refuses to fake all three in survey weeks. Instead, the final month is a guided, hands-on taste of the three roads, a real Flask build, a real pandas analysis, a real AI-API script, so every graduate chooses their specialization from experience rather than marketing, and continues into our dedicated Django, data analysis or AI courses with the Python depth those courses quietly assume. The pace is real: nine months at two live classes a week plus four to six hours of practice, with two more months in hand when needed. Problem sets after every class, monthly mixed reviews that reach back deliberately, phase exams, and a final exam that decides the certificate, with focused revision and a free retest. Real Python, real depth, depth over dopamine.

WHAT MAKES THIS COURSE DIFFERENT

  - Depth where it compounds: core and advanced Python owned properly, not surveyed
  - The professional toolkit is the syllabus: testing, Git, environments, APIs, automation, concurrency
  - Honest specialization: the three roads (web, data, AI) tasted hands-on, then continued in dedicated courses instead of faked in survey weeks
  - Pythonic style taught deliberately: comprehensions, iterators and the standard library as a first resort
  - Certification-aware: the syllabus covers what PCEP and PCAP examine, for students who want the credential road
  - Real assessment: weekly problem sets, monthly mixed reviews, and a final exam that decides the certificate, with focused revision and a free retest

THE LEARNING PATH, STEP BY STEP

  Phase 1: Core Python (Months 1-3): syntax to data structures, learned through daily building
  Phase 2: Professional Python (Months 4-6): OOP, files and exceptions, the standard library, testing and a real capstone
  Phase 3: The working toolkit (Months 7-8): Git and GitHub, APIs and scraping, automation, concurrency
  Phase 4: The three roads and the finale (Month 9): Flask, pandas and AI APIs tasted honestly, then the final capstone and exam

WHAT A STUDENT NEEDS BEFORE STARTING

  Coding experience: None. The course starts at the very first line
  Equipment: A computer with a stable internet connection; Python and every tool used are free
  Age: 18+; college students, graduates and working professionals
  Time commitment: 2 live classes plus 4-6 hours of practice a week

WHO THIS COURSE IS FOR

  College students: Students who want Python owned properly, not survived for a semester
  Career switchers: Professionals entering software through its friendliest serious door
  Half learners: The tutorial-experienced who can follow along but cannot build alone, this course closes that gap
  Future specialists: Learners heading for web, data or AI who want the foundation those courses quietly assume
  Certification seekers: Students eyeing PCEP and PCAP, whose syllabi this course covers

FULL CURRICULUM, WEEK BY WEEK

This is the complete teaching plan. Parents can ask about any week.

PHASE 1: CORE PYTHON (MONTHS 1-3, WEEKS 1-12)

The language itself, learned properly: syntax, control flow, functions and the core data structures, practiced through daily building.

Month 1: First Python (Weeks 1-4)

Introduction to Programming & Python Setup

Topics:

- What is programming? How computers understand code
- Why Python? History, features, and popularity
- Python applications: web, data science, AI, automation, games
- Python 3 installation (Windows, Mac, Linux)
- Setting up development environment: VS Code, PyCharm
- Running Python: interactive shell vs script files
- IDLE, Jupyter Notebook, and Google Colab introduction
- Your first Python program: print('Hello World')
- Python syntax rules and code structure
- Comments: single-line (#) and multi-line (''')
- Indentation and its importance in Python
- Python PEP 8 style guide basics

Projects built:

- Hello World variations (personalized greetings)
- Simple calculator using print statements
- About Me program (display personal information)
- ASCII art creator

Practice: Daily: 30 min typing practice, write 5 simple print programs

Variables, Data Types & Operators

Topics:

- Variables: naming rules and conventions
- Assignment operator (=) and multiple assignments
- Data types: int, float, string, boolean
- Type checking with type() function
- Type conversion: int(), float(), str(), bool()
- Arithmetic operators: +, -, *, /, //, %, **
- Comparison operators: ==, !=, >, <, >=, <=
- Logical operators: and, or, not
- Assignment operators: +=, -=, *=, /=
- String basics: creation, concatenation, repetition
- String indexing and slicing [start:stop:step]
- F-strings and string formatting (format(), %)

Projects built:

- Temperature converter (Celsius/Fahrenheit)
- Age calculator with days, hours, minutes
- Simple interest calculator
- BMI (Body Mass Index) calculator
- Tip calculator with bill splitting

Practice: Solve 25 problems on variables, data types, and operators

Assessment: Month 1 check: a small program built live, plus a take-home mixing everything so far

Month 2: Control Flow and Functions (Weeks 5-8)

Control Flow: Conditions & Loops

Topics:

- Boolean expressions and truthiness
- If statement: basic conditional execution
- If-else: two-way branching
- If-elif-else: multi-way branching
- Nested if statements
- Ternary operator (conditional expression)
- While loop: condition-based repetition
- Infinite loops and break statement
- Continue statement to skip iterations
- For loop: iterating over sequences
- Range function: range(start, stop, step)
- Nested loops and loop patterns

Projects built:

- Number guessing game with attempts
- Grade calculator with letter grades
- Even/odd number checker
- Multiplication table generator
- Pattern printing (stars, pyramids, diamonds)
- Simple password validator
- FizzBuzz challenge

Practice: Solve 30 conditional and loop problems

Functions & Modular Programming

```
      Topics:
        - What are functions? DRY principle
        - Defining functions with 'def' keyword
        - Parameters and arguments (positional, keyword)
        - Return statement and return values
        - Multiple return values (tuples)
        - Default parameter values
        - Variable scope: local vs global
        - Global and nonlocal keywords
        - Docstrings for function documentation
        - *args for variable positional arguments
        - **kwargs for variable keyword arguments
        - Lambda functions (anonymous functions)
        - Built-in functions: len, sum, max, min, abs, round
      Projects built:
        - Function library for common calculations
        - Password strength checker function
        - Text analyzer (word count, character count)
        - Prime number checker and generator
        - Palindrome checker
        - Simple quiz game with scoring
        - Unit converter (length, weight, temperature)
      Practice: Create 20 different utility functions
      Assessment: Month 2 check: refactor a messy script into clean functions live, plus
      mixed review

  Month 3: The Data Structures (Weeks 9-12)
    Lists & List Operations
      Topics:
        - Lists: creating and accessing elements
        - List indexing (positive and negative)
        - List slicing: extracting sublists
        - List methods: append, insert, extend
        - Removing elements: remove, pop, clear
        - List methods: sort, reverse, copy
        - index() and count() methods
        - List comprehensions: compact list creation
        - Nested lists (2D lists, matrices)
        - Iterating lists with for loops
        - Enumerate function for index-value pairs
        - List vs tuple: mutability difference
      Projects built:
        - Todo list application (add, remove, display)
        - Shopping cart system
        - Student grade manager
        - Number list statistics (average, min, max)
        - List sorting and searching programs
        - Tic-tac-toe board representation
      Practice: Solve 25 list manipulation problems
    Tuples, Sets & Dictionaries
      Topics:
        - Tuples: immutable sequences
        - Tuple packing and unpacking
        - Tuple methods: count, index
        - When to use tuples vs lists
        - Sets: unordered unique collections
        - Set operations: union, intersection, difference
        - Set methods: add, remove, discard, clear
        - Dictionaries: key-value pairs
        - Accessing, adding, updating dictionary items
        - Dictionary methods: keys(), values(), items()
        - get() method with default values
        - Dictionary comprehensions
        - Nested dictionaries for complex data
        - String mastery: slicing, methods, f-strings and first regular expressions
      Projects built:
        - Contact book (name, phone, email)
        - Word frequency counter
        - Student database with grades
        - Inventory management system
        - English-Spanish dictionary translator
        - Vote counting system
      Practice: Build 10 projects using dictionaries and sets
      Assessment: Phase 1 exam: a data-wrangling task built live, plus a written mixed paper
      over months 1-3

------------------------------------------------------------
PHASE 2: PROFESSIONAL PYTHON (MONTHS 4-6, WEEKS 13-24)
------------------------------------------------------------
```

The jump from scripts to software: object-oriented design, files and exceptions, the standard library as a first resort, testing, and a real capstone.

- Month 4: Object-Oriented Python (Weeks 13-16)
  - Introduction to OOP Concepts
    - Topics:
      - What is Object-Oriented Programming?
      - Classes and objects: blueprint and instances
      - Creating classes with 'class' keyword
      - The __init__ constructor method
      - Instance variables (attributes)
      - Instance methods
      - Self parameter explained
      - Creating and using objects
      - Class vs instance attributes
      - Class methods with @classmethod decorator
      - Static methods with @staticmethod decorator
      - __str__ and __repr__ magic methods
    - Projects built:
      - Bank account class with deposit/withdraw
      - Student class with grades management
      - Book class for library system
      - Car class with properties and methods
      - Rectangle/Circle classes with area calculation
    - Practice: Create 15 different classes modeling real-world objects
  - OOP Principles: Inheritance & Polymorphism
    - Topics:
      - Inheritance: parent and child classes
      - Method overriding in child classes
      - Super() function to call parent methods
      - Multiple inheritance
      - Method Resolution Order (MRO)
      - Polymorphism: same interface, different implementation
      - Duck typing in Python
      - Abstract base classes (ABC module)
      - Encapsulation: public, protected, private
      - Name mangling with double underscore
      - Property decorators: @property, @setter
      - Composition vs inheritance
    - Projects built:
      - Animal hierarchy (Animal -> Dog, Cat, Bird)
      - Employee management system (Employee -> Manager, Developer)
      - Shape calculator with inheritance
      - Vehicle rental system
      - Game character classes with different abilities
    - Practice: Build 10 class hierarchies with inheritance
    - Assessment: Month 4 check: design a small class hierarchy live and defend it, plus mixed review

- Month 5: Files, Exceptions and the Standard Library (Weeks 17-20)
  - File Handling & Exception Handling
    - Topics:
      - Opening files: open() function and modes (r, w, a, r+)
      - Reading files: read(), readline(), readlines()
      - Writing to files: write(), writelines()
      - With statement for automatic file closing
      - File paths: absolute vs relative
      - Working with CSV files
      - JSON file handling: json.dump(), json.load()
      - Exception handling: try-except blocks
      - Catching specific exceptions
      - Multiple except blocks
      - Else and finally clauses
      - Raising exceptions with 'raise'
      - Creating custom exceptions
    - Projects built:
      - Note-taking app with file persistence
      - Contact manager with CSV storage
      - Configuration file reader/writer
      - Log file analyzer
      - Student records system with JSON
      - Error-safe calculator
    - Practice: Build 8 file-based applications
  - Modules, Packages & Standard Library
    - Topics:
      - Importing modules: import, from...import
      - Creating custom modules
      - Module search path and PYTHONPATH
      - Packages and __init__.py

- Creating package structures
- Math module: mathematical functions
- Random module: random numbers and choices
- Datetime module: working with dates and times
- OS module: operating system interface
- Sys module: system-specific parameters
- Collections module: deque, Counter, defaultdict
- Itertools module: efficient iterators
- Comprehensions and generator expressions: Pythonic style as a habit

Projects built:
- Dice rolling simulator with statistics
- Birthday reminder application
- File organizer using os module
- Random password generator
- Custom utility package creation
- Date calculator (age, days between dates)

Practice: Explore 15 standard library modules

Assessment: Month 5 check: solve three tasks stdlib-first, plus mixed review reaching back to phase 1

Month 6: Testing and the Phase Capstone (Weeks 21-24)

Testing & Debugging

Topics:
- Why testing matters
- Manual testing vs automated testing
- Unit testing with unittest module
- Test cases and assertions
- SetUp and tearDown methods
- Pytest framework introduction
- Writing pytest test functions
- Test fixtures in pytest
- Parameterized testing
- Code coverage with coverage.py
- Debugging techniques in Python
- Using Python debugger (pdb)
- Logging with logging module

Projects built:
- Test suite for calculator
- Testing OOP classes
- Testing file operations
- TDD (Test-Driven Development) mini project
- Debugging exercise solutions

Practice: Write tests for all previous projects

Phase 2 Capstone

Topics:
- Object-oriented design
- Algorithm implementation
- File-based data persistence
- Error handling throughout
- Unit testing
- Code documentation

Projects built:
- PHASE 2 CAPSTONE: Library Management System (OOP-based)
- Features: Books, members, lending, returns, fines, search, file storage, testing
- Alternative: School Management System
- Alternative: Banking System with multiple account types
- Alternative: E-commerce Inventory System

Assessment: Phase 2 exam: a tested, documented capstone defended, plus a cumulative written paper

---

PHASE 3: THE WORKING TOOLKIT (MONTHS 7-8, WEEKS 25-32)

What turns language skill into working capability: Git and GitHub, real APIs and polite scraping, automation that survives reality, and concurrency without folklore.

Month 7: Git, GitHub and the Living Web (Weeks 25-28)

Version Control with Git & GitHub

Topics:
- What is version control?
- Git installation and setup
- Git basic commands: init, add, commit
- Git workflow: working directory, staging, repository
- Checking status and history: status, log
- Branches: creating and switching
- Merging branches
- Handling merge conflicts
- Remote repositories: GitHub
- Push, pull, clone operations

```
      - GitHub collaboration basics
      - .gitignore file for Python projects
    Projects built:
      - Initialize Git for existing projects
      - Create GitHub repository
      - Collaborate on shared repository
      - Open source contribution preparation
    Practice: Use Git for all future projects
  APIs and Web Scraping, Done Politely
    Topics:
      - Advanced BeautifulSoup techniques
      - Navigating HTML tree
      - CSS selectors for scraping
      - Scrapy framework introduction
      - Creating Scrapy spiders
      - Item pipelines for data processing
      - Scrapy selectors and XPath
      - Handling pagination
      - Selenium for dynamic websites
      - WebDriver automation
      - Headless browsing
      - Ethics, robots.txt, and rate limiting
    Projects built:
      - News scraper with BeautifulSoup
      - E-commerce price tracker
      - Job listings aggregator with Scrapy
      - Social media scraper (ethical)
      - Automated form filler with Selenium
    Practice: Build 8 scraping and automation projects
    Assessment: Month 7 check: build an API client live with error handling, plus mixed
    review

Month 8: Automation and Concurrency (Weeks 29-32)
  Automation and Scripting That Survives Reality
    Topics:
      - File and folder automation
      - Batch file processing
      - PDF manipulation with PyPDF2
      - Excel automation with openpyxl
      - CSV data processing
      - Email automation with smtplib
      - Scheduling tasks with schedule library
      - System administration scripts
      - Desktop automation with PyAutoGUI
      - Clipboard automation
      - Screenshot and image manipulation
      - Building CLI tools with Click/argparse
      - Virtual environments and dependency hygiene as reflexes
    Projects built:
      - File organizer automation
      - Excel report generator
      - Email sender with attachments
      - PDF merger and splitter
      - Automated backup system
      - Desktop notification system
      - System monitoring script
    Practice: Create 10 automation scripts for daily tasks
  Concurrency Without Folklore
    Topics:
      - Concurrency vs parallelism
      - Threading basics with threading module
      - Creating and starting threads
      - Thread synchronization
      - Multiprocessing module
      - Process creation and management
      - Pool for parallel execution
      - AsyncIO for asynchronous programming
      - Async/await syntax
      - Concurrent.futures module
      - ThreadPoolExecutor and ProcessPoolExecutor
      - When to use threading vs multiprocessing
    Projects built:
      - Multi-threaded file downloader
      - Parallel data processing
      - Async web scraper
      - CPU-intensive task with multiprocessing
    Practice: Optimize slow programs with concurrency
    Assessment: Phase 3 exam: an automation built and scheduled live, plus a cumulative
    written paper
```

PHASE 4: THE THREE ROADS AND THE FINALE (MONTH 9, WEEKS 33-36)

Web, data and AI, each tasted hands-on in real builds, then the final capstone and the exam that decides the certificate.

Month 9: Choose Your Road, Then Prove the Journey (Weeks 33-36)

The Three Roads, Tasted Honestly

Topics:

- Road one, web: a real Flask app built in two sessions, routes to deployment
- Road two, data: a real pandas analysis, load, clean, group, chart, conclude
- Road three, AI: a real script on a modern AI API, structured output included
- What each road demands next, told straight
- Where our Django, data analysis and AI courses continue each road
- Choosing from experience: which build did you not want to stop?

Projects built:

- Three small real builds: a deployed Flask app, a pandas analysis, an AI-API tool

Practice: Extend the road that pulled hardest by one more feature

Final Capstone Build

Topics:

- One focused week: a complete Python product using the whole course
- Tested core logic, clean structure, honest README
- Instructor checkpoint and scope cuts
- Version control history that tells the story

Projects built:

- The final capstone: a tool, automation or application built to be shown

Practice: Daily commits; a working build at the end of every session

Demo Day and the Final Exam

Topics:

- Presenting the capstone: live demo plus the hardest bug story
- A full-course spiral review before the exam
- PCEP and PCAP: how this syllabus maps to the certifications, for those who want them
- The road chosen, and the dedicated course that continues it

Projects built:

- Demo day presentation delivered to the batch

Assessment: FINAL EXAM: a practical build plus a written paper with questions mixed from every phase. Passing earns the certificate; falling short earns a focused revision plan and a free retest

PROJECTS THE STUDENT BUILDS AND KEEPS

- Phase 1: daily builds from calculators to data-wrangling tools
- Phase 2: an OOP system, stdlib-first utilities, and a tested phase capstone
- Phase 3: a Git-managed portfolio, API clients, polite scrapers and scheduled automations
- Phase 4: a Flask app, a pandas analysis, an AI-API tool, and the defended final capstone

Total projects: 25+ real builds, crowned by a tested, defended capstone

SKILLS THE STUDENT WILL HAVE AT THE END

- Core Python to genuine depth: syntax, data structures, functions, OOP
- Pythonic style: comprehensions, iterators and the standard library as a first resort
- The professional toolkit: pytest, Git and GitHub, virtual environments
- The living web: APIs consumed properly, scraping done politely
- Automation and concurrency: scripts that survive reality
- Road literacy: Flask, pandas and AI APIs each experienced hands-on

HOW A TYPICAL WEEK IS SPLIT

Live classes: 2 live one-hour classes per week, coding along with the instructor

Homework: A problem set after every class, and a mixed-review assignment at the end of every month

Practice: 4-6 hours of building between classes

Review: Every submission reviewed with written feedback; recurring gaps reopened in class

SUPPORT INCLUDED

Doubt support: WhatsApp doubt support between classes, for the traceback that makes no sense at midnight

Progress updates: Honest monthly progress reviews: what is solid, what is wobbly, and the plan for the wobble

CERTIFICATION DETAIL

Completion: Certificate from Modern Age Coders, awarded on passing the final exam. Fall short and there is focused revision and a free retest: the certificate certifies knowledge, not attendance

WHERE THIS CAN LEAD

- Django and Flask web development: our dedicated web course continues road one
- Data analysis and data science: our data courses continue road two
- AI and machine learning: our AI/ML and generative AI courses continue road three
- PCEP and PCAP certification: the credential road, entered with real depth
- Automation everywhere: the skill that pays off in any job from day one

EARNING POTENTIAL (share only if asked, and never promise it)

Market context: The ranges below are general market salary bands for these roles in India and abroad, drawn from public industry data. They are shown for career context only and are not a promise or guarantee of income. Actual pay depends on your skills, experience, location, and the job market.
Early career roles: Rs 2-4 LPA (Junior Python Developer / Intern)
Growing roles: Rs 4-7 LPA (Python Developer / Automation Engineer); Rs 7-12 LPA (Full Stack Python / Data Analyst)
Experienced roles: Rs 10-20 LPA (Senior Python / Data Scientist / ML Engineer)
Other roles: Rs 12-30 LPA in India, $80k-180k USD internationally; Rs 15-40 LPA in India, $100k-200k+ USD internationally
Freelance: Rs 500-3,000/hour based on specialization
International: $60k-150k USD (USA) based on role and experience

COMMON QUESTIONS ABOUT THIS COURSE

For anything about cost, use PART 4 and RULE 1. Do not quote two regions.

Q: What does this Python masterclass cover?
A: Python to genuine professional depth across nine months: the core language and data structures, object-oriented design, files and exceptions, the standard library used as a first resort, testing with pytest, Git and GitHub, APIs and polite scraping, automation and concurrency, and a final month that tastes the three roads, a real Flask build, a real pandas analysis, a real AI-API tool, before the capstone and final exam.

Q: How long does it take to learn Python properly?
A: To professional depth: nine months at 2 live classes a week plus 4 to 6 hours of practice, and the course keeps two more months in hand for learners who need them. Two-week Python courses teach syntax; syntax is perhaps a tenth of the skill employers actually test.

Q: How am I assessed? Is the certificate just for attending?
A: No. Problem sets follow every class with written feedback, monthly reviews deliberately mix new material with earlier topics, each phase ends with an exam, and the course ends with a final exam: a practical build plus written questions from the whole syllabus. Passing earns the certificate; falling short earns focused revision and a free retest.

Q: Does this course cover web development, data science and AI?
A: It covers what makes them possible, deep Python, and then tastes each road honestly in the final month: a deployed Flask app, a pandas analysis, an AI-API tool. Full web, data and AI tracks are their own multi-month disciplines, and we teach them properly in dedicated courses rather than faking them here in survey weeks. Graduates choose their road from experience and continue with the depth those courses assume.

Q: Will this prepare me for PCEP or PCAP certification?
A: Yes: the syllabus covers what both exams examine, and the final weeks map it explicitly for students who want the credential. We also run a dedicated PCEP/PCAP preparation course for those who want exam-format drilling specifically.

Q: Is Python still the right language to learn?
A: More than ever: it is the language of AI and data, the default automation tool of every industry, and the most commonly listed skill in technical hiring. The AI era raised its value, the people directing AI tools well are the ones who understand the code those tools produce, and Python is where that understanding is cheapest to build.

Q: Can I try a class before enrolling?
A: Yes, a free demo class with no commitment: book at learn.modernagecoders.com/contact or message us on WhatsApp at +91 91233 66161. You will write and run real Python inside the demo. (Agent note: the free demo is a waiting list with no fixed date. The Priority Live Demo is a guaranteed class today or tomorrow, booked at https://learn.modernagecoders.com/priority-demo . Offer both, as RULE 3 says.)

Q: Are classes live or recorded?
A: Live, always: small groups with a real instructor reading your actual code, never pre-recorded videos. Python habits, good and bad, form in the first months; live correction is what makes them good.

To enrol, message Shivam Sir on +91 9123366161 or send the parent this link: https://learn.modernagecoders.com/courses/python-programming-masterclass-zero-to-advanced-college
For a demo: the Priority Live Demo (guaranteed, today or tomorrow) is booked at https://learn.modernagecoders.com/priority-demo . The free demo is a waiting list with no fixed date.

==
COURSE 120 OF 137: PYTHON WEB DEVELOPMENT WITH DJANGO AND FLASK COURSE
==

Course link: https://learn.modernagecoders.com/courses/python-web-development-django-flask-course
Subject area: Web Development
Designed for: College students
Who can join: Intermediate, college students and working professionals with Python basics
Course length: 6 months (24 weeks)
Time needed: 2 live classes/week + 3-4 hours practice
Certificate: Certificate from Modern Age Coders, awarded on passing the final assessment

PRICE FOR THIS COURSE (quote only the one that applies to the person asking)
  In India, per month: group Rs 1,499, mini batch Rs 2,999, one to one Rs 4,999
  In Canada, per month: group CAD 140, one to one CAD 210
  Anywhere else, per month: group $100, one to one $150
  Classes: group and mini batch two live classes a week, eight a month; one to one in India one
  live class a week, four a month; one to one outside India two live classes a week, eight a
  month. Each class is one hour.

WHAT THIS COURSE IS

  Python web development course with Django and Flask: live online classes on routing,
  templates, databases, auth, REST APIs and deploying a real project.

  In one line: You know Python. Six months from now, your code answers requests on a real URL.

ABOUT THE PROGRAMME

  Knowing Python and being able to ship a web application are two different skills, and the
  second one is what this course builds. It starts where confusion usually begins: what
  actually happens when a browser asks a server for a page. Month 1 answers that with HTTP
  fundamentals and Flask, a framework small enough to see through: routes, templates, and forms
  with nothing hidden. Month 2 adds the database layer, SQL first and then the SQLAlchemy ORM,
  plus sessions and login, so by the halfway mark students have built a complete Flask
  application from scratch. Months 3 and 4 move to Django, the framework Indian and global
  companies run in production: models, migrations, the admin, authentication, relationships,
  and class-based views, ending in a database-backed project with real users. Month 5 covers
  what most jobs actually ask for, REST APIs with Django REST Framework: serializers, token
  authentication, permissions, and a documented API tested end to end. Month 6 is deployment
  and the capstone: environment configuration, Postgres, Gunicorn, static files, a live host,
  and a project of the student's own design shipped to a public URL and defended. Classes are
  live and small, everything is built by typing, and code review is part of the course, not a
  bonus.

WHAT MAKES THIS COURSE DIFFERENT

  - Flask before Django, on purpose: a small framework first means Django's conveniences read as
    solutions, not magic
  - SQL is taught before the ORM, so students understand what save() and filter() actually send
    to the database
  - The middle of the course is a complete Flask app and a complete Django app, not fragments
    that never meet
  - REST APIs get a full month with Django REST Framework, because that is what backend job
    descriptions actually list
  - Deployment is a taught skill, not a footnote: every student ships the capstone to a real
    public URL
  - Code review from a working instructor on every project, with the same standards a team lead
    would apply

THE LEARNING PATH, STEP BY STEP

  Phase 1: How the web works and Flask from scratch: HTTP, routes, templates, forms, SQL, the
  ORM, sessions, and a complete Flask application
  Phase 2: Django properly: models, migrations, admin, authentication, relationships, and
  class-based views, ending in a database-backed multi-user project
  Phase 3: REST APIs with Django REST Framework, then production: deployment, Postgres,
  environment config, and a capstone shipped to a live URL

WHAT A STUDENT NEEDS BEFORE STARTING

  Python basics: Required: variables, loops, functions, lists, and dictionaries. Our Python
    courses cover this if you are not there yet
  Web experience: None needed. HTTP, HTML, and databases are all taught from zero inside the
    course
  Equipment: Any Windows, Mac, or Linux computer that runs Python and VS Code comfortably, plus
    a stable internet connection

Time: Around 3-4 hours a week outside class. The projects are real, and they are where the learning compounds

WHO THIS COURSE IS FOR

College students: Students with Python from coursework who want a portfolio that says more than marks do
Working professionals: Professionals in testing, support, data, or other fields moving toward backend development roles
Python learners stuck at scripts: Self-taught programmers who can write scripts but have never shipped anything with a URL
Startup builders: Founders and hobbyists who want to build and deploy their own product idea end to end
Interview preparers: Candidates targeting backend roles where Django, DRF, and deployment questions come up by name

FULL CURRICULUM, WEEK BY WEEK

This is the complete teaching plan. Parents can ask about any week.

PHASE 1: HOW THE WEB WORKS, THEN FLASK (MONTHS 1-2, WEEKS 1-8)

HTTP demystified with real requests, then Flask built up from a single route to a complete application with a database, forms, and login.

Month 1: HTTP and Your First Flask Apps (Weeks 1-4)
What Happens When You Load a Page
Topics:
- Client and server: who asks, who answers
- HTTP requests dissected: method, path, headers, body
- Status codes worth knowing: 200, 301, 404, 500
- Watching real traffic in the browser network tab
- Making requests by hand with curl and Python's requests library
- GET vs POST, and why the difference matters before any framework
Projects built:
- Request detective: a written trace of one real page load, every request annotated, plus a script that fetches and inspects three sites
Practice: Use curl to make ten requests against a public API, logging method, status, and one header for each
First Flask Application
Topics:
- Virtual environments and pip: project hygiene from day one
- A Flask app in seven lines, and what each line does
- Routes and view functions
- Dynamic routes: reading values out of the URL
- The development server and debug mode
- Project structure that will survive growth
Projects built:
- Personal API: a Flask app with five routes returning text and JSON, including a dynamic greeting route
Practice: Build a dice-roll and coin-flip service with routes that take the number of rolls from the URL
Templates
Topics:
- Why string concatenation dies fast: enter Jinja2
- render_template and passing data to pages
- Template logic: loops and conditionals in Jinja2
- Template inheritance: one base layout, many pages
- Static files: CSS and images served properly
- Just enough HTML and CSS, taught as the projects need it
Projects built:
- Movie catalog site: a browsable list rendered from Python data with a shared base layout and detail pages
Practice: Add a search-results page and an empty-state design to the movie catalog using template conditionals
Forms and User Input
Topics:
- HTML forms: action, method, and named fields
- Reading form data in Flask with request.form
- The POST-redirect-GET pattern and why refreshing resubmits without it
- Validating input on the server, always
- Flash messages: telling users what just happened
- Never trusting the client: a first look at input handling as a security matter
Projects built:
- Feedback board: a form that accepts, validates, and displays entries, with flash messages for errors and success
Practice: Add server-side validation rules to the feedback board and prove each one works with a bad submission

```
      Assessment: Month 1 build check: a small multi-page Flask app with one form, built live
      from a spec

  Month 2: Databases and a Complete Flask App (Weeks 5-8)
    SQL Before the ORM
      Topics:
        - Why files stop working: the case for databases
        - SQLite: a real database with zero setup
        - CREATE TABLE, data types, and primary keys
        - INSERT, SELECT, UPDATE, DELETE by hand
        - WHERE, ORDER BY, and LIMIT
        - Running queries from Python with sqlite3
      Projects built:
        - Query workbook: a seeded database of books and members, interrogated with fifteen handwritten
          SQL queries
      Practice: Write ten more queries against the workbook database, including two that join
      tables
    The ORM: SQLAlchemy
      Topics:
        - What an ORM is and what it is hiding
        - Defining models as Python classes
        - Creating, querying, updating, and deleting through the ORM
        - Echoing the generated SQL: seeing what the ORM sends
        - Filtering and ordering with query methods
        - When to drop to raw SQL, honestly
      Projects built:
        - Movie catalog, database edition: the month 1 site rebuilt on SQLAlchemy models instead of
          Python lists
      Practice: For five ORM queries, predict the SQL before enabling echo, and score your
      predictions
    CRUD End to End
      Topics:
        - The CRUD pattern: create, read, update, delete as routes
        - Forms that create and edit database records
        - Deleting safely: confirmation and POST-only deletes
        - URL design for resources: lists, details, edits
        - Handling the missing record: 404 done properly
        - Keeping view functions thin
      Projects built:
        - Notes application: full CRUD with create, edit, delete, and detail pages backed by the
          database
      Practice: Add pinning and archiving to the notes app, each touching the model, routes,
      and templates
    Sessions and Login
      Topics:
        - Cookies and sessions: how a server remembers you
        - Password hashing with werkzeug: why plain text is malpractice
        - Register, login, and logout routes
        - Protecting routes: login required, by hand once
        - Per-user data: your notes are not my notes
        - The complete Flask app: what we built and what Django will automate
      Projects built:
        - Notes app with accounts: registration, hashed passwords, login, logout, and notes scoped to
          their owner
      Practice: Write a short attack review of your own app: three things a hostile user
      might try, and what stops each
      Assessment: Phase 1 project review: the complete Flask notes app submitted with a
      README, code-reviewed one on one

------------------------------------------------------------
PHASE 2: DJANGO PROPERLY (MONTHS 3-4, WEEKS 9-16)
------------------------------------------------------------
The production framework, learned with Flask as the reference point: models, migrations, the
admin, real authentication, relationships, and class-based views, ending in a multi-user
project.

  Month 3: Django Foundations (Weeks 9-12)
    Projects, Apps, and URLs
      Topics:
        - Why Django after Flask: batteries included, and which batteries
        - startproject and startapp: what every generated file is for
        - URLconf: routing requests to views
        - Function-based views and HttpResponse
        - Django templates: familiar ground after Jinja2
        - settings.py toured honestly: the settings that matter now
      Projects built:
        - Django hello-world done right: a two-app project with routed pages, shared base template, and
          static files
      Practice: Port your Flask movie catalog's pages to Django views and templates, noting
```

```
    what moved where
  Models and Migrations
    Topics:
      - Defining models with Django fields
      - Migrations: what makemigrations and migrate actually do
      - The ORM: create, filter, get, exclude, order_by
      - The Django shell as your laboratory
      - Field options: defaults, null, blank, and choices
      - Changing a model after data exists: the migration workflow
    Projects built:
      - Job board, part one: JobPosting and Company models, migrated, seeded, and queried from the
        shell
    Practice: Fifteen ORM exercises in the Django shell against the job board data, saved
    as a script
  The Admin and Django Templates
    Topics:
      - The Django admin: a working back office for free
      - Registering models and customizing list displays
      - Search, filters, and inline editing in the admin
      - Wiring list and detail pages to real data
      - get_object_or_404 and clean URL patterns with slugs
      - Why the admin exists and where its limits are
    Projects built:
      - Job board, part two: public listing and detail pages, plus a configured admin where postings
        are managed
    Practice: Customize the admin with two list filters and a search field, and add a
    published/draft toggle that the public site respects
  Django Forms
    Topics:
      - The Form class: declaration instead of repetition
      - ModelForm: forms generated from models
      - Validation: built-in validators and clean methods
      - Rendering forms in templates and displaying errors well
      - CSRF protection: what that token was always for
      - File uploads, introduced carefully
    Projects built:
      - Job board, part three: a post-a-job form with validation, plus an application form with
        resume upload
    Practice: Write three custom validation rules, including one clean method that checks
    two fields against each other
    Assessment: Month 3 review: job board demo plus live ORM queries answered in the Django
    shell

Month 4: Auth, Relationships, and Structure (Weeks 13-16)
  Authentication
    Topics:
      - django.contrib.auth: the battery you were promised
      - Login, logout, and signup flows with Django's views and forms
      - login_required and testing it properly
      - The User model and when to extend it with a profile
      - Permissions and groups, introduced with real cases
      - Password reset flow, understood even before email is wired
    Projects built:
      - Job board accounts: employer and candidate signup, login, and pages that respond to who is
        viewing them
    Practice: Protect three routes with different rules: any logged-in user, employers
    only, and owner only
  Relationships
    Topics:
      - ForeignKey: companies have many postings
      - Querying across relationships in both directions
      - ManyToManyField: tags and saved jobs
      - related_name and readable reverse queries
      - The N+1 query problem: found with the debug toolbar, fixed with select_related
      - Designing a schema on paper before typing it
    Projects built:
      - Job board relationships: companies, postings, tags, and saved-jobs wired together with
        efficient queries
    Practice: Hunt N+1 queries on two pages using the debug toolbar, and record the query
    count before and after fixing
  Class-Based Views and Polish
    Topics:
      - Class-based views: ListView and DetailView without mystery
      - CreateView, UpdateView, DeleteView and when generic views earn their keep
      - Pagination that holds up with real data
      - The messages framework for user feedback
      - Query parameters for search and filtering
      - Function-based vs class-based: an honest decision guide
    Projects built:
```

- Job board, refactored: listing pages moved to generic views with pagination, search, and tag filtering

Practice: Convert two of your remaining function-based views to class-based views, and write three lines on which reads better

Project Week: Ship the Django App

Topics:

- Feature freeze and a finishing checklist
- Seeding believable demo data with a management command
- Error pages: custom 404 and 500
- A structured self-review before the instructor's review
- Writing a README with setup steps that actually work
- Django's request lifecycle, reviewed now that every piece is familiar

Projects built:

- Complete job board: multi-user Django application with auth, relationships, search, pagination, and admin, delivered with a README

Practice: Follow a classmate's README from git clone to running app, and file issues for every step that failed

Assessment: Phase 2 code review: full walkthrough of the job board with questions on models, queries, and auth decisions

---

PHASE 3: REST APIS AND PRODUCTION (MONTHS 5-6, WEEKS 17-24)

The skills backend jobs list by name: REST API design with Django REST Framework, token auth and permissions, then real deployment and a capstone shipped to a public URL.

Month 5: REST APIs with Django REST Framework (Weeks 17-20)

API Thinking

Topics:

- Why APIs exist: mobile apps, frontends, and other servers as clients
- REST conventions: resources, methods, and status codes as a contract
- Designing endpoints on paper: the URL table for the job board
- JSON in and JSON out: serialization as the core problem
- Installing DRF and the browsable API
- Your first APIView returning real data

Projects built:

- API design document plus a first read-only endpoint serving job postings as JSON

Practice: Design the full endpoint table for a library system: paths, methods, status codes, and example payloads

Serializers and CRUD Endpoints

Topics:

- ModelSerializer: validation and conversion in one place
- List and detail endpoints for every resource
- Create, update, and delete through the API
- Nested and related data: choices and trade-offs
- Serializer validation mirroring the form validation you already know
- Testing endpoints with the browsable API and httpie

Projects built:

- Job board API: full CRUD endpoints for postings and companies with proper status codes throughout

Practice: Write an httpie session script that exercises every endpoint, including three requests designed to fail correctly

API Authentication and Permissions

Topics:

- Session auth vs token auth, and why APIs need the latter
- Token authentication set up and tested
- Permission classes: read for all, write for owners
- Custom permissions: employers edit only their own postings
- Throttling: rate limits as basic self-defense
- Consistent, safe error responses

Projects built:

- Secured API: token auth plus owner-scoped write permissions, proven with a scripted attack-and-verify session

Practice: Write six permission test cases: two allowed, four denied, each asserting the exact status code

Consuming and Documenting the API

Topics:

- A minimal JavaScript page that fetches from your API
- CORS: why the browser said no, and django-cors-headers
- A Python client consuming the same API: one backend, many clients
- Filtering, searching, and pagination in DRF
- Auto-generated API documentation with drf-spectacular
- Versioning and other habits of APIs that live long

Projects built:

- Consumed API: a small JS-driven jobs page and a Python CLI client, both running against your documented API

Practice: Hand your API docs to a classmate and have them build one working request without asking you anything

Assessment: API month review: live demo of the secured, documented API with a Q&A on

```
        auth and permission choices

    Month 6: Deployment and the Capstone (Weeks 21-24)
      Deployment, For Real
        Topics:
          - Development vs production: DEBUG, secrets, and environment variables
          - PostgreSQL: moving off SQLite and why production demands it
          - Gunicorn: what a WSGI server does that runserver does not
          - Static files in production with WhiteNoise
          - Deploying the job board to a cloud host, live in class
          - Reading server logs when something breaks, because something will
        Projects built:
          - Deployed job board: the phase 2 project live on a public URL with Postgres, Gunicorn, and
            env-based settings
        Practice: Break and fix your deployment once on purpose: bad env var in, error read
        from logs, corrected, redeployed
      Capstone: Scope and Foundations
        Topics:
          - Choosing a capstone: your own idea, or a track like bookings, forums, or expense tracking
          - Writing the spec: models, pages, endpoints, and what done means
          - Schema design reviewed before a line of code
          - Repository setup and the first deploy in week one, not the last
          - Must-have vs nice-to-have, decided while calm
          - Instructor sign-off on scope
        Projects built:
          - Approved capstone spec plus a skeleton project with models migrated and a hello page already
            deployed
        Practice: Build and seed your capstone's data layer, and query it from the shell to
        prove the schema holds
      Capstone: Build and Review
        Topics:
          - Building vertically: one complete feature at a time
          - A first pass at automated tests: models and one endpoint
          - Mid-sprint code review with written findings
          - Continuous deployment: pushing progress to the live URL
          - Handling feedback without derailing the plan
          - Cutting scope honestly when the deadline is fixed
        Projects built:
          - Feature-complete capstone: core features working on the live URL, tests passing, review
            findings addressed
        Practice: Write tests for your two most important behaviors and wire them into a
        pre-push habit
      Ship and Defend
        Topics:
          - The production checklist: DEBUG off, secrets out of git, error pages, backups considered
          - README and API docs finalized
          - Presenting a backend project: the demo, the data model, the hardest bug
          - Defending technical decisions under friendly fire
          - Your GitHub as evidence: six months of reviewed commits
          - What comes next: DSA for interviews, deeper Python, or frontend to pair with your backend
        Projects built:
          - Delivered capstone: a live, documented, tested web application at a public URL, presented and
            defended
        Practice: Send your capstone URL to two people outside the class and fix the first
        confusing thing each one reports
        Assessment: Capstone defense: live demo, data-model walkthrough, and Q&A, plus
        course-completion certificate review

PROJECTS THE STUDENT BUILDS AND KEEPS

  - Request detective: a full annotated trace of real HTTP traffic
  - Movie catalog site with Jinja2 templates and template inheritance
  - Feedback board with server-side validation and flash messages
  - SQL query workbook against a seeded relational database
  - Notes application with full CRUD, sessions, and hashed-password login
  - Job board: a complete multi-user Django application with auth, relationships, search, and
    admin
  - Job board REST API: full CRUD with token auth, permissions, and generated documentation
  - JS jobs page and Python CLI client consuming the same API
  - Deployed job board on a public URL with Postgres and Gunicorn
  - Capstone: a self-designed, tested, documented web application shipped to production

  Total projects: 12+ real builds across two frameworks, ending with a capstone live on a public URL

SKILLS THE STUDENT WILL HAVE AT THE END

  - HTTP fluency: requests, responses, status codes, and debugging traffic like a backend
    developer
  - Flask from scratch: routing, Jinja2 templates, forms, sessions, and password hashing
```

- SQL and ORMs: handwritten queries first, then SQLAlchemy and the Django ORM with eyes open
- Django in production shape: models, migrations, admin, auth, relationships, and class-based views
- REST APIs with DRF: serializers, token auth, permissions, throttling, and generated docs
- Deployment: environment config, Postgres, Gunicorn, static files, and reading production logs

HOW A TYPICAL WEEK IS SPLIT

Live classes: 2 live one-hour classes per week, building alongside the instructor with code review baked in
Practice: 3-4 hours of project work and exercises between classes
Review: Project submissions reviewed with written findings; recurring issues become the next class's opening
Homework: A task or problem set after every class, and a monthly mixed-review assignment that deliberately folds in earlier topics

SUPPORT INCLUDED

Doubt support: WhatsApp doubt support between classes, because deployment errors do not wait for Tuesday
Progress updates: Regular progress notes covering what was built, what was reviewed, and what needs another pass
Career guidance: Honest guidance on portfolios, resumes for backend roles, and what to learn next, grounded in what each student actually built

CERTIFICATION DETAIL

Completion: Certificate from Modern Age Coders, awarded on passing the final assessment. Fall short and there is focused revision and a free retest: the certificate certifies real learning, not attendance

WHERE THIS CAN LEAD

- Backend or Python developer roles, applied for with a deployed project and a reviewed GitHub history
- Full-stack development: pair this backend depth with our JavaScript and React courses
- Freelance web projects: the build-deploy-maintain cycle this course teaches is the whole freelance job
- Our data structures and algorithms course for product-company interview preparation
- Deeper Python specializations: data engineering, automation, or our AI and machine learning tracks

EARNING POTENTIAL (share only if asked, and never promise it)

Market context: The ranges below are general market salary bands for these roles in India and abroad, drawn from public industry data. They are shown for career context only and are not a promise or guarantee of income. Actual pay depends on your skills, experience, location, and the job market.
Early career roles: Rs 3-6 LPA (Junior Python Developer / Backend Developer)
Growing roles: Rs 6-12 LPA (Python/Django Developer with 2-4 years of experience)
Experienced roles: Rs 12-25 LPA (Senior Backend Engineer / Lead Developer)
Freelance: Rs 800-2,500/hour for Django and API work, depending on specialization and track record
International: $70k-140k USD (USA) for backend Python roles, based on role and experience

COMMON QUESTIONS ABOUT THIS COURSE

For anything about cost, use PART 4 and RULE 1. Do not quote two regions.

Q: How much Python do I need before joining?
A: Comfortable basics: variables, loops, functions, lists, and dictionaries, roughly what a first Python course or one college semester covers. If you are unsure whether you qualify, the free demo class includes a short, low-pressure skills check and an honest recommendation, which is sometimes to take our Python course first. (Agent note: the free demo is a waiting list with no fixed date. The Priority Live Demo is a guaranteed class today or tomorrow, booked at https://learn.modernagecoders.com/priority-demo . Offer both, as RULE 3 says.)

Q: Why does the course teach Flask and Django instead of just Django?
A: Because Django learned first tends to be memorized, not understood. Flask is small enough that you see every moving part: what a route is, what a session does, what the ORM is actually saving you from. After two months of that, Django's structure reads as a set of solutions to problems you personally hit. Employers get a candidate who can work in either framework and explain the difference, which is a genuinely common interview question.

Q: Is Django still in demand, or has Node.js taken over?
A: Both stacks hire steadily, and pretending otherwise would be dishonest either way. Django remains a standard choice at Indian product companies, agencies, and startups, especially anywhere Python already runs: data-heavy products, fintech, and internal platforms. Instagram and Spotify famously run Python at scale. If your longer-term interest is JavaScript

everywhere, our Node.js track fits better; if you know Python and want employable backend skills now, this stack is the shorter path.

Q: Will I learn front-end development too?
A: Enough to ship, not more: the HTML, CSS, and templates your pages need, plus one small JavaScript client in month 5 so you experience your API from the consumer's side. This is deliberately a backend course. Students who want the full stack typically take our React course afterwards, and the capstone API you build here becomes the backend for that work.

Q: What will I actually be able to show a recruiter after six months?
A: A capstone application live at a public URL, a complete Django job board, a documented REST API with token authentication, and a GitHub profile showing six months of steady, code-reviewed commits. In interviews you can walk through your own data model, explain an N+1 query you found and fixed, and describe your deployment step by step, which lands very differently from listing frameworks on a resume.

Q: I work full time. Can I manage this course?
A: The course is built for exactly that constraint: two live one-hour classes a week scheduled in evening-friendly slots, plus 3 to 4 hours of project work you place wherever your week allows. The pace is steady rather than punishing, and WhatsApp doubt support means a blocked Tuesday problem does not have to wait for Thursday's class. Professionals who fall behind a week can use the mini-batch or 1-on-1 formats to catch up.

Q: How am I assessed, and is the certificate just for showing up?
A: No. A task follows every class with feedback, monthly reviews deliberately mix new material with earlier topics so nothing is forgotten, and the course ends with a final exam covering the whole course. Passing earns the certificate; falling short earns focused revision and a free retest. We measure real learning, not attendance.

Q: Can I try a class before enrolling?
A: Yes, the first demo class is free and carries no obligation. Book it at learn.modernagecoders.com/contact or message us on WhatsApp at +91 91233 66161. The demo includes the Python readiness check and a clear walkthrough of how the course is taught and what you will build.

To enrol, message Shivam Sir on +91 9123366161 or send the parent this link: https://learn.modernagecoders.com/courses/python-web-development-django-flask-course
For a demo: the Priority Live Demo (guaranteed, today or tomorrow) is booked at https://learn.modernagecoders.com/priority-demo . The free demo is a waiting list with no fixed date.

==========
COURSE 121 OF 137: QUEEN CODERS: ADVANCED ENGINEERING FOR WOMEN DEVELOPERS
==========

Course link: https://learn.modernagecoders.com/courses/queen-coders-advanced-tech-leadership
Subject area: Women in Tech
Designed for: Girls only batches
Who can join: Women developers with working experience (roughly 2+ years or a strong portfolio)
Course length: 9-11 months (36-44 weeks)
Time needed: 2 live classes/week + 4-6 hours practice
Certificate: Certificate from Modern Age Coders, awarded on passing the final exam

PRICE FOR THIS COURSE (quote only the one that applies to the person asking)
In India, per month: group Rs 1,499, mini batch Rs 2,999, one to one Rs 4,999
In Canada, per month: group CAD 140, one to one CAD 210
Anywhere else, per month: group $100, one to one $150
Classes: group and mini batch two live classes a week, eight a month; one to one in India one live class a week, four a month; one to one outside India two live classes a week, eight a month. Each class is one hour.

WHAT THIS COURSE IS

Advanced course for women developers: software architecture, cloud, security, AI engineering and technical leadership in 9-11 months, live online.

In one line: The step from good developer to trusted engineer: architecture, AI engineering and technical leadership, built deliberately in nine months.

ABOUT THE PROGRAMME

There is a career moment where writing good code stops being enough: teams need architecture judgment, security thinking, AI fluency and the leadership skills that turn seniority into influence. Queen Coders builds that step deliberately, for women developers, in a room of peers on the same climb. The arc runs in three movements. Advanced engineering: software design principles at depth, cloud architecture, data architecture, performance and security, the judgment layer above syntax. AI engineering: machine learning engineering, modern AI applications, LLMs and agent development, the layer every senior role now assumes. Technical leadership: the honest skills of staff-level work, technical decision records, code review

leadership, mentoring, engineering management versus the senior IC road, taught practically rather than aspirationally. Nine months at two live classes a week plus four to six hours of practice, with two more months in hand. Homework, monthly mixed reviews, phase exams, and a final exam, an architecture defense, that decides the certificate with a free retest. Real engineering, real leadership, no crowns required.

WHAT MAKES THIS COURSE DIFFERENT

- The judgment layer: architecture, security and performance as decisions, not buzzwords
- AI engineering included seriously: ML engineering, LLMs and agents, the layer senior roles now assume
- Technical leadership taught practically: ADRs, review leadership, mentoring, the staff-vs-management fork
- A peer room of women on the same climb, which changes what gets asked and answered
- An honest 9-month arc with 2 months in hand
- Real assessment: monthly mixed reviews and a final architecture defense that decides the certificate, with a free retest

THE LEARNING PATH, STEP BY STEP

Phase 1: Advanced engineering (Months 1-3): design principles, cloud and data architecture, performance and security
Phase 2: AI engineering (Months 4-6): ML engineering, AI applications, LLMs and agents, data engineering
Phase 3: Technical leadership (Months 7-8): staff-level skills, leadership practice, management versus senior IC
Phase 4: The finale (Month 9): community leadership, the architecture capstone, and the final defense

WHAT A STUDENT NEEDS BEFORE STARTING

Experience: Working development experience, roughly 2+ years or a strong portfolio; Princess Coders graduates qualify after building professionally
Equipment: A computer with a stable internet connection
Audience: Women developers preparing for senior, staff and leadership work
Time commitment: 2 live classes plus 4-6 hours of practice a week

WHO THIS COURSE IS FOR

Mid level engineers: Women developers whose next review says "more scope", and who want the skills that earn it
Aspiring leads: Engineers choosing between management and the senior IC road, wanting the choice informed
Ai upskillers: Developers whose roles now quietly assume AI engineering fluency
Returning seniors: Experienced women re-entering after a break, rebuilding at the level they left
Community builders: Engineers who want a peer room that continues past the course

FULL CURRICULUM, WEEK BY WEEK

This is the complete teaching plan. Parents can ask about any week.

PHASE 1: ADVANCED ENGINEERING (MONTHS 1-3, WEEKS 1-12)

The judgment layer above syntax: design principles, cloud and data architecture, performance and security.

Month 1: Design and Cloud (Weeks 1-4)
Advanced Software Engineering Principles
Topics:
- Welcome to Queen Coders elite community
- Women tech leaders panel and networking
- Advanced data structures: Trees, Graphs, Heaps
- Algorithm complexity and optimization
- Design patterns: Factory, Observer, Strategy, Decorator
- SOLID principles deep dive
- Domain-Driven Design (DDD)
- Event-driven architecture patterns
- Microservices vs Monolithic architecture
- Service mesh and API gateways
- Distributed systems fundamentals
- CAP theorem and consistency models
Projects built:
- Design and implement a distributed cache system
- Build a custom ORM framework
- Create a microservices architecture blueprint
- Implement advanced design patterns library
Practice: Daily: System design problems, Algorithm challenges

```
  Cloud Architecture & Infrastructure
    Topics:
      - Multi-cloud strategy: AWS, Azure, GCP comparison
      - Infrastructure as Code with Terraform
      - Advanced Kubernetes: operators, service mesh
      - Serverless architecture patterns
      - Event-driven with AWS Lambda, EventBridge
      - Container orchestration at scale
      - Cloud security: IAM, VPC, encryption
      - Cost optimization strategies
      - Disaster recovery and high availability
      - Multi-region deployment strategies
      - CDN and edge computing
      - Observability: metrics, logs, traces
    Projects built:
      - Multi-region Kubernetes deployment
      - Serverless e-commerce backend
      - Infrastructure automation with Terraform
      - Cloud cost optimization audit tool
    Practice: Deploy 5 different cloud architectures
    Assessment: Month 1 check: an architecture sketch defended live, plus mixed review

Month 2: Data and Performance (Weeks 5-8)
  Advanced Databases & Data Architecture
    Topics:
      - Database internals: B-trees, LSM trees
      - ACID vs BASE consistency models
      - Sharding strategies and implementation
      - Multi-master replication
      - Time-series databases: InfluxDB, TimescaleDB
      - Graph databases: Neo4j, Amazon Neptune
      - Vector databases for AI: Pinecone, Weaviate
      - Data warehousing: Snowflake, Redshift
      - Stream processing: Kafka, Kinesis
      - Event sourcing and CQRS
      - Data lake architecture
      - Real-time analytics pipelines
    Projects built:
      - Build a sharded database system
      - Real-time analytics pipeline with Kafka
      - Graph-based recommendation engine
      - Data warehouse ETL pipeline
    Practice: Design 10 complex data architectures
  Performance Engineering & Optimization
    Topics:
      - Performance profiling and benchmarking
      - Memory management and garbage collection
      - Concurrency patterns and parallel processing
      - Lock-free data structures
      - Cache optimization strategies
      - Database query optimization
      - Network optimization techniques
      - Load balancing algorithms
      - Rate limiting and throttling
      - Circuit breaker pattern implementation
      - Chaos engineering principles
      - Performance testing with JMeter, K6
    Projects built:
      - Build a high-performance web server
      - Optimize a slow application (10x improvement)
      - Implement custom load balancer
      - Create performance monitoring dashboard
    Practice: Optimize 5 production systems
    Assessment: Month 2 check: a performance investigation presented, plus mixed review

Month 3: Security and APIs (Weeks 9-12)
  Advanced Security Engineering
    Topics:
      - Security architecture patterns
      - Zero-trust architecture implementation
      - OAuth 2.0 and OpenID Connect deep dive
      - Multi-factor authentication systems
      - Encryption: symmetric, asymmetric, hashing
      - PKI and certificate management
      - Secure coding practices
      - OWASP Top 10 prevention strategies
      - Penetration testing techniques
      - Security incident response
      - Compliance: GDPR, HIPAA, SOC2
```

- Blockchain for security applications
    Projects built:
      - Build enterprise SSO system
      - Implement zero-trust network
      - Security audit automation tool
      - Encrypted messaging system
    Practice: Security audit 10 applications
  API Design & GraphQL Mastery
    Topics:
      - REST API design best practices
      - GraphQL schema design patterns
      - Federation and schema stitching
      - Real-time subscriptions with GraphQL
      - API versioning strategies
      - API gateway patterns: Kong, Zuul
      - Rate limiting and quotas
      - API documentation with OpenAPI
      - gRPC for microservices
      - WebSocket architecture
      - Server-sent events (SSE)
      - API testing and mocking
    Projects built:
      - Design federated GraphQL architecture
      - Build API gateway from scratch
      - Real-time collaboration API
      - Multi-protocol API server
    Practice: Design and implement 5 complex APIs
    Assessment: Phase 1 exam: a system design defended under questioning, plus a written mixed paper

---
PHASE 2: AI ENGINEERING (MONTHS 4-6, WEEKS 13-24)

The layer every senior role now assumes: ML engineering, modern AI applications, LLMs and agent development, and data engineering.

Month 4: ML Engineering (Weeks 13-16)
  Machine Learning Engineering
    Topics:
      - ML system design and architecture
      - Feature engineering at scale
      - Model training pipelines
      - TensorFlow and PyTorch deep dive
      - Neural network architectures
      - CNNs for computer vision
      - RNNs and LSTMs for sequences
      - Transformers and attention mechanisms
      - Model optimization and quantization
      - MLOps: versioning, deployment, monitoring
      - A/B testing for ML models
      - Explainable AI (XAI)
    Projects built:
      - Build ML pipeline from scratch
      - Deploy computer vision system
      - Create NLP application
      - Implement recommendation system
    Practice: Deploy 5 ML models to production
  Advanced AI Applications
    Topics:
      - Large Language Models (LLMs) integration
      - Fine-tuning pre-trained models
      - Prompt engineering techniques
      - RAG (Retrieval Augmented Generation)
      - Vector databases for AI
      - Computer vision applications
      - Speech recognition and synthesis
      - Reinforcement learning basics
      - Generative AI: GANs, VAEs
      - AI ethics and bias mitigation
      - Federated learning
      - Edge AI deployment
    Projects built:
      - Build AI-powered chatbot with RAG
      - Create custom LLM application
      - Implement computer vision solution
      - Deploy edge AI system
    Practice: Build 5 AI-powered applications
    Assessment: Month 4 check: an ML system design reviewed, plus mixed review

```
  Month 5: LLMs and Agents (Weeks 17-20)
    LLMs & Generative AI
      Topics:
        - Transformer architecture deep dive
        - Building with GPT, BERT, T5
        - Fine-tuning strategies for LLMs
        - Prompt engineering advanced techniques
        - RAG systems architecture
        - Vector search optimization
        - LangChain and semantic kernel
        - Multi-agent AI systems
        - Constitutional AI and alignment
        - Diffusion models for generation
        - Voice synthesis and cloning
        - Cost optimization for LLM apps
      Projects built:
        - Custom LLM fine-tuning pipeline
        - Enterprise RAG system
        - Multi-agent AI platform
        - Generative AI creative tool
      Practice: Build 5 production LLM applications
    AI Engineering & Agent Development
      Topics:
        - LLM architecture deep dive: what the model actually does
        - Prompting as engineering, not incantation
        - Structured output and schema-constrained generation
        - Function calling and tool use
        - The agent loop: plan, act, observe, correct
        - Retrieval-augmented generation over real corpora
        - Vector stores, chunking, and when retrieval is the wrong answer
        - Multi-agent orchestration and where it fails
        - Evaluation: building an eval set before you build the feature
        - Guardrails, injection and untrusted input
        - Cost, latency and token budgets in production
        - Observability: tracing a non-deterministic system
      Projects built:
        - Retrieval-backed assistant
        - Tool-using agent
        - Eval harness with a real dataset
        - Production AI service with guardrails
      Practice: Deploy 5 smart contracts
      Assessment: Month 5 check: an agent design with guardrails defended, plus mixed review

  Month 6: Data Engineering and the Phase Capstone (Weeks 21-24)
    Data Engineering & Analytics
      Topics:
        - Data pipeline architecture
        - Apache Spark for big data
        - Real-time processing with Flink
        - Data lakehouse architecture
        - Delta Lake and Apache Iceberg
        - Orchestration with Apache Airflow
        - Data quality and governance
        - Business intelligence tools
        - Advanced SQL and query optimization
        - Time-series analysis
        - Predictive analytics
        - Data visualization best practices
      Projects built:
        - Build complete data platform
        - Real-time analytics dashboard
        - Predictive maintenance system
        - Data quality monitoring tool
      Practice: Build 5 data pipelines
    Phase 2 Capstone: An AI-Era System
      Topics:
        - Designing a system with an AI capability that earns its place
        - Cost, latency and quality traded off explicitly
        - Evaluation and guardrails as first-class design
        - Writing the design document a skeptic could audit
      Projects built:
        - A complete AI-era system design document, reviewed in panel
      Assessment: Phase 2 exam: the design defended, plus a cumulative written paper

------------------------------------------------------------
PHASE 3: TECHNICAL LEADERSHIP (MONTHS 7-8, WEEKS 25-32)
------------------------------------------------------------
The honest skills of staff-level work: leading through decisions, reviews and people, and
choosing between management and the senior IC road.
```

Month 7: Staff-Level Craft (Weeks 25-28)
  Staff/Principal Engineering Skills
    Topics:
      - Staff+ engineering career paths
      - Technical leadership without management
      - Driving technical strategy
      - Cross-team collaboration
      - Technical mentorship at scale
      - Writing engineering strategies
      - Building technical roadmaps
      - Influencing without authority
      - Managing technical debt strategically
      - Architecture governance
      - Technical risk management
      - Being a force multiplier
    Projects built:
      - Create technical strategy doc
      - Lead cross-team initiative
      - Build mentorship program
      - Design technical roadmap
    Practice: Lead 5 strategic initiatives
  Technical Leadership Skills
    Topics:
      - Technical decision making
      - Architecture review boards
      - RFC and design doc writing
      - Code review best practices
      - Mentoring and coaching developers
      - Building high-performing teams
      - Stakeholder management
      - Technical debt management
      - Innovation frameworks
      - Budget and resource planning
      - Vendor evaluation and selection
      - Open source strategy
    Projects built:
      - Lead architecture review
      - Create mentorship program
      - Write technical RFC
      - Build team playbook
    Practice: Lead 5 technical initiatives
    Assessment: Month 7 check: an ADR written and defended, plus mixed review

Month 8: Leading Engineers (Weeks 29-32)
  Engineering Leadership
    Topics:
      - From IC to leadership transition
      - Leading without authority
      - Building engineering culture
      - Hiring and interviewing
      - Performance management
      - Difficult conversations
      - Delegation and empowerment
      - Strategic thinking for engineers
      - Executive communication
      - Board presentation skills
      - Managing up and sideways
      - Women in leadership challenges
    Projects built:
      - Create hiring framework
      - Build team charter
      - Design performance system
      - Leadership portfolio
    Practice: Lead team of 5+ developers
  Engineering Management vs the Senior IC Road
    Topics:
      - Building high-performance teams
      - Agile at scale: SAFe, LeSS
      - OKRs and goal setting
      - Resource planning and allocation
      - Budget management for engineering
      - Vendor and contractor management
      - Remote team leadership
      - Diversity and inclusion initiatives
      - Engineering productivity metrics
      - Developer experience optimization
      - Burnout prevention strategies
      - Succession planning

```
      Projects built:
        - Design team structure
        - Implement OKR system
        - Create D&I initiative
        - Build productivity dashboard
      Practice: Manage team of 10+ engineers
      Assessment: Phase 3 exam: a leadership case study argued in writing, plus cumulative
      review

  ---------------------------------------------------------------
  PHASE 4: THE FINALE (MONTH 9, WEEKS 33-36)
  ---------------------------------------------------------------
  Community leadership, the architecture capstone, and the final defense.

    Month 9: Capstone and Defense (Weeks 33-36)
      Open Source and Community Leadership
        Topics:
          - Starting successful open source projects
          - Building contributor community
          - Open source governance models
          - License selection and implications
          - Monetizing open source
          - Developer advocacy
          - Conference speaking mastery
          - Technical writing and blogging
          - Building personal brand
          - Influencer strategies for developers
          - Podcast and video content
          - Women in open source
        Projects built:
          - Launch open source project
          - Speak at conference
          - Build developer community
          - Create content strategy
        Practice: Contribute to 10 major projects
      Capstone Build: The Architecture Dossier
        Topics:
          - One real system, redesigned: current state, pressures, target architecture
          - Trade-offs argued with numbers where numbers exist
          - Migration plan that respects reality
          - The dossier assembled for panel review
        Projects built:
          - The architecture dossier: a complete system redesign proposal
        Practice: Daily dossier progress; sections reviewed as written
      The Final Defense
        Topics:
          - Presenting the dossier before a panel
          - Taking hard questions without flinching or bluffing
          - A full-course spiral review
          - The road on: senior roles, Alpha Girls for systems at scale, and the community that stays
        Projects built:
          - The panel defense, delivered
        Assessment: FINAL EXAM: the architecture defense plus a written paper mixed from every
        phase. Passing earns the certificate; falling short earns focused revision and a free
        retest

PROJECTS THE STUDENT BUILDS AND KEEPS

  - Phase 1: architecture sketches, performance investigations and a defended system design
  - Phase 2: ML system designs, an agent with guardrails, and an AI-era design document
  - Phase 3: ADRs, review leadership practice and a leadership case portfolio
  - Phase 4: the architecture dossier, defended before a panel

  Total projects: A portfolio of defended designs, ADRs and the final architecture dossier

SKILLS THE STUDENT WILL HAVE AT THE END

  - Architecture judgment: cloud, data, performance and security as explicit trade-offs
  - AI engineering: ML systems, LLMs and agents designed responsibly
  - Staff-level craft: decisions documented, reviews led, systems owned
  - Leadership: mentoring, influence and the management-vs-IC choice made consciously
  - Defense: presenting technical work under hard questioning

HOW A TYPICAL WEEK IS SPLIT

  Live classes: 2 live one-hour classes per week
  Homework: Homework after every class, and a mixed-review assignment at the end of every month
  Practice: 4-6 hours of practice between classes
  Review: Every submission reviewed with written feedback; recurring gaps reopened in class
```

SUPPORT INCLUDED

  Doubt support: WhatsApp doubt support between classes
  Progress updates: Honest monthly progress reviews with a named focus for the next month

CERTIFICATION DETAIL

  Completion: Certificate from Modern Age Coders, awarded on passing the final exam. Fall short
    and there is focused revision and a free retest: the certificate certifies knowledge, not
    attendance

WHERE THIS CAN LEAD

  - Senior and staff engineering roles: the judgment and defense practice map directly
  - Alpha Girls: systems at scale, for engineers who want the deepest technical road
  - Engineering management: entered consciously, with the trade-offs understood
  - Our GenAI and agents courses: deeper into the AI engineering layer
  - Community leadership: mentoring the next Princess Coders batch

COMMON QUESTIONS ABOUT THIS COURSE

  For anything about cost, use PART 4 and RULE 1. Do not quote two regions.

  Q: What is Queen Coders, and who is it for?
  A: An advanced course for women developers with working experience (roughly 2+ years or a
  strong portfolio) building the step from good developer to trusted engineer: architecture and
  security judgment, AI engineering with LLMs and agents, and practical technical leadership,
  ending in an architecture dossier defended before a panel.

  Q: I am a developer but not "senior". Is this too early?
  A: If you can build and ship features independently, this is exactly the right time: the
  course teaches the judgment layer that turns feature-builders into engineers trusted with
  systems. A short conversation before enrolment places you honestly; Princess Coders graduates
  typically join after a period of real building.

  Q: How is leadership taught without becoming motivational fluff?
  A: Through artifacts and practice: architecture decision records written and defended, code
  reviews led live, mentoring practiced on real juniors from our other courses, and the
  management-versus-senior-IC fork examined with honest trade-offs. Every leadership week
  produces something reviewable.

  Q: How is progress assessed? Is the certificate just for attending?
  A: No. Homework follows every class, each month ends with an assignment that deliberately
  mixes new questions with earlier topics, every phase closes with a cumulative exam, and the
  course ends with a final exam. Passing earns the certificate; falling short earns focused
  revision and a free retest.

  Q: What comes after Queen Coders?
  A: Senior and staff-level work, entered with a defended dossier in hand; Alpha Girls for
  women who want the deepest technical road, systems at scale; or engineering management,
  chosen consciously. The peer room tends to persist, which is quietly the most valuable
  outcome.

  Q: Is there a free trial class?
  A: Yes, a free demo class with no commitment: book at learn.modernagecoders.com/contact or
  message us on WhatsApp at +91 91233 66161. (Agent note: the free demo is a waiting list with
  no fixed date. The Priority Live Demo is a guaranteed class today or tomorrow, booked at
  https://learn.modernagecoders.com/priority-demo . Offer both, as RULE 3 says.)

  Q: Are classes live or recorded?
  A: Live, always: small groups with a real instructor, never pre-recorded videos.

  To enrol, message Shivam Sir on +91 9123366161 or send the parent this link: https://learn.modernagecoders.com/courses/queen-coders-advanced-tech-leadership
  For a demo: the Priority Live Demo (guaranteed, today or tomorrow) is booked at
  https://learn.modernagecoders.com/priority-demo . The free demo is a waiting list with no fixed date.

==
COURSE 122 OF 137: REACT COURSE FOR TEENS: JAVASCRIPT TO REAL REACT APPS
==

Course link: https://learn.modernagecoders.com/courses/react-for-teens-complete-masterclass
Subject area: Web Development
Designed for: Teens
Who can join: Absolute beginner, ages 13 to 18
Course length: 9-11 months (36-44 weeks)
Time needed: 2 live classes/week + 3-4 hours practice

Certificate: Certificate from Modern Age Coders, awarded on passing the final exam

PRICE FOR THIS COURSE (quote only the one that applies to the person asking)
  In India, per month: group Rs 1,499, mini batch Rs 2,999, one to one Rs 4,999
  In Canada, per month: group CAD 140, one to one CAD 210
  Anywhere else, per month: group $100, one to one $150
  Classes: group and mini batch two live classes a week, eight a month; one to one in India one live class a week, four a month; one to one outside India two live classes a week, eight a month. Each class is one hour.

WHAT THIS COURSE IS

  React course for teens aged 13-18: web foundations, modern JavaScript, then React with hooks, router, TypeScript and a deployed capstone in 9-11 months.

  In one line: The framework behind the interfaces teens live in, learned properly: real JavaScript first, then React the way it is written now, ending deployed.

ABOUT THE PROGRAMME

  React renders the interfaces of Instagram, Netflix and half the modern web, and it rewards exactly one kind of learner: the one whose JavaScript is real. This live online course for ages 13 to 18 is built on that truth. Three months of genuine foundations, HTML, CSS and JavaScript through the DOM and modern ES6+, then React itself: components, state, hooks, routing, data fetching, styling, forms, and the craft layer of TypeScript, testing and performance that separates tutorial-followers from builders. The final month adds an honest taste of Next.js and ships a deployed capstone at demo day. Everything deploys: projects go to public URLs from the first phase, and the capstone is a polished, routed, data-driven React application the student can send to anyone. What the course refuses to do is pad: React Native, full-stack backends and framework tours live in our dedicated courses, pointed to honestly, not stapled on as filler weeks. The pace is honest: nine months at two live classes a week plus three to four hours of practice, with two more months in hand when needed. Homework after every class, monthly mixed reviews, phase exams, and a final exam that decides the certificate, with focused revision and a free retest. Real JavaScript, real React, depth over dopamine.

WHAT MAKES THIS COURSE DIFFERENT

  - JavaScript first, seriously: three months of real foundations, because React punishes weak JavaScript forever
  - React as it is written now: function components, hooks, and honest data patterns with loading and error states everywhere
  - The craft layer included: TypeScript, testing and performance, not left for "later"
  - Everything deploys: public URLs from phase 1, a deployed capstone at the end
  - Honest scope: React Native and backends are dedicated courses, pointed to truthfully, not filler weeks
  - Real assessment: weekly homework, monthly mixed reviews, and a final exam that decides the certificate, with focused revision and a free retest

THE LEARNING PATH, STEP BY STEP

  Phase 1: Web and JavaScript foundations (Months 1-3): HTML, CSS, JavaScript through the DOM and ES6+, ending deployed
  Phase 2: React core (Months 4-6): components, state, hooks, routing, APIs and styling, project by project
  Phase 3: React craft (Months 7-8): forms, state at scale, TypeScript, testing and performance
  Phase 4: Ship (Month 9): a Next.js taste, then the capstone built, deployed and defended at demo day

WHAT A STUDENT NEEDS BEFORE STARTING

  Coding experience: None. The course starts at the first HTML tag
  Computer skills: Comfortable typing and managing files
  Equipment: A computer with a stable internet connection; every tool used is free
  Age: 13 to 18. Batches are grouped by age and pace
  Time commitment: 2 live classes plus 3-4 hours of practice a week

WHO THIS COURSE IS FOR

  Interface lovers: Teens who notice good interfaces and want to build the kind they admire
  Complete beginners: Students starting from zero: the JavaScript foundation is built in, not assumed
  Tutorial escapees: Teens with tutorial miles who cannot yet build alone; the assessments close that gap
  Future developers: Students heading toward software careers where React remains the default frontend answer
  Makers: Teens who want their work live on real URLs, not in folders

FULL CURRICULUM, WEEK BY WEEK

This is the complete teaching plan. Parents can ask about any week.

PHASE 1: WEB AND JAVASCRIPT FOUNDATIONS (MONTHS 1-3, WEEKS 1-12)

The real base React stands on: HTML, CSS and JavaScript learned deeply, through the DOM and modern ES6+, ending with a deployed project.

Month 1: The Web, Properly (Weeks 1-4)

Your First Steps in Web Development

Topics:

- How the internet works - simplified for teens
- What happens when you visit Instagram or TikTok
- Setting up your coding environment (VS Code)
- Your first HTML page - creating a personal profile
- HTML tags that matter: headings, paragraphs, images
- Adding links and navigation to pages
- Creating lists (perfect for todo apps later)
- HTML forms - how login pages work
- Embedding YouTube videos and Spotify playlists
- Making your page accessible to everyone
- File organization and naming conventions
- Using GitHub like a pro developer

Projects built:

- Personal profile page about your interests
- Fan page for your favorite artist/game/show
- School club or team website

Practice: Daily: Create one new HTML page about topics you love

CSS - Making Things Look Amazing

Topics:

- CSS basics - adding style to your pages
- Colors and backgrounds - creating themes
- Typography - choosing fonts like a designer
- The Box Model - spacing elements perfectly
- Flexbox - Instagram-style photo grids
- CSS Grid - Pinterest-like layouts
- Hover effects and transitions
- Animations - making elements move and bounce
- CSS variables for dark/light themes
- Mobile-responsive design for phones
- CSS frameworks introduction (Tailwind)
- Design principles teens should know

Projects built:

- Animated landing page for a fake startup
- Instagram-style photo gallery
- Responsive blog design with dark mode

Practice: Recreate UI elements from popular apps using CSS

Assessment: Month 1 check: build a styled page live from a sketch, plus a take-home mixing everything so far

Month 2: Modern CSS and First JavaScript (Weeks 5-8)

Advanced CSS & Modern Web Design

Topics:

- CSS animations and keyframes
- Transform and 3D effects
- Creating loading spinners and progress bars
- Gradient backgrounds like Spotify
- CSS filters for image effects
- Scroll-triggered animations
- Parallax scrolling effects
- CSS custom properties (variables)
- Responsive images and videos
- Mobile-first design approach
- Performance optimization basics
- Browser developer tools mastery

Projects built:

- Animated movie poster with hover effects
- Spotify-inspired music player UI
- Gaming website with parallax scrolling

Practice: Build 5 trending UI components from Dribbble

JavaScript Fundamentals - Programming Basics

Topics:

- What is JavaScript and why it's awesome
- Variables - storing information (let, const)
- Data types - numbers, strings, booleans
- Basic math and calculations
- Working with text (string methods)
- Making decisions with if/else

```
        - Comparison operators (==, ===, >, <)
        - Logical operators (&&, ||, !)
        - Arrays - managing lists of data
        - Loops - repeating tasks efficiently
        - Functions - reusable code blocks
        - First interactive features
      Projects built:
        - Grade calculator for school
        - Simple quiz game about your interests
        - Password strength checker
      Practice: Solve 20 beginner-friendly JavaScript challenges
      Assessment: Month 2 check: a JavaScript logic challenge live, plus mixed review of
      month 1

  Month 3: The DOM and Modern JavaScript (Weeks 9-12)
    JavaScript DOM Manipulation
      Topics:
        - The DOM - controlling web pages with JavaScript
        - Selecting elements like jQuery but vanilla JS
        - Changing content dynamically
        - Adding and removing CSS classes
        - Creating new elements with JavaScript
        - Event listeners - clicks, hovers, keyboard
        - Building interactive forms
        - Form validation and error messages
        - Local storage - saving user data
        - Working with dates and times
        - setTimeout and setInterval for timing
        - Building countdown timers
      Projects built:
        - Interactive todo list with local storage
        - Countdown timer for events
        - Simple drawing app with canvas
      Practice: Create 10 interactive web components
    Modern JavaScript (ES6+) for React
      Topics:
        - Arrow functions - the React way
        - Template literals for dynamic strings
        - Destructuring - unpacking objects and arrays
        - Spread operator - copying and merging
        - Array methods crucial for React (map, filter, reduce)
        - Working with objects in JavaScript
        - ES6 modules - import and export
        - Promises - handling asynchronous code
        - Async/await - making promises easier
        - Fetch API - getting data from the internet
        - Working with JSON data
        - Error handling with try/catch
        - Deploying your best project to a public URL
      Projects built:
        - Meme generator using API
        - Weather app for your city
        - Pokemon card collection from API
      Practice: Master array methods with 25 exercises
      Assessment: Phase 1 exam: an interactive page built live, plus a written mixed paper
      over months 1-3

----------------------------------------------------------------
PHASE 2: REACT CORE (MONTHS 4-6, WEEKS 13-24)
----------------------------------------------------------------
React the way it is actually written: components and props, state and hooks, routing, real
data with honest loading states, and styling that scales.

  Month 4: Components and State (Weeks 13-16)
    Introduction to React
      Topics:
        - What is React and why teens should learn it
        - React vs vanilla JavaScript - the difference
        - Setting up React with Vite
        - Understanding the React project structure
        - JSX - writing HTML in JavaScript
        - Your first React component
        - Functional components explained
        - Props - passing data to components
        - Children props and composition
        - Conditional rendering (showing/hiding elements)
        - Rendering lists with map
        - Keys in React lists
      Projects built:
```

```
      - Profile card component
      - Social media post component
      - Product showcase with props
    Practice: Build 15 different React components
  React State & Interactivity
    Topics:
      - Understanding state in React
      - useState hook - your first hook
      - Handling events (onClick, onChange)
      - Forms in React - controlled components
      - Lifting state up between components
      - State vs props - when to use what
      - Multiple state variables
      - State with objects and arrays
      - Updating state correctly
      - React Developer Tools
      - Debugging React applications
      - Common React mistakes to avoid
    Projects built:
      - Like button with counter
      - Toggle dark/light theme
      - Interactive shopping cart
    Practice: Add state to 10 static components
    Assessment: Month 4 check: build an interactive component live, plus mixed review
    reaching back to JavaScript

Month 5: Hooks and Routing (Weeks 17-20)
  React Hooks Deep Dive
    Topics:
      - useEffect - side effects in React
      - useEffect dependencies array
      - Cleanup functions in useEffect
      - Data fetching with useEffect
      - Loading states and error handling
      - useContext for global state
      - Creating custom hooks
      - useReducer for complex state
      - useRef for DOM manipulation
      - useMemo for performance
      - useCallback explained
      - Rules of hooks
    Projects built:
      - GitHub profile viewer
      - Real-time search with debouncing
      - Theme context provider
    Practice: Create 5 custom hooks for common tasks
  React Router & Navigation
    Topics:
      - Single Page Applications (SPAs) explained
      - React Router installation and setup
      - Routes and Route components
      - Link vs regular anchor tags
      - NavLink for active styles
      - URL parameters and useParams
      - Query strings and useSearchParams
      - Nested routes and layouts
      - Protected routes for authentication
      - 404 pages and error handling
      - Programmatic navigation
      - Route animations and transitions
    Projects built:
      - Multi-page portfolio site
      - Blog with individual post pages
      - E-commerce site with routing
    Practice: Add routing to previous projects
    Assessment: Month 5 check: a routed mini-app built live, plus mixed review

Month 6: Real Data and Styling (Weeks 21-24)
  Data and APIs in React
    Topics:
      - REST APIs explained for teens
      - Fetch API in React components
      - Axios for HTTP requests
      - Managing loading and error states
      - Displaying API data in components
      - Pagination with APIs
      - Infinite scrolling implementation
      - Search functionality with APIs
      - Authentication tokens and headers
```

- Environment variables for API keys
- CORS and how to handle it
- Mock APIs for development
- Loading, error and empty states as a discipline, not an afterthought

Projects built:
- Movie database app (TMDB API)
- Spotify playlist viewer
- News aggregator for teens

Practice: Integrate 5 different public APIs

Styling React Applications

Topics:
- CSS Modules in React
- Styled-components introduction
- CSS-in-JS benefits and drawbacks
- Tailwind CSS with React
- Material-UI components
- Chakra UI for quick development
- Creating a design system
- Responsive design in React
- Animation libraries (Framer Motion)
- React Spring for animations
- Transition effects between routes
- Building reusable styled components

Projects built:
- Instagram-style photo feed
- Animated dashboard with charts
- Discord-inspired chat UI

Practice: Style 5 apps with different approaches

Assessment: Phase 2 exam: a data-driven, routed, styled app defended, plus a cumulative written paper

---

PHASE 3: REACT CRAFT (MONTHS 7-8, WEEKS 25-32)

What separates builders from tutorial-followers: forms done right, state at scale, TypeScript, and testing with performance judgment.

Month 7: Forms and State at Scale (Weeks 25-28)

Forms & Validation in React

Topics:
- Controlled vs uncontrolled components
- Complex form handling
- Multi-step forms
- Form validation strategies
- React Hook Form library
- Yup validation schema
- File uploads in React
- Image preview before upload
- Dynamic form fields
- Form state management
- Error display patterns
- Success feedback to users

Projects built:
- Registration form with validation
- Survey form with multiple steps
- Profile editor with image upload

Practice: Build 5 different form types

State at Scale: Context and Beyond

Topics:
- When to use Context API
- Creating context providers
- useContext hook patterns
- Multiple contexts in an app
- Context optimization techniques
- Avoiding unnecessary re-renders
- Context vs props drilling
- Auth context implementation
- Theme context patterns
- Shopping cart with context
- Context best practices
- When context isn't enough
- Redux Toolkit and Zustand in honest perspective: when component state stops being enough

Projects built:
- Multi-theme app with context
- Global notification system
- User authentication with context

Practice: Implement context in 5 different scenarios

Assessment: Month 7 check: lift and share state across an app live, plus mixed review

  Month 8: TypeScript and Quality (Weeks 29-32)
    TypeScript with React
      Topics:
        - Why TypeScript makes React better
        - TypeScript setup for React
        - Typing props and state
        - Function component types
        - Event handler types
        - useReducer with TypeScript
        - Context API with TypeScript
        - Redux with TypeScript
        - Generic components
        - Utility types for React
        - Third-party library types
        - Migration strategies
      Projects built:
        - Convert React app to TypeScript
        - Type-safe form builder
        - TypeScript component library
      Practice: Write all new React code in TypeScript
    Testing and Performance
      Topics:
        - Why testing matters for teens
        - Jest testing framework basics
        - React Testing Library introduction
        - Writing your first test
        - Testing components with props
        - Testing state changes
        - Testing user interactions
        - Mocking API calls in tests
        - Testing custom hooks
        - Integration testing basics
        - Test-driven development (TDD) intro
        - Coverage reports
        - Performance essentials: memoization judgment, lazy loading and measuring before optimizing
      Projects built:
        - Add tests to todo app
        - Test suite for form validation
        - Testing user authentication flow
      Practice: Write tests for 5 components
      Assessment: Phase 3 exam: type and test a feature live, plus a cumulative written paper
      over phases 1-3

PHASE 4: SHIP (MONTH 9, WEEKS 33-36)

An honest taste of Next.js, then the main event: the capstone built, deployed and defended at
demo day.

  Month 9: Next Taste, Capstone, Demo Day (Weeks 33-36)
    A Taste of Next.js
      Topics:
        - Why the industry wraps React in Next.js
        - File-based routing and layouts
        - Server components in plain words
        - When plain React is still the right call
        - Deploying a Next.js site
        - How everything you learned maps onto any React framework
      Projects built:
        - A small blog or portfolio rebuilt in Next.js
      Practice: Compare your Vite and Next builds: what changed and why
    Capstone Spec and Setup
      Topics:
        - Choosing the capstone: a real product idea scoped to three weeks
        - A one-page spec: users, screens, data, components
        - Component architecture sketched before code
        - Repository, TypeScript config and deployment target ready on day one
        - Instructor sign-off on scope
      Projects built:
        - Approved capstone spec plus the running skeleton, deployed
      Practice: Pitch the spec to the batch and absorb one hard question
    Capstone Build
      Topics:
        - One focused week: features in vertical slices
        - TypeScript throughout, loading states everywhere
        - Instructor checkpoints and honest scope cuts
        - Daily commits and an always-deployed build
        - A mid-week hallway test with a real user
      Projects built:

- The capstone: a routed, data-driven, styled React application, feature-complete
Practice: A deployed build at the end of every session
Demo Day and the Final Exam
Topics:
- Polish pass: empty states, small screens, accessibility basics
- Presenting the capstone: live demo plus the hardest bug story
- A full-course spiral review before the exam
- Where each path leads: full-stack for the backend half, app development for React Native
Projects built:
- Demo day presentation delivered to the batch and parents
Assessment: FINAL EXAM: a practical build plus a written paper with questions mixed from every phase. Passing earns the certificate; a student who falls short gets a focused revision plan and a free retest

PROJECTS THE STUDENT BUILDS AND KEEPS

- Phase 1: styled pages, JavaScript games and an interactive project deployed to a public URL
- Phase 2: component libraries, routed apps and a data-driven project with honest loading states
- Phase 3: validated forms, shared-state apps, a typed and tested feature set
- Phase 4: a Next.js rebuild, then the deployed capstone defended at demo day

Total projects: 20+ real builds, crowned by a deployed React capstone

SKILLS THE STUDENT WILL HAVE AT THE END

- Web foundations: HTML, CSS and responsive layouts done properly
- JavaScript to real depth: the DOM, ES6+ and the async patterns React assumes
- React core: components, hooks, routing, data fetching and styling
- The craft layer: TypeScript, testing, performance judgment and forms
- Shipping: deployment as a habit, from phase 1 to the capstone

HOW A TYPICAL WEEK IS SPLIT

Live classes: 2 live one-hour classes per week, coding along with the instructor
Homework: Homework after every class, and a mixed-review assignment at the end of every month
Practice: 3-4 hours of building between classes
Review: Every submission reviewed with written feedback; recurring gaps reopened in class

SUPPORT INCLUDED

Doubt support: WhatsApp doubt support between classes, for the component that renders nothing and says nothing
Progress updates: Regular progress notes to parents: what was built, what comes next, and where encouragement helps

CERTIFICATION DETAIL

Completion: Certificate from Modern Age Coders, awarded on passing the final exam. Fall short and there is focused revision and a free retest: the certificate certifies knowledge, not attendance

WHERE THIS CAN LEAD

- Full-stack web development: our dedicated course adds the backend half
- App development: React Native continues this exact skill set onto phones
- Data Structures and Algorithms: the computer-science muscle for engineering paths
- Design directions: component thinking pairs naturally with UI/UX
- Real projects now: sites and apps for school clubs, family and friends

COMMON QUESTIONS ABOUT THIS COURSE

For anything about cost, use PART 4 and RULE 1. Do not quote two regions.

Q: What will my teen build in this React course?
A: More than 20 real builds across nine months: styled, deployed pages and JavaScript projects in the foundation phase, then routed, data-driven React applications with honest loading states, typed and tested features in the craft phase, a small Next.js rebuild, and finally a capstone, a complete React application deployed to a public URL and defended at demo day.

Q: How long does it take a teenager to learn React?
A: Nine months at 2 live classes a week plus 3 to 4 hours of practice, and a third of that is deliberately spent on JavaScript foundations, because React punishes weak JavaScript forever. The course keeps two more months in hand for students who need them. Courses that jump into React in week one produce students who can follow tutorials and cannot debug them.

Q: How is my teen assessed? Is the certificate just for attending?
A: No. Homework follows every class, each month ends with an assignment that deliberately

mixes new questions with earlier topics, every phase closes with an exam, and the course ends with a final exam: a practical build plus written questions from the whole syllabus. Passing earns the certificate; falling short earns focused revision and a free retest.

Q: Does my teen need to know JavaScript first?
A: No, and that is the design: the first three months build HTML, CSS and JavaScript properly, through the DOM and modern ES6+, before a single React component. Teens who already know some JavaScript are placed by a quick check and move faster through the early months.

Q: Does this course cover React Native or backend development?
A: Honestly, no, and on purpose. React Native and backend engineering are real disciplines with their own dedicated courses here, and stapling them on as survey weeks would cheat all three subjects. This course makes the React foundation deep; our app development course continues it onto phones, and our full-stack course adds the backend half.

Q: Is React still worth learning?
A: Yes: it remains the most-used frontend framework in industry by a wide margin, the concepts it teaches, components, state, unidirectional data, transfer to every alternative, and its ecosystem (Next.js included, which this course tastes honestly) keeps compounding. A teen fluent in React and TypeScript holds a genuinely employable-track skill.

Q: Is there a free trial class?
A: Yes, a free demo class with no commitment: book at learn.modernagecoders.com/contact or message us on WhatsApp at +91 91233 66161. Parents are welcome to sit in. (Agent note: the free demo is a waiting list with no fixed date. The Priority Live Demo is a guaranteed class today or tomorrow, booked at https://learn.modernagecoders.com/priority-demo . Offer both, as RULE 3 says.)

Q: Are classes live or recorded?
A: Live, always: small interactive groups with a real instructor, never pre-recorded videos. React errors are famously cryptic for beginners; live eyes on the code is what keeps early frustration from becoming quitting.

To enrol, message Shivam Sir on +91 9123366161 or send the parent this link: https://learn.modernagecoders.com/courses/react-for-teens-complete-masterclass
For a demo: the Priority Live Demo (guaranteed, today or tomorrow) is booked at https://learn.modernagecoders.com/priority-demo . The free demo is a waiting list with no fixed date.

==========

COURSE 123 OF 137: REACT MASTERCLASS: JAVASCRIPT TO PRODUCTION REACT

==========

Course link: https://learn.modernagecoders.com/courses/react-js-complete-masterclass-college
Subject area: Web Development
Designed for: College students
Who can join: Complete beginner (18+); college students, graduates and working professionals
Course length: 10-12 months (44-52 weeks)
Time needed: 2 live classes/week + 4-6 hours practice
Certificate: Certificate from Modern Age Coders, awarded on passing the final exam

PRICE FOR THIS COURSE (quote only the one that applies to the person asking)
In India, per month: group Rs 1,499, mini batch Rs 2,999, one to one Rs 4,999
In Canada, per month: group CAD 140, one to one CAD 210
Anywhere else, per month: group $100, one to one $150
Classes: group and mini batch two live classes a week, eight a month; one to one in India one live class a week, four a month; one to one outside India two live classes a week, eight a month. Each class is one hour.

WHAT THIS COURSE IS

React course for college students and professionals: JavaScript foundations, React with hooks, state management, TypeScript, testing and Next.js in 10-12 months.

In one line: The frontend library hiring still runs on, learned to production depth: hooks, state, TypeScript, testing and Next.js, ending deployed.

ABOUT THE PROGRAMME

React remains the most-hired frontend skill by a wide margin, and the gap between tutorial React and production React is where careers are decided. This live online masterclass closes it: JavaScript foundations first, then React as it is actually written, function components, hooks, honest data patterns, real state management with Redux Toolkit, then the production layer: TypeScript throughout, testing that catches regressions, performance measured before optimized, and Next.js as the industry wrapper. A finale month ships a production-shaped capstone and sits the final exam. The pace is honest: ten teaching months at two live classes a week plus four to six hours of practice, with two more in hand. Problem sets, monthly mixed reviews, phase exams, and a final exam that decides the certificate with a free retest.

WHAT MAKES THIS COURSE DIFFERENT

- JavaScript depth first: React punishes weak JavaScript forever
- Production patterns, not tutorial patterns: loading states, error boundaries and data honesty throughout
- TypeScript and testing as core phases, not appendices
- Next.js taught as the industry actually uses it
- An honest 10-month arc with 2 months in hand
- Real assessment: weekly problem sets, monthly mixed reviews, phase exams and a final exam with a free retest

THE LEARNING PATH, STEP BY STEP

Phase 1: Foundations (Months 1-3): JavaScript properly, then React fundamentals
Phase 2: Advanced React (Months 4-6): hooks in depth, patterns, and state management that scales
Phase 3: Production layer (Months 7-9): TypeScript, testing, performance and Next.js
Phase 4: The finale (Month 10): a production-shaped capstone and the final exam

WHAT A STUDENT NEEDS BEFORE STARTING

Coding experience: None. Everything is taught from the first line
Equipment: Any computer with a stable internet connection; every tool used is free
Age: 18+; college students, graduates and working professionals
Time commitment: 2 live classes plus 4-6 hours of practice a week

WHO THIS COURSE IS FOR

College students: Students who want the most-hired frontend skill at production depth
Tutorial escapees: Developers who can follow React tutorials but not debug them
Career switchers: Professionals entering frontend at the hiring baseline
Backend developers: Engineers adding the frontend half properly
Product builders: Founders and makers whose products need real interfaces

FULL CURRICULUM, WEEK BY WEEK

This is the complete teaching plan. Parents can ask about any week.

PHASE 1: JAVASCRIPT & REACT FUNDAMENTALS (MONTHS 1-3, WEEKS 1-13)

Build rock-solid foundations in JavaScript ES6+ and React core concepts, components, and hooks.

Months 1-2: JavaScript Mastery for React (Weeks 1-8)
Modern JavaScript Essentials
Topics:
- JavaScript fundamentals review
- ES6+ features: let, const, arrow functions
- Template literals and string interpolation
- Destructuring arrays and objects
- Spread and rest operators
- Default parameters
- Object property shorthand
- Array methods: map, filter, reduce, find
- forEach vs map understanding
- Promises and async/await
- Modules: import/export
- Classes and inheritance

Projects built:
- JavaScript utility functions library
- Todo app with vanilla JavaScript
- Weather app with API calls
- Array manipulation exercises

Practice: Complete 100 JavaScript challenges

Introduction to React
Topics:
- What is React and why use it?
- Virtual DOM concept
- React ecosystem overview
- Setting up development environment
- Vite vs Next.js: choosing a React setup
- Project structure best practices
- JSX syntax and expressions
- JSX vs HTML differences
- Embedding JavaScript in JSX
- React Developer Tools
- First React component
- React.StrictMode

```
    Projects built:
      - First React app setup
      - Static website with React
      - Personal portfolio starter
      - JSX exercises and experiments
    Practice: Create 20 simple React components
  Components & Props
    Topics:
      - Functional components
      - Component composition
      - Props and prop types
      - Children props
      - Prop drilling introduction
      - Default props
      - Spreading props
      - Component organization
      - Conditional rendering techniques
      - Lists and keys in React
      - Fragments and React.Fragment
      - Component lifecycle overview
    Projects built:
      - Component library creation
      - Blog post list component
      - Product card components
      - Navigation menu component
    Practice: Build 30 reusable components
  State & Event Handling
    Topics:
      - Understanding state in React
      - useState Hook deep dive
      - State vs props
      - Event handling in React
      - Synthetic events
      - Common events: onClick, onChange, onSubmit
      - Event object and preventDefault
      - Handling forms basics
      - Controlled vs uncontrolled components
      - Multiple state variables
      - State update patterns
      - Immutability importance
    Projects built:
      - Interactive counter app
      - Form with validation
      - Todo list with state
      - Color picker component
    Practice: Build 20 interactive components with state

Month 3: React Hooks Mastery (Weeks 9-13)
  Essential Hooks
    Topics:
      - Rules of Hooks
      - useState advanced patterns
      - useEffect lifecycle replacement
      - useEffect dependencies array
      - Cleanup functions
      - Multiple useEffect hooks
      - useContext for global state
      - useReducer for complex state
      - useReducer vs useState
      - useCallback for memoization
      - useMemo for expensive computations
      - useRef for DOM access and values
    Projects built:
      - Data fetching with useEffect
      - Theme switcher with Context
      - Complex form with useReducer
      - Performance optimization examples
    Practice: Master all essential hooks with 30 examples
  Custom Hooks & Patterns
    Topics:
      - Creating custom hooks
      - Custom hook best practices
      - useLocalStorage hook
      - useFetch hook
      - useDebounce hook
      - useThrottle hook
      - usePrevious hook
      - useOnClickOutside hook
      - useMediaQuery hook
```

```
        - useIntersectionObserver hook
        - Hook composition patterns
        - Testing custom hooks
      Projects built:
        - Custom hooks library
        - Form validation hooks
        - API hooks collection
        - Animation hooks
      Practice: Create 20 custom hooks
    Styling in React
      Topics:
        - CSS modules
        - CSS-in-JS introduction
        - Styled-components basics
        - Emotion library
        - Inline styles in React
        - Dynamic styling
        - CSS frameworks with React
        - Tailwind CSS integration
        - Bootstrap with React
        - Material-UI basics
        - Animations with React
        - CSS transitions in React
      Projects built:
        - Styled-components theme
        - Responsive design system
        - Animated components
        - PHASE 1 CAPSTONE: Complete React Application with Custom Styling
      Assessment: Phase 1 exam: a practical build defended live, plus a written paper mixing
      this phase with everything before it

----------------------------------------------------------------
PHASE 2: ADVANCED REACT & STATE MANAGEMENT (MONTHS 4-6, WEEKS 14-26)
----------------------------------------------------------------
Master routing, forms, API integration, and professional state management solutions.

  Months 4-5: Routing & Data Management (Weeks 14-21)
    React Router
      Topics:
        - React Router v6 setup
        - BrowserRouter vs HashRouter
        - Route components
        - Link and NavLink
        - Nested routes
        - Route parameters
        - Query strings
        - useNavigate hook
        - useLocation hook
        - useParams hook
        - Protected routes
        - Route guards
        - Lazy loading routes
        - 404 pages
      Projects built:
        - Multi-page application
        - E-commerce product routing
        - Admin dashboard with nested routes
        - Authentication flow
      Practice: Build 10 routing scenarios
    Forms & Validation
      Topics:
        - Controlled components deep dive
        - Form state management
        - Multi-step forms
        - File uploads
        - Form validation strategies
        - React Hook Form
        - Formik library
        - Yup validation schemas
        - Custom validation
        - Error handling
        - Form optimization
        - Dynamic forms
        - Form arrays
        - Accessibility in forms
      Projects built:
        - Registration system
        - Survey application
        - Dynamic form builder
```

```
      - Checkout process
    Practice: Create 15 complex forms
  API Integration & Data Fetching
    Topics:
      - Fetch API with React
      - Axios integration
      - Loading states
      - Error handling
      - Async operations in React
      - Data fetching patterns
      - Caching strategies
      - Optimistic updates
      - Pagination implementation
      - Infinite scrolling
      - Real-time data with WebSockets
      - Server-Sent Events
      - GraphQL with Apollo Client
      - React Query (TanStack Query)
    Projects built:
      - Blog with API backend
      - Real-time chat application
      - GitHub profile viewer
      - Infinite scroll feed
    Practice: Integrate 10 different APIs
  Context API & State Management
    Topics:
      - Context API deep dive
      - Creating providers
      - Multiple contexts
      - Context optimization
      - Context vs props
      - Global state patterns
      - State management principles
      - Introduction to Redux
      - Redux Toolkit modern approach
      - Actions and reducers
      - Redux DevTools
      - Async actions with Redux Thunk
      - RTK Query
    Projects built:
      - Shopping cart with Context
      - Theme system with Context
      - Todo app with Redux
      - E-commerce with Redux Toolkit
    Practice: Implement 10 state management scenarios
  Advanced Redux Patterns
    Topics:
      - Redux middleware
      - Redux Saga introduction
      - Normalized state shape
      - Reselect for memoization
      - Redux persist
      - Redux forms
      - Time travel debugging
      - Redux performance
      - Code splitting with Redux
      - Redux with TypeScript preview
      - Alternative: Zustand
      - Alternative: MobX
      - Alternative: Recoil
      - Choosing state management
    Projects built:
      - Complex app with Redux Saga
      - Offline-capable app
      - Multi-user collaboration app
      - State management comparison
    Practice: Master advanced Redux patterns

Month 6: Component Patterns & Architecture (Weeks 22-26)
  Advanced Component Patterns
    Topics:
      - Higher-Order Components (HOCs)
      - Render props pattern
      - Compound components
      - Controlled vs uncontrolled
      - Presentational vs container components
      - Provider pattern
      - State initializer pattern
      - State reducer pattern
```

- Prop collections pattern
- Prop getters pattern
- Component composition strategies
- Slot pattern
- Inversion of control
- Extensible components

Projects built:

- Advanced UI component library
- Flexible modal system
- Data table component
- Accordion component set

Practice: Implement 15 component patterns

Performance Optimization

Topics:

- React DevTools Profiler
- Performance metrics
- React.memo optimization
- useMemo strategies
- useCallback patterns
- Lazy loading components
- Code splitting with React.lazy
- Suspense for data fetching
- Virtualization with react-window
- Image optimization
- Bundle size optimization
- Tree shaking
- Performance monitoring
- Core Web Vitals

Projects built:

- Optimize large list rendering
- Performance audit project
- Image gallery optimization
- Bundle size reduction

Practice: Optimize 10 slow React apps

Error Handling & Debugging

Topics:

- Error boundaries
- Error boundary patterns
- Fallback UI design
- Error reporting services
- Debugging techniques
- React DevTools mastery
- Console debugging strategies
- Network tab debugging
- Source maps
- Debugging production issues
- Logging strategies
- Error tracking with Sentry
- Performance debugging
- Memory leak detection

Projects built:

- Error boundary system
- Debugging toolkit
- Error monitoring setup
- Production debugging guide

Practice: Debug 20 React issues

Accessibility & SEO

Topics:

- Web accessibility principles
- ARIA attributes in React
- Keyboard navigation
- Screen reader support
- Focus management
- Accessible forms
- Color contrast
- Accessible modals
- Testing accessibility
- SEO with React SPA
- Meta tags management
- React Helmet
- Open Graph tags
- Structured data

Projects built:

- Accessible component library
- SEO-optimized blog
- Accessibility audit tool
- WCAG compliant app

Practice: Make 10 apps fully accessible

Phase 2 Capstone Project

```
      Topics:
        - Complex application planning
        - Architecture design
        - State management setup
        - API integration
        - Performance optimization
        - Testing implementation
      Projects built:
        - PHASE 2 CAPSTONE: Full-Featured Social Media App
        - Build complete social platform with posts, comments, likes
        - Include: authentication, real-time updates, image uploads
        - Redux state management, optimized performance
      Assessment: Phase 2 exam: a practical build defended live, plus a written paper mixing
      this phase with everything before it

---------------------------------------------------------------
PHASE 3: TYPESCRIPT, TESTING & NEXT.JS (MONTHS 7-9, WEEKS 27-39)
---------------------------------------------------------------
Master TypeScript with React, comprehensive testing, and server-side rendering with Next.js.

  Months 7-8: TypeScript & Testing (Weeks 27-34)
    TypeScript Fundamentals for React
      Topics:
        - TypeScript setup with React
        - Basic types and interfaces
        - Type annotations
        - Function types
        - Union and intersection types
        - Type aliases
        - Generics basics
        - Type inference
        - Strict mode
        - tsconfig.json configuration
        - TypeScript with Vite
        - TypeScript with Vite
        - Migration strategies
        - Common TypeScript errors
      Projects built:
        - Convert JS project to TypeScript
        - Type-safe component library
        - TypeScript configuration setup
        - Type definitions creation
      Practice: Type 30 React components
    TypeScript with React
      Topics:
        - Typing functional components
        - Props interface patterns
        - Children prop types
        - Event handler types
        - Hooks with TypeScript
        - useState with TypeScript
        - useReducer typing
        - useContext typing
        - Custom hooks typing
        - Generic components
        - Discriminated unions
        - Type guards
        - Utility types
        - Third-party library types
      Projects built:
        - Type-safe form system
        - Redux with TypeScript
        - API client with types
        - Component library with types
      Practice: Build 20 type-safe components
    Testing React Applications
      Topics:
        - Testing philosophy
        - Jest setup and configuration
        - React Testing Library
        - Component testing
        - Testing hooks
        - Testing async operations
        - Mocking modules
        - Testing user interactions
        - Integration testing
        - Snapshot testing
        - Coverage reports
        - Testing best practices
```

```
      - TDD with React
      - Debugging tests
    Projects built:
      - Test suite for component library
      - TDD todo application
      - Integration test suite
      - Testing utilities library
    Practice: Write 100+ test cases
  End-to-End Testing
    Topics:
      - E2E testing introduction
      - Cypress setup
      - Writing Cypress tests
      - Page object pattern
      - API testing with Cypress
      - Visual regression testing
      - Playwright introduction
      - Cross-browser testing
      - CI/CD integration
      - Test automation strategies
      - Performance testing
      - Accessibility testing
      - Security testing basics
      - Test reporting
    Projects built:
      - E2E test suite with Cypress
      - Visual regression tests
      - CI/CD pipeline with tests
      - Automated test reports
    Practice: Create comprehensive E2E coverage
  Introduction to Next.js
    Topics:
      - Next.js benefits and features
      - Create Next App setup
      - File-based routing
      - Pages and layouts
      - Static generation (SSG)
      - Server-side rendering (SSR)
      - API routes
      - Dynamic routes
      - Link component
      - Image optimization
      - CSS and styling in Next.js
      - Environment variables
      - Next.js vs a plain Vite SPA
      - Migration to Next.js
    Projects built:
      - Blog with Next.js
      - Portfolio with SSG
      - E-commerce homepage
      - API with Next.js
    Practice: Build 5 Next.js applications

Month 9: Advanced Next.js & Full-Stack (Weeks 35-39)
  Advanced Next.js Features
    Topics:
      - Incremental Static Regeneration (ISR)
      - Dynamic imports
      - Middleware
      - Edge functions
      - Authentication in Next.js
      - NextAuth.js
      - Database integration
      - Prisma with Next.js
      - tRPC integration
      - Internationalization (i18n)
      - SEO optimization
      - Performance optimization
      - Deployment strategies
      - Vercel deployment
    Projects built:
      - Full-stack app with authentication
      - Multi-language website
      - E-commerce with ISR
      - SaaS application starter
    Practice: Master advanced Next.js features
  GraphQL with React
    Topics:
      - GraphQL introduction
```

- GraphQL vs REST
- Apollo Client setup
- Queries and mutations
- GraphQL fragments
- Optimistic UI
- Caching strategies
- Subscriptions
- Error handling
- Authentication with GraphQL
- File uploads
- Relay modern basics
- GraphQL code generation
- Performance optimization

Projects built:

- GraphQL blog application
- Real-time chat with subscriptions
- E-commerce with GraphQL
- GitHub clone with GraphQL

Practice: Build 5 GraphQL applications

Micro-Frontends & Module Federation

Topics:

- Micro-frontends architecture
- Benefits and challenges
- Module federation with Webpack 5
- Sharing dependencies
- Runtime integration
- Build-time integration
- Single-spa framework
- Qiankun framework
- Communication between micro-frontends
- Shared state management
- Deployment strategies
- Testing micro-frontends
- Performance considerations
- When to use micro-frontends

Projects built:

- Micro-frontend architecture
- Module federation setup
- Multi-team application
- Legacy app integration

Practice: Implement micro-frontend patterns

Progressive Web Apps (PWA)

Topics:

- PWA principles
- Service workers in React
- Offline functionality
- Cache strategies
- Web app manifest
- Push notifications
- Background sync
- App shell architecture
- Performance optimization for PWA
- Lighthouse audits
- PWA deployment
- App store submission
- PWA vs native apps
- Workbox library

Projects built:

- Offline-first news app
- PWA e-commerce site
- Push notification system
- Installable web app

Practice: Convert 5 apps to PWAs

Phase 3 Capstone Project

Topics:

- Full-stack application design
- TypeScript throughout
- Comprehensive testing
- Next.js implementation
- Performance optimization
- Production deployment

Projects built:

- PHASE 3 CAPSTONE: Production-Ready SaaS Application
- Build complete SaaS with Next.js, TypeScript, testing
- Include: authentication, payments, admin panel
- Full test coverage, deployed to production

Assessment: Phase 3 exam: a practical build defended live, plus a written paper mixing this phase with everything before it

---

PHASE 4: THE FINALE (MONTH 10, WEEKS 40-44)

The capstone month: spec, build, ship and defend, then the final exam that decides the certificate.

Month 10: Capstone and the Final Exam (Weeks 40-44)

Capstone Spec and Setup

Topics:

- Choosing the capstone: a production-shaped React application: dashboard, social product or commerce frontend
- A one-page spec: scope, milestones, stack
- Repository and skeleton ready on day one
- Instructor sign-off before the build begins

Projects built:

- Approved capstone spec plus the running skeleton, deployed where applicable

Practice: Pitch the spec to the batch and absorb one hard question

Capstone Build

Topics:

- Two focused weeks in vertical slices
- Instructor checkpoints and honest scope cuts
- Using the whole course: hooks, state management, TypeScript, tests and Next.js where it earns it
- Daily commits and an always-working build

Projects built:

- The capstone, feature-complete with version control

Practice: A working build at the end of every session

Ship and Polish

Topics:

- The finishing pass: edge cases, errors, documentation
- Lighthouse and test-suite pass: performance and correctness by evidence
- A README worth reading and a demo worth watching
- A full-course spiral review before the exam

Projects built:

- The capstone shipped, documented and rehearsed

Practice: Two mock demos, each tighter than the last

Demo Day and the Final Exam

Topics:

- Presenting the capstone: live demo plus the hardest bug story
- The honest map of next roads: frontend specialization, full-stack product work, or React Native
- Where our other courses continue the journey

Projects built:

- Demo day presentation delivered to the batch

Assessment: FINAL EXAM: a practical build plus a written paper with questions mixed from every phase. Passing earns the certificate; falling short earns a focused revision plan and a free retest

PROJECTS THE STUDENT BUILDS AND KEEPS

- Phase 1: JavaScript builds and first React applications
- Phase 2: hook-driven apps with real state management
- Phase 3: typed, tested, measured applications with Next.js
- Phase 4: the production-shaped capstone, deployed and defended

Total projects: 20+ real builds, crowned by a deployed production-shaped capstone

SKILLS THE STUDENT WILL HAVE AT THE END

- JavaScript depth: the async and data patterns React assumes
- React as written now: components, hooks and honest data handling
- State at scale: context judgment and Redux Toolkit fluency
- The production layer: TypeScript, React Testing Library, performance measurement
- Next.js: the industry wrapper, used with judgment

HOW A TYPICAL WEEK IS SPLIT

Live classes: 2 live one-hour classes per week, coding along with the instructor
Homework: A problem set after every class, and a mixed-review assignment at the end of every month
Practice: 4-6 hours of building between classes
Review: Every submission reviewed with written feedback; recurring gaps reopened in class

SUPPORT INCLUDED

Doubt support: WhatsApp doubt support between classes
Progress updates: Honest monthly progress reviews: what is solid, what is wobbly, and the plan for the wobble

CERTIFICATION DETAIL

  Completion: Certificate from Modern Age Coders, awarded on passing the final exam. Fall short
    and there is focused revision and a free retest: the certificate certifies knowledge, not
    attendance

WHERE THIS CAN LEAD

  - Frontend roles: this is the depth those interviews probe
  - Our full-stack course: add the backend half
  - App development: React Native carries this skill onto phones
  - DSA for the interview algorithm rounds

EARNING POTENTIAL (share only if asked, and never promise it)

  Market context: The ranges below are general market salary bands for these roles in India and
    abroad, drawn from public industry data. They are shown for career context only and are not a
    promise or guarantee of income. Actual pay depends on your skills, experience, location, and
    the job market.
  Growing roles: Rs 5-8 LPA (Junior React Developer)
  Experienced roles: Rs 8-15 LPA (React Developer); Rs 12-25 LPA (Senior React Developer); Rs
    20-40+ LPA (Lead/Architect)
  Freelance: Rs 2,000-8,000/hour based on expertise
  International: $60k-150k USD based on location and experience

COMMON QUESTIONS ABOUT THIS COURSE

  For anything about cost, use PART 4 and RULE 1. Do not quote two regions.

  Q: What does this React masterclass cover?
  A: JavaScript foundations first, then React as production teams write it: components and
  hooks in depth, honest data patterns, state management with Redux Toolkit, then the
  production layer, TypeScript throughout, testing with React Testing Library, performance
  measured before optimized, and Next.js. A finale month ships a deployed, tested capstone and
  sits the final exam.

  Q: How long does it take to learn React properly?
  A: Ten months of teaching at 2 live classes a week plus 4 to 6 hours of practice, with two
  more months in hand for learners who need them. The three teaching phases build the skill and
  its real-world application; the finale month ships a capstone and sits the final exam.

  Q: How am I assessed? Is the certificate just for attending?
  A: No. Problem sets follow every class with written feedback, monthly reviews deliberately
  mix new material with earlier topics, each phase ends with a cumulative exam, and the course
  ends with a final exam: a practical build plus written questions from the whole syllabus.
  Passing earns the certificate; falling short earns focused revision and a free retest.

  Q: Does this course include React Native?
  A: No, honestly: mobile is its own discipline with its own course here (our app development
  track), and stapling it on would cheat both. What this course guarantees is the React depth
  React Native then assumes, students who continue into the app course arrive ready.

  Q: Can I try a class before enrolling?
  A: Yes, a free demo class with no commitment: book at learn.modernagecoders.com/contact or
  message us on WhatsApp at +91 91233 66161. (Agent note: the free demo is a waiting list with
  no fixed date. The Priority Live Demo is a guaranteed class today or tomorrow, booked at
  https://learn.modernagecoders.com/priority-demo . Offer both, as RULE 3 says.)

  Q: Are classes live or recorded?
  A: Live, always: small groups with a real instructor reading your actual code, never
  pre-recorded videos.

  To enrol, message Shivam Sir on +91 9123366161 or send the parent this link: https://learn.modernagecoders.com/courses/react-js-complete-masterclass-college
  For a demo: the Priority Live Demo (guaranteed, today or tomorrow) is booked at
  https://learn.modernagecoders.com/priority-demo . The free demo is a waiting list with no fixed date.

==========
COURSE 124 OF 137: ROBLOX GAME CODING FOR KIDS: BUILD REAL GAMES IN LUAU
==========

Course link: https://learn.modernagecoders.com/courses/roblox-game-coding-for-kids-lua-course
Subject area: Game Development
Designed for: Kids
Who can join: Beginner, ages 8 to 14
Course length: 6 months (24 weeks)
Time needed: 2 live classes/week + 2-3 hours practice
Certificate: Certificate from Modern Age Coders, awarded on passing the final assessment

PRICE FOR THIS COURSE (quote only the one that applies to the person asking)
In India, per month: group Rs 1,499, mini batch Rs 2,999, one to one Rs 4,999
In Canada, per month: group CAD 140, one to one CAD 210
Anywhere else, per month: group $100, one to one $150
Classes: group and mini batch two live classes a week, eight a month; one to one in India one live class a week, four a month; one to one outside India two live classes a week, eight a month. Each class is one hour.

WHAT THIS COURSE IS

Roblox coding course for kids ages 8-14: live online classes in Roblox Studio and Luau scripting, from first parts to a published game friends can play.

In one line: Your child already plays Roblox. In six months they publish a game of their own on it.

ABOUT THE PROGRAMME

Roblox is where millions of kids already spend their screen time, and it hides a genuinely serious tool: Roblox Studio, the free game-making software behind every experience on the platform, scripted in a real programming language called Luau. This 6-month live course turns a player into a maker. Months 1 and 2 cover building in Studio and the first Luau scripts: variables, decisions, loops, and functions, each one changing something visible in a 3D world. Months 3 and 4 bring games to life with events, player interaction, scoring, and checkpoints, which is where an obby stops being a row of parts and starts being a game. Month 5 adds the mechanics kids recognize from games they love: shops, timers, rounds, sound, and polish. Month 6 is the capstone: each student designs, builds, tests, and publishes their own game to Roblox, then presents it. Classes are live and small, and students build in every single session. Nothing in this course is watch-and-copy: the instructor sets a challenge, watches each student work, and reviews the homework builds between classes.

WHAT MAKES THIS COURSE DIFFERENT

- Students learn Luau, the actual scripting language of Roblox, not a drag-and-drop imitation of it
- Every concept lands inside a 3D world the student built: loops make disco floors, conditionals open doors, functions run traps
- The classic beginner bugs (debounce, anchoring, nil) are taught on purpose, because fixing them is where real understanding starts
- By month 4 students have leaderboards, checkpoints, and coin systems working, the same building blocks behind popular Roblox games
- The capstone is published to Roblox for real, so the finished game has a link a grandparent can open
- Everything used is free: Roblox Studio costs nothing, publishing costs nothing, and no Robux are ever needed

THE LEARNING PATH, STEP BY STEP

Phase 1: Builder to scripter: master Roblox Studio's tools, then write first Luau scripts that change the world from code
Phase 2: Making it a game: events, player interaction, scoring, coins, checkpoints, and on-screen interfaces
Phase 3: Shops, timers, rounds, and polish, then a capstone game scoped, built, published to Roblox, and presented

WHAT A STUDENT NEEDS BEFORE STARTING

Coding experience: None. The course starts from placing the first part and writing the first line
Roblox experience: Helpful but not required. Most students have played Roblox; none have needed to
Equipment: A Windows or Mac computer that runs Roblox Studio, plus a stable internet connection. Phones, tablets, and most Chromebooks cannot run Studio
Account: A free Roblox account, set up with a parent. No Robux or paid membership is needed at any point

WHO THIS COURSE IS FOR

Roblox players: Kids who already love playing Roblox and keep asking how the games they play are actually made
Complete beginners: Children aged 8 to 14 with no coding background who want a first language wrapped in a world they care about
Scratch graduates: Students moving up from block coding who are ready to type real scripts in a real engine
Young game designers: Kids who fill notebooks with game ideas and need the tools to build one for real
Parents seeking direction: Families who want Roblox hours converted from pure consumption into building, debugging, and finishing things

FULL CURRICULUM, WEEK BY WEEK

This is the complete teaching plan. Parents can ask about any week.

PHASE 1: STUDIO SKILLS AND FIRST LUAU SCRIPTS (MONTHS 1-2, WEEKS 1-8)

First the tools: building worlds in Roblox Studio with confidence. Then the leap every Roblox kid dreams about: writing real Luau code that changes the world by itself.

Month 1: Becoming a Builder in Roblox Studio (Weeks 1-4)

Welcome to Roblox Studio

Topics:

- Installing Roblox Studio and a tour of the interface: Explorer, Properties, and the 3D viewport
- Camera controls: fly, zoom, and orbit without getting lost
- Creating parts: blocks, spheres, wedges, and cylinders
- Move, scale, and rotate tools, and snapping to the grid
- Play-testing your world with your own avatar
- Saving your work and opening it again next class

Projects built:

- First playground: a small floating island with ramps, towers, and a jump course to test

Practice: Build a room with four different part shapes, then screenshot your avatar standing on top of it

Parts and Properties

Topics:

- The Properties panel: color, material, transparency, and reflectance
- Anchored explained properly: why unanchored builds collapse when you press play
- CanCollide: making walls you can walk through
- Grouping parts into models and naming things in the Explorer
- Duplicating and mirroring to build faster
- Union and negate: cutting holes and making custom shapes

Projects built:

- Secret hideout: a house with a hidden walk-through wall and a glass floor over a drop

Practice: Property scavenger hunt: recreate five reference parts exactly from their pictures

Building a World

Topics:

- Terrain tools: sculpting hills, water, and caves
- Spawn locations and where players appear
- Planning an obby on paper before placing a single part
- Difficulty curves: why the first jump should be easy
- Lighting basics: time of day and atmosphere
- Testing like a stranger: playing your own course as if you had never seen it

Projects built:

- Obby, part one: a ten-stage jump course across terrain you sculpted yourself

Practice: Add three more stages to your obby, each slightly harder than the last, and have a family member test them

Your First Script

Topics:

- What a Script object is and where it lives in the Explorer
- print and the Output window: making the computer talk
- Variables: naming a part in code and holding numbers and words
- Changing a part's color and material from code instead of the mouse
- Reading your first error message without panicking
- Comments: leaving notes for future-you

Projects built:

- Magic brick: a part that changes color and prints a welcome message the moment the game starts

Practice: Write three scripts that each change a different property of a part, and break one on purpose to read the error

Assessment: Month 1 build check: a small world using anchoring, grouping, terrain, and one working script, walked through live

Month 2: Luau from Zero (Weeks 5-8)

Variables and Values

Topics:

- Numbers, strings, and booleans in Luau
- local and why every variable gets it
- Doing maths in code: changing a part's size and position with numbers
- String concatenation: building messages out of pieces
- Vector3 gently introduced: positions in a 3D world need three numbers
- nil: the most famous value in Roblox scripting

Projects built:

- Teleporting part: a script that moves a platform to a new position, then a script that grows it step by step

Practice: Ten short scripts: resize, recolor, rename, and reposition parts using only variables and code

Making Decisions

```
      Topics:
        - if, then, else: teaching a script to choose
        - Comparisons: equal, not equal, greater, and less
        - Booleans in action: checking if a part is anchored or transparent
        - elseif chains for more than two choices
        - and, or, not: combining conditions
        - Common trap: = for setting, == for asking
      Projects built:
        - Weather machine: a script that checks a variable and sets the world to day, night, or fog to
          match
      Practice: Decision drills: a password checker, a size judge that labels parts small or
      large, and a fix-the-broken-if puzzle
    Loops
      Topics:
        - while loops and task.wait: doing something forever, politely
        - Blinking, pulsing, and color-cycling parts
        - for loops: counting exactly, from disco floors to stairways
        - Building with loops: a staircase generated by code in one second
        - Loop variables inside the loop body
        - Infinite loops without a wait: what happens and how to stop it
      Projects built:
        - Disco floor: a grid of tiles that flash random colors forever
        - Instant staircase: a for loop that builds a climbable spiral stair
      Practice: Loop katas: a countdown announcer, a growing tower, and a part that fades out
      smoothly step by step
    Functions
      Topics:
        - Writing a function: name, parentheses, body, end
        - Parameters: one function that colors any part you hand it
        - Return values: functions that answer questions
        - Why functions matter: change the trap once, fix it everywhere
        - Organizing a script into small named functions
        - Calling functions from loops: the payoff moment
      Projects built:
        - Trap factory: one makeTrap function used to fill an obby stage with ten identical traps in
          seconds
      Practice: Refactor your disco floor and staircase scripts to use functions, then write
      one new function from a written spec
      Assessment: Month 2 skills check: live coding of three short Luau exercises using
      variables, if statements, loops, and one function

----------------------------------------------------------------
PHASE 2: EVENTS, PLAYERS, AND KEEPING SCORE (MONTHS 3-4, WEEKS 9-16)
----------------------------------------------------------------
Scripts so far ran on their own. Now they respond to players: touched events, health, doors,
and traps, then leaderboards, coins, and checkpoints, the machinery every real Roblox game
runs on.

  Month 3: Events and Player Interaction (Weeks 9-12)
    The Touched Event
      Topics:
        - Events: code that waits for something to happen
        - part.Touched:Connect and functions as event handlers
        - Finding out what touched the part
        - Humanoid and character models: how Roblox represents a player
        - The classic lava brick, built properly
        - Print-debugging events: seeing exactly when they fire
      Projects built:
        - Lava stage: an obby section with kill bricks that send careless players back to the start
      Practice: Build a safe-path puzzle: nine tiles, some deadly, some safe, with the
      pattern hidden until touched
    Changing the Player
      Topics:
        - Reading and changing Humanoid health
        - WalkSpeed and JumpPower: speed pads and super-jumps
        - Healing pads and damage zones
        - Resetting effects after a delay with task.wait
        - Being fair: telling the player what a pad does before it does it
        - Testing multiplayer effects with two test players in Studio
      Projects built:
        - Power-up alley: a course with speed strips, jump pads, a healing station, and one sneaky
          slow-down trap
      Practice: Design and script one original power-up of your own invention, then write two
      sentences on how it changes the game
    Doors, Buttons, and Debounce
      Topics:
        - Doors that open: toggling Transparency and CanCollide from a touch
        - Buttons on the floor and on the wall
        - The debounce problem: why your door fires twenty times per step
```

```
      - Fixing debounce with a boolean flag, the pattern every Roblox scripter knows
      - Timed doors that close themselves
      - Locked doors: combining a condition with an event
    Projects built:
      - Dungeon gate room: a button-operated gate with proper debounce and a door that only opens for
        players holding the right key part
    Practice: Break a working door by removing its debounce, watch the Output flood, then
    repair it and explain the fix in class
  Project Week: The Scripted Obby
    Topics:
      - Combining the month: lava, power-ups, doors, and traps in one course
      - Pacing a level: challenge, relief, surprise
      - Organizing scripts so each stage's code is findable
      - Playtesting a classmate's obby and writing useful feedback
      - Fixing the top two problems your testers found
      - Naming and Explorer hygiene before a project grows
    Projects built:
      - Obby 2.0: a fully scripted multi-stage obby with kill bricks, power-ups, at least one gate,
        and a victory area
    Practice: Run two playtests and log every place a tester got stuck or confused, then
    fix the worst one
    Assessment: Obby 2.0 demo: live playthrough plus a code walkthrough of one trap, one
    power-up, and one door

Month 4: Score, Coins, and Checkpoints (Weeks 13-16)
  Leaderboards
    Topics:
      - leaderstats: the folder-and-value pattern behind every Roblox leaderboard
      - IntValue objects and setting them from code
      - Players.PlayerAdded: running code when someone joins
      - Awarding points from a touched event
      - Server scripts vs local effects, kept simple: why the score lives on the server
      - Watching the leaderboard update live in a two-player test
    Projects built:
      - Point course: a stage where every platform reached for the first time adds points to a live
        leaderboard
    Practice: Add a second leaderboard stat of your choice, such as deaths or stages
    cleared, and make something update it
  Collectibles
    Topics:
      - Coins that spin: rotating parts with a loop
      - Collecting: touched event plus destroy, with debounce so one coin pays once
      - Adding coins to leaderstats
      - Spawning coins with a function instead of copy-paste
      - Sound effects on pickup
      - Respawning coins after a delay for endless play
    Projects built:
      - Coin rush: a field of spinning coins with pickup sounds, a live coin counter, and coins that
        respawn
    Practice: Make a rare golden coin worth ten normal ones and place three somewhere
    genuinely hard to reach
  Checkpoints
    Topics:
      - SpawnLocation objects and how respawning works
      - Team-based checkpoints vs scripted checkpoints, and which we use
      - Remembering each player's checkpoint in code
      - Sending a respawned player to the right stage
      - Checkpoint feedback: color change and sound when activated
      - Why checkpoints make hard games fair instead of frustrating
    Projects built:
      - Checkpoint tower: a vertical obby where falling returns you to your highest activated
        checkpoint, not the bottom
    Practice: Tune your tower: move one checkpoint to the fairest possible spot and defend
    the choice in one sentence
  On-Screen Interfaces
    Topics:
      - ScreenGui, Frame, and TextLabel: putting words on the screen
      - Updating a label from code: live coin and timer displays
      - TextButton: a clickable button and its event
      - Sizing and anchoring GUI so it works on different screens
      - A welcome message that appears and fades
      - Keeping GUI readable: contrast and size for real players
    Projects built:
      - Game HUD: an on-screen coin counter and stage display wired to real leaderstats, plus a
        welcome banner
    Practice: Add one more GUI element of your choice, such as a best-height display or a
    hint button
    Assessment: Month 4 systems check: coins, checkpoints, leaderboard, and HUD all working
    together in one place, demonstrated live
```

PHASE 3: REAL GAME MECHANICS AND THE PUBLISHED CAPSTONE (MONTHS 5-6, WEEKS 17-24)

Shops, timers, rounds, and polish turn a course into a game people replay. Then the capstone month: design, build, playtest, and publish an original game to Roblox.

Month 5: Mechanics That Make Games Fun (Weeks 17-20)
The Shop
Topics:
- Spending coins: checking if a player can afford something
- A shop GUI with buy buttons
- Selling upgrades: speed, jump, and a trail effect
- Subtracting coins and applying the upgrade in one safe function
- Saying no nicely: what happens when coins run short
- Balancing prices so the game stays challenging
Projects built:
- Upgrade shop: a working store where coins collected in-game buy speed and jump upgrades
Practice: Add a third item to your shop and set all three prices, then explain your pricing to the class
Timers and Rounds
Topics:
- A countdown clock on screen, driven by a loop
- Round structure: waiting, playing, and finishing
- Announcing round results to everyone
- Teleporting all players to the arena and back
- Resetting the world between rounds
- Why rounds make players say one more game
Projects built:
- Round machine: a lobby-and-arena game loop with a countdown, a 90-second round, and a winners announcement
Practice: Adjust your round length and lobby time after two playtests, and note what changed in player behavior
Sound, Light, and Polish
Topics:
- Background music and where it belongs
- Sound effects for wins, coins, and traps, used tastefully
- Particles: sparkles, fire, and confetti in the right doses
- Lighting mood: making a lava zone feel dangerous
- Victory effects that reward without annoying
- The polish pass: a checklist run on your own game
Projects built:
- Polish pass: music, pickup sounds, victory confetti, and lighting applied to the round machine game
Practice: Do a sound-only playtest: close your eyes while a classmate plays your game and list what you can tell is happening
Project Week: The Complete Mini-Game
Topics:
- Assembling the phase: rounds, shop, coins, HUD, and polish in one game
- Finding the fun: the one change that most improves your game
- Bug hunting with a checklist instead of luck
- Watching testers without helping them
- Writing simple in-game instructions new players actually read
- Preparing a 2-minute demo of your own game
Projects built:
- Complete mini-game: a round-based coin game with a shop, HUD, sound, and polish, tested by classmates
Practice: Fix the three most confusing things your playtesters hit, in order of how much they hurt the game
Assessment: Mini-game demo day: every student's game played live by a classmate, followed by questions about the code

Month 6: The Capstone, Published to Roblox (Weeks 21-24)
Designing Your Game
Topics:
- Choosing a game you can actually finish in three weeks
- The one-page game design sheet: theme, goal, mechanics, win condition
- Sketching the map on paper before Studio opens
- Listing features as must-have, nice-to-have, and dream
- Estimating honestly: what four class weeks can hold
- Getting the plan approved before building starts
Projects built:
- Approved capstone plan: a design sheet and map sketch reviewed one-on-one with the instructor
Practice: Build your capstone's map skeleton: terrain, main structures, and spawn, with no scripts yet
Build Sprint One: Core Mechanics
Topics:
- Building the must-have features first, smallest first
- Reusing your own code from earlier months, the honest shortcut

- Instructor code review: reading feedback and applying it
- Debugging on your own: reproduce, guess, test, fix
- Keeping the Explorer organized as the project grows
- Cutting a feature without shame when time asks for it

Projects built:

- Capstone core: the two or three mechanics that make your game itself, working end to end

Practice: Three 30-minute build sessions at home, each ending with one sentence on what now works that did not before

Build Sprint Two: Testing and Tuning

Topics:

- Full playtests with classmates as strangers
- Reading a playtest: stuck points, boredom points, and delight points
- Difficulty tuning: the numbers that change how a game feels
- Final GUI pass: title screen, instructions, and HUD
- Second code review and cleanup
- The finish line checklist: what done means for this game

Projects built:

- Feature-complete capstone: all must-have features in, tested by at least two classmates, tuned once

Practice: Run one family playtest and one classmate playtest, log every issue, fix the top two

Publish and Present

Topics:

- Publishing to Roblox from Studio, step by step, with a parent in the loop
- Game settings: name, description, icon, and who can play
- Privacy choices explained: public, friends-only, and what we recommend discussing at home
- The final bug sweep before going live
- Presenting your game: demo first, code second
- Where to go next: Python, more advanced game development, or a bigger Roblox project

Projects built:

- Published capstone: an original Roblox game live on the platform, presented to the class and family

Practice: Share your game link with three people outside the class and collect one piece of feedback from each

Assessment: Capstone presentation and code Q&A, plus course-completion certificate review

PROJECTS THE STUDENT BUILDS AND KEEPS

- Floating-island playground built with Studio tools
- Ten-stage terrain obby with sculpted hills and caves
- Disco floor and instant staircase generated by loops
- Trap factory built from a single reusable function
- Obby 2.0 with kill bricks, power-ups, and scripted doors
- Coin rush field with spinning, respawning collectibles
- Checkpoint tower with fair respawn logic
- Round-based mini-game with shop, HUD, timer, and sound
- Published capstone: an original game live on Roblox

Total projects: 12+ finished builds and games, ending with one published to Roblox

SKILLS THE STUDENT WILL HAVE AT THE END

- Roblox Studio fluency: parts, properties, terrain, models, and lighting
- Luau fundamentals: variables, conditionals, loops, functions, and events written by hand
- Game systems: leaderboards, collectibles, checkpoints, shops, timers, and rounds
- GUI building: on-screen counters, buttons, and menus wired to live game data
- Debugging habits: reading errors, print-debugging, and the debounce pattern
- Project skills: scoping a game, playtesting honestly, and presenting your own work

HOW A TYPICAL WEEK IS SPLIT

Live classes: 2 live one-hour classes per week, building and scripting along with the instructor

Practice: 2-3 hours of building challenges and script exercises between classes

Review: Homework builds reviewed with written feedback; stuck points reopened in the next class

Homework: A task or problem set after every class, and a monthly mixed-review assignment that deliberately folds in earlier topics

SUPPORT INCLUDED

Doubt support: WhatsApp doubt support between classes, so nobody stays stuck until the next session

Progress updates: Regular progress notes to parents: what was covered, what was built, what needs practice

CERTIFICATION DETAIL

Completion: Certificate from Modern Age Coders, awarded on passing the final assessment. Fall short and there is focused revision and a free retest: the certificate certifies real learning, not attendance

WHERE THIS CAN LEAD

- Our Python for kids course, where the logic learned in Luau transfers directly to the most-used language in the world
- Advanced game development courses, carrying over events, game loops, and level design instincts
- Bigger Roblox projects: many students keep building and publishing on their own after the course
- School coding clubs and game jams with a finished, published game already in hand
- Our JavaScript or app development tracks for students who want to build beyond gaming

COMMON QUESTIONS ABOUT THIS COURSE

For anything about cost, use PART 4 and RULE 1. Do not quote two regions.

Q: Is this course run by Roblox?
A: No. Modern Age Coders is an independent coding school, and this course is not affiliated with or endorsed by Roblox Corporation. We teach children to build games using Roblox Studio, the free development tool that Roblox makes available to everyone, the same way a Python course teaches Python without being run by the Python Software Foundation.

Q: Is Roblox safe for my child? How do you handle safety in class?
A: Class time is spent in Roblox Studio, which is a development tool rather than the social game: students build and test their own worlds, not chat with strangers. We still recommend parents set up Roblox's parental controls on the child's account, including chat restrictions, and we walk parents through those settings on request. Publishing the capstone game is done together with a parent, and the privacy setting (public or friends-only) is the family's decision.

Q: Does my child need a paid Roblox account or Robux?
A: No. A free Roblox account is all that is required, for the entire course. Roblox Studio is free to download and use, and publishing a game to Roblox costs nothing. We never ask students to buy Robux, and no course project depends on any paid item.

Q: What exactly will my child learn to code?
A: Luau, the scripting language every Roblox game actually runs on. It is a real programming language (a Roblox-evolved version of Lua), so students learn genuine concepts: variables, conditionals, loops, functions, and events. Those ideas transfer directly to Python, JavaScript, and every language they meet afterwards; only the spelling changes.

Q: Is 8 years old too young for this? Is 14 too old?
A: The 8 to 14 range is deliberate. Eight-year-olds who read comfortably do well because month 1 is visual building and scripts arrive gradually, with typing kept short. Fourteen-year-olds are not bored because Luau is a real language and the later months involve genuine systems: leaderboards, shops, and round loops. Batches are grouped so students work alongside kids of similar age and pace.

Q: What computer do we need?
A: Roblox Studio does not run on phones, tablets, or most Chromebooks, so a proper computer is a requirement. If you are unsure whether your machine qualifies, tell us the model before the demo class and we will check.

Q: My child already plays Roblox for hours. Will this just mean more screen time?
A: It changes what the screen time is. Playing a game and building one exercise completely different muscles: planning, logic, debugging, and finishing something hard. Most parents tell us the course redirects hours the child was already spending, and that watching your own game get published beats another afternoon of playing someone else's.

Q: How is my child assessed, and is the certificate just for attending?
A: No. A task follows every class with feedback, monthly reviews deliberately mix new material with earlier topics so nothing is forgotten, and the course ends with a friendly final assessment of everything learned. Passing earns the certificate; falling short earns focused revision and a free retest. We measure real learning, not attendance.

Q: Can we try a class before enrolling?
A: Yes, the first demo class is free and carries no obligation. Book it at learn.modernagecoders.com/contact or message us on WhatsApp at +91 91233 66161. Parents are welcome to sit in, and the demo is also where we confirm your computer runs Roblox Studio comfortably.

To enrol, message Shivam Sir on +91 9123366161 or send the parent this link: https://learn.modernagecoders.com/courses/roblox-game-coding-for-kids-lua-course
For a demo: the Priority Live Demo (guaranteed, today or tomorrow) is booked at https://learn.modernagecoders.com/priority-demo . The free demo is a waiting list with no fixed date.

==
COURSE 125 OF 137: SAT MATH 800 PREP: LIVE CLASSES FOR THE DIGITAL SAT
==

Course link: https://learn.modernagecoders.com/courses/sat-math-prep-course
Subject area: Test Prep Mathematics
Designed for: High school
Who can join: Grades 10-12, all starting scores
Course length: 6 months (26 weeks)
Time needed: 2 live one-hour classes per week + weekly timed practice
Certificate: Certificate from Modern Age Coders, awarded on passing the final assessment

PRICE FOR THIS COURSE (quote only the one that applies to the person asking)
  In India, per month: group Rs 1,499, mini batch Rs 2,999, one to one Rs 4,999
  In Canada, per month: group CAD 140, one to one CAD 210
  Anywhere else, per month: group $100, one to one $150
  Classes: group and mini batch two live classes a week, eight a month; one to one in India one
  live class a week, four a month; one to one outside India two live classes a week, eight a
  month. Each class is one hour.

WHAT THIS COURSE IS

  Live online SAT Math prep for the Digital SAT: Heart of Algebra, Advanced Math, Data
  Analysis, Desmos strategy and full adaptive mock cycles with a mentor.

  In one line: The Digital SAT rewards thinkers. We build the thinker, then train the test.

ABOUT THE PROGRAMME

  A 6-month live prep program for the Digital SAT's math section, taught 1-on-1 or in small
  groups by a dedicated mentor. The SAT math section rewards structure recognition and clean
  algebra far more than memorized tricks, so we teach the mathematics underneath first, linear
  and nonlinear equations, functions, ratios, data, then layer on adaptive-test strategy:
  module pacing, Desmos calculator fluency, and when to solve versus when to backsolve. Every
  student runs full timed mock cycles with question-by-question review, so score movement is
  measured, not hoped for.

WHAT MAKES THIS COURSE DIFFERENT

  - Understanding-first: we repair the algebra underneath before drilling question types, because
    that is where 600-scorers become 750-scorers
  - Digital SAT native: adaptive module strategy and built-in Desmos calculator workflows taught
    as first-class skills
  - A dedicated mentor who tracks your error log across the whole program, not a rotating cast
  - Full mock cycles under real timing with question-by-question review against the reasoning,
    not just the answer key
  - One full interactive hour per class, twice a week, no 25-minute check-ins
  - Honest score guidance: a diagnostic in week one and evidence-based targets, never invented
    score promises
  - Small groups capped tight, or fully private 1-on-1 mentorship
  - Every class recorded for revision before test day

THE LEARNING PATH, STEP BY STEP

  Phase 1: Diagnostic + the algebra core: linear equations, systems, inequalities and the
  function idea, repaired to fluency
  Phase 2: Advanced Math and Problem-Solving & Data: quadratics, exponentials, ratios,
  percentages and data interpretation
  Phase 3: Test craft: adaptive pacing, Desmos mastery, full mock cycles and error-log-driven
  polishing to peak on test day

WHAT A STUDENT NEEDS BEFORE STARTING

  Education: Grades 10-12 (or gap-year students retaking the SAT)
  Math background: School algebra at any comfort level, the diagnostic finds the real starting
    point
  Equipment: Computer with stable internet; the Digital SAT's Desmos calculator is built into
    practice tools
  Time commitment: 2 live hours plus 2-3 practice hours weekly
  English: Course taught in English
  Motivation: A target test date, or our help choosing one

WHO THIS COURSE IS FOR

  Score raisers: Students scoring 500-650 on practice tests who need the algebra core rebuilt,
    not more drills
  Top end: Students at 700+ hunting the last 60-100 points through hard-module craft and error
    elimination

Strong at school: Teens with good school grades whose practice scores do not match, the classic craft gap
Planners: Grade 10 families starting early so the real test year is calm
Retakers: Students whose first attempt underperformed and who want a method, not more of the same

FULL CURRICULUM, WEEK BY WEEK

This is the complete teaching plan. Parents can ask about any week.

PHASE 1: THE ALGEBRA CORE (WEEKS 1-8)

The Digital SAT's biggest domain is algebra. This phase diagnoses exactly where points are leaking and rebuilds linear equations, systems, inequalities and functions to reconstruction strength, the foundation every later question type stands on.

Weeks 1-2: Diagnostic + Linear Equations Rebuilt
Topics:
- Full timed diagnostic module with question-by-question review
- Personal error log opened: content gaps vs speed gaps vs careless patterns
- Linear equations and expressions from meaning, not moves
- Translating word problems into equations, the SAT's favorite disguise
- Slope and intercepts as rates and starting values in context
- Desmos introduction: graphing as a checking habit

Projects built:
- Personal score map: your exact domains, question types and target
- First timed mini-module under real Digital SAT pacing

Practice: Complete one timed linear equations mini set, log every miss in your error log as content, speed or careless, and redo the misses untimed.

Weeks 3-4: Systems and Inequalities
Topics:
- Systems solved three ways: substitution, elimination, Desmos intersection
- How many solutions? Parallel, intersecting and identical lines as ideas
- Linear inequalities and shaded regions read from the graph
- Systems word problems: mixtures, rates, break-even setups
- When solving is slower than testing answer choices, strategy honestly taught
- Timed reps: the 60-second system question

Projects built:
- Break-even mini-case solved by equation, table and graph
- Error-log review: your system-question mistakes classified and closed

Practice: Work a 15 question systems and inequalities set, solving at least five by Desmos intersection, and file each error in your log with its fix.

Weeks 5-6: Functions as Machines
Topics:
- Function notation read as a sentence: f(x) is an output, not a mystery
- Evaluating, composing and interpreting functions in context
- Graph reading: intercepts, increasing/decreasing, transformations
- Linear function word problems and modeling
- Function questions in the calculator module: Desmos-first workflows
- Timed reps: function questions across both modules

Projects built:
- Function-transformation exploration built live in Desmos
- Mixed timed set: algebra domain at full pace

Practice: Finish a mixed function notation problem set, then rebuild two missed questions in Desmos to see what the graph was telling you.

Weeks 7-8: Algebra Domain Checkpoint
Topics:
- Full algebra-domain timed section under adaptive conditions
- Review ritual taught: why each miss happened, what changes next time
- Absolute value and compound inequalities, the fringe cases
- Careless-error engineering: writing habits that stop point leaks
- Module-1 pacing plan drafted against your speed data

Projects built:
- Algebra checkpoint mock + personal pacing plan v1
- Updated error log with closed vs open gap list

Practice: Take one timed algebra domain section and write a one line cause and correction for every dropped point before the review class.

PHASE 2: ADVANCED MATH + PROBLEM-SOLVING & DATA (WEEKS 9-18)

The domains that separate good scores from great ones: quadratics and exponentials taught as ideas, then the ratio-percent-data cluster where careless points go to die. Every topic is drilled at real SAT difficulty tiers, including the hard-module versions.

Weeks 9-11: Quadratics and Nonlinear Equations
Topics:
- Quadratics four ways: factoring, completing the square, formula, Desmos
- The discriminant as an idea: how many solutions and why the SAT asks
- Vertex form and parabola word problems (projectiles, revenue, area)
- Nonlinear systems: line meets parabola, read from the graph
- Exponent rules rebuilt from meaning; rational exponents and radicals
- Hard-module quadratic questions: recognizing the structure in costume
Projects built:
- Projectile/revenue modeling mini-case solved by vertex reasoning
- Timed hard-module quadratic set with full review
Practice: Drill a 12 question hard module quadratic set, solving each question twice: once by algebra and once by the fastest Desmos route.

Weeks 12-14: Exponential Growth, Polynomials and Rational Expressions
Topics:
- Linear vs exponential growth: the comparison the SAT loves to test
- Exponential word problems: percent growth/decay, doubling, interest
- Polynomial arithmetic, zeros and graph behavior
- Rational expressions and equations without fear
- Isolating variables in formulas, the classic layup question
- Equivalent-expression questions: the algebra-fluency tax
Projects built:
- Growth-model comparison case: same data, linear vs exponential fits
- Advanced Math domain checkpoint under timing
Practice: Complete a percent growth and decay problem set plus five isolate the variable questions, keeping each layup question under a minute.

Weeks 15-18: Problem-Solving & Data Analysis
Topics:
- Ratio and proportion reasoning: the choose-the-easy-comparison skill
- Percent problems in every SAT costume: change, reverse, repeated
- Unit conversion and rates with dimensional discipline
- Reading tables, scatterplots, histograms and box plots fast
- Line of best fit, slope interpretation and prediction questions
- Mean, median, range and standard deviation as concepts
- Margin of error and study-design questions, what the SAT actually asks
- Two-way tables and conditional probability without formulas
Projects built:
- Data-interpretation sprint: 20 real chart questions under time
- Full mixed-domain mock: first complete Digital SAT math section
Practice: Run a 20 question ratio, percent and data interpretation sprint under time and classify every miss before class.

PHASE 3: ADAPTIVE TEST CRAFT + MOCK CYCLES (WEEKS 19-26)

Content becomes score in this phase: adaptive module strategy, Desmos speed workflows, geometry-and-trig completion, and a full mock cycle rhythm, test, review, repair, retest, that peaks the week of the real exam.

Weeks 19-20: Geometry and Trigonometry Domain
Topics:
- Area, volume and the reference-sheet formulas used intelligently
- Triangles: similarity, right-triangle trig, special right triangles
- Circles: arcs, sectors, and the circle equation
- Angle chasing with parallel lines and polygons
- Coordinate geometry: distance, midpoint, and geometric reasoning on the grid
- Trig on the SAT: exactly what is tested, nothing more
Projects built:
- Geometry domain checkpoint under timing
- Personal formula-and-recognition sheet, built not copied
Practice: Finish a geometry domain set using your own recognition sheet wherever possible, starring any formula you still had to look up.

Weeks 21-23: Adaptive Strategy and Desmos Mastery
Topics:
- How Digital SAT adaptivity works and what module 1 accuracy is worth
- Pacing plans per module built from your own timing data
- Desmos power workflows: solving, systems, regressions, tables at speed
- Solve vs backsolve vs plug-in: choosing the fastest honest route
- Flag-and-return discipline; the two-pass module method
- Guessing strategy and the no-blank rule, applied calmly
Projects built:
- Desmos speed drills: 15 questions where the calculator wins
- Strategy card: your personal decision rules for module 2
Practice: Do the 15 question Desmos speed drill, record your per question times and flag anything over 90 seconds for strategy review.

Weeks 24-26: Full Mock Cycles and Peak Week
Topics:
- Full adaptive mocks under exact timing, reviewed question by question
- Error-log closure: every recurring mistake gets a named fix
- Score-trend review with honest final-target calibration
- Peak-week plan: what to practice, what to rest, sleep and logistics
- Test-day routine: warm-up set, timing checkpoints, reset ritual after hard questions

Projects built:
- Two to three full mock cycles with documented score progression
- Written test-day plan, rehearsed twice before the real thing

Practice: Sit one full adaptive mock under exact timing this week and bring the question by question review with your named fixes.

PROJECTS THE STUDENT BUILDS AND KEEPS

- Personal score map and error log maintained across all 6 months
- Desmos workflow library built by the student, question type by question type
- Two to three full adaptive mock cycles with documented score progression
- Personal pacing plans for both modules, built from real timing data
- Written test-day plan rehearsed before the real exam

Total projects: 5+ prep artifacts including full mock cycles

SKILLS THE STUDENT WILL HAVE AT THE END

- Linear equations, systems and inequalities at SAT speed
- Functions, quadratics and exponentials as ideas
- Ratio, percent and data-analysis fluency
- SAT geometry and trigonometry domain
- Desmos calculator power workflows
- Adaptive module pacing and two-pass strategy
- Error-log discipline and careless-point engineering
- Test-day routine and calm under the clock

HOW A TYPICAL WEEK IS SPLIT

Live classes: 2 one-hour live classes with your mentor
Timed practice: 1-2 timed sets or module sections per week
Review: Every practice set reviewed for reasoning, not just answers
Total per week: About 4-5 focused hours
Homework: A problem set after every class, and a monthly mixed-review assignment that deliberately folds in earlier topics

SUPPORT INCLUDED

Live sessions: 8 live one-hour classes every month, 2 per week
Mentorship: One dedicated mentor across the whole program
Recordings: Every class recorded for revision
Progress tracking: Error log + mock-score progression shared with parents
Flexibility: Slots move around school exams and family plans

CERTIFICATION DETAIL

Completion: Certificate from Modern Age Coders, awarded on passing the final assessment. Fall short and there is focused revision and a free retest: the certificate certifies mastery, not attendance

WHERE THIS CAN LEAD

- A math score that strengthens selective-college applications
- AP Calculus and AP Statistics readiness, built on real algebra fluency
- Stronger merit-scholarship positioning at score-aware universities
- Ready for AP Calculus Exam Prep or the College Mathematics Masterclass

COMMON QUESTIONS ABOUT THIS COURSE

For anything about cost, use PART 4 and RULE 1. Do not quote two regions.

Q: Is this course for the Digital SAT?
A: Yes, the course is built for the Digital SAT format: two adaptive math modules, the built-in Desmos graphing calculator, and current question styles. Module strategy and Desmos fluency are taught as first-class skills alongside the mathematics, and we verify current test details against College Board materials for your test date.

Q: What score improvement can we expect?
A: We will not invent a number, improvement depends on the starting score, weeks available and practice done between classes. What we promise instead: a real diagnostic in week one, a plan that attacks your highest-value gaps first, and a documented mock-score progression you can watch. Students who complete the mock cycles see their trend line clearly before test

day.

Q: My teen scores well in school math but low on SAT practice tests. Why?
A: This is the most common profile we see. School rewards showing your work over weeks; the SAT rewards structure recognition under a clock. The gap is usually speed, question-reading and strategy rather than missing content, all trainable. The diagnostic separates content gaps from craft gaps in the first week.

Q: When should SAT math prep start?
A: The full program is 6 months, which comfortably fits a spring test from an autumn start. Starting closer to the test still works, the mentor compresses toward your highest-value domains and mock cycles, but more runway means the algebra core gets properly rebuilt rather than patched.

Q: How is this different from a prep-book or app-based course?
A: Books and apps give practice; they cannot watch your teen think. A live mentor catches the broken step inside the work, the sign error, the misread, the slow route, and fixes the habit, not just the answer. That is why our classes are a full interactive hour with your teen solving and explaining aloud, twice a week.

Q: Do you cover the reading and writing section too?
A: This course is deliberately math-only, depth over bundling. Math is where a specialist mentor moves scores fastest, and where our maths-and-coding teaching method gives a real edge. Families wanting verbal prep can run it in parallel elsewhere without conflict.

Q: How am I assessed, and is the certificate just for showing up?
A: No. A problem set follows every class with written feedback, monthly reviews deliberately mix new material with earlier topics so nothing is forgotten, and the course ends with a full mock SAT-math paper as the final assessment. Passing earns the certificate; falling short earns focused revision and a free retest. We measure real understanding, not attendance.

Q: Can we try it before paying?
A: Yes. Every student starts with a free live demo class that doubles as the diagnostic, a real lesson plus an honest read on the starting point and target, with no card details required.

To enrol, message Shivam Sir on +91 9123366161 or send the parent this link: https://learn.modernagecoders.com/courses/sat-math-prep-course
For a demo: the Priority Live Demo (guaranteed, today or tomorrow) is booked at https://learn.modernagecoders.com/priority-demo . The free demo is a waiting list with no fixed date.

==========
COURSE 126 OF 137: SCRATCH CODING FOR KIDS: ZERO TO REAL GAMES IN 3 MONTHS
==========

Course link: https://learn.modernagecoders.com/courses/scratch-programming-complete-course
Subject area: Kids Coding
Designed for: Kids
Who can join: Complete beginner, ages 6 to 12
Course length: 3-4 months (12-16 weeks)
Time needed: 2 live classes/week + 2-3 hours practice
Certificate: Certificate from Modern Age Coders, awarded on passing the final exam

PRICE FOR THIS COURSE (quote only the one that applies to the person asking)
In India, per month: group Rs 1,499, mini batch Rs 2,999, one to one Rs 4,999
In Canada, per month: group CAD 140, one to one CAD 210
Anywhere else, per month: group $100, one to one $150
Classes: group and mini batch two live classes a week, eight a month; one to one in India one live class a week, four a month; one to one outside India two live classes a week, eight a month. Each class is one hour.

WHAT THIS COURSE IS

Scratch coding course for kids aged 6-12: live online classes from first block to real games and animations, 35+ projects in 3-4 months on free MIT Scratch.

In one line: The best first coding language ever built, mastered properly: from the first dragged block to real games your child designed, in three focused months.

ABOUT THE PROGRAMME

Scratch, built by MIT, is where millions of children write their first real program, and for good reason: logic is learned by snapping colorful blocks together, and the results move, sing and play back immediately. This live online course takes children aged 6 to 12 from zero to genuinely capable: 35+ projects across three months, from first animations to complete games with scores, levels, clones and multi-sprite coordination. The pace is honest and kid-sized: two live classes a week plus 2 to 3 hours of playful practice completes the course in 3 months, and children who want more time take up to 4, the batch adapts. Every week ends

with something to show the family; every month ends with a friendly mixed challenge that quietly revises earlier skills; and the course ends with a final project exam, a game demo plus a short viva, that decides the certificate. Real skills, real games, real pride.

WHAT MAKES THIS COURSE DIFFERENT

- Every single week ships projects: 35+ games, animations and stories across the course, built by the child, not the teacher
- Real Scratch depth: variables, lists, clones and broadcasts, the concepts that make later Python feel familiar
- Kid-sized honest pace: 3 months at 2 classes a week, with a 4th month in hand for children who want more practice time
- Monthly mixed challenges revise earlier skills on purpose, so nothing fades between weeks
- A final project exam decides the certificate: a game demo plus a friendly viva, with a free retest after revision if needed
- Small live batches capped at 10, grouped by age, with mini-batch and 1-on-1 options

THE LEARNING PATH, STEP BY STEP

Month 1: Foundations (Weeks 1-4): sprites, motion, sounds, events and first games, plus creative pen art
Month 2: Real game mechanics (Weeks 5-8): variables and scores, lists, clones, and multi-sprite games with broadcasts
Month 3: Mastery (Weeks 9-12): extensions and AI blocks, physics, polish, and the final capstone game presented at demo day

WHAT A STUDENT NEEDS BEFORE STARTING

Coding experience: None. Scratch was invented exactly for this start
Reading: Basic reading ability to follow on-screen labels
Equipment: A computer or laptop with a stable internet connection; Scratch is free and runs in the browser
Age: 6 to 12. Batches are grouped by age so pace and examples fit the room
Time commitment: 2 live classes plus 2-3 hours of playful practice a week

WHO THIS COURSE IS FOR

Complete beginners: Kids aged 6-14 with zero coding experience
Creative kids: Children who love games, stories, art, or music
Visual learners: Kids who learn best through visual, hands-on activities
Future coders: Children interested in eventually learning Python or JavaScript
Homeschoolers: Families looking for structured coding education

FULL CURRICULUM, WEEK BY WEEK

This is the complete teaching plan. Parents can ask about any week.

MONTH 1: SCRATCH FOUNDATIONS & BASIC GAME DEVELOPMENT

Master Scratch basics, create animations, and build your first games.

Introduction to Scratch & Basic Motion

Topics:
- What is programming? Why learn to code?
- Introduction to MIT Scratch platform
- Creating your Scratch account
- Scratch interface tour: Stage, Sprites, Blocks
- Understanding coordinates (x, y) system
- Sprite selection and management
- Basic motion blocks: move, turn, go to
- Using the green flag and stop button
- Saving and naming projects
- Sprite costumes and switching
- Stage backdrops basics
- First animation: making sprites move

Projects built:
- {'name': 'Hello World Animation', 'description': 'Sprite introduces itself and moves around', 'skills': 'Basic motion, say blocks, timing'}
- {'name': 'Aquarium Scene', 'description': 'Fish swimming with glide blocks', 'skills': 'Glide motion, multiple sprites, backdrop'}
- {'name': 'Dance Party', 'description': 'Characters dancing with costume changes', 'skills': 'Costume switching, rhythm, coordination'}
- {'name': 'Maze Navigator', 'description': 'Move sprite through simple maze with arrow keys', 'skills': 'Keyboard control, precise movement'}

Practice: Make your sprite dance across the stage with move and glide blocks, visiting all four corners using x and y coordinates.

Looks, Sound, and Interactivity

Topics:
- Advanced looks blocks and effects
- Graphic effects: color, fisheye, whirl, pixelate
- Size changes and animations
- Show and hide sprites strategically
- Layer ordering with go to front/back
- Adding sounds from library
- Recording custom sounds
- Sound effects and volume control
- Playing notes and creating melodies
- Tempo and beat in projects
- Mouse interaction and following
- Creating buttons and click events

Projects built:
- {'name': 'Interactive Music Maker', 'description': 'Piano with visual effects', 'skills': 'Sound blocks, mouse interaction, effects'}
- {'name': 'Animated Story Book', 'description': 'Story with sound effects and narration', 'skills': 'Timing, sound synchronization, scene changes'}
- {'name': 'Dress Up Game', 'description': 'Click to change character outfits', 'skills': 'Mouse clicks, costume logic, layering'}
- {'name': 'Magic Show', 'description': 'Sprites appear/disappear with effects', 'skills': 'Show/hide, graphic effects, timing'}

Practice: Give your sprite a costume change show that uses three graphic effects and plays a sound at each transformation.

Control Flow and Basic Logic

Topics:
- Understanding forever loops
- Repeat loops with specific counts
- If-then conditional statements
- If-then-else decision making
- Wait blocks and timing control
- Repeat until conditions
- Stop commands for sprites and scripts
- Combining multiple conditions
- Nested loops understanding
- Creating smooth animations with loops
- Basic collision detection
- Game over and winning conditions

Projects built:
- {'name': 'Catch the Falling Stars', 'description': 'Catch objects with increasing speed', 'skills': 'Forever loops, collision detection, scoring'}
- {'name': 'Traffic Light Simulator', 'description': 'Automated traffic control system', 'skills': 'Repeat loops, timing, state management'}
- {'name': 'Platform Jumper', 'description': 'Basic platformer with gravity', 'skills': 'Conditional logic, physics simulation'}
- {'name': 'Quiz Game', 'description': 'Multiple choice questions with scoring', 'skills': 'If-then-else, user input, logic flow'}

Practice: Build a guess the door scene where if then else blocks decide what happens behind each of three doors.

Pen Extension and Creative Drawing

Topics:
- Adding the Pen extension
- Pen down and pen up commands
- Drawing lines and shapes
- Changing pen color and shade
- Pen size adjustments
- Creating geometric patterns
- Stamps and creating trails
- Drawing with mouse control
- Mathematical art and fractals
- Spirograph patterns
- Clearing and managing drawings
- Creating drawing applications

Projects built:
- {'name': 'Etch-a-Sketch', 'description': 'Drawing app with keyboard control', 'skills': 'Pen control, user input, clearing'}
- {'name': 'Geometric Art Generator', 'description': 'Create mathematical patterns', 'skills': 'Loops with pen, angles, repetition'}
- {'name': 'Rainbow Spiral Maker', 'description': 'Colorful spiral patterns', 'skills': 'Color changes, mathematical spirals'}
- {'name': 'Signature Pad', 'description': 'Mouse-controlled drawing', 'skills': 'Mouse tracking, pen following'}

Practice: Draw a rainbow spiral with the pen extension by changing the pen color inside a repeat loop.

Assessment: Month 1 check: build a small interactive scene live, plus a fun take-home challenge mixing everything from month 1

MONTH 2: ADVANCED SCRATCH TECHNIQUES

Master variables, lists, clones, and build complex games.

  Variables and Score Systems
    Topics:
      - What are variables? Real-world examples
      - Creating variables for all sprites vs. this sprite only
      - Setting and changing variable values
      - Displaying variables on stage
      - Creating score systems
      - Lives and health systems
      - Timers and countdowns
      - High score tracking
      - Currency systems for games
      - Variable-based animations
      - Random number generation
      - Mathematical operations with variables
    Projects built:
      - {'name': 'Cookie Clicker Game', 'description': 'Incremental game with upgrades', 'skills':
        'Variables, click counting, cost systems'}
      - {'name': 'Racing Game with Laps', 'description': 'Track laps and best times', 'skills':
        'Timer variables, lap counting, records'}
      - {'name': 'RPG Character Stats', 'description': 'Health, mana, experience system', 'skills':
        'Multiple variables, stat management'}
      - {'name': 'Math Challenge Game', 'description': 'Timed math problems with scoring', 'skills':
        'Random numbers, calculations, timing'}
    Practice: Create a clicker game where a score variable rises with every click and the
    sprite celebrates at ten points.

  Lists and Data Management
    Topics:
      - Understanding lists (arrays)
      - Creating and naming lists
      - Adding items to lists
      - Deleting items from lists
      - Inserting at specific positions
      - Replacing list items
      - Finding items in lists
      - List length and iteration
      - Using lists for inventories
      - Leaderboards and high scores
      - Question banks for quizzes
      - Shopping lists and collections
    Projects built:
      - {'name': 'Memory Card Game', 'description': 'Match pairs using lists', 'skills': 'List
        shuffling, pair matching, memory'}
      - {'name': 'Word Guessing Game', 'description': 'Hangman-style with word lists', 'skills':
        'String manipulation, list iteration'}
      - {'name': 'Inventory System RPG', 'description': 'Collect and manage items', 'skills':
        'Dynamic lists, item management'}
      - {'name': 'Quiz Bowl Game', 'description': 'Questions from lists', 'skills': 'Random
        selection, list traversal'}
    Practice: Make a favorites program that stores five favorite foods in a list and says a
    random one when the space key is pressed.

  Clones and Advanced Game Mechanics
    Topics:
      - Understanding clones concept
      - Creating clones of sprites
      - When I start as a clone
      - Clone-specific behaviors
      - Deleting clones properly
      - Managing multiple clones
      - Bullet systems in games
      - Enemy spawning mechanics
      - Particle effects with clones
      - Power-ups and collectibles
      - Clone collision detection
      - Performance optimization
    Projects built:
      - {'name': 'Space Shooter', 'description': 'Shoot bullets at enemy clones', 'skills': 'Clone
        bullets, enemy waves, collision'}
      - {'name': 'Tower Defense Game', 'description': 'Defend against clone enemies', 'skills': 'Path
        following, tower placement, waves'}
      - {'name': 'Fireworks Simulator', 'description': 'Particle effects with clones', 'skills':
        'Visual effects, physics, timing'}
      - {'name': 'Asteroid Field', 'description': 'Navigate through clone obstacles', 'skills':

'Random spawning, difficulty scaling'}
Practice: Build a falling snowflake shower using clones that appear at random x positions and delete themselves at the bottom.

Broadcast Messages and Multi-Sprite Coordination
Topics:
- Understanding broadcast messages
- When I receive message
- Broadcast and wait
- Scene management with broadcasts
- Menu systems and navigation
- Coordinating multiple sprites
- Turn-based game mechanics
- Cutscenes and dialogues
- Game state management
- Pause and resume functionality
- Level transitions
- Achievement notifications
Projects built:
- {'name': 'RPG with Dialogue System', 'description': 'Story-driven game with conversations', 'skills': 'Message coordination, dialogue trees'}
- {'name': 'Multi-Level Platformer', 'description': 'Complete game with level progression', 'skills': 'Scene management, state tracking'}
- {'name': 'Turn-Based Battle System', 'description': 'Pokemon-style combat', 'skills': 'Turn management, action queuing'}
- {'name': 'Escape Room Puzzle', 'description': 'Multiple interconnected puzzles', 'skills': 'Puzzle logic, item interaction'}
Practice: Create a two scene story where a broadcast message switches the backdrop and cues the next character to speak.
Assessment: Month 2 check: a mini game built live using variables and clones, with challenge questions reaching back to month 1

MONTH 3: MASTERY AND ADVANCED PROJECTS

Create professional games, master extensions, and prepare for text coding.

Extensions and AI Blocks
Topics:
- Music extension advanced features
- Creating dynamic soundtracks
- Text to Speech capabilities
- Language translation features
- Video Sensing for motion detection
- Creating motion-controlled games
- Using webcam for interaction
- Machine Learning extension intro
- Creating AI-powered projects
- Optional hardware fun: micro:bit and Makey Makey, for families who have one at home
Projects built:
- {'name': 'Motion-Controlled Game', 'description': 'Control with body movements', 'skills': 'Video sensing, motion tracking'}
- {'name': 'Multi-Language Quiz', 'description': 'Quiz with translation features', 'skills': 'Translation, text-to-speech'}
- {'name': 'AI Pet Game', 'description': 'Pet that responds to actions', 'skills': 'Machine learning basics, interaction'}
- {'name': 'Musical Composition Tool', 'description': 'Create and play music', 'skills': 'Music extension mastery'}
Practice: Use the Text to Speech extension to make a talking pet that greets you in two different languages.

Physics and Simulation
Topics:
- Implementing gravity
- Jump mechanics and physics
- Velocity and acceleration
- Collision detection advanced
- Bouncing and elasticity
- Friction simulation
- Pendulum motion
- Projectile motion
- Water and fluid effects
- Particle systems advanced
- Realistic movement patterns
- Physics-based puzzles
Projects built:
- {'name': 'Angry Birds Clone', 'description': 'Physics-based puzzle game', 'skills': 'Projectile physics, destruction'}
- {'name': 'Pinball Machine', 'description': 'Realistic ball physics', 'skills': 'Bouncing,

flippers, gravity'}
- {'name': 'Solar System Simulator', 'description': 'Orbital mechanics', 'skills': 'Circular motion, gravity simulation'}
- {'name': 'Fluid Dynamics Demo', 'description': 'Water and particle effects', 'skills': 'Particle systems, flow simulation'}

Practice: Give a character a real jump using a velocity variable, gravity and a landing check on a platform.

Optimization and Professional Polish

Topics:
- Performance optimization techniques
- Reducing lag and improving FPS
- Efficient clone management
- Sprite and backdrop optimization
- Code organization and comments
- Creating custom blocks (functions)
- Debugging techniques
- Error handling strategies
- Testing and quality assurance
- User interface design
- Menu and navigation systems
- Settings and options menus

Projects built:
- {'name': 'Professional Game UI', 'description': 'Complete menu system', 'skills': 'Navigation, settings, polish'}
- {'name': 'Optimized Particle System', 'description': 'Efficient visual effects', 'skills': 'Performance, visual quality'}
- {'name': 'Debugger Tool', 'description': 'In-game debugging system', 'skills': 'Testing, monitoring, logging'}
- {'name': 'Modular Game Engine', 'description': 'Reusable game components', 'skills': 'Custom blocks, organization'}

Practice: Tidy up one of your older projects by adding comments to three scripts and merging any blocks that repeat.

Final Projects and Portfolio

Topics:
- Planning large projects
- Game design documentation
- Project management basics
- Version control concepts
- Sharing and remixing ethics
- Scratch community guidelines
- Creating tutorials for others
- Portfolio presentation
- Transitioning to text coding
- JavaScript similarities
- Python connections
- Future learning paths

Projects built:
- THE CAPSTONE: an original game designed and built by the child, with levels, scoring and a polished start screen
- Classic picks: an RPG adventure with quests, an educational quiz world, or an arcade game with increasing difficulty
- A portfolio page collecting the course's best 10 projects

Practice: Write a one page plan for your final game with its goal, its sprites and three rules, then build the title screen.

Assessment: FINAL EXAM: capstone game demo plus a friendly viva and a mixed quiz drawn from the whole course. Passing earns the certificate; a child who falls short gets focused revision and a free retest

PROJECTS THE STUDENT BUILDS AND KEEPS

- Month 1 (Weeks 1-4): 12+ projects: animations, interactive stories, pen art and first games
- Month 2 (Weeks 5-8): 12+ games: score systems, list-powered quizzes, clone effects and multi-sprite worlds
- Month 3 (Weeks 9-12): 10+ advanced builds: AI-block experiments, physics simulations, and the polished capstone

Total projects: 35+ Scratch projects plus an original capstone game

SKILLS THE STUDENT WILL HAVE AT THE END

- Scratch Basics: sprites, motion, looks, sound, pen blocks, backdrops
- Programming Logic: loops, conditionals, events, variables, operators
- Data Structures: lists, data management, cloud variables
- Game Development: score systems, collision detection, clones, physics
- Animation: character animation, scene transitions, storytelling
- Advanced: extensions (music, video sensing, text-to-speech), optimization
- Professional Skills: debugging, code organization, project planning

HOW A TYPICAL WEEK IS SPLIT

  Live classes: 2 live one-hour classes per week, building along with the teacher
  Homework: A small homework build after every class, and a mixed-review challenge at the end of every month
  Practice: 2-3 hours of playful practice between classes
  Review: Every project gets teacher feedback; wobbly concepts are reopened in class

SUPPORT INCLUDED

  Doubt support: WhatsApp doubt support between classes, so no child stays stuck and discouraged
  Progress updates: Regular progress notes to parents: what was built, what comes next, and how to encourage practice at home

CERTIFICATION DETAIL

  Completion: Certificate from Modern Age Coders, awarded on passing the final exam, a capstone demo plus a friendly viva. A child who falls short gets focused revision and a free retest: the certificate certifies knowledge, not attendance

WHERE THIS CAN LEAD

  - Junior Game Developer
  - Creative Coder
  - Animation Creator
  - Interactive Media Designer
  - Ready for Python/JavaScript transition

COMMON QUESTIONS ABOUT THIS COURSE

  For anything about cost, use PART 4 and RULE 1. Do not quote two regions.

  Q: What will my child actually create in this Scratch course?
  A: Over 3 months your child builds 35+ real projects in Scratch: animations and interactive stories in month 1, genuine games with scores, clones and multi-sprite logic in month 2, and physics experiments, AI-block projects and a polished original capstone game in month 3. Every project is the child's own work, demonstrated at home the same week it is built.

  Q: What age is this Scratch course right for?
  A: The course is designed for ages 6 to 12 and assumes zero coding experience. All your child needs is basic reading ability to follow on-screen labels; lessons are visual and hands-on, which suits younger learners especially well. Batches are grouped by age, so a 6-year-old is never racing an 11-year-old.

  Q: How long does it take a child to learn Scratch?
  A: To real capability, games with scores, levels, clones and logic, it takes most children 3 months at 2 live classes a week plus a little playful practice. The course keeps a 4th month in hand for children who want more repetition, with no rushing and no penalty. The very first animation happens in class one; the pride starts immediately.

  Q: How is my child assessed? Is the certificate just for attending?
  A: No, and it is all gentle: classwork in every session, a small homework build after every class, and a monthly challenge that mixes new blocks with earlier ones so skills compound instead of fading. The course ends with a final exam, a capstone demo plus a friendly viva. Passing earns the certificate; a child who falls short gets focused revision and a free retest. Real knowledge, real projects, no empty badges.

  Q: Does my child need any coding background before joining?
  A: None at all. Scratch was created by MIT precisely for first-time coders: children snap colorful blocks together instead of typing code, so there is no syntax to memorize. The course starts from the very first block.

  Q: What comes after Scratch?
  A: Scratch builds the computational thinking that makes text-based languages far easier later. The course ends with a guided transition path toward typed code, and most students continue into our Python or web development courses when they are ready.

  Q: Can we try a free class before enrolling?
  A: Yes, every child can take a free demo class first, with no commitment of any kind. Book a slot at learn.modernagecoders.com/contact, and you are welcome to sit in and watch; you can also reach us on WhatsApp at +91 91233 66161 with any questions. (Agent note: the free demo is a waiting list with no fixed date. The Priority Live Demo is a guaranteed class today or tomorrow, booked at https://learn.modernagecoders.com/priority-demo . Offer both, as RULE 3 says.)

  Q: Are classes live or pre-recorded?
  A: All classes are live 1-hour online sessions taught by a real teacher; we never use

pre-recorded videos. Batches are small and interactive, so your child builds projects during class while the teacher watches and helps in real time.

Q: Does my child receive a certificate at the end?
A: Yes, and it is earned, not handed out: the certificate is awarded on passing the final exam, a capstone game demo plus a friendly viva and a short mixed quiz, with a free retest after revision if the first attempt falls short. Alongside it stands the portfolio of 35+ real Scratch projects, which for most kids is the part they are proudest of.

To enrol, message Shivam Sir on +91 9123366161 or send the parent this link: https://learn.modernagecoders.com/courses/scratch-programming-complete-course
For a demo: the Priority Live Demo (guaranteed, today or tomorrow) is booked at https://learn.modernagecoders.com/priority-demo . The free demo is a waiting list with no fixed date.

==========

COURSE 127 OF 137: STATISTICS & PROBABILITY: DATA TO HYPOTHESIS TESTING

==========

Course link: https://learn.modernagecoders.com/courses/statistics-probability-maths-course
Subject area: Data Science & Analytics Mathematics
Designed for: College students
Who can join: College students and working professionals; no programming required
Course length: 6 months (24 weeks)
Time needed: 2 live classes/week + 3-4 hours practice
Certificate: Certificate from Modern Age Coders, awarded on passing the final assessment

PRICE FOR THIS COURSE (quote only the one that applies to the person asking)
In India, per month: group Rs 1,499, mini batch Rs 2,999, one to one Rs 4,999
In Canada, per month: group CAD 140, one to one CAD 210
Anywhere else, per month: group $100, one to one $150
Classes: group and mini batch two live classes a week, eight a month; one to one in India one live class a week, four a month; one to one outside India two live classes a week, eight a month. Each class is one hour.

WHAT THIS COURSE IS

Online statistics and probability course for college and professionals: descriptive stats, distributions, hypothesis testing and regression on real data.

In one line: The subject that decides whether a claim is evidence or noise, taught on real data from the first week.

ABOUT THE PROGRAMME

Statistics is the working mathematics of almost every field that touches data: business, medicine, psychology, economics, engineering, machine learning. It is also routinely taught backwards, as formula memorisation first and meaning never. This 6-month live course teaches it the other way. Months 1 and 2 build the two foundations: describing data honestly, and probability as the grammar of uncertainty, including conditional probability and Bayes' theorem worked through real cases like medical test results. Months 3 and 4 cover the distributions that model the world, then sampling, the central limit theorem seen through simulation rather than assertion, and confidence intervals interpreted the way they actually work. Month 5 is hypothesis testing done properly: t-tests, proportion tests and chi-square, with equal attention to what p-values do not say. Month 6 covers correlation and regression, then a capstone: a full analysis of a real dataset of your choosing, written up with methods and limitations. Every technique is practised on real data in a spreadsheet, and an optional Python track runs alongside for those who want it. Neither is required knowledge coming in; one of them becomes a working skill going out.

WHAT MAKES THIS COURSE DIFFERENT

- Real datasets from week 1: public health, sports, economics and business data, not textbook tables invented to make the arithmetic clean
- Spreadsheet-first with an optional Python track, so non-programmers finish everything and programmers get the pandas version of each technique
- Probability taught through consequential examples: false positives in medical testing, base-rate mistakes, and why intuition fails on conditional probability
- The central limit theorem demonstrated by simulation you run yourself, because a theorem you have watched happen is one you actually trust
- Honest inference: what a p-value is and is not, why statistical significance is not importance, and how p-hacking happens
- A capstone analysis of a dataset you choose, written up with methods and limitations like a piece of real analytical work

THE LEARNING PATH, STEP BY STEP

Phase 1: Foundations: describing data with the right summaries and charts, then probability, conditional probability, Bayes' theorem and random variables
Phase 2: Models and estimation: binomial, Poisson and normal distributions, sampling and the

central limit theorem, and confidence intervals done honestly
Phase 3: Inference and the capstone: hypothesis tests for means, proportions and categories, correlation and regression, then a full real-data analysis of your own

WHAT A STUDENT NEEDS BEFORE STARTING

Maths level: Comfortable school algebra: rearranging formulas and working with fractions and percentages. No calculus is needed anywhere in the course
Programming: None. Everything can be completed in a spreadsheet; the Python track is optional and taught from zero for those who choose it
Equipment: A computer with a spreadsheet application (Excel or Google Sheets) and a stable internet connection
Audience: Built for college students and working professionals; motivated final-year school students who clear the diagnostic are welcome

WHO THIS COURSE IS FOR

College students: Students in commerce, economics, psychology, biology or engineering whose degrees assume statistics that was never properly taught
Working professionals: Analysts, marketers, product managers and operations people who face dashboards and A/B tests daily and want to stop nodding along
Data science aspirants: People headed for data science or machine learning who know the statistics half is the half they are missing
Researchers: Postgraduate students and early researchers who need to design studies and read papers with methods sections
Non programmers: Anyone who wants rigorous data skills without being forced through a programming course to get them

FULL CURRICULUM, WEEK BY WEEK

This is the complete teaching plan. Parents can ask about any week.

PHASE 1: DESCRIBING DATA AND PROBABILITY (MONTHS 1-2, WEEKS 1-8)

The two foundations everything else stands on: honest description of data, and probability as the language of uncertainty.

Month 1: Describing Data Honestly (Weeks 1-4)
Data: What It Is and How It Lies to You
Topics:
- Populations, samples and why the difference drives everything
- Types of data: categorical and numerical, and the scales of measurement
- Tidy data: rows, columns and the shape analysis expects
- Where data comes from: surveys, experiments, logs and their built-in biases
- Spreadsheet setup: importing, cleaning basics and first summaries
- Famous data failures: survivorship bias and selection bias with real stories
Projects built:
- First dataset walk: load a real public dataset, document its variables, units and suspicious values before computing anything
Practice: Profile two provided datasets: identify variable types, spot three data-quality problems, write one paragraph on each
Central Tendency: What Is Typical
Topics:
- Mean, median and mode, and what question each one answers
- How skew and outliers pull the mean away from the median
- Weighted means and when unweighted averages mislead
- Group comparisons: the danger of comparing averages of unequal groups
- Computing summaries in the spreadsheet with named functions
- Reading claims critically: what average salary headlines usually hide
Projects built:
- Income exercise: a salary dataset summarised with mean and median, with a written note on why they disagree and which to report
Practice: 12 central tendency problems on real data, each answer accompanied by one sentence on which measure fits and why
Spread: How Much Things Vary
Topics:
- Range and interquartile range
- Variance and standard deviation, built up from deviations rather than dropped as a formula
- The 1.5 IQR rule for flagging outliers
- z-scores: how unusual is this value
- Comparing variability across different units with the coefficient of variation
- Why spread is the half of the story that dashboards leave out
Projects built:
- Consistency study: two players or products with the same average compared on spread, with a recommendation written up
Practice: 14 spread problems including 4 z-score questions, standard deviation computed once by hand and thereafter by software
Charts That Tell the Truth

Topics:
- Histograms and the shapes of distributions: symmetric, skewed, bimodal
- Box plots and comparing groups at a glance
- Scatter plots and the first look at relationships
- Bar charts versus histograms, and why the difference matters
- Misleading charts: truncated axes, cherry-picked windows, area distortions
- Building clean charts in the spreadsheet, with labels that earn their space

Projects built:
- Chart audit: find one misleading chart in the wild, explain the distortion, and rebuild it honestly from the underlying data

Practice: Build five charts from a real dataset, each with a one-line takeaway written underneath

Assessment: Month 1 checkpoint: a full descriptive analysis of a provided dataset, summaries, charts and a short written brief

Month 2: Probability, the Grammar of Uncertainty (Weeks 5-8)

Probability from First Ideas

Topics:
- Experiments, outcomes, sample spaces and events
- Probability as long-run frequency and as degree of belief
- The complement rule and the addition rule
- Mutually exclusive events versus events that overlap
- Venn diagrams that actually resolve arguments
- Simulating simple probabilities in the spreadsheet to check intuition

Projects built:
- Simulation warm-up: estimate a dice probability by simulation, compare with the exact answer, watch the gap shrink with more trials

Practice: 16 probability problems from single events to unions, each hard one checked by a quick simulation

Conditional Probability and Independence

Topics:
- Conditional probability: how information changes the odds
- The multiplication rule and tree diagrams
- Independence: what it means and how to test for it
- The base-rate fallacy introduced with a real screening example
- Sampling with and without replacement
- Why P(A given B) and P(B given A) are different, and the famous confusions

Projects built:
- Two-way table study: a real dataset cross-tabulated, with conditional probabilities read off and independence checked

Practice: 14 conditional probability problems, every tree diagram drawn before any multiplication

Bayes' Theorem: Updating Beliefs with Evidence

Topics:
- Bayes' theorem derived from the definition of conditional probability
- The medical test problem: why a positive result on a rare disease is usually a false alarm
- Prior, likelihood and posterior in plain language
- Natural frequencies: the counting method that makes Bayes intuitive
- Spam filters and diagnostic reasoning as everyday Bayes
- The prosecutor's fallacy and other courtroom probability errors

Projects built:
- Bayes explainer: work the medical test problem with natural frequencies and write an explanation a friend could follow

Practice: 10 Bayes problems solved twice each, once by formula and once by counting, until the two views agree in your head

Counting and Random Variables

Topics:
- Permutations and combinations, and which one the question wants
- Discrete random variables and probability distributions
- Expected value: what fair means, and why casinos always win
- Variance of a random variable
- Expected value in decisions: insurance, warranties and lotteries
- Building a probability distribution from real frequency data

Projects built:
- Game analysis: compute the expected value of a real lottery or carnival game and write the verdict in two sentences

Practice: 12 counting and random variable problems including 3 expected-value decisions argued in writing

Assessment: Month 2 checkpoint: a mixed probability paper from basic rules through Bayes and expected value

---

PHASE 2: DISTRIBUTIONS, SAMPLING AND ESTIMATION (MONTHS 3-4, WEEKS 9-16)

The named distributions that model real processes, then the machinery of inference: sampling distributions, the central limit theorem seen by simulation, and confidence intervals.

Month 3: The Distributions That Model the World (Weeks 9-12)

The Binomial Distribution

Topics:
- Bernoulli trials and the binomial conditions, checked in words
- The binomial formula and where it comes from
- Mean and variance of a binomial
- Computing binomial probabilities in the spreadsheet and, on the Python track, with scipy
- Cumulative probabilities and careful at-least versus at-most reading
- Real binomial settings: quality control, conversion rates, free-throw streaks

Projects built:
- Conversion study: model a marketing conversion scenario as a binomial and answer three business questions with it

Practice: 14 binomial problems, the conditions checked in writing before any computation

Poisson and Geometric: Counts and Waits

Topics:
- The Poisson distribution for counts per interval: arrivals, defects, calls
- When Poisson fits and when it does not
- Poisson as a limit of the binomial, seen numerically
- The geometric distribution: waiting for the first success
- Choosing the right model: binomial, Poisson or geometric from the story
- Fitting a Poisson to real count data and judging the fit by eye

Projects built:
- Arrivals study: fit a Poisson model to real count data, compare observed and expected counts in a table

Practice: 12 modelling problems where the first marked step is naming the right distribution and defending the choice

Continuous Distributions and the Normal

Topics:
- From histograms to density curves: probability as area
- The uniform distribution as the simplest continuous case
- The normal distribution: shape, parameters and the 68-95-99.7 rule
- Standardising and the standard normal
- Normal probabilities by software, with the table method understood once
- What is and is not normal in real data: heights yes, incomes no

Projects built:
- Normal check: test the 68-95-99.7 rule against a real dataset and report where it holds and where it breaks

Practice: 14 normal distribution problems, each one opened with a sketch of the shaded region

Working with the Normal

Topics:
- Inverse problems: finding cutoffs from probabilities
- Percentiles, reference ranges and grading on a curve
- Assessing normality with histograms and quantile plots
- The normal approximation to the binomial and when it is safe
- Combining independent normal quantities
- A distribution field guide: one page mapping situations to models

Projects built:
- Field guide build: your own one-page reference mapping real situations to binomial, Poisson, geometric, uniform or normal

Practice: 12 mixed distribution problems where the model is never announced in the question

Assessment: Month 3 checkpoint: a distributions paper mixing model choice, computation and interpretation

Month 4: Sampling, the CLT and Confidence Intervals (Weeks 13-16)

Sampling: How Data Gets Collected and Corrupted

Topics:
- Simple random, stratified, cluster and systematic sampling
- Convenience samples and why most internet polls mean little
- Sampling bias, nonresponse bias and question wording effects
- Famous polling failures and what went wrong
- Randomised experiments versus observational studies
- Designing a small survey that will not embarrass you

Projects built:
- Survey critique: take one published poll, identify its sampling method, and write three specific bias risks

Practice: 10 sampling design problems plus one short survey designed, with its weaknesses honestly listed

Sampling Distributions and the Central Limit Theorem

Topics:
- The sampling distribution of the mean: a distribution of statistics, not data
- Standard error and why bigger samples pin the mean down
- The central limit theorem stated carefully
- The CLT demonstrated by simulation: skewed populations, normal-looking sample means
- How sample size affects the shape, watched live
- Why the CLT is the load-bearing wall of everything that follows

Projects built:
- CLT simulation: run the resampling experiment yourself in the spreadsheet or Python, and keep the charts as evidence

Practice: 10 standard error and sampling distribution problems, plus the simulation repeated on a second population shape

Confidence Intervals for Means

Topics:

- The logic of interval estimation
- z-intervals and t-intervals, and when the t-distribution is the honest choice
- Degrees of freedom in plain language
- What 95 percent confidence actually means, and the misreadings to avoid
- Interval width: the three levers of confidence, spread and sample size
- Computing and reporting intervals from real data

Projects built:

- Interval report: a confidence interval for a real dataset's mean, reported in one correct sentence and one wrong-but-common sentence, labelled

Practice: 12 confidence interval problems, every interval followed by a correctly worded interpretation

Proportions and Planning Sample Sizes

Topics:

- Confidence intervals for proportions
- Margin of error and how polls report it
- Sample size calculations: how many people do we actually need
- Reading polling small print: confidence level, margin, population
- Intervals for differences, previewed
- Estimation recap: the full toolkit so far, organised

Projects built:

- Poll deconstruction: take a real published poll and verify its stated margin of error from its sample size

Practice: 12 proportion and sample size problems including two taken from real published surveys

Assessment: Month 4 checkpoint: an estimation paper from sampling design through confidence intervals, interpretation marked as strictly as computation

---

PHASE 3: HYPOTHESIS TESTING, REGRESSION AND THE CAPSTONE (MONTHS 5-6, WEEKS 17-24)

Testing claims with data, measuring and modelling relationships, and then a complete analysis of a real dataset of your own, written up like professional work.

Month 5: Hypothesis Testing Done Honestly (Weeks 17-20)

The Logic of a Hypothesis Test

Topics:

- Null and alternative hypotheses: the courtroom analogy done carefully
- Test statistics and the p-value defined precisely
- Significance levels and the arbitrary honesty of 0.05
- Type I and Type II errors, and which one your situation fears more
- What a p-value is not: not the probability the null is true
- One-tailed versus two-tailed tests and how to choose before seeing data

Projects built:

- Error analysis: for three real scenarios, name both error types and argue which is costlier in each

Practice: 10 test-logic problems with no computation at all: hypotheses, tails and error types only

One-Sample Tests

Topics:

- The one-sample t-test for a mean, start to finish
- The one-sample proportion test
- Checking conditions before trusting the test
- Computing tests in the spreadsheet and, on the Python track, with scipy
- Writing conclusions in context, with the p-value reported not worshipped
- Confidence intervals and tests as two views of the same evidence

Projects built:

- Claim check: test a real advertised claim against real or provided data, and write the verdict in three sentences

Practice: 12 one-sample tests, each conclusion written in context and checked against its confidence interval

Comparing Two Groups

Topics:

- Independent two-sample t-tests
- Paired tests and recognising paired designs
- Two-proportion tests: the A/B test in its natural form
- Effect size: statistically significant versus actually important
- How A/B testing works in product teams, and where it goes wrong
- Reading a published study's methods section without fear

Projects built:

- A/B analysis: a realistic conversion dataset analysed end to end, with a recommendation that weighs effect size, not just p

Practice: 12 two-group problems including one paired design hiding among independent ones

Chi-Square and the Ethics of Testing

Topics:

- Chi-square goodness of fit: does the data match the claimed distribution
- Chi-square test of independence on two-way tables
- Expected counts and when the test is valid
- Multiple comparisons: why testing twenty things finds one false discovery
- p-hacking and publication bias: how honest people fool themselves
- Pre-registering your question: deciding what to test before looking

Projects built:
- Independence study: a real two-way table tested for independence with the full expected-count working shown

Practice: 10 chi-square problems plus a written half-page on one real p-hacking case

Assessment: Month 5 checkpoint: a full inference paper across one-sample, two-sample and chi-square tests, conclusions marked for wording

Month 6: Correlation, Regression and the Capstone (Weeks 21-24)

Correlation

Topics:
- Covariance and the Pearson correlation coefficient
- What r measures and the linear-only caveat
- Anscombe's quartet: four datasets, one r, four different stories
- Correlation is not causation, with the confounder named each time
- Rank correlation for curved but monotonic relationships
- Computing and charting correlations across a real dataset

Projects built:
- Correlation hunt: find the three strongest relationships in a real dataset, chart them, and flag which might be confounded

Practice: 10 correlation problems, every claim of relationship backed by a scatter plot

Linear Regression

Topics:
- The least squares line: what is being minimised and why
- Interpreting slope and intercept in the units of the problem
- R-squared: how much variation the line explains
- Residual plots: the honesty check most analyses skip
- Prediction within range versus extrapolation beyond it
- Multiple regression previewed: several predictors at once, and its dangers

Projects built:
- Prediction model: fit a regression on real data, check residuals, make two predictions and state their limits

Practice: 10 regression problems with slope interpretations written in context every time

Assessment: Capstone gate: analysis plan approved, dataset, question, methods and chosen track (spreadsheet or Python)

Capstone Build

Topics:
- Framing an answerable question before touching the data
- Cleaning and documenting the dataset
- Choosing methods that fit the data, not the other way around
- Descriptive pass first: summaries and charts before any test
- Running the inference or regression the question calls for
- Instructor review checkpoint mid-build

Projects built:
- Capstone analysis in progress: the full pipeline from raw data to preliminary findings, on your own chosen dataset

Practice: Capstone work sessions with a written progress note after each: what was found, what is uncertain, what is next

Capstone Write-Up and Presentation

Topics:
- Structuring an analysis report: question, data, methods, findings, limitations
- Writing limitations honestly: what your analysis cannot claim
- Charts chosen for the reader, not the author
- Presenting analytical work in ten minutes
- Answering methods questions about your own work
- Where to go next: deeper statistics, Python for data, or machine learning

Projects built:
- Completed capstone: a written analysis report and a short presentation, delivered to the class and kept for your portfolio

Practice: Final report polish plus a dry-run presentation with peer questions

Assessment: Capstone review: report and presentation assessed on method, honesty of interpretation and clarity, plus certificate review

PROJECTS THE STUDENT BUILDS AND KEEPS

- A full descriptive analysis brief on a real public dataset
- A Bayes explainer of the medical test problem in your own words
- An expected-value verdict on a real lottery or game
- A Poisson model fitted to real count data
- A CLT simulation run and charted by you
- A deconstruction of a real published poll's margin of error
- An A/B test analysed end to end with an effect-size-aware recommendation
- A regression prediction model with residual checks

- The capstone: a complete written analysis of a dataset you chose

Total projects: A portfolio of small real-data studies plus one complete capstone analysis with report and presentation

SKILLS THE STUDENT WILL HAVE AT THE END

- Describing data honestly with the right summaries and charts
- Probability, conditional probability and Bayes' theorem used correctly
- Choosing and applying binomial, Poisson and normal models
- Confidence intervals and hypothesis tests, computed and worded properly
- Correlation and regression with the honesty checks included
- Spreadsheet analysis throughout, plus optional Python with pandas and scipy on the parallel track

HOW A TYPICAL WEEK IS SPLIT

Live classes: 2 live one-hour classes per week, working on real data during class
Practice: 3-4 hours weekly of problem sets and dataset work between classes
Review: Homework reviewed with written feedback; interpretation wording corrected as strictly as calculations
Homework: A problem set after every class, and a monthly mixed-review assignment that deliberately folds in earlier topics

SUPPORT INCLUDED

Doubt support: WhatsApp doubt support between classes, with worked solutions for stuck problems
Progress updates: Monthly progress notes covering test scores and capstone readiness
Career guidance: Honest guidance on next steps: which roles use these skills, what to learn next, and what this course alone does and does not qualify you for

CERTIFICATION DETAIL

Completion: Certificate from Modern Age Coders, awarded on passing the final assessment. Fall short and there is focused revision and a free retest: the certificate certifies mastery, not attendance

WHERE THIS CAN LEAD

- Data analyst and reporting analyst roles, where descriptive statistics and inference are the daily toolkit
- Business and product analytics: A/B testing, metrics and experiment literacy
- A prepared entry into data science and machine learning courses, including our Python and AI/ML tracks
- Research work in any field with a methods section: psychology, economics, public health
- Better decisions in your current role, which is the quiet majority use of statistics

EARNING POTENTIAL (share only if asked, and never promise it)

Market context: The ranges below are general market salary bands for roles where statistics is a core skill, in India and abroad, drawn from public industry data. They are shown for career context only and are not a promise or guarantee of income. Actual pay depends on your skills, experience, location, and the job market.
Early career roles: Rs 3-6 LPA (Data Analyst / Reporting Analyst / MIS Analyst)
Growing roles: Rs 6-12 LPA (Senior Analyst / Business Analyst / Product Analyst)
Experienced roles: Rs 12-25 LPA (Analytics Lead / Data Scientist, typically with added programming and ML skills)
International: $55k-110k USD (USA) for analyst roles, depending on role, industry and experience

COMMON QUESTIONS ABOUT THIS COURSE

For anything about cost, use PART 4 and RULE 1. Do not quote two regions.

Q: Do I need to know programming for this course?
A: No, and this is a real no, not a marketing one. Every technique in the course, from descriptive statistics through regression, is taught and assessed in a spreadsheet, and the capstone can be completed entirely without code. A parallel Python track runs for those who want it: the same analyses redone with pandas and scipy, taught from zero. Roughly speaking, the spreadsheet track gives you the statistics; adding the Python track gives you the statistics plus a tool employers increasingly expect.

Q: How much maths do I need coming in?
A: School algebra: you should be able to rearrange a simple formula and be comfortable with fractions, percentages and squared terms. There is no calculus in the course. Where a result normally requires calculus to derive, we demonstrate it numerically or by simulation instead, which is often more convincing anyway. The week 1 diagnostic catches genuine gaps, and we patch them in the early weeks rather than turning you away.

  Q: How is this different from a data science course?
  A: A data science course is mostly tooling: Python, data wrangling, machine learning
  libraries, deployment. This course is the statistical reasoning underneath, which data
  science courses typically compress into two rushed weeks and which is exactly where most
  self-taught data scientists are weakest. If your goal is data science, this course first and
  a data science course second is the strong order. If your goal is to understand data, studies
  and experiments in your existing work, this course alone may be all you need.

  Q: What is the capstone project, and do I choose the dataset?
  A: In the final month you take one real dataset, yours from work, or one you choose from
  public sources with our help, frame a question, run the appropriate analysis and write it up
  with methods and limitations, then present it. The write-up format mirrors how analytical
  work is actually reported. Students on the spreadsheet track and the Python track complete
  the same capstone with different tools, and both versions are portfolio pieces you keep.

  Q: I am a working professional. Can I manage this alongside a job?
  A: The course is built for it: two live one-hour classes a week, scheduled in evening and
  weekend slots, plus three to four hours of practice you can place wherever your week allows.
  The pace is steady rather than punishing, and WhatsApp doubt support means a stuck Tuesday
  problem does not have to wait for Saturday. Professionals who miss a class can attend the
  same session with another batch where scheduling allows.

  Q: Will this course make me a data analyst?
  A: It gives you the statistical core of the job, which is genuinely the hard part, and a
  capstone analysis to show. It does not by itself supply everything analyst job listings ask
  for: SQL and dashboard tools are common requirements we do not cover here. Our honest advice,
  which we repeat in the career guidance sessions, is that this course plus SQL practice plus a
  portfolio of two or three analyses is a credible analyst preparation. The course alone is the
  foundation, not the whole house.

  Q: Is this course aligned to any university syllabus?
  A: It covers the standard core of a first university statistics course: descriptive
  statistics, probability, distributions, estimation, hypothesis testing and regression, so
  students frequently use it alongside degree coursework in commerce, economics, psychology and
  engineering. It is not tied to any single university's paper pattern, and we do not teach to
  one exam. Students preparing for a specific university exam get targeted practice on their
  syllabus topics in the doubt sessions.

  Q: How am I assessed, and is the certificate just for showing up?
  A: No. A problem set follows every class with written feedback, monthly reviews deliberately
  mix new material with earlier topics so nothing is forgotten, and the course ends with a
  final exam covering the whole course. Passing earns the certificate; falling short earns
  focused revision and a free retest. We measure real understanding, not attendance.

  To enrol, message Shivam Sir on +91 9123366161 or send the parent this link: https://learn.modernagecoders.com/courses/statistics-probability-maths-course
  For a demo: the Priority Live Demo (guaranteed, today or tomorrow) is booked at
  https://learn.modernagecoders.com/priority-demo . The free demo is a waiting list with no fixed date.

==
COURSE 128 OF 137: SWIFT AND IOS COURSE: SWIFTUI APPS FROM ZERO
==

Course link: https://learn.modernagecoders.com/courses/complete-swift-programming-masterclass-college
Subject area: App Development
Designed for: College students
Who can join: Complete beginner (18+); college students, graduates and working professionals
Course length: 10-12 months (44-52 weeks)
Time needed: 2 live classes/week + 4-6 hours practice
Certificate: Certificate from Modern Age Coders, awarded on passing the final exam

PRICE FOR THIS COURSE (quote only the one that applies to the person asking)
  In India, per month: group Rs 1,499, mini batch Rs 2,999, one to one Rs 4,999
  In Canada, per month: group CAD 140, one to one CAD 210
  Anywhere else, per month: group $100, one to one $150
  Classes: group and mini batch two live classes a week, eight a month; one to one in India one
  live class a week, four a month; one to one outside India two live classes a week, eight a
  month. Each class is one hour.

WHAT THIS COURSE IS

  Swift course for college students and professionals: modern Swift, then real iOS development
  with SwiftUI, data, networking and a capstone app in 10-12 months.

  In one line: The Apple stack learned honestly: Swift to real depth, SwiftUI as the future it already is, and a capstone app built to App Store discipline.

ABOUT THE PROGRAMME

iOS development is one of the most rewarding specializations in software, and it deserves an honest course: Swift learned as a real language, optionals, value types, protocols and concurrency understood properly, then iOS built the modern way with SwiftUI, architecture and state done right, data persistence, networking, and the production habits that make apps feel like Apple apps. A finale month ships a capstone and sits the final exam. One honesty first: serious iOS development requires a Mac, Xcode runs only on macOS. This course says so upfront (see the FAQ for the realistic options) rather than discovering it for you in week three. With that settled, the pace is honest too: ten teaching months at two live classes a week plus four to six hours of practice, with two more in hand. Problem sets, monthly mixed reviews, phase exams, and a final exam that decides the certificate with a free retest.

WHAT MAKES THIS COURSE DIFFERENT

- The Mac requirement stated upfront, with realistic options, honesty most iOS courses skip
- Swift as a language first: optionals, value semantics, protocols and structured concurrency understood properly
- SwiftUI-first: the declarative future Apple is already building on
- Apple-feel as a standard: human interface habits taught alongside code
- An honest 10-month arc with 2 months in hand
- Real assessment: weekly problem sets, monthly mixed reviews, phase exams and a final exam with a free retest

THE LEARNING PATH, STEP BY STEP

Phase 1: Swift (Months 1-3): the language to real depth, optionals to protocols
Phase 2: SwiftUI (Months 4-6): views, state, navigation and interfaces that feel like Apple built them
Phase 3: Professional iOS (Months 7-9): architecture, data, networking, testing and release discipline
Phase 4: The finale (Month 10): the capstone app, shipped and defended, and the final exam

WHAT A STUDENT NEEDS BEFORE STARTING

Coding experience: None. Swift is taught from the first line
Equipment: A Mac is required for iOS development (Xcode is macOS-only); see the FAQ for realistic options if you do not own one yet
Age: 18+; college students, graduates and working professionals
Time commitment: 2 live classes plus 4-6 hours of practice a week

WHO THIS COURSE IS FOR

Apple ecosystem fans: People who love the platform and want to build for it properly
College students: Students who want a premium, demonstrable specialization
Designers who code: Detail-oriented builders drawn to the craft end of apps
Career switchers: Professionals entering mobile on the Apple side
Indie dreamers: Builders who want one polished app of their own on the store someday

FULL CURRICULUM, WEEK BY WEEK

This is the complete teaching plan. Parents can ask about any week.

PHASE 1: FOUNDATION & CORE SWIFT SKILLS (MONTHS 1-3, WEEKS 1-13)

Build rock-solid Swift fundamentals. Learn programming logic, master Swift syntax, protocol-oriented programming, and create your first iOS applications.

Months 1-2: Swift Fundamentals & Programming Basics (Weeks 1-7)

Introduction to Swift & Development Environment Setup

Topics:
- What is Swift? History, features, and evolution from Objective-C
- Swift ecosystem: Xcode, Swift Package Manager, Playgrounds
- Apple platforms overview: iOS, macOS, watchOS, tvOS, visionOS
- Swift applications: Mobile apps, desktop apps, server-side Swift
- Installing Xcode from Mac App Store
- Setting up development environment on macOS
- Understanding Xcode interface, panels, and shortcuts
- Your first Swift program: Hello World in Playground
- Swift program structure: imports, main entry point
- Running Swift code in Playgrounds vs Apps
- Understanding LLVM compiler and Swift runtime
- Comments: single-line (//), multi-line (/* */), documentation (///)
- Swift coding conventions and API Design Guidelines
- Introduction to Apple Human Interface Guidelines (HIG)

Projects built:
- Hello World variations with personalized messages in Playground
- Simple output programs using print() function
- Personal information display program

- ASCII art generator in Swift Playground
- Interactive Playground with markdown documentation

Practice: Daily: 30 min Swift syntax practice, write 5-10 simple programs in Playgrounds

Variables, Data Types & Operators

Topics:
- Variables (var) and Constants (let): declaration and initialization
- Type inference vs explicit type annotation
- Basic data types: Int, Double, Float, Bool, String, Character
- Understanding Int8, Int16, Int32, Int64, UInt variants
- Type safety and type inference in Swift
- Type conversion and casting with as, as?, as!
- Optionals: declaring with ?, unwrapping with !, optional binding
- Nil-coalescing operator ??
- Optional chaining with ?.
- Implicitly unwrapped optionals
- Operators: arithmetic (+, -, *, /, %)
- Compound assignment operators: +=, -=, *=, /=
- Comparison operators: ==, !=, >, <, >=, <=
- Logical operators: &&, ||, !
- Range operators: closed range (...), half-open range (..<)
- Ternary conditional operator: ? :
- Nil-coalescing operator: ??
- String basics: creation, interpolation, multiline strings
- String manipulation: concatenation, substring, characters

Projects built:
- Simple calculator (four basic operations) in Playground
- Temperature converter (Celsius, Fahrenheit, Kelvin)
- Age calculator with optional handling
- BMI calculator with health categories
- Currency converter with type safety
- Area and perimeter calculator for shapes
- Compound interest calculator
- String formatter and validator

Practice: Solve 30 problems on variables, data types, optionals, and operators

Control Flow Statements

Topics:
- Boolean expressions and conditions
- If statement: single condition execution
- If-else statement: two-way branching
- If-else-if ladder: multiple conditions
- Nested if statements
- Switch statement: powerful pattern matching
- Switch with value binding and where clauses
- Switch with compound cases
- Switch with ranges and tuples
- No implicit fallthrough in Swift switch
- While loop: pre-tested loop
- Repeat-while loop: post-tested loop (equivalent to do-while)
- For-in loop: iterating over sequences
- For-in with ranges and stride
- For-in with enumerated() for index access
- Break statement: exit loop
- Continue statement: skip iteration
- Labeled statements for nested loops
- Guard statement: early exit pattern
- Defer statement: cleanup code

Projects built:
- Number guessing game with attempts limit
- Grade calculator with letter grades using switch
- Even/odd checker and list generator
- Prime number checker and generator
- Multiplication table generator
- Factorial calculator (iterative)
- Fibonacci series generator
- Pattern printing (stars, numbers, pyramids, diamonds)
- FizzBuzz challenge with switch
- Menu-driven calculator with guard statements
- Simple ATM simulation with validation

Practice: Solve 40 control flow and loop problems

Functions & Collections

Topics:
- Functions: definition, purpose, and structure
- Function declaration: parameters and return types
- Function calling and argument labels
- External and internal parameter names
- Default parameter values
- Variadic parameters (...)
- In-out parameters for mutating arguments

- Functions returning multiple values with tuples
- Nested functions
- Function types as parameters and return types
- Closures: inline anonymous functions
- Closure syntax and shorthand argument names ($0, $1)
- Trailing closure syntax
- Capturing values in closures
- Escaping closures (@escaping)
- Autoclosures (@autoclosure)
- Arrays: declaration, initialization, manipulation
- Array methods: append, insert, remove, contains, filter, map
- Sets: unique unordered collections
- Set operations: union, intersection, subtraction
- Dictionaries: key-value pairs
- Dictionary methods: updateValue, removeValue, keys, values
- Iterating over collections
- Higher-order functions: map, filter, reduce, flatMap, compactMap

Projects built:

- Function library for mathematical operations
- Array statistics calculator (sum, average, min, max)
- Linear search and binary search implementation
- Sorting algorithms: bubble sort, selection sort
- Contact list with dictionary
- Todo list with array operations
- Student grade management system
- Factorial using recursion
- Palindrome checker (string/number)
- Prime number generator in range
- Shopping cart with higher-order functions
- Word frequency counter with closures

Practice: Create 25 functions for various functionalities, solve 30 collection problems

Month 3: Object-Oriented & Protocol-Oriented Programming (Weeks 8-13)

Structures, Classes & Properties

Topics:

- Object-Oriented Programming paradigm in Swift
- Structures (struct): value types
- Classes (class): reference types
- Value types vs reference types comparison
- When to use struct vs class
- Properties: stored and computed properties
- Property observers: willSet and didSet
- Lazy stored properties
- Type properties (static)
- Instance methods
- Type methods (static and class)
- Mutating methods in structures
- Initializers: default, custom, memberwise
- Failable initializers (init?)
- Required initializers
- Deinitializers (deinit)
- Self keyword usage
- Access control: private, fileprivate, internal, public, open
- Encapsulation and data hiding
- Copy-on-write optimization

Projects built:

- Student struct with properties and methods
- Bank Account class with deposit/withdraw
- Book struct for library management
- Employee class with computed salary
- Rectangle/Circle structs with area/perimeter
- Car class with property observers
- Product struct for inventory system
- Person struct with multiple initializers
- Date struct implementation
- Timer class with proper memory management

Practice: Create 20 different structs and classes modeling real-world entities

Inheritance, Polymorphism & Memory Management

Topics:

- Inheritance: creating subclasses
- Base class and subclass relationship
- Overriding methods with 'override' keyword
- Overriding properties
- Preventing overrides with 'final'
- Calling superclass methods with 'super'
- Designated and convenience initializers
- Initializer inheritance and overriding
- Required initializers in inheritance
- Polymorphism in Swift

- Type casting: is, as, as?, as!
- Any and AnyObject types
- Automatic Reference Counting (ARC)
- Strong references and retain cycles
- Weak references (weak)
- Unowned references (unowned)
- Closure capture lists [weak self], [unowned self]
- Memory leaks detection and prevention
- Identity operators: === and !==

Projects built:
- Animal hierarchy (Animal -> Dog, Cat, Bird)
- Shape hierarchy with area calculation
- Vehicle system (Vehicle -> Car, Bike, Truck)
- Employee hierarchy (Employee -> Manager, Developer)
- Bank account types (Account -> Savings, Current)
- School management (Person -> Student, Teacher)
- Media player hierarchy (Media -> Audio, Video)
- Retain cycle demonstration and fix
- Memory-safe delegate implementation

Practice: Build 15 inheritance hierarchies, solve 25 ARC and memory problems

Protocols & Protocol-Oriented Programming

Topics:
- Protocols: defining blueprints
- Protocol syntax and requirements
- Property requirements in protocols
- Method requirements in protocols
- Mutating method requirements
- Initializer requirements in protocols
- Protocol adoption by structs, classes, enums
- Protocol inheritance
- Protocol composition with &
- Protocol extensions: default implementations
- Protocol-Oriented Programming (POP) philosophy
- POP vs OOP comparison
- Conditional conformance
- Associated types in protocols
- Self requirements in protocols
- Opaque types (some Protocol)
- Existential types (any Protocol)
- Common Swift protocols: Equatable, Hashable, Comparable, Codable
- Custom protocol creation
- Delegation pattern with protocols

Projects built:
- Shape calculator with protocol requirements
- Payment gateway with protocol abstraction
- Database abstraction with protocols
- Notification system (Email, SMS, Push protocols)
- Sortable collection with Comparable
- Custom Equatable and Hashable types
- Plugin architecture using protocols
- PHASE 1 MINI CAPSTONE: Library Management System (Console-based)
- Features: Books, members, issue/return, search, POP principles

Practice: Solve 30 protocol and POP problems

Assessment: Phase 1 exam: a practical build defended live, plus a written paper mixing this phase with everything before it

---

PHASE 2: INTERMEDIATE SWIFT & SWIFTUI MASTERY (MONTHS 4-6, WEEKS 14-26)

Master advanced Swift features, enumerations, generics, error handling, SwiftUI fundamentals, and basic iOS app development.

Month 4: Advanced Swift Features & SwiftUI Basics (Weeks 14-18)

Enumerations & Advanced Types

Topics:
- Enumerations (enum) in Swift
- Enum cases and raw values
- Enum with associated values
- Computed properties in enums
- Methods in enums
- Mutating methods in enums
- Recursive enumerations (indirect)
- CaseIterable protocol for enum iteration
- Pattern matching with enums in switch
- If-case and guard-case syntax
- Nested types: structs, classes, enums inside types
- Type aliases (typealias)
- Tuple types and destructuring
- Optional as enum (Optional<Wrapped>)

    - Result type for error handling
    - Never type for functions that don't return
  Projects built:
    - Compass direction enum with methods
    - HTTP status code enum with raw values
    - Network response enum with associated values
    - Card game with suit and rank enums
    - State machine with enum
    - Currency converter with enum
    - Error handling system with Result enum
    - Menu system with nested enums
    - Traffic light state machine
    - JSON parsing result handling
  Practice: Solve 35 enumeration and advanced type problems
Error Handling & Advanced Error Management
  Topics:
    - Error handling philosophy in Swift
    - Error protocol and custom errors
    - Creating custom error types with enum
    - Throwing functions with 'throws' keyword
    - Throwing initializers
    - Do-catch blocks for error handling
    - Multiple catch clauses
    - Catching specific errors
    - Converting errors to optionals with try?
    - Forcing try with try! (use sparingly)
    - Propagating errors with throws
    - Rethrowing functions (rethrows)
    - LocalizedError protocol for user messages
    - CustomNSError for bridging to Objective-C
    - Error handling best practices
    - Cleanup with defer statements
    - Assertions and preconditions
    - fatalError for unimplemented code
  Projects built:
    - Robust calculator with error handling
    - File reader with proper error handling
    - Custom banking error system
    - Network request error handling
    - User validation with custom errors
    - Age validator with localized errors
    - Division calculator with error handling
    - User registration with validation errors
    - JSON parser with comprehensive error handling
  Practice: Solve 25 error handling scenarios
Generics & Type System Deep Dive
  Topics:
    - Introduction to generics: type parameters
    - Generic functions
    - Generic types (struct, class, enum)
    - Type constraints with protocol conformance
    - Where clauses for complex constraints
    - Associated types in protocols
    - Generic subscripts
    - Generic extensions
    - Protocol extensions with constraints
    - Type erasure patterns
    - Opaque types (some Protocol) deep dive
    - Primary associated types (Swift 5.7+)
    - Existential types (any Protocol)
    - Conditional conformance
    - Specialized generic implementations
    - Standard library generic types: Array, Dictionary, Optional, Result
  Projects built:
    - Generic stack and queue implementation
    - Generic linked list
    - Type-safe data repository
    - Generic cache implementation
    - Custom Result type with generics
    - Generic sorting algorithms
    - Generic tree data structure
    - Type-safe networking layer
  Practice: Create 15 generic types, solve 25 generics problems
SwiftUI Fundamentals - Part 1
  Topics:
    - Introduction to SwiftUI: declarative UI
    - SwiftUI vs UIKit comparison
    - View protocol and basic views
    - Text view: styling, modifiers, formatting

```
      - Image view: SF Symbols, asset images, resizing
      - Button view: actions, styles, labels
      - TextField and SecureField for input
      - Toggle, Slider, Stepper, Picker
      - VStack, HStack, ZStack for layout
      - Spacer and Divider
      - Frame modifier: fixed and flexible sizing
      - Padding, background, overlay modifiers
      - ForEach for dynamic content
      - ScrollView for scrollable content
      - List view for table-like layouts
      - @State property wrapper for local state
      - Two-way binding with $
      - View modifiers and modifier order
    Projects built:
      - Hello World SwiftUI app
      - Profile card with image and text
      - Simple counter app with @State
      - Temperature converter UI
      - BMI calculator with input fields
      - Todo list with basic functionality
      - Color picker interface
      - Settings screen with toggles and pickers
    Practice: Build 15 SwiftUI views with various controls
  SwiftUI Fundamentals - Part 2
    Topics:
      - @Binding for child view communication
      - @ObservableObject and @Published
      - @StateObject vs @ObservedObject
      - @EnvironmentObject for app-wide state
      - ObservableObject protocol implementation
      - NavigationStack (iOS 16+) navigation
      - NavigationLink for navigation
      - NavigationPath for programmatic navigation
      - TabView for tab-based navigation
      - Sheet, fullScreenCover for modal presentation
      - Alert and confirmationDialog
      - Custom view extraction
      - ViewBuilder for custom containers
      - Creating reusable components
      - SF Symbols integration
      - Dark mode and color schemes
    Projects built:
      - Multi-screen navigation app
      - Tab-based application
      - Settings app with observable object
      - Shopping list with CRUD operations
      - Note-taking app with navigation
      - Modal presentation examples
      - Reusable component library
      - Theme-aware application
    Practice: Build 10 multi-view SwiftUI applications

Month 5: Advanced SwiftUI & UIKit Fundamentals (Weeks 19-22)
  SwiftUI Lists, Forms & Data Display
    Topics:
      - List view deep dive
      - List styles: plain, grouped, insetGrouped, sidebar
      - SwipeActions for list items
      - Contextual menus (contextMenu)
      - List with sections and headers
      - Dynamic lists with Identifiable
      - List editing: delete, move, selection
      - Searchable modifier for filtering
      - Pull to refresh (refreshable)
      - Form view for settings and input
      - Section in forms
      - LabeledContent for forms (iOS 16+)
      - Grid layouts: LazyVGrid, LazyHGrid
      - GridItem and grid configuration
      - Lazy stacks for performance
      - Table view (macOS and iPadOS)
      - OutlineGroup for hierarchical data
    Projects built:
      - Contact list with search and sections
      - Settings app with forms
      - Photo gallery with grid layout
      - Task manager with swipe actions
      - Editable list with add/delete/reorder
```

- Recipe list with contextual menus
- Product catalog with grid view
- Hierarchical file browser

Practice: Build 10 list and grid-based applications

SwiftUI Animations & Custom Drawing

Topics:

- Animation fundamentals in SwiftUI
- Implicit animations with .animation modifier
- Explicit animations with withAnimation
- Animation types: linear, easeIn, easeOut, spring
- Custom spring animations
- Animatable protocol and animatableData
- Transitions: opacity, scale, slide, move
- Combined and asymmetric transitions
- MatchedGeometryEffect for hero animations
- TimelineView for continuous animations
- Canvas for high-performance drawing
- Shapes: Rectangle, Circle, Ellipse, Capsule
- Path for custom shapes
- GeometryReader for dynamic layouts
- Custom shapes with Shape protocol
- Gradients: Linear, Radial, Angular
- Blend modes and visual effects

Projects built:

- Animated button effects
- Loading spinner animations
- Card flip animation
- Hero transition between views
- Custom progress indicator
- Animated chart visualization
- Drawing app with Canvas
- Custom animated splash screen
- Particle effect animation
- Morphing shape animations

Practice: Create 15 animations and custom shapes

UIKit Fundamentals

Topics:

- UIKit overview and architecture
- UIViewController lifecycle
- Storyboards vs programmatic UI
- UIView and view hierarchy
- Auto Layout: constraints and anchors
- Programmatic Auto Layout with NSLayoutConstraint
- UIStackView for simplified layouts
- UILabel, UIButton, UIImageView
- UITextField and UITextView
- UITableView: cells, sections, data source
- UITableView delegate methods
- UICollectionView fundamentals
- UINavigationController navigation
- UITabBarController tabs
- Presenting view controllers modally
- UIAlertController for alerts and action sheets
- Integrating UIKit in SwiftUI (UIViewRepresentable)
- Integrating SwiftUI in UIKit (UIHostingController)

Projects built:

- UIKit todo list app
- Table view with custom cells
- Collection view photo gallery
- Navigation-based master-detail app
- Tab bar application
- Form with text fields and validation
- UIKit + SwiftUI hybrid app
- Custom table view cells

Practice: Build 12 UIKit-based views and controllers

Data Persistence - UserDefaults & File System

Topics:

- Data persistence options in iOS
- UserDefaults for simple preferences
- Storing primitives in UserDefaults
- Storing custom objects with Codable
- @AppStorage property wrapper
- FileManager for file operations
- iOS file system: Documents, Caches, tmp
- Reading and writing files
- JSON encoding and decoding
- Codable protocol: Encodable, Decodable
- CodingKeys for custom mapping
- Custom encoding/decoding logic

```
      - PropertyListEncoder and Decoder
      - Keychain for secure storage
      - Keychain wrapper libraries
      - iCloud key-value storage
      - Data migration strategies
    Projects built:
      - User preferences with UserDefaults
      - Settings app with @AppStorage
      - Note-taking app with file storage
      - JSON data persistence
      - Secure login credentials with Keychain
      - Configuration file manager
      - Data export/import utility
      - User profile with local storage
    Practice: Implement persistence in all previous projects

Month 6: Concurrency, Core Data & Combine (Weeks 23-26)
  Swift Concurrency - Async/Await
    Topics:
      - Concurrency in Swift: history and evolution
      - Grand Central Dispatch (GCD) basics
      - DispatchQueue: main, global, custom
      - Async/await syntax (Swift 5.5+)
      - Async functions and methods
      - Calling async functions with await
      - Task for spawning async work
      - Task groups for parallel execution
      - Async sequences (AsyncSequence)
      - Actors for data race protection
      - @MainActor for UI updates
      - Global actors and custom actors
      - Sendable protocol for thread safety
      - Structured concurrency
      - Task cancellation and priorities
      - Migrating from GCD to async/await
    Projects built:
      - Async data fetching example
      - Parallel image downloader
      - Actor-based counter
      - Async file operations
      - Concurrent API calls
      - Background task processing
      - Thread-safe data manager
      - Async search implementation
    Practice: Convert 10 projects to async/await
  Core Data Fundamentals
    Topics:
      - Core Data overview and architecture
      - Core Data stack: NSPersistentContainer
      - NSManagedObjectModel: data model
      - NSManagedObjectContext: scratch pad
      - NSPersistentStoreCoordinator
      - Creating data model in Xcode
      - Entities, attributes, and relationships
      - NSManagedObject subclasses
      - Creating and saving objects
      - Fetching objects with NSFetchRequest
      - Predicates for filtering (NSPredicate)
      - Sorting with NSSortDescriptor
      - Updating and deleting objects
      - Core Data with SwiftUI: @FetchRequest
      - @Environment(\.managedObjectContext)
      - FetchedResults for displaying data
      - Relationships: one-to-one, one-to-many, many-to-many
    Projects built:
      - Todo app with Core Data
      - Contact manager with Core Data
      - Expense tracker with categories
      - Note-taking app with Core Data
      - Book library with authors relationship
      - Recipe app with ingredients relationship
      - Core Data with SwiftUI integration
      - Search and filter implementation
    Practice: Build 8 Core Data applications
  Combine Framework Fundamentals
    Topics:
      - Reactive programming concepts
      - Publishers and Subscribers
      - Built-in publishers: Just, Future, Empty, Fail
```

- @Published property wrapper
- Subjects: PassthroughSubject, CurrentValueSubject
- Operators: map, filter, flatMap, merge
- Combining publishers: combineLatest, zip, merge
- Error handling in Combine
- Scheduling and threads
- Cancellables and memory management
- Combine with SwiftUI
- Combine with URLSession
- Debounce and throttle for search
- Combine vs async/await comparison
- When to use Combine

Projects built:
- Form validation with Combine
- Search with debounce
- Real-time data binding
- API response handling with Combine
- Multi-field form validation
- Live search implementation
- Timer-based updates

Practice: Implement Combine in 8 projects

Swift Package Manager & Project Organization

Topics:
- Swift Package Manager (SPM) overview
- Creating Swift packages
- Package.swift manifest file
- Adding dependencies to projects
- Popular Swift packages and libraries
- Creating reusable libraries
- Local packages for modularization
- Publishing packages
- Semantic versioning
- Version control with Git (review/deep dive)
- Git branching strategies
- GitHub collaboration for iOS projects
- .gitignore for Xcode projects
- Code organization best practices
- MVVM architecture introduction

Projects built:
- Create custom Swift package
- Multi-module app architecture
- Networking library package
- UI component library package
- Git repository for all projects
- Modular app structure

Practice: Convert all projects to modular structure

Assessment: Phase 2 exam: a practical build defended live, plus a written paper mixing this phase with everything before it

---

PHASE 3: PROFESSIONAL IOS DEVELOPMENT (MONTHS 7-9, WEEKS 27-39)

Master professional iOS development with networking, advanced architecture, testing, accessibility, and real-world app development patterns.

Month 7: Networking & Architecture (Weeks 27-31)

Networking with URLSession

Topics:
- Networking fundamentals: HTTP protocol
- HTTP methods: GET, POST, PUT, DELETE, PATCH
- HTTP headers and status codes
- JSON format and structure
- URLSession overview and configuration
- URLSessionDataTask for data requests
- URLSessionDownloadTask for downloads
- URLSessionUploadTask for uploads
- URLRequest configuration
- Async/await with URLSession
- Error handling in networking
- Parsing JSON with Codable
- Handling nested JSON
- Custom CodingKeys and date handling
- Network error types and handling
- URL components and query parameters

Projects built:
- Weather app consuming REST API
- Movie database browser (TMDb API)
- News reader with API integration
- GitHub user search

    - Currency exchange rate app
    - Photo download and caching
    - REST API client library
    - API response error handling
  Practice: Build 10 network-connected applications
Advanced Networking & Authentication
  Topics:
    - Building a generic networking layer
    - Protocol-based API client
    - Request/Response interceptors
    - Authentication: API keys, tokens
    - OAuth 2.0 flow implementation
    - JWT token handling
    - Refresh token management
    - Keychain for token storage
    - SSL pinning for security
    - Background downloads and uploads
    - Network reachability (NWPathMonitor)
    - Caching strategies: URLCache
    - Image caching solutions
    - Request retry logic
    - Rate limiting handling
    - GraphQL basics with Swift
  Projects built:
    - Complete authenticated API client
    - Social media login (OAuth)
    - Image caching library
    - Offline-first data sync
    - Background upload manager
    - Network layer with unit tests
    - GraphQL client implementation
    - API wrapper for multiple endpoints
  Practice: Build production-ready networking layer
App Architecture - MVVM
  Topics:
    - Software architecture importance
    - MVC: Model-View-Controller (Apple's default)
    - Problems with Massive View Controller
    - MVVM: Model-View-ViewModel
    - ViewModel responsibilities
    - Data binding with Combine
    - Data binding with @Observable (iOS 17+)
    - Dependency Injection principles
    - Protocol-based dependencies
    - Coordinator pattern for navigation
    - Repository pattern for data access
    - Service layer architecture
    - Clean Architecture overview
    - VIPER architecture basics
    - Choosing the right architecture
    - Testing with architecture patterns
  Projects built:
    - Refactor app to MVVM
    - MVVM with Combine bindings
    - Coordinator-based navigation
    - Repository pattern implementation
    - Dependency injection container
    - Clean architecture example
    - Testable architecture demo
    - Multi-module MVVM app
  Practice: Apply MVVM to all major projects
Advanced Architecture & The Composable Architecture
  Topics:
    - State management challenges
    - Unidirectional data flow
    - The Composable Architecture (TCA) introduction
    - Reducers and State
    - Actions and Effects
    - Store and ViewStore
    - Scoping and composition
    - Testing in TCA
    - Alternatives: ReSwift, Redux-like patterns
    - Feature modules with TCA
    - Navigation in TCA
    - Dependency injection in TCA
    - Performance optimization
    - When to use TCA vs MVVM
    - Architecture decision factors
  Projects built:

- Counter app with TCA
- Todo list with TCA
- Navigation with TCA
- Feature composition example
- TCA with network effects
- Full app with TCA architecture
- Testing TCA reducers

Practice: Build 5 TCA-based features

Unit Testing & Test-Driven Development

Topics:

- Testing importance and types
- XCTest framework overview
- Writing test cases
- XCTAssert functions
- Test lifecycle: setUp, tearDown
- Testing view models
- Testing with protocols and mocks
- Dependency injection for testing
- Async testing with expectations
- Testing async/await code
- Testing Combine publishers
- Test doubles: mocks, stubs, fakes, spies
- Code coverage with Xcode
- Test-Driven Development (TDD) methodology
- Testing best practices
- Continuous testing workflow

Projects built:

- Unit tests for calculator
- ViewModel testing suite
- Mock network layer tests
- TDD implementation of stack
- Core Data unit tests
- Async code testing
- Test coverage improvement
- Complete test suite for capstone

Practice: Write tests for all major projects, achieve 70%+ coverage

Month 8: UI Testing, Accessibility & Advanced Features (Weeks 32-36)

UI Testing & Snapshot Testing

Topics:

- UI testing with XCUITest
- XCUIApplication for app launching
- XCUIElement for element identification
- Accessibility identifiers for testing
- Tapping, typing, swiping gestures
- Assertions in UI tests
- Waiting for elements
- Testing navigation flows
- Testing lists and tables
- UI test recording
- Snapshot testing introduction
- swift-snapshot-testing library
- Testing different device sizes
- Testing dark mode
- Testing accessibility features
- Page Object pattern for UI tests

Projects built:

- UI test suite for login flow
- Navigation UI tests
- List interaction tests
- Snapshot tests for components
- Multi-device snapshot tests
- Dark mode snapshot tests
- Accessibility audit tests
- End-to-end UI test suite

Practice: Add UI tests to all major projects

Accessibility & Localization

Topics:

- Accessibility importance and guidelines
- VoiceOver support
- Accessibility labels and hints
- Accessibility traits
- Accessibility value for dynamic content
- SwiftUI accessibility modifiers
- UIKit accessibility properties
- Dynamic Type support
- Color contrast requirements
- Reduce Motion support
- Accessibility testing with Xcode

```
    - Localization fundamentals
    - String localization: Localizable.strings
    - String catalogs (Xcode 15+)
    - Pluralization rules
    - Date and number formatting
    - Right-to-left (RTL) language support
    - Testing localization
  Projects built:
    - Accessibility audit and fixes
    - VoiceOver-optimized app
    - Dynamic Type implementation
    - Localized app in 3+ languages
    - RTL language support
    - Accessible custom controls
    - Localization testing automation
  Practice: Make all projects fully accessible
Maps, Location & Background Tasks
  Topics:
    - MapKit framework overview
    - Displaying maps with Map (SwiftUI)
    - MKMapView in UIKit
    - Map annotations and overlays
    - Custom annotation views
    - Route calculation and directions
    - Core Location framework
    - Requesting location permissions
    - Getting user location
    - Significant location changes
    - Geofencing with CLCircularRegion
    - Geocoding and reverse geocoding
    - Background location updates
    - Background tasks (BGTaskScheduler)
    - Background app refresh
    - Background processing tasks
  Projects built:
    - Map with user location
    - Points of interest app
    - Route planning app
    - Location-based reminders (geofencing)
    - Store finder with directions
    - Background location tracker
    - Background sync implementation
    - Fitness tracker with background location
  Practice: Build 8 location-aware applications
Push Notifications & App Extensions
  Topics:
    - Push notifications overview
    - Local notifications with UNUserNotificationCenter
    - Notification triggers: time, calendar, location
    - Notification content and categories
    - Custom notification actions
    - Remote push notifications (APNs)
    - Setting up APNs certificates
    - Firebase Cloud Messaging (FCM) alternative
    - Handling notifications in app
    - Rich notifications with attachments
    - App extensions overview
    - Today widgets / Widget extension
    - Share extension
    - Action extension
    - Notification content extension
    - App groups for data sharing
  Projects built:
    - Local notification reminder app
    - Scheduled notification system
    - Remote push notification setup
    - Rich notification with images
    - Widget for app data
    - Share extension for app
    - Interactive notification actions
    - Multi-widget app
  Practice: Add notifications and widgets to 5 projects
Camera, Photos & Media
  Topics:
    - Camera access with UIImagePickerController
    - PHPickerViewController for photo selection
    - Camera with AVCaptureSession
    - Custom camera UI
    - Photo library access (PhotosUI)
```

- Saving photos to library
- Photo editing with Core Image
- CIFilter for image processing
- AVFoundation for video
- AVPlayer for media playback
- AVAudioPlayer for audio
- Recording audio with AVAudioRecorder
- Video capture and editing
- Media file formats and compression
- Metal basics for graphics

Projects built:
- Photo capture app
- Photo gallery with picker
- Image filter app
- Video player app
- Voice memo recorder
- Custom camera with filters
- Photo editor with Core Image
- Media-rich content app

Practice: Build 8 media-focused applications

Month 9: Performance, Purchases & Security (Weeks 37-39)
App Performance & Optimization
Topics:
- Performance measurement importance
- Instruments tool overview
- Time Profiler for CPU analysis
- Allocations for memory analysis
- Leaks instrument for memory leaks
- Network profiling
- Core Animation instrument
- App launch time optimization
- Memory management best practices
- Image optimization and caching
- Table/collection view performance
- Lazy loading patterns
- Background thread optimization
- Energy and battery impact
- MetricKit for production monitoring

Projects built:
- Performance profiling report
- Memory leak identification and fix
- App launch optimization
- Image caching implementation
- List performance optimization
- Battery efficiency improvements
- Production metrics setup

Practice: Profile and optimize all major projects
In-App Purchases & Subscriptions
Topics:
- StoreKit framework overview
- StoreKit 2 (modern API)
- Product types: consumable, non-consumable, subscription
- Configuring products in App Store Connect
- Fetching products
- Processing purchases
- Transaction verification
- Receipt validation
- Subscription management
- Subscription offers and trials
- Restoring purchases
- Server-side validation
- RevenueCat SDK integration
- Testing in-app purchases

Projects built:
- Consumable IAP implementation
- Premium feature unlock
- Subscription-based app
- Restore purchases feature
- Receipt validation implementation
- RevenueCat integration
- Premium app conversion

Practice: Add monetization to 3 projects
Security & Data Protection
Topics:
- iOS security architecture
- App Transport Security (ATS)
- Secure data storage best practices
- Keychain deep dive

```
        - Keychain access groups
        - Data encryption with CryptoKit
        - Hashing and digital signatures
        - Biometric authentication (Face ID, Touch ID)
        - LocalAuthentication framework
        - Secure text entry
        - Jailbreak detection
        - SSL certificate pinning
        - Code obfuscation basics
        - Privacy manifest (iOS 17+)
        - Privacy nutrition labels
      Projects built:
        - Biometric login implementation
        - Encrypted data storage
        - Secure notes app
        - Certificate pinning implementation
        - Privacy-focused app
        - Keychain wrapper library
        - Security audit checklist
      Practice: Security audit all projects
      Assessment: Phase 3 exam: a practical build defended live, plus a written paper mixing
      this phase with everything before it

  ---------------------------------------------------------------
  PHASE 4: THE FINALE (MONTH 10, WEEKS 40-44)
  ---------------------------------------------------------------
  The capstone month: spec, build, ship and defend, then the final exam that decides the
  certificate.

    Month 10: Capstone and the Final Exam (Weeks 40-44)
      Capstone Spec and Setup
        Topics:
          - Choosing the capstone: a complete SwiftUI app with real data, networking and Apple-feel
            polish
          - A one-page spec: scope, milestones, stack
          - Repository and project skeleton ready on day one
          - Instructor sign-off before the build begins
        Projects built:
          - Approved capstone spec plus the running skeleton
        Practice: Pitch the spec to the batch and absorb one hard question
      Capstone Build
        Topics:
          - Two focused weeks of building in vertical slices
          - Instructor checkpoints and honest scope cuts
          - Using the whole course: Swift depth, SwiftUI, architecture, persistence and testing
          - Daily commits and an always-working build
        Projects built:
          - The capstone, feature-complete with version control
        Practice: A working build at the end of every session
      Ship and Polish
        Topics:
          - The finishing pass: edge cases, errors, documentation
          - App Store readiness pass: assets, review rules and the honest release checklist
          - A README worth reading and a demo worth watching
          - A full-course spiral review before the exam
        Projects built:
          - The capstone shipped, documented and rehearsed
        Practice: Two mock demos, each tighter than the last
      Demo Day and the Final Exam
        Topics:
          - Presenting the capstone: live demo plus the hardest bug story
          - The honest map of next roads: iOS roles, indie apps, and the wider Apple platforms
          - Where our other courses continue the journey
        Projects built:
          - Demo day presentation delivered to the batch
        Assessment: FINAL EXAM: a practical build plus a written paper with questions mixed
        from every phase. Passing earns the certificate; falling short earns a focused revision
        plan and a free retest

PROJECTS THE STUDENT BUILDS AND KEEPS

  - Phase 1: Swift programs from fundamentals through protocol-oriented tools
  - Phase 2: SwiftUI interfaces with real state and navigation
  - Phase 3: architected apps with persistence, networking and tests
  - Phase 4: the capstone app, App-Store-disciplined and defended at demo day

  Total projects: 20+ real builds, crowned by an App-Store-disciplined capstone

SKILLS THE STUDENT WILL HAVE AT THE END
```

- Swift to real depth: optionals, value types, protocols, concurrency
- SwiftUI: declarative interfaces with state done right
- Architecture: structure that survives features and time
- Data and networking: persistence and API clients done properly
- Apple craft: interface habits that make apps feel native

HOW A TYPICAL WEEK IS SPLIT

Live classes: 2 live one-hour classes per week, coding along with the instructor
Homework: A problem set after every class, and a mixed-review assignment at the end of every month
Practice: 4-6 hours of building between classes
Review: Every submission reviewed with written feedback; recurring gaps reopened in class

SUPPORT INCLUDED

Doubt support: WhatsApp doubt support between classes
Progress updates: Honest monthly progress reviews: what is solid, what is wobbly, and the plan for the wobble

CERTIFICATION DETAIL

Completion: Certificate from Modern Age Coders, awarded on passing the final exam. Fall short and there is focused revision and a free retest: the certificate certifies knowledge, not attendance

WHERE THIS CAN LEAD

- iOS development roles: SwiftUI-first is exactly where hiring is moving
- Indie development: the App Store rewards craft like nowhere else
- The wider Apple ecosystem: watchOS, macOS and visionOS share this foundation
- Our full-stack course for the server half of app products

EARNING POTENTIAL (share only if asked, and never promise it)

Market context: The ranges below are general market salary bands for these roles in India and abroad, drawn from public industry data. They are shown for career context only and are not a promise or guarantee of income. Actual pay depends on your skills, experience, location, and the job market.
Early career roles: Rs 3-6 LPA (Junior iOS Developer / Fresher)
Growing roles: Rs 6-12 LPA (iOS Developer); Rs 10-18 LPA (Senior iOS Developer)
Experienced roles: Rs 15-30 LPA (Lead iOS Developer / Mobile Architect); Rs 22-50 LPA (Principal Engineer / Solutions Architect)
Freelance: Rs 2,000-7,000/hour based on expertise
International usa: $95k-210k USD (iOS Developer to Principal)
International europe: €55k-140k EUR based on country and experience

COMMON QUESTIONS ABOUT THIS COURSE

For anything about cost, use PART 4 and RULE 1. Do not quote two regions.

Q: What does this Swift and iOS course cover?
A: Swift as a real language first, optionals, value types, protocols and structured concurrency, then modern iOS with SwiftUI: views and state, navigation, architecture, persistence, networking, testing and App Store discipline, ending with a capstone app and the final exam. SwiftUI-first throughout, because that is where Apple and hiring are already going.

Q: How long does it take to learn Swift and iOS properly?
A: Ten months of teaching at 2 live classes a week plus 4 to 6 hours of practice, with two more months in hand for learners who need them. The three teaching phases build the language and its real-world domain; the finale month ships a capstone and sits the final exam.

Q: How am I assessed? Is the certificate just for attending?
A: No. Problem sets follow every class with written feedback, monthly reviews deliberately mix new material with earlier topics, each phase ends with a cumulative exam, and the course ends with a final exam: a practical build plus written questions from the whole syllabus. Passing earns the certificate; falling short earns focused revision and a free retest.

Q: Do I really need a Mac?
A: Yes, honestly: Xcode runs only on macOS, and pretending otherwise wastes students' money. Realistic options: any Apple-silicon Mac including used M1 machines handles the whole course; some students share a family Mac for practice sessions. If a Mac is out of reach right now, our React Native-based app course builds cross-platform apps from any laptop, and this course will still be here.

Q: Swift or React Native for mobile?
A: Native Swift wins when you want the Apple platform mastered deeply, the best performance

and feel, and access to every new framework the day it ships. React Native wins for one-codebase-both-platforms from any laptop. We teach both roads honestly; this is the native-depth one.

Q: Can I try a class before enrolling?
A: Yes, a free demo class with no commitment: book at learn.modernagecoders.com/contact or message us on WhatsApp at +91 91233 66161. (Agent note: the free demo is a waiting list with no fixed date. The Priority Live Demo is a guaranteed class today or tomorrow, booked at https://learn.modernagecoders.com/priority-demo . Offer both, as RULE 3 says.)

Q: Are classes live or recorded?
A: Live, always: small groups with a real instructor reading your actual code, never pre-recorded videos.

To enrol, message Shivam Sir on +91 9123366161 or send the parent this link: https://learn.modernagecoders.com/courses/complete-swift-programming-masterclass-college
For a demo: the Priority Live Demo (guaranteed, today or tomorrow) is booked at https://learn.modernagecoders.com/priority-demo . The free demo is a waiting list with no fixed date.

==========
COURSE 129 OF 137: TRADING AUTOMATION COURSE: BOTS, BACKTESTING & SYSTEMS
==========

Course link: https://learn.modernagecoders.com/courses/algorithmic-trading-automation-masterclass
Subject area: Data Science
Designed for: College students
Who can join: Complete beginner (18+); college students, graduates and working professionals
Course length: 10-12 months (44-52 weeks)
Time needed: 2 live classes/week + 4-6 hours practice
Certificate: Certificate from Modern Age Coders, awarded on passing the final exam

PRICE FOR THIS COURSE (quote only the one that applies to the person asking)
In India, per month: group Rs 1,499, mini batch Rs 2,999, one to one Rs 4,999
In Canada, per month: group CAD 140, one to one CAD 210
Anywhere else, per month: group $100, one to one $150
Classes: group and mini batch two live classes a week, eight a month; one to one in India one live class a week, four a month; one to one outside India two live classes a week, eight a month. Each class is one hour.

WHAT THIS COURSE IS

Trading automation course for adults and professionals: build, backtest and deploy automated trading systems in Python, with broker APIs, risk controls and production infrastructure, taught as engineering, in 10-12 months.

In one line: The systems half of quant, done properly: build, backtest and deploy automated trading systems in Python, with broker APIs, risk controls and real production discipline.

ABOUT THE PROGRAMME

Building a strategy is one skill; running it reliably, unattended, with real safeguards is another, and this course teaches the second one. It is an engineering course, not a money-making pitch: Python for finance, technical and fundamental analysis in code, strategy design and rigorous backtesting, then portfolio theory and risk-management systems, machine learning for trading, and the part most courses skip entirely, connecting to broker APIs, paper trading, and building live systems with monitoring, logging, compliance awareness and the safeguards that stop an automated system doing real damage. Throughout, the message is repeated and honest: markets carry real risk of loss, backtests do not predict the future, and this is education, not financial advice. A finale month builds and paper-deploys a full automated system and sits the final exam. The pace is honest: ten teaching months at two live classes a week plus four to six hours of practice, with two more in hand. Problem sets, monthly mixed reviews, phase exams, and a final exam that decides the certificate with a free retest.

WHAT MAKES THIS COURSE DIFFERENT

- The systems half done right: from backtest to reliable, monitored, unattended execution
- Broker APIs and paper trading taught hands-on, the step most courses skip
- Safeguards as a core topic: the controls that stop an automated system causing harm
- Production engineering: deployment, monitoring, logging and compliance awareness
- Honest about risk on every page: education, not financial advice, no profit claims
- Real assessment: weekly problem sets, monthly mixed reviews, phase exams and a final exam with a free retest

THE LEARNING PATH, STEP BY STEP

Phase 1: Foundations (Months 1-3): markets, Python for finance, analysis, strategy design and backtesting

Phase 2: Risk, ML and going live (Months 4-6): portfolio theory, risk systems, ML, broker APIs and paper trading
Phase 3: Production systems (Months 7-9): institutional concepts, infrastructure, deployment and compliance
Phase 4: The finale (Month 10): a full paper-deployed automated system and the final exam

WHAT A STUDENT NEEDS BEFORE STARTING

Coding experience: None. Everything is taught from the first line
Equipment: Any computer with a stable internet connection; every tool used is free
Age: 18+; college students, graduates and working professionals
Time commitment: 2 live classes plus 4-6 hours of practice a week

WHO THIS COURSE IS FOR

Developers: Programmers who want to build reliable automated trading systems
College students: Students targeting quant developer and trading-systems roles
Quant researchers: Strategy researchers who need the engineering to deploy their ideas
Fintech bound: Engineers moving into fintech and trading infrastructure
Disciplined learners: Adults who want real systems skill, not a signals subscription

FULL CURRICULUM, WEEK BY WEEK

This is the complete teaching plan. Parents can ask about any week.

PHASE 1: FINANCIAL MARKETS & PYTHON FOUNDATION (MONTHS 1-3, WEEKS 1-13)

Build solid understanding of financial markets, trading fundamentals, and Python programming for finance.

Month 1: Financial Markets Fundamentals (Weeks 1-5)
Introduction to Financial Markets
Topics:
- What is algorithmic trading? History and evolution
- Financial markets overview: stocks, bonds, commodities, forex
- Market participants: retail, institutional, market makers
- Exchanges and trading venues: NYSE, NASDAQ, NSE, BSE
- Order types: market, limit, stop-loss, stop-limit
- Bid-ask spread and market microstructure
- Trading hours and market sessions
- Settlement and clearing processes
- Regulatory environment: SEC, SEBI, regulations
- Market indices: S&P 500, Nifty, Sensex
- Economic indicators and their impact
- Introduction to fundamental analysis
Projects built:
- Market research report on major indices
- Trading account setup (paper trading)
- Market terminology glossary
Practice: Daily market observation and journaling
Trading Basics & Market Mechanics
Topics:
- Long vs short positions
- Margin trading and leverage
- Market volatility and VIX
- Trading psychology and behavioral finance
- Common trading mistakes and biases
- Position sizing basics
- Risk-reward ratios
- Trading costs: commissions, slippage, spreads
- Dividends and corporate actions
- Stock splits and bonus shares
- Market cycles and trends
- Introduction to derivatives: futures and options
Projects built:
- Paper trading diary with 10 trades
- Risk-reward calculator
- Trading cost analyzer
Practice: Execute 20 paper trades with analysis
Python Setup for Finance
Topics:
- Python environment setup for trading
- Anaconda and Jupyter for finance
- Essential libraries: NumPy, Pandas
- Financial data structures in Python
- Date and time handling for markets
- Working with financial data types
- Data cleaning for financial data

```
      - Basic statistics with Python
      - Visualization with Matplotlib
      - Plotly for interactive charts
      - Git for version control
      - Project structure for trading systems
    Projects built:
      - Python trading environment setup
      - Stock price data analyzer
      - Market statistics calculator
    Practice: Complete 30 Python finance exercises
  Financial Data Acquisition
    Topics:
      - Yahoo Finance API with yfinance
      - Alpha Vantage API integration
      - NSE/BSE data sources
      - Real-time vs historical data
      - WebSocket connections for live data
      - Data storage: CSV, databases, HDF5
      - Time series data management
      - Corporate actions data handling
      - Economic data from FRED
      - Alternative data sources
      - Data quality and validation
      - Building a data pipeline
    Projects built:
      - Multi-source data fetcher
      - Historical data downloader
      - Real-time price tracker
      - Financial database creator
    Practice: Collect data for 100 stocks

Month 2: Technical Analysis & Indicators (Weeks 6-9)
  Classical Technical Analysis
    Topics:
      - Price action and candlestick patterns
      - Support and resistance levels
      - Trend lines and channels
      - Chart patterns: head and shoulders, triangles, flags
      - Moving averages: SMA, EMA, WMA
      - Moving average crossovers
      - Volume analysis and interpretation
      - Market breadth indicators
      - Dow Theory principles
      - Elliott Wave basics
      - Fibonacci retracements and extensions
      - Japanese candlestick patterns
    Projects built:
      - Candlestick pattern detector
      - Support/resistance calculator
      - Moving average strategy implementation
      - Chart pattern recognition system
    Practice: Analyze 50 charts with technical analysis
  Technical Indicators Programming
    Topics:
      - Momentum indicators: RSI, Stochastic
      - MACD and signal lines
      - Bollinger Bands implementation
      - ATR (Average True Range)
      - ADX (Average Directional Index)
      - Volume indicators: OBV, VWAP
      - Ichimoku Cloud components
      - Custom indicator development
      - Indicator optimization
      - Multi-timeframe analysis
      - Indicator backtesting
      - TA-Lib library usage
    Projects built:
      - Technical indicator library
      - Custom indicator creator
      - Multi-indicator dashboard
      - Indicator signal generator
    Practice: Implement 20 technical indicators from scratch
  Fundamental Analysis Automation
    Topics:
      - Financial statements analysis
      - P/E, P/B, and valuation ratios
      - Revenue and earnings analysis
      - Cash flow analysis
      - Debt and leverage metrics
```

```
      - ROE, ROA, ROCE calculations
      - Sector comparison metrics
      - Earnings calendar tracking
      - Insider trading data
      - Analyst recommendations scraping
      - News sentiment analysis
      - Fundamental data APIs
    Projects built:
      - Fundamental analysis screener
      - Earnings announcement tracker
      - Financial ratio calculator
      - Company comparison tool
    Practice: Analyze 30 companies fundamentally
  Market Analysis & Screening
    Topics:
      - Stock screening strategies
      - Sector rotation analysis
      - Market regime detection
      - Correlation analysis
      - Beta calculation and usage
      - Relative strength analysis
      - Market sentiment indicators
      - Options flow analysis basics
      - Unusual activity detection
      - Pre-market and after-hours analysis
      - Global market correlations
      - Economic calendar integration
    Projects built:
      - Advanced stock screener
      - Market regime identifier
      - Correlation matrix builder
      - Sentiment analysis system
    Practice: Build 10 different screening strategies

Month 3: Strategy Development & Backtesting (Weeks 10-13)
  Trading Strategy Design
    Topics:
      - Types of trading strategies
      - Trend following strategies
      - Mean reversion strategies
      - Momentum strategies
      - Breakout strategies
      - Pairs trading and arbitrage
      - Market making basics
      - Strategy hypothesis formation
      - Entry and exit rules
      - Position sizing methods
      - Stop-loss and take-profit logic
      - Strategy documentation
    Projects built:
      - Moving average crossover strategy
      - RSI mean reversion strategy
      - Breakout trading system
      - Pairs trading strategy
    Practice: Design 10 trading strategies
  Backtesting Frameworks
    Topics:
      - Backtesting concepts and pitfalls
      - Look-ahead bias and survivorship bias
      - Vectorized backtesting with Pandas
      - Event-driven backtesting
      - Backtrader framework
      - Zipline backtesting engine
      - Custom backtesting framework
      - Transaction cost modeling
      - Slippage simulation
      - Market impact modeling
      - Walk-forward analysis
      - Out-of-sample testing
    Projects built:
      - Custom backtesting engine
      - Strategy comparison framework
      - Walk-forward optimizer
      - Monte Carlo simulator
    Practice: Backtest 20 strategies
  Performance Analytics
    Topics:
      - Returns calculation methods
      - Sharpe ratio and risk-adjusted returns
```

- Maximum drawdown analysis
- Calmar and Sortino ratios
- Win rate and profit factor
- Value at Risk (VaR)
- Conditional VaR (CVaR)
- Performance attribution
- Benchmark comparison
- Rolling performance metrics
- Trade analysis and statistics
- Performance reporting

Projects built:
- Performance analytics dashboard
- Risk metrics calculator
- Trade journal analyzer
- Strategy report generator

Practice: Analyze 15 strategy performances

Strategy Optimization

Topics:
- Parameter optimization techniques
- Grid search optimization
- Random search methods
- Bayesian optimization
- Genetic algorithms for trading
- Machine learning for optimization
- Overfitting prevention
- Robust parameter selection
- Multi-objective optimization
- Strategy combination methods
- Ensemble strategies
- Adaptive strategies

Projects built:
- Parameter optimizer tool
- Genetic algorithm optimizer
- Strategy ensemble system
- Adaptive strategy framework

Practice: Optimize 10 strategies

Assessment: Phase 1 exam: a practical build defended live, plus a written paper mixing this phase with everything before it

---

PHASE 2: ADVANCED STRATEGIES & PORTFOLIO MANAGEMENT (MONTHS 4-6, WEEKS 14-26)

Master portfolio theory, risk management, advanced strategies, and quantitative methods.

Month 4: Portfolio Theory & Risk Management (Weeks 14-17)

Modern Portfolio Theory

Topics:
- Portfolio theory foundations
- Expected returns and variance
- Covariance and correlation in portfolios
- Efficient frontier construction
- Capital Asset Pricing Model (CAPM)
- Beta and systematic risk
- Alpha generation concepts
- Multi-factor models
- Fama-French factors
- Risk parity strategies
- Black-Litterman model
- Portfolio rebalancing strategies

Projects built:
- Efficient frontier calculator
- CAPM implementation
- Portfolio optimizer
- Risk parity portfolio builder

Practice: Build 10 optimal portfolios

Risk Management Systems

Topics:
- Types of financial risk
- Market risk measurement
- Credit risk basics
- Liquidity risk management
- Operational risk in trading
- Position sizing techniques
- Kelly criterion implementation
- Risk budgeting methods
- Stress testing portfolios
- Scenario analysis
- Risk limits and controls
- Real-time risk monitoring

```
    Projects built:
      - Risk management dashboard
      - Position sizing calculator
      - Risk limit monitor
      - Stress testing framework
    Practice: Implement 15 risk management techniques
  Advanced Trading Strategies
    Topics:
      - Statistical arbitrage strategies
      - Cointegration and pairs trading
      - Options strategies: covered calls, spreads
      - Delta hedging techniques
      - Volatility trading strategies
      - Calendar spread strategies
      - Sector rotation strategies
      - Factor-based strategies
      - Smart beta strategies
      - Alternative risk premia
      - Carry trade strategies
      - Global macro strategies
    Projects built:
      - Statistical arbitrage system
      - Options strategy builder
      - Volatility trading bot
      - Factor rotation strategy
    Practice: Implement 20 advanced strategies
  Market Microstructure & Execution
    Topics:
      - Order book dynamics
      - Market depth analysis
      - Liquidity provision strategies
      - Optimal execution algorithms
      - TWAP and VWAP execution
      - Implementation shortfall
      - Dark pools and alternative trading
      - High-frequency trading concepts
      - Latency optimization basics
      - Co-location advantages
      - Smart order routing
      - Transaction cost analysis
    Projects built:
      - Order book analyzer
      - VWAP execution algorithm
      - Market impact estimator
      - Smart order router
    Practice: Build 10 execution algorithms

Month 5: Machine Learning for Trading (Weeks 18-22)
  ML Fundamentals for Trading
    Topics:
      - Machine learning in finance overview
      - Supervised learning for trading
      - Feature engineering for markets
      - Technical indicators as features
      - Fundamental data features
      - Alternative data features
      - Train-test splitting for time series
      - Cross-validation for trading
      - Overfitting in financial ML
      - Feature selection methods
      - Data preprocessing for trading
      - Label engineering for trading signals
    Projects built:
      - ML feature engineering pipeline
      - Trading signal predictor
      - Feature importance analyzer
      - ML data preparation tool
    Practice: Engineer 100 trading features
  Classification & Regression for Trading
    Topics:
      - Logistic regression for signals
      - Support Vector Machines for trading
      - Random Forests for prediction
      - Gradient boosting: XGBoost, LightGBM
      - Neural networks for trading
      - Ensemble methods for signals
      - Price prediction models
      - Direction prediction models
      - Volatility forecasting
```

- Multi-class classification for signals
- Probability calibration
- Model interpretation for trading

Projects built:
- ML signal generator
- Price prediction system
- Ensemble trading model
- ML strategy builder

Practice: Train 20 ML trading models

Deep Learning for Markets

Topics:
- Deep learning in finance
- LSTM for time series prediction
- GRU networks for trading
- CNN for pattern recognition
- Attention mechanisms for trading
- Transformer models for markets
- Autoencoders for anomaly detection
- GANs for synthetic data
- Reinforcement learning basics
- Deep Q-Learning for trading
- Policy gradient methods
- Multi-agent trading systems

Projects built:
- LSTM price predictor
- Deep learning trading bot
- RL trading agent
- Transformer-based strategy

Practice: Build 10 deep learning models

Alternative Data & NLP

Topics:
- Alternative data sources for trading
- News sentiment analysis
- Social media sentiment: Twitter, Reddit
- Earnings call transcripts analysis
- SEC filings analysis
- Web scraping for trading signals
- Satellite data for trading
- NLP preprocessing for finance
- Named entity recognition for stocks
- Topic modeling for market themes
- Event detection from text
- Real-time sentiment pipeline

Projects built:
- News sentiment trading system
- Social media signal generator
- Earnings call analyzer
- Alternative data pipeline

Practice: Process 10 alternative data sources

ML Model Deployment

Topics:
- Model deployment strategies
- Real-time inference for trading
- Model versioning and management
- A/B testing trading models
- Model monitoring in production
- Drift detection for financial models
- Model retraining pipelines
- Feature stores for trading
- MLOps for trading systems
- Cloud deployment for ML models
- Edge deployment for low latency
- Model governance and compliance

Projects built:
- ML model deployment pipeline
- Model monitoring dashboard
- Automated retraining system
- Production ML trading system

Practice: Deploy 5 ML models to production

Month 6: Live Trading & Production Systems (Weeks 23-26)

Broker APIs & Connectivity

Topics:
- Interactive Brokers API
- Alpaca Trading API
- TD Ameritrade API
- Zerodha Kite Connect
- FIX protocol basics
- WebSocket connections for real-time data

- Order management systems
- Order routing logic
- API authentication and security
- Rate limiting handling
- Error handling and recovery
- Connection redundancy

Projects built:
- Multi-broker connector
- Order management system
- Real-time data aggregator
- API abstraction layer

Practice: Connect to 5 different brokers

Paper Trading Implementation

Topics:
- Paper trading environment setup
- Simulated order execution
- Paper trading engines
- Real-time paper trading
- Strategy deployment for paper trading
- Performance tracking
- Paper vs live trading differences
- Transitioning to live trading
- Risk controls for paper trading
- Paper trading best practices
- Multiple strategy management
- Portfolio paper trading

Projects built:
- Paper trading platform
- Strategy deployment system
- Performance tracker
- Risk monitor for paper trading

Practice: Paper trade 10 strategies for 30 days

Live Trading Systems

Topics:
- Live trading infrastructure
- Production system architecture
- Order execution engines
- Risk management systems
- Position tracking and P&L
- Real-time monitoring dashboards
- Alerting and notifications
- Fail-safe mechanisms
- Circuit breakers implementation
- Disaster recovery planning
- System redundancy and backup
- Round-the-clock operation considerations

Projects built:
- Live trading engine
- Risk management system
- Monitoring dashboard
- Alert system implementation

Practice: Build complete live trading infrastructure

Cryptocurrency Trading

Topics:
- Cryptocurrency markets overview
- Crypto exchanges: Binance, Coinbase
- Crypto trading APIs
- Round-the-clock trading considerations
- Crypto-specific strategies
- Arbitrage in crypto markets
- DeFi and automated market makers
- Stablecoin strategies
- Cross-exchange arbitrage
- Crypto portfolio management
- Tax implications for crypto
- Regulatory considerations

Projects built:
- Crypto trading bot
- Arbitrage detection system
- DeFi yield optimizer
- Multi-exchange trading platform

Practice: Trade 10 crypto strategies

Assessment: Phase 2 exam: a practical build defended live, plus a written paper mixing this phase with everything before it

---

PHASE 3: PRODUCTION SYSTEMS AND ADVANCED APPLICATIONS (MONTHS 7-9, WEEKS 27-39)

From working strategies to production-grade systems: advanced instruments, trading

infrastructure, cloud deployment, monitoring, compliance awareness and the safeguards that reliable automation demands.

Month 7: Advanced Instruments and Institutional Concepts (Weeks 27-31)
Options Trading Automation
Topics:
- Options fundamentals review
- Greeks: Delta, Gamma, Theta, Vega, Rho
- Options pricing models: Black-Scholes
- Binomial option pricing
- Implied volatility calculation
- Volatility surfaces and skew
- Options market making
- Delta-neutral strategies
- Options arbitrage strategies
- Automated options screening
- Risk management for options
- Options backtesting challenges
Projects built:
- Options pricing calculator
- Greeks dashboard
- Options strategy backtester
- Volatility trading system
Practice: Implement 15 options strategies
Futures & Derivatives Trading
Topics:
- Futures markets overview
- Futures pricing and basis
- Calendar spreads in futures
- Commodity trading strategies
- Interest rate futures
- Currency futures trading
- Index futures strategies
- Futures arbitrage
- Roll strategies
- Margin requirements management
- Delivery and settlement
- Futures data handling
Projects built:
- Futures trading system
- Spread trading bot
- Commodity trading strategy
- Futures arbitrage detector
Practice: Build 10 futures strategies
High-Frequency Trading Concepts
Topics:
- HFT strategies overview
- Market making algorithms
- Statistical arbitrage HFT
- Latency arbitrage
- Order book imbalance strategies
- Tick data processing
- Ultra-low latency systems
- FPGA and hardware acceleration
- Co-location benefits
- Network optimization
- HFT risk management
- Regulatory considerations for HFT
Projects built:
- HFT simulator
- Market making bot
- Latency measurement tool
- Order book strategy
Practice: Simulate 5 HFT strategies
Fixed Income & Forex Trading
Topics:
- Bond markets and pricing
- Yield curve strategies
- Duration and convexity
- Credit spread trading
- Government bond strategies
- Corporate bond trading
- Forex market structure
- Currency pair strategies
- Carry trade implementation
- Forex arbitrage
- Central bank policy trading
- Cross-asset strategies
Projects built:

- Bond trading system
- Yield curve analyzer
- Forex trading bot
- Carry trade optimizer

Practice: Develop 10 fixed income/forex strategies

Quantitative Risk Analytics

Topics:

- Advanced risk metrics
- Expected Shortfall (ES)
- Stressed VaR
- Backtesting VaR models
- Extreme value theory
- Copula models for risk
- Credit risk modeling
- Counterparty risk
- Liquidity risk modeling
- Model risk management
- Risk aggregation methods
- Regulatory capital calculations

Projects built:

- Advanced risk system
- VaR backtesting framework
- Credit risk model
- Risk aggregation platform

Practice: Implement 10 risk models

Month 8: Advanced Infrastructure & Deployment (Weeks 32-36)

Trading Infrastructure Design

Topics:

- System architecture for trading
- Microservices for trading systems
- Message queuing: RabbitMQ, Kafka
- Event-driven architectures
- Database design for trading
- Time-series databases: InfluxDB
- In-memory databases: Redis
- Data lakes for trading
- Distributed systems design
- System scalability patterns
- High availability design
- Disaster recovery planning

Projects built:

- Microservices trading platform
- Event-driven trading system
- Scalable data architecture
- HA trading infrastructure

Practice: Design 5 trading architectures

Cloud Deployment for Trading

Topics:

- AWS for trading systems
- EC2 and auto-scaling
- S3 for data storage
- Lambda for serverless trading
- RDS and DynamoDB for trading data
- Google Cloud Platform for trading
- Azure for financial services
- Kubernetes for trading apps
- Docker containerization
- CI/CD for trading systems
- Infrastructure as Code
- Cloud cost optimization

Projects built:

- Cloud-native trading platform
- Serverless trading functions
- Kubernetes trading deployment
- Multi-cloud trading system

Practice: Deploy to 3 cloud providers

Monitoring & Observability

Topics:

- Monitoring trading systems
- Prometheus and Grafana
- ELK stack for logging
- Application performance monitoring
- Trading metrics and KPIs
- Real-time alerting systems
- Anomaly detection in monitoring
- Distributed tracing
- Performance profiling
- System health checks

- SLA monitoring
- Incident response procedures
Projects built:
- Monitoring dashboard
- Alert management system
- Performance analyzer
- Incident response toolkit
Practice: Monitor 10 trading systems
Compliance & Regulatory
Topics:
- Financial regulations overview
- MiFID II requirements
- Best execution obligations
- Market abuse regulations
- Trade reporting requirements
- Audit trail maintenance
- Data retention policies
- KYC and AML in trading
- Risk disclosure requirements
- Compliance monitoring systems
- Regulatory reporting automation
- License requirements
Projects built:
- Compliance monitoring system
- Audit trail generator
- Regulatory reporting tool
- Risk disclosure system
Practice: Implement compliance for 5 systems
Testing & Quality Assurance
Topics:
- Testing strategies for trading systems
- Unit testing trading logic
- Integration testing
- End-to-end testing
- Performance testing
- Stress testing systems
- Chaos engineering for trading
- Test data management
- Mock trading environments
- Continuous testing
- Test automation frameworks
- Quality metrics
Projects built:
- Testing framework for trading
- Stress testing suite
- Mock trading environment
- Quality assurance dashboard
Practice: Test 10 trading systems comprehensively

Month 9: Advanced Applications and Market Making (Weeks 37-39)
Advanced Machine Learning Applications
Topics:
- Deep reinforcement learning for trading
- Multi-agent reinforcement learning
- Evolutionary algorithms for strategy discovery
- Genetic programming for trading rules
- Neural architecture search for trading
- Transfer learning in finance
- Few-shot learning for markets
- Online learning for adaptation
- Federated learning for trading
- Explainable AI for trading
- Causal inference in markets
- Quantum computing for finance basics
Projects built:
- Advanced RL trading agent
- Strategy evolution system
- Adaptive learning trader
- Explainable AI dashboard
Practice: Implement 10 advanced ML techniques
Market Making & Liquidity Provision
Topics:
- Market making strategies
- Inventory management
- Quote generation algorithms
- Spread optimization
- Adverse selection mitigation
- Order book modeling
- Queue position strategies

- Cross-market making
- Options market making
- Risk management for market makers
- Regulatory requirements for market makers
- Market maker profitability

Projects built:

- Market making simulator
- Quote generation engine
- Inventory manager
- Market maker risk system

Practice: Build 5 market making strategies

Alternative Trading Venues

Topics:

- Dark pools and ATSs
- Decentralized exchanges (DEXs)
- Automated market makers (AMMs)
- Liquidity pools and yield farming
- Flash loans and arbitrage
- Cross-chain trading
- NFT trading automation
- Prediction markets trading
- Binary options automation
- Social trading platforms
- Copy trading systems
- Signal provider systems

Projects built:

- DEX trading bot
- AMM strategy implementation
- Cross-chain arbitrage bot
- Social trading platform

Practice: Trade on 5 alternative venues

Assessment: Phase 3 exam: a practical build defended live, plus a written paper mixing this phase with everything before it

---

PHASE 4: THE FINALE (MONTH 10, WEEKS 40-44)

The capstone month: spec, build, ship and defend, then the final exam that decides the certificate.

Month 10: Capstone and the Final Exam (Weeks 40-44)

Capstone Spec and Setup

Topics:

- Choosing the capstone: a full automated trading system, paper-deployed: strategy, risk controls, broker connectivity, monitoring and safeguards
- A one-page spec: scope, milestones, stack
- Repository and skeleton ready on day one
- Instructor sign-off before the build begins

Projects built:

- Approved capstone spec plus the running skeleton

Practice: Pitch the spec to the batch and absorb one hard question

Capstone Build

Topics:

- Two focused weeks in vertical slices
- Instructor checkpoints and honest scope cuts
- Using the whole course: Python engineering, backtesting, risk systems, broker APIs and production monitoring
- Daily commits and an always-working build

Projects built:

- The capstone, feature-complete with version control

Practice: A working build at the end of every session

Ship and Polish

Topics:

- The finishing pass: edge cases, errors, documentation
- Paper-deployed and monitored: a system that runs unattended with real safeguards, on paper trading
- A README worth reading and a demo worth watching
- A full-course spiral review before the exam

Projects built:

- The capstone shipped, documented and rehearsed

Practice: Two mock demos, each tighter than the last

Demo Day and the Final Exam

Topics:

- Presenting the capstone: live demo plus the hardest bug story
- The honest map of next roads: quant developer, trading-systems engineer or fintech roles; trading your own capital is a personal decision, not a placement
- Where our other courses continue the journey

Projects built:

- Demo day presentation delivered to the batch

Assessment: FINAL EXAM: a practical build plus a written paper with questions mixed from every phase. Passing earns the certificate; falling short earns a focused revision plan and a free retest

PROJECTS THE STUDENT BUILDS AND KEEPS

- Phase 1: analysis tools, indicators and backtesting frameworks in Python
- Phase 2: risk systems, ML models and paper-trading connectivity
- Phase 3: production infrastructure with monitoring and compliance awareness
- Phase 4: the full paper-deployed automated-system capstone

Total projects: 15+ engineering projects, crowned by a paper-deployed automated system

SKILLS THE STUDENT WILL HAVE AT THE END

- Python engineering for finance: data, indicators and backtesting frameworks
- Risk-management systems and portfolio construction in code
- Broker API integration and paper trading
- Production systems: deployment, monitoring, logging and safeguards
- Compliance awareness and the discipline of unattended automation

HOW A TYPICAL WEEK IS SPLIT

Live classes: 2 live one-hour classes per week, coding along with the instructor
Homework: A problem set after every class, and a mixed-review assignment at the end of every month
Practice: 4-6 hours of building between classes
Review: Every submission reviewed with written feedback; recurring gaps reopened in class

SUPPORT INCLUDED

Doubt support: WhatsApp doubt support between classes
Progress updates: Honest monthly progress reviews: what is solid, what is wobbly, and the plan for the wobble

CERTIFICATION DETAIL

Completion: Certificate from Modern Age Coders, awarded on passing the final exam. Fall short and there is focused revision and a free retest: the certificate certifies knowledge, not attendance

WHERE THIS CAN LEAD

- Quant developer and trading-systems engineer roles in funds and fintech
- Our algorithmic trading course for the research and strategy half
- General backend and data-engineering roles: the skills transfer directly
- Trading your own capital is a personal financial decision, made with full awareness of the risk

EARNING POTENTIAL (share only if asked, and never promise it)

Market context: The ranges below are general market salary bands for these roles in India and abroad, drawn from public industry data. They are shown for career context only and are not a promise or guarantee of income. Actual pay depends on your skills, experience, location, and the job market.
Early career roles: Rs 5-8 LPA (Junior Quant Analyst)
Growing roles: Rs 10-15 LPA (Algo Trader); Rs 15-25 LPA (Quant Developer)
Experienced roles: Rs 20-50+ LPA (Senior Quant Trader)
Freelance: Rs 2,000-10,000/hour consulting
International: $80k-300k+ USD based on location

COMMON QUESTIONS ABOUT THIS COURSE

For anything about cost, use PART 4 and RULE 1. Do not quote two regions.

Q: What does this trading automation course cover?
A: The systems half of quant trading, taught as engineering: Python for finance, technical and fundamental analysis in code, strategy design and rigorous backtesting, portfolio theory and risk-management systems, machine learning for trading, then connecting to broker APIs, paper trading, and building live systems with monitoring, logging, compliance awareness and safeguards. A finale month builds and paper-deploys a full automated system and sits the final exam. It is education, not financial advice.

Q: How long does it take to learn trading automation properly?
A: Ten months of teaching at 2 live classes a week plus 4 to 6 hours of practice, with two more months in hand for learners who need them. The three teaching phases build the skill and its real-world application; the finale month ships a capstone and sits the final exam.

Q: How am I assessed? Is the certificate just for attending?

A: No. Problem sets follow every class with written feedback, monthly reviews deliberately mix new material with earlier topics, each phase ends with a cumulative exam, and the course ends with a final exam: a practical build plus written questions from the whole syllabus. Passing earns the certificate; falling short earns focused revision and a free retest.

Q: Is this financial advice? Will I make guaranteed profits?
A: No, and be wary of anyone who says otherwise. This is an engineering and quantitative course: it teaches you to research, build, backtest and automate trading systems, not what to buy or a way to get rich. Markets carry real risk of loss, backtest results do not guarantee future returns, and we make no profit claims of any kind. What you gain is genuine, in-demand skill; what you do with real money afterwards is your own decision and your own risk.

Q: How is this different from your algorithmic trading course?
A: This course is the systems-and-execution half: how to take a strategy and run it reliably and safely through broker APIs, with monitoring, safeguards and production discipline. The algorithmic trading course is the research half: what to trade, why, and how to backtest it honestly. Many serious learners take both; that one makes you the researcher, this one makes you the systems engineer.

Q: Do I need finance or trading experience to start?
A: No. The markets knowledge and the maths you need are taught from the ground up. This course leans slightly more toward software engineering, so comfort with programming logic helps, but everything is taught step by step from the first class.

Q: Can I try a class before enrolling?
A: Yes, a free demo class with no commitment: book at learn.modernagecoders.com/contact or message us on WhatsApp at +91 91233 66161. (Agent note: the free demo is a waiting list with no fixed date. The Priority Live Demo is a guaranteed class today or tomorrow, booked at https://learn.modernagecoders.com/priority-demo . Offer both, as RULE 3 says.)

Q: Are classes live or recorded?
A: Live, always: small groups with a real instructor reading your actual code, never pre-recorded videos.

To enrol, message Shivam Sir on +91 9123366161 or send the parent this link: https://learn.modernagecoders.com/courses/algorithmic-trading-automation-masterclass
For a demo: the Priority Live Demo (guaranteed, today or tomorrow) is booked at https://learn.modernagecoders.com/priority-demo . The free demo is a waiting list with no fixed date.

==========

COURSE 130 OF 137: TYPESCRIPT COURSE: TYPED JAVASCRIPT, REACT AND NODE

==========

Course link: https://learn.modernagecoders.com/courses/complete-typescript-programming-masterclass-college
Subject area: Web Development
Designed for: College students
Who can join: Complete beginner (18+); college students, graduates and working professionals
Course length: 10-12 months (44-52 weeks)
Time needed: 2 live classes/week + 4-6 hours practice
Certificate: Certificate from Modern Age Coders, awarded on passing the final exam

PRICE FOR THIS COURSE (quote only the one that applies to the person asking)
In India, per month: group Rs 1,499, mini batch Rs 2,999, one to one Rs 4,999
In Canada, per month: group CAD 140, one to one CAD 210
Anywhere else, per month: group $100, one to one $150
Classes: group and mini batch two live classes a week, eight a month; one to one in India one live class a week, four a month; one to one outside India two live classes a week, eight a month. Each class is one hour.

WHAT THIS COURSE IS

TypeScript course for college students and professionals: JavaScript foundations, the type system to depth, then typed React and Node in 10-12 months.

In one line: The language modern teams actually write: JavaScript foundations, the type system as a superpower, then typed React and Node end to end.

ABOUT THE PROGRAMME

TypeScript won: new frontend and most serious Node work is written in it, and the type system, learned properly, is not bureaucracy but a superpower: bugs caught at compile time, refactors that stop being scary, editors that finish your thoughts. This live online masterclass builds it honestly: JavaScript foundations first (TypeScript is JavaScript underneath), then the type system to real depth, generics, narrowing, utility types, the honest limits, then typed application development: React with TypeScript the way product teams write it, and Node backends with types end to end. A finale month ships a full-stack typed capstone and sits the final exam. The pace is honest: ten teaching months at two live classes a week plus four to six hours of practice, with two more in hand. Problem sets,

monthly mixed reviews, phase exams, and a final exam that decides the certificate with a free retest.

WHAT MAKES THIS COURSE DIFFERENT

- JavaScript first, honestly: TypeScript without JS depth is decoration
- The type system as a skill: generics and narrowing understood, not copy-pasted
- Typed both ends: React and Node with types flowing end to end
- Real-team habits: strictness levels, migration judgment, when any is a lie
- An honest 10-month arc with 2 months in hand
- Real assessment: weekly problem sets, monthly mixed reviews, phase exams and a final exam with a free retest

THE LEARNING PATH, STEP BY STEP

Phase 1: Foundations (Months 1-3): JavaScript properly, then TypeScript fundamentals
Phase 2: Typed frontend (Months 4-6): React with TypeScript as product teams write it
Phase 3: Typed backend (Months 7-9): Node and Express with types end to end
Phase 4: The finale (Month 10): a full-stack typed capstone and the final exam

WHAT A STUDENT NEEDS BEFORE STARTING

Coding experience: None. Everything is taught from the first line
Equipment: Any computer with a stable internet connection; every tool used is free
Age: 18+; college students, graduates and working professionals
Time commitment: 2 live classes plus 4-6 hours of practice a week

WHO THIS COURSE IS FOR

Js developers: JavaScript developers making the move every team already made
College students: Students who want the hiring default, not the legacy path
Self taught: Tutorial-experienced learners ready for the discipline layer
Backend bound: Developers who want typed Node without the framework fog
Career switchers: Professionals entering web development at the modern baseline

FULL CURRICULUM, WEEK BY WEEK

This is the complete teaching plan. Parents can ask about any week.

PHASE 1: FOUNDATION & TYPESCRIPT FUNDAMENTALS (MONTHS 1-3, WEEKS 1-13)

Build rock-solid JavaScript and TypeScript fundamentals. Learn programming logic, master TypeScript syntax, type systems, and create your first applications.

Months 1-2: JavaScript & TypeScript Fundamentals (Weeks 1-7)

Introduction to Programming & JavaScript Basics

Topics:

- What is programming? Introduction to software development
- JavaScript ecosystem: browsers, Node.js, runtime environments
- Why TypeScript? Benefits over plain JavaScript
- Installing Node.js and npm package manager
- Setting up development environment: VS Code with TypeScript extensions
- Understanding IDE features: IntelliSense, debugging, extensions
- Your first JavaScript program: Hello World
- JavaScript program structure: statements, expressions
- Running JavaScript in browser console and Node.js
- Comments: single-line (//), multi-line (/* */), documentation
- JavaScript coding conventions and naming standards
- Console methods: log, error, warn, table
- Introduction to ECMAScript versions (ES6+)

Projects built:

- Hello World variations with personalized messages
- Simple output programs using console.log
- Personal information display program
- ASCII art generator in JavaScript
- Interactive greeting program

Practice: Daily: 30 min JavaScript syntax practice, write 5-10 simple programs

Variables, Data Types & Operators

Topics:

- Variables: var, let, const - differences and best practices
- Primitive data types: string, number, boolean, null, undefined, symbol, bigint
- Type coercion: implicit and explicit conversion
- typeof operator for type checking
- Template literals and string interpolation
- Numbers: integers, floats, Infinity, NaN
- Operators: arithmetic (+, -, *, /, %, **, ++, --)
- Relational operators: ==, ===, !=, !==, >, <, >=, <=
- Logical operators: &&, ||, !, nullish coalescing (??)

- Assignment operators: =, +=, -=, *=, /=, %=
- Bitwise operators: &, |, ^, ~, <<, >>, >>>
- Ternary operator: ? :
- Operator precedence and associativity
- Optional chaining operator (?.) and its uses

Projects built:
- Simple calculator (four basic operations)
- Temperature converter (Celsius, Fahrenheit, Kelvin)
- Age calculator with detailed output
- BMI calculator with health categories
- Currency converter with exchange rates
- Area and perimeter calculator for shapes
- Compound interest calculator

Practice: Solve 30 problems on variables, data types, and operators

Control Flow & Functions

Topics:
- Boolean expressions and truthy/falsy values
- If statement: single condition execution
- If-else statement: two-way branching
- If-else-if ladder: multiple conditions
- Nested if statements
- Switch statement: multi-way branching
- Switch with fall-through and break
- While loop: pre-tested loop
- Do-while loop: post-tested loop
- For loop: counter-based iteration
- For-of loop: iterating arrays/strings
- For-in loop: iterating object properties
- Break and continue statements
- Labeled statements for nested loops
- Function declarations and expressions
- Arrow functions: concise syntax
- Parameters, arguments, default parameters
- Rest parameters and spread operator
- Return statement and return values
- Function scope and hoisting

Projects built:
- Number guessing game with attempts limit
- Grade calculator with letter grades
- Even/odd checker and list generator
- Prime number checker and generator
- Multiplication table generator
- Factorial calculator (iterative and recursive)
- Fibonacci series generator
- Pattern printing (stars, numbers, pyramids)
- FizzBuzz challenge
- Menu-driven calculator
- Simple ATM simulation

Practice: Solve 40 control flow and function problems

Arrays, Objects & ES6+ Features

Topics:
- Arrays: declaration, creation, initialization
- Array indexing and accessing elements
- Array methods: push, pop, shift, unshift, splice
- Array iteration: forEach, map, filter, reduce
- Array methods: find, findIndex, some, every, includes
- Array sorting and reversing
- Spread operator with arrays
- Destructuring arrays
- Objects: creation and property access
- Object methods and 'this' keyword
- Object shorthand properties and methods
- Computed property names
- Object destructuring
- Spread operator with objects
- Object.keys(), Object.values(), Object.entries()
- JSON: parse and stringify
- Classes: declaration, constructor, methods
- Class inheritance: extends and super
- Static methods and properties
- Getters and setters

Projects built:
- Array statistics calculator (sum, average, min, max)
- Todo list with array operations
- Linear search and binary search implementation
- Sorting algorithms: bubble sort, selection sort
- Student grade management system
- Contact book with objects
- Shopping cart implementation

- Product inventory system
- Simple class-based game (Rock Paper Scissors)

Practice: Create 25 programs using arrays and objects, solve 30 problems

Month 3: TypeScript Core & Type System (Weeks 8-13)

TypeScript Fundamentals & Setup

Topics:

- Introduction to TypeScript: static typing benefits
- TypeScript vs JavaScript: key differences
- Installing TypeScript globally and locally
- tsconfig.json configuration file
- Compiler options: target, module, strict mode
- Basic types: string, number, boolean
- Type annotations and type inference
- Arrays with type annotations
- Tuple types for fixed-length arrays
- Enum types: numeric and string enums
- Any type: when and when not to use
- Unknown type: safe alternative to any
- Void, null, and undefined types
- Never type for unreachable code
- Type assertions: as and angle-bracket syntax
- Literal types: string, number, boolean literals
- Union types: combining multiple types
- Type narrowing and type guards

Projects built:

- Convert JavaScript projects to TypeScript
- Type-safe calculator application
- Enum-based status system
- Student management with typed objects
- Configuration manager with TypeScript
- Simple CLI tool with TypeScript

Practice: Convert 10 JavaScript programs to TypeScript with proper types

Interfaces, Type Aliases & Advanced Types

Topics:

- Interface declaration and usage
- Optional properties with ?
- Readonly properties
- Index signatures for dynamic properties
- Interface extending other interfaces
- Implementing interfaces in classes
- Type aliases with 'type' keyword
- Interface vs type alias: when to use which
- Intersection types: combining types with &
- Discriminated unions for type safety
- Type guards: typeof, instanceof, in operator
- User-defined type guards with 'is' keyword
- Nullable types and strict null checks
- Optional chaining with types
- Nullish coalescing with types
- Function types and signatures
- Call signatures in interfaces
- Function overloading in TypeScript

Projects built:

- Type-safe user management system
- Product catalog with interfaces
- API response types modeling
- Form validation with types
- State management with discriminated unions
- Plugin system with interface contracts
- Event system with typed events

Practice: Build 15 projects using interfaces and advanced types

Generics & Advanced TypeScript

Topics:

- Introduction to generics: type parameters
- Generic functions and type inference
- Generic interfaces
- Generic classes
- Generic constraints with extends
- Multiple type parameters
- Default type parameters
- Generic utility types: Partial, Required, Readonly
- Pick, Omit, Record utility types
- Extract, Exclude, NonNullable types
- ReturnType and Parameters utility types
- Conditional types with extends and infer
- Mapped types for transforming types
- Template literal types
- Keyof operator for type keys

```
        - Typeof operator in type context
        - Module systems: ES modules in TypeScript
        - Declaration files (.d.ts) basics
      Projects built:
        - Generic data structure library (Stack, Queue, LinkedList)
        - Type-safe API client with generics
        - Generic form handler
        - State container with generic types
        - Generic validation library
        - PHASE 1 MINI CAPSTONE: CLI Task Manager
        - Features: Tasks, categories, priorities, file persistence, full TypeScript typing
      Practice: Create 15 generic utilities, solve 30 generics problems
      Assessment: Phase 1 exam: a practical build defended live, plus a written paper mixing
      this phase with everything before it

----------------------------------------------------------------
PHASE 2: FRONTEND MASTERY WITH REACT & TYPESCRIPT (MONTHS 4-6, WEEKS 14-26)
----------------------------------------------------------------
Master modern frontend development with React, state management, testing, and build
production-ready user interfaces.

  Months 4-5: React Fundamentals & Advanced Patterns (Weeks 14-21)
    HTML, CSS & DOM Fundamentals
      Topics:
        - HTML5 semantic elements and structure
        - Forms, inputs, and validation attributes
        - CSS fundamentals: selectors, specificity, cascade
        - CSS Box Model and layout basics
        - Flexbox for one-dimensional layouts
        - CSS Grid for two-dimensional layouts
        - Responsive design with media queries
        - CSS custom properties (variables)
        - CSS animations and transitions
        - DOM manipulation: selecting elements
        - DOM events: click, submit, input, keyboard
        - Event delegation and bubbling
        - Creating and modifying DOM elements
        - Local Storage and Session Storage
        - Fetch API for HTTP requests
      Projects built:
        - Responsive portfolio website
        - Interactive form with validation
        - Todo app with DOM manipulation
        - Image gallery with lightbox
        - Weather app using Fetch API
        - Quiz application
        - Calculator with UI
        - Responsive navigation menu
      Practice: Build 10 interactive web pages with DOM manipulation
    React Fundamentals & JSX
      Topics:
        - Introduction to React: component-based architecture
        - TypeScript with Vite
        - Vite for React TypeScript projects
        - JSX syntax and expressions
        - Components: functional components
        - Props: passing data to components
        - TypeScript with React: typing props
        - Children prop and composition
        - Conditional rendering techniques
        - Lists and keys in React
        - Event handling in React
        - TypeScript event types
        - Styling: CSS modules, styled-components
        - Tailwind CSS with React
        - Component organization and file structure
      Projects built:
        - Hello World React app with TypeScript
        - Component library with props
        - Card component with typed props
        - Product listing page
        - Navigation component
        - Footer component
        - Button component variants
        - Simple landing page
      Practice: Build 15 reusable React components with TypeScript
    React Hooks & State Management
      Topics:
        - useState hook for local state
```

```
      - Typing useState with TypeScript
      - useEffect hook for side effects
      - Cleanup functions in useEffect
      - useRef hook for DOM references
      - useMemo for expensive calculations
      - useCallback for memoizing functions
      - useReducer for complex state logic
      - Typing useReducer actions and state
      - Custom hooks creation
      - Rules of hooks
      - useContext for prop drilling solution
      - Creating typed context providers
      - React.memo for component memoization
      - Performance optimization strategies
    Projects built:
      - Counter app with useState
      - Todo list with useReducer
      - Form handling with hooks
      - Data fetching with useEffect
      - Theme switcher with useContext
      - Custom useFetch hook
      - Custom useLocalStorage hook
      - Debounced search with useMemo
    Practice: Create 10 custom hooks with TypeScript
  Advanced React Patterns
    Topics:
      - Compound components pattern
      - Render props pattern
      - Higher-Order Components (HOCs)
      - Custom hooks vs HOCs vs render props
      - Controlled vs uncontrolled components
      - Form libraries: React Hook Form
      - Typing forms with TypeScript
      - Form validation with Zod
      - Error boundaries for error handling
      - Suspense for data fetching
      - React.lazy for code splitting
      - Portal for modals and tooltips
      - Forwarding refs with forwardRef
      - useImperativeHandle hook
      - Accessibility (a11y) in React
    Projects built:
      - Modal component with portals
      - Dropdown menu with compound components
      - Form with React Hook Form and Zod
      - Error boundary wrapper
      - Lazy loaded routes
      - Accessible form components
      - Tooltip component
      - Tabs component with compound pattern
    Practice: Implement all advanced patterns in projects
  React Router & Navigation
    Topics:
      - React Router v6 fundamentals
      - BrowserRouter and Route components
      - Link and NavLink for navigation
      - Route parameters and useParams
      - Query strings and useSearchParams
      - Nested routes and Outlet
      - Protected routes implementation
      - useNavigate for programmatic navigation
      - useLocation hook
      - Route guards and authentication
      - 404 and error pages
      - Code splitting with routes
      - Scroll restoration
      - Route transitions and animations
    Projects built:
      - Multi-page application with routing
      - Dashboard with nested routes
      - Protected admin routes
      - Blog with dynamic routes
      - E-commerce product pages
      - User profile with tabs
    Practice: Build 5 multi-page applications with React Router

Month 6: State Management & Testing (Weeks 22-26)
  Global State Management
    Topics:
```

    - State management overview and options
    - Redux Toolkit fundamentals
    - Creating slices with createSlice
    - Redux store configuration
    - useSelector and useDispatch hooks
    - TypeScript with Redux Toolkit
    - Async logic with createAsyncThunk
    - RTK Query for data fetching
    - Zustand: lightweight alternative
    - Zustand with TypeScript
    - Jotai: atomic state management
    - React Query/TanStack Query
    - Caching and background refetching
    - Optimistic updates
    - Comparing state management solutions
  Projects built:
    - Todo app with Redux Toolkit
    - Shopping cart with Redux
    - User authentication state
    - Data fetching with RTK Query
    - Blog with TanStack Query
    - Real-time dashboard with Zustand
    - Complex form with state management
  Practice: Implement state management in all previous projects
Testing React Applications
  Topics:
    - Testing pyramid: unit, integration, e2e
    - Jest testing framework setup
    - React Testing Library fundamentals
    - Rendering components for testing
    - Querying elements: getBy, findBy, queryBy
    - User event simulation
    - Testing forms and inputs
    - Testing async operations
    - Mocking API calls with MSW
    - Testing hooks with renderHook
    - Testing context providers
    - Snapshot testing
    - Code coverage reports
    - Cypress for E2E testing
    - Playwright introduction
  Projects built:
    - Test suite for component library
    - Form testing with user events
    - API mocking with MSW
    - E2E tests with Cypress
    - Integration tests for features
    - Accessibility testing
  Practice: Write tests for all React components, aim for 80%+ coverage
Build Tools & Performance
  Topics:
    - Webpack fundamentals and configuration
    - Vite: modern build tool
    - Environment variables management
    - Bundle analysis and optimization
    - Tree shaking for dead code elimination
    - Code splitting strategies
    - Lazy loading components and routes
    - Image optimization
    - React DevTools profiler
    - Performance measurement with Web Vitals
    - React.memo and useMemo optimization
    - Virtualization for long lists
    - Service workers basics
    - PWA fundamentals
    - Lighthouse audits
  Projects built:
    - Optimized production build
    - Bundle size optimization
    - Performance-optimized dashboard
    - Virtualized list component
    - PWA conversion of existing app
    - Image gallery with lazy loading
  Practice: Optimize all projects for production performance
UI Libraries & Design Systems
  Topics:
    - Component libraries overview
    - Material-UI (MUI) with TypeScript
    - Chakra UI fundamentals

- Ant Design components
- Headless UI for unstyled components
- Radix UI primitives
- Shadcn/ui component system
- Theme customization
- Design tokens and theming
- Dark mode implementation
- Responsive design patterns
- Animation libraries: Framer Motion
- Building design systems
- Storybook for component documentation
- Component documentation best practices

Projects built:
- Dashboard with MUI components
- Landing page with Chakra UI
- Custom design system
- Storybook documentation
- Animated page transitions
- Dark mode toggle implementation

Practice: Build 5 projects with different UI libraries

Phase 2 Capstone Project

Topics:
- Full frontend application architecture
- Component design and organization
- State management implementation
- Routing and navigation
- Form handling and validation
- API integration
- Testing strategy
- Performance optimization

Projects built:
- PHASE 2 CAPSTONE: E-commerce Frontend
- Features: Product catalog, cart, wishlist, user auth UI, checkout flow, responsive design, dark mode, comprehensive testing
- Alternative: Social Media Dashboard (posts, feeds, profiles, messaging UI)
- Alternative: Project Management Tool (boards, tasks, drag-drop, real-time updates)
- Alternative: Learning Platform Frontend (courses, progress, quizzes, video player)

Assessment: Phase 2 exam: a practical build defended live, plus a written paper mixing this phase with everything before it

---

PHASE 3: BACKEND ENGINEERING WITH NODE.JS & TYPESCRIPT (MONTHS 7-9, WEEKS 27-39)

Master server-side development with Node.js, Express, databases, REST APIs, authentication, and production deployment.

Month 7: Node.js & Express Fundamentals (Weeks 27-31)

Node.js Fundamentals

Topics:
- Node.js architecture: event loop, non-blocking I/O
- Node.js vs browser JavaScript
- npm and package.json management
- CommonJS vs ES modules in Node
- TypeScript setup for Node.js
- Built-in modules: fs, path, os, url
- File system operations: read, write, delete
- Streams and buffers
- Event emitter pattern
- Process and environment variables
- Child processes and workers
- Nodemon for development
- ts-node for TypeScript execution
- Debugging Node.js applications
- Error handling in Node.js

Projects built:
- File system CLI tool
- Directory watcher application
- Log file parser
- Simple HTTP server from scratch
- Stream-based file processor
- Environment config manager
- Task runner CLI

Practice: Build 10 Node.js utility scripts

Express.js Framework

Topics:
- Introduction to Express.js
- Express with TypeScript setup
- Routing: GET, POST, PUT, DELETE, PATCH
- Route parameters and query strings

    - Request and response objects
    - Middleware concept and implementation
    - Built-in middleware: json, urlencoded, static
    - Custom middleware creation
    - Error handling middleware
    - Router for modular routes
    - Request validation with express-validator
    - File uploads with Multer
    - CORS configuration
    - Helmet for security headers
    - Rate limiting with express-rate-limit
  Projects built:
    - Basic REST API server
    - User CRUD API
    - File upload service
    - API with validation
    - Middleware chain implementation
    - Logging middleware
    - Request timing middleware
  Practice: Build 8 Express APIs with proper middleware
REST API Design & Best Practices
  Topics:
    - REST architecture principles
    - Resource naming conventions
    - HTTP status codes usage
    - Request/response design
    - API versioning strategies
    - Pagination implementation
    - Filtering and sorting
    - HATEOAS principles
    - API documentation with Swagger/OpenAPI
    - TypeScript types for API contracts
    - Zod for runtime validation
    - Error response standardization
    - API testing with Postman/Insomnia
    - API testing with supertest
    - Contract-first API design
  Projects built:
    - RESTful Blog API
    - E-commerce Product API
    - API with Swagger documentation
    - Paginated list API
    - Filter and search API
    - API test suite with supertest
  Practice: Design and document 5 production-ready APIs
Database Fundamentals - SQL
  Topics:
    - Relational database concepts
    - SQL fundamentals: SELECT, INSERT, UPDATE, DELETE
    - WHERE, ORDER BY, LIMIT, OFFSET
    - JOINs: INNER, LEFT, RIGHT, FULL
    - Aggregations: COUNT, SUM, AVG, GROUP BY
    - Database design and normalization
    - Primary keys and foreign keys
    - Indexes for performance
    - PostgreSQL setup and usage
    - Node.js with pg driver
    - Connection pooling
    - Parameterized queries for security
    - Transactions in Node.js
    - Database migrations concept
    - SQL injection prevention
  Projects built:
    - User management with PostgreSQL
    - Blog with posts and comments
    - E-commerce products and orders
    - Library management system
    - Transaction-based banking API
    - Database migration scripts
  Practice: Build 8 database-connected applications
ORMs - Prisma & Drizzle
  Topics:
    - ORM concepts and benefits
    - Prisma setup and configuration
    - Prisma schema definition
    - Prisma Client for queries
    - CRUD operations with Prisma
    - Relations: one-to-one, one-to-many, many-to-many
    - Prisma migrations

- Prisma with TypeScript
- Drizzle ORM introduction
- Drizzle schema and queries
- Type-safe queries with Drizzle
- Raw SQL with ORMs
- Seeding databases
- ORM performance considerations
- Choosing between ORMs

Projects built:

- Blog API with Prisma
- User authentication with Prisma
- E-commerce backend with Prisma
- Multi-tenant application
- Complex relations example
- Database seeding scripts

Practice: Convert all SQL projects to use Prisma

Month 8: Production Backend: Observability, Security & Deployment (Weeks 32-36)

Authentication & Authorization

Topics:

- Authentication vs authorization
- Password hashing with bcrypt
- JWT (JSON Web Tokens) fundamentals
- Access tokens and refresh tokens
- JWT implementation in Express
- Passport.js authentication strategies
- Session-based authentication
- Cookie security: httpOnly, secure, sameSite
- Role-based access control (RBAC)
- Permission-based authorization
- OAuth 2.0 and OpenID Connect
- Social login: Google, GitHub, Facebook
- Two-factor authentication (2FA)
- Password reset flow
- Security best practices

Projects built:

- User registration and login API
- JWT authentication system
- Refresh token rotation
- Role-based API access
- OAuth social login
- Password reset with email
- 2FA implementation

Practice: Secure all APIs with authentication

NoSQL Databases - MongoDB

Topics:

- NoSQL database concepts
- MongoDB architecture and documents
- MongoDB Atlas cloud setup
- Mongoose ODM for Node.js
- Mongoose schemas and models
- TypeScript with Mongoose
- CRUD operations with Mongoose
- Mongoose middleware (hooks)
- Population for references
- Aggregation pipeline
- Indexing in MongoDB
- Schema validation
- Embedded vs referenced documents
- MongoDB transactions
- SQL vs NoSQL: when to use which

Projects built:

- Blog with MongoDB and Mongoose
- Social media posts API
- Real-time chat data model
- Analytics data storage
- Product catalog with nested data
- User activity tracking

Practice: Build 6 MongoDB-backed applications

Caching, Sessions & Real-time

Topics:

- Caching strategies overview
- Redis: in-memory data store
- Redis with Node.js (ioredis)
- Caching API responses
- Session storage with Redis
- Rate limiting with Redis
- Pub/Sub with Redis
- WebSocket fundamentals

- Socket.io for real-time communication
- TypeScript with Socket.io
- Real-time events and rooms
- Broadcasting messages
- Server-Sent Events (SSE)
- Long polling vs WebSocket
- Real-time architecture patterns

Projects built:
- Cached API responses
- Session management with Redis
- Real-time chat application
- Live notifications system
- Collaborative document editing
- Real-time dashboard updates
- Live auction system

Practice: Add real-time features to existing projects

Email, File Storage & External Services

Topics:
- Email sending with Nodemailer
- Email templates with EJS/Handlebars
- Transactional email services: SendGrid, Resend
- Queue-based email sending
- File storage strategies
- AWS S3 for object storage
- Cloudinary for image management
- File upload to cloud storage
- Image processing with Sharp
- PDF generation in Node.js
- Payment integration: Stripe
- Webhook handling
- Third-party API integration
- API rate limiting and retries
- Error handling for external services

Projects built:
- Email notification service
- Welcome email flow
- Password reset emails
- File upload to S3
- Image resize and optimization
- Payment checkout flow
- Invoice PDF generation

Practice: Integrate 5 external services

Testing Backend Applications

Topics:
- Backend testing strategies
- Unit testing with Jest
- Testing Express routes
- Supertest for HTTP testing
- Mocking database calls
- Integration testing setup
- Test database management
- Factory patterns for test data
- Testing authentication flows
- Testing async operations
- Code coverage for backend
- CI/CD testing pipeline
- Load testing with Artillery
- Performance testing basics
- End-to-end API testing

Projects built:
- Unit test suite for services
- Integration tests for APIs
- Authentication flow tests
- Database operation tests
- Load testing scripts
- CI/CD with automated tests

Practice: Write comprehensive tests for all APIs

Month 9: Production Backend: Observability, Security & Deployment (Weeks 37-39)

Logging, Monitoring & Observability

Topics:
- Logging best practices
- Winston logger configuration
- Pino for high-performance logging
- Log levels and formatting
- Structured logging (JSON)
- Request logging and tracing
- Application metrics with Prometheus
- Custom metrics collection

```
        - Health check endpoints
        - Error tracking with Sentry
        - APM (Application Performance Monitoring)
        - Distributed tracing basics
        - OpenTelemetry introduction
        - Monitoring dashboards
        - Alerting strategies
      Projects built:
        - Centralized logging setup
        - Metrics endpoint implementation
        - Health check system
        - Error tracking integration
        - Performance monitoring
        - Alerting rules configuration
      Practice: Add observability to all backend services
    Security & API Protection
      Topics:
        - OWASP Top 10 for Node.js
        - SQL/NoSQL injection prevention
        - XSS prevention strategies
        - CSRF protection
        - Security headers with Helmet
        - Input sanitization
        - Rate limiting implementation
        - API key management
        - Secrets management
        - Environment security
        - Dependency vulnerability scanning
        - npm audit and fixes
        - HTTPS and TLS
        - Content Security Policy
        - Secure file uploads
      Projects built:
        - Security-hardened API
        - Rate limiting system
        - API key authentication
        - Vulnerability scanning setup
        - Security audit checklist
        - Penetration testing basics
      Practice: Security audit all backend applications
    Docker & Deployment
      Topics:
        - Docker fundamentals
        - Dockerfile for Node.js apps
        - Multi-stage builds
        - Docker Compose for development
        - Container orchestration basics
        - Environment configuration
        - Deploying to VPS (DigitalOcean, Linode)
        - Process managers: PM2
        - Nginx reverse proxy
        - SSL certificates with Let's Encrypt
        - CI/CD with GitHub Actions
        - Deployment to Railway, Render
        - Zero-downtime deployments
        - Database backups
        - Production checklist
      Projects built:
        - Dockerized Node.js app
        - Docker Compose setup
        - CI/CD pipeline creation
        - VPS deployment
        - Nginx configuration
        - Automated deployments
      Practice: Deploy all applications to production
      Assessment: Phase 3 exam: a practical build defended live, plus a written paper mixing
      this phase with everything before it

---------------------------------------------------------------
PHASE 4: THE FINALE (MONTH 10, WEEKS 40-44)
---------------------------------------------------------------
The capstone month: spec, build, ship and defend, then the final exam that decides the
certificate.

  Month 10: Capstone and the Final Exam (Weeks 40-44)
    Capstone Spec and Setup
      Topics:
        - Choosing the capstone: a full-stack typed application with shared types end to end
        - A one-page spec: scope, milestones, stack
```

          - Repository and skeleton ready on day one
          - Instructor sign-off before the build begins
        Projects built:
          - Approved capstone spec plus the running skeleton, deployed where applicable
        Practice: Pitch the spec to the batch and absorb one hard question
      Capstone Build
        Topics:
          - Two focused weeks in vertical slices
          - Instructor checkpoints and honest scope cuts
          - Using the whole course: the type system, typed React, typed Node and shared contracts
          - Daily commits and an always-working build
        Projects built:
          - The capstone, feature-complete with version control
        Practice: A working build at the end of every session
      Ship and Polish
        Topics:
          - The finishing pass: edge cases, errors, documentation
          - Strict-mode clean: the compiler as your first reviewer
          - A README worth reading and a demo worth watching
          - A full-course spiral review before the exam
        Projects built:
          - The capstone shipped, documented and rehearsed
        Practice: Two mock demos, each tighter than the last
      Demo Day and the Final Exam
        Topics:
          - Presenting the capstone: live demo plus the hardest bug story
          - The honest map of next roads: frontend depth, backend engineering, or full-stack product work
          - Where our other courses continue the journey
        Projects built:
          - Demo day presentation delivered to the batch
        Assessment: FINAL EXAM: a practical build plus a written paper with questions mixed
        from every phase. Passing earns the certificate; falling short earns a focused revision
        plan and a free retest

PROJECTS THE STUDENT BUILDS AND KEEPS

  - Phase 1: JavaScript builds converted and hardened with types
  - Phase 2: typed React applications with real state and data
  - Phase 3: typed Node APIs with contracts the frontend shares
  - Phase 4: the full-stack typed capstone, strict-mode clean

  Total projects: 20+ real builds, crowned by a strict-mode-clean full-stack capstone

SKILLS THE STUDENT WILL HAVE AT THE END

  - JavaScript foundations solid enough to type
  - The type system to depth: generics, narrowing, utility types and honest limits
  - Typed React: props, state, hooks and data with the compiler on your side
  - Typed Node: APIs with contracts shared across the stack
  - Team habits: strictness judgment, migration strategy, review-quality types

HOW A TYPICAL WEEK IS SPLIT

  Live classes: 2 live one-hour classes per week, coding along with the instructor
  Homework: A problem set after every class, and a mixed-review assignment at the end of every
    month
  Practice: 4-6 hours of building between classes
  Review: Every submission reviewed with written feedback; recurring gaps reopened in class

SUPPORT INCLUDED

  Doubt support: WhatsApp doubt support between classes
  Progress updates: Honest monthly progress reviews: what is solid, what is wobbly, and the
    plan for the wobble

CERTIFICATION DETAIL

  Completion: Certificate from Modern Age Coders, awarded on passing the final exam. Fall short
    and there is focused revision and a free retest: the certificate certifies knowledge, not
    attendance

WHERE THIS CAN LEAD

  - Full-stack roles: TypeScript is the shared language of both ends now
  - Our React and full-stack courses pair naturally either side of this one
  - Backend depth: typed Node into production architectures
  - DSA for interviews, with types making practice cleaner

EARNING POTENTIAL (share only if asked, and never promise it)

Market context: The ranges below are general market salary bands for these roles in India and abroad, drawn from public industry data. They are shown for career context only and are not a promise or guarantee of income. Actual pay depends on your skills, experience, location, and the job market.
Early career roles: Rs 3-5 LPA (Junior Developer / Fresher)
Growing roles: Rs 5-10 LPA (Frontend Developer / React Developer); Rs 8-15 LPA (Full-Stack Developer)
Experienced roles: Rs 12-25 LPA (Senior Full-Stack Developer / Tech Lead); Rs 20-45 LPA (Lead Developer / Architect)
Freelance: Rs 1,500-6,000/hour based on expertise
International usa: $90k-200k USD (TypeScript Developer to Senior)
International europe: €55k-130k EUR based on country and experience

COMMON QUESTIONS ABOUT THIS COURSE

For anything about cost, use PART 4 and RULE 1. Do not quote two regions.

Q: What does this TypeScript course cover?
A: JavaScript foundations first (TypeScript is JavaScript underneath), the type system to real depth, generics, narrowing, utility types and their honest limits, then typed application development on both ends: React with TypeScript as product teams write it, and Node APIs with contracts the frontend shares. A finale month ships a strict-mode-clean full-stack capstone and sits the final exam.

Q: How long does it take to learn TypeScript properly?
A: Ten months of teaching at 2 live classes a week plus 4 to 6 hours of practice, with two more months in hand for learners who need them. The three teaching phases build the skill and its real-world application; the finale month ships a capstone and sits the final exam.

Q: How am I assessed? Is the certificate just for attending?
A: No. Problem sets follow every class with written feedback, monthly reviews deliberately mix new material with earlier topics, each phase ends with a cumulative exam, and the course ends with a final exam: a practical build plus written questions from the whole syllabus. Passing earns the certificate; falling short earns focused revision and a free retest.

Q: Should I learn JavaScript first, or start directly with TypeScript?
A: This course settles it: you learn JavaScript properly inside it, then add types. Starting with TypeScript syntax over weak JavaScript produces developers who fight the compiler; learning JS first then typing it produces developers the compiler helps. That order is the course.

Q: Can I try a class before enrolling?
A: Yes, a free demo class with no commitment: book at learn.modernagecoders.com/contact or message us on WhatsApp at +91 91233 66161. (Agent note: the free demo is a waiting list with no fixed date. The Priority Live Demo is a guaranteed class today or tomorrow, booked at https://learn.modernagecoders.com/priority-demo . Offer both, as RULE 3 says.)

Q: Are classes live or recorded?
A: Live, always: small groups with a real instructor reading your actual code, never pre-recorded videos.

To enrol, message Shivam Sir on +91 9123366161 or send the parent this link: https://learn.modernagecoders.com/courses/complete-typescript-programming-masterclass-college
For a demo: the Priority Live Demo (guaranteed, today or tomorrow) is booked at https://learn.modernagecoders.com/priority-demo . The free demo is a waiting list with no fixed date.

==========
COURSE 131 OF 137: VEDIC MATHS MASTERY: SPEED CALCULATION WITH ALL 16 SUTRAS
==========

Course link: https://learn.modernagecoders.com/courses/vedic-maths-course-speed-calculation-mastery
Subject area: Speed Mathematics
Designed for: Middle school
Who can join: Beginner friendly, ages 8 to adult
Course length: 6 months (24 weeks)
Time needed: 2 live classes/week + 20-30 minutes of drill practice most days
Certificate: Certificate from Modern Age Coders, awarded on passing the final assessment

PRICE FOR THIS COURSE (quote only the one that applies to the person asking)
In India, per month: group Rs 1,499, mini batch Rs 2,999, one to one Rs 4,999
In Canada, per month: group CAD 140, one to one CAD 210
Anywhere else, per month: group $100, one to one $150
Classes: group and mini batch two live classes a week, eight a month; one to one in India one live class a week, four a month; one to one outside India two live classes a week, eight a month. Each class is one hour.

WHAT THIS COURSE IS

Vedic maths course online with live classes: all 16 sutras for fast multiplication, squares, division and mental calculation. Ages 8 to adult, free demo class.

In one line: The same sums, done in a third of the time, with a method you can check.

ABOUT THE PROGRAMME

Vedic maths is a system of calculation shortcuts organised around 16 sutras, short working rules like Nikhilam (all from 9 and the last from 10) and Urdhva-Tiryagbhyam (vertically and crosswise). Used well, they turn sums like 97 x 96 or 998 squared into a few seconds of mental work. This 6-month live course teaches the system the way a maths teacher would: every shortcut is shown, practised against the clock, and then explained, because a student who knows why a trick works can trust it in an exam and adapt it when the numbers change. The course runs in one straight line: multiplication shortcuts first, because they pay off fastest, then squares and cubes, then division including the flag method, then fractions, decimals and percentages at speed, and finally the algebra applications of the same sutras. Week 1 starts with a timed diagnostic; week 24 ends with the same style of paper, so every student can see exactly how much faster and more accurate they have become. We are honest about what this course is: it makes arithmetic faster and frees up exam time. It does not replace school maths, and it will not turn anyone into a prodigy. It rewards steady drill, and we structure that drill for you.

WHAT MAKES THIS COURSE DIFFERENT

- Every shortcut comes with its reason: students see the algebra behind Nikhilam and the duplex method, so the rules stick instead of jumbling together
- Timed drills from week 1, with a personal speed log so progress is measured against your own diagnostic, not against a claim
- We teach judgement, not just tricks: which sutra fits which sum, and when the ordinary school method is actually the better choice
- Digit-sum checking is built in from the start, so speed never comes at the cost of accuracy
- Mixed-age friendly: the same system is drilled at school-exam pace for children and at competitive-exam pace for older students
- Live small-group classes where the teacher watches you calculate, catches bad habits early, and adjusts the drill sheets to your errors

THE LEARNING PATH, STEP BY STEP

Phase 1: The multiplication engine: complements, Nikhilam base multiplication, special patterns, then Urdhva-Tiryagbhyam for any numbers, all against the clock
Phase 2: Squares, cubes and roots with Yavadunam and the duplex method, then division three ways: Nikhilam, Paravartya and the flag method
Phase 3: Fractions, decimals and percentages at speed, the algebra applications of the sutras, and a timed capstone measured against the week 1 diagnostic

WHAT A STUDENT NEEDS BEFORE STARTING

Maths level: Comfortable addition and subtraction, and multiplication tables up to 10. That is genuinely all
Age: 8 to adult. Batches are grouped by age so drills run at the right pace
Equipment: A notebook, a pen, and a device with a camera and stable internet for live classes
Prior vedic maths: None expected. The course starts from the first sutra

WHO THIS COURSE IS FOR

School students: Students in classes 3 to 10 who lose exam time to slow arithmetic and want it back
Competitive exam aspirants: Older students preparing for arithmetic-heavy MCQ exams where a saved minute per section matters
Parents learning alongside: Adults who want to sharpen mental arithmetic, sometimes in the same batch as their child
Students who fear calculation: Children who understand concepts but freeze on big multiplications; the drills rebuild confidence with evidence
Maths enjoyers: Students who simply like numbers and want to know why the shortcuts work, not just that they do

FULL CURRICULUM, WEEK BY WEEK

This is the complete teaching plan. Parents can ask about any week.

PHASE 1: THE MULTIPLICATION ENGINE (MONTHS 1-2, WEEKS 1-8)

Multiplication shortcuts pay off fastest, so they come first: complements and base multiplication, the special patterns, then Urdhva-Tiryagbhyam for any two numbers.

Month 1: Complements and Base Multiplication (Weeks 1-4)

How the System Works: Complements

    Topics:
      - Timed diagnostic paper: 30 mixed sums, your before picture for the whole course
      - What the 16 sutras are and how this course walks through them
      - Nikhilam Navatashcaramam Dashatah: all from 9 and the last from 10
      - Instant subtraction from 100, 1000 and 10000 using complements
      - Left-to-right working: why Vedic methods read numbers the way we say them
      - Digit sums (Beejank) as a ten-second answer check
    Projects built:
      - Personal speed log opened: diagnostic scores recorded by sum type, to be updated all course
    Practice: 40 complement subtractions from 100, 1000 and 10000, target under 5 minutes
    with every answer digit-sum checked
  Nikhilam Multiplication Below the Base
    Topics:
      - Multiplying numbers just under 100: 97 x 96 in one line
      - The two-part answer: cross subtraction on the left, deficiency product on the right
      - Base 1000 and base 10: 988 x 997, 8 x 7 done the Nikhilam way
      - Handling carries when the right-hand part overflows
      - Why it works: the algebra of (base - a)(base - b), shown honestly
      - Spotting when a sum is close enough to a base for Nikhilam to be worth it
    Projects built:
      - One-page proof poster: a student's own explanation of why Nikhilam works, with one worked
        example per base
    Practice: 30 Nikhilam multiplications near 100 and 1000, target under 8 minutes, misses
    redone with the algebra written out
  Above the Base and Working Bases
    Topics:
      - Numbers just above the base: 104 x 103, 1002 x 1015
      - Mixed cases, one above and one below: 105 x 97 and the negative right-hand part
      - Vinculum digits: writing 98 as 100 minus 2 inside a calculation
      - Anurupyena, the working base idea: multiplying near 50, 200, 250 and 500
      - Choosing the base that makes the sum smallest
      - Speed drill technique: reading the sum, picking the method, then writing
    Projects built:
      - Worked set: 20 mixed base multiplications with the chosen base and method noted next to each
    Practice: 35 mixed above/below/working-base multiplications, target under 10 minutes,
    with the base choice justified for any five
  The Special Patterns
    Topics:
      - Ekadhikena Purvena: squares of numbers ending in 5, done in two seconds
      - Antyayordashake'pi: same start, last digits adding to 10, such as 43 x 47
      - Multiplying by 11 and by 12 with single-pass rules
      - Multiplying by 5, 25 and 50 as fractions of powers of 10
      - Pattern recognition drills: which of the five patterns fits, or none
      - Consolidation of month 1: complements, Nikhilam, working bases, patterns
    Projects built:
      - Pattern wall chart: all month 1 shortcuts on one sheet in the student's own words and
        examples
    Practice: 50-question pattern-spotting sheet mixing all month 1 techniques, target
    under 15 minutes
    Assessment: Month 1 speed check: timed mixed paper, scores logged against the week 1
    diagnostic

Month 2: Urdhva-Tiryagbhyam, Multiplication for Any Numbers (Weeks 5-8)
  Vertically and Crosswise: Two Digits
    Topics:
      - Urdhva-Tiryagbhyam for 2-digit x 2-digit: the three-step cross pattern
      - Where each part of the answer comes from, mapped to long multiplication
      - Carry discipline: keeping the running answer clean
      - One-line working: 34 x 72 without intermediate rows
      - Checking with digit sums after every sum, as a habit not an afterthought
      - When Nikhilam beats Urdhva-Tiryagbhyam and the reverse
    Projects built:
      - Cross-pattern diagram set: the student draws the crosswise structure for five sums before
        solving them
    Practice: 40 two-digit by two-digit crosswise multiplications, target under 12 minutes
    at 90 percent accuracy
  Three Digits and Mixed Sizes
    Topics:
      - The five-step cross pattern for 3-digit x 3-digit
      - Mixed sizes: 3-digit x 2-digit by padding with a zero
      - Managing bigger carries without losing the thread
      - Writing less: moving from full working to compact working
      - Common crosswise errors and how the digit-sum check catches them
      - Speed strategy: which digit pairs to multiply first
    Projects built:
      - Worked set: 15 three-digit crosswise multiplications with compact working shown
    Practice: 25 three-digit crosswise multiplications, target under 15 minutes, every
    answer digit-sum checked
  Taking It Mental

      Topics:
        - Dropping the pen: holding the cross pattern in your head for 2-digit sums
        - Chunking: multiplying 68 x 7 as 60 x 7 plus 8 x 7, said aloud
        - Doubling and halving: 16 x 35 as 8 x 70
        - Multiplying by 125, 75 and 15 through fraction thinking
        - Estimation first: knowing roughly what the answer must be before starting
        - Building a personal mental-maths warm-up routine
      Projects built:
        - Mental drill routine card: a 5-minute daily warm-up the student designs and follows
      Practice: Daily 5-minute no-paper drills: 20 two-digit multiplications spoken or typed,
      streaks recorded in the speed log
    Speed Lab One
      Topics:
        - Full multiplication mix under exam timing: patterns, bases, crosswise, mental
        - Error triage: was it method choice, a carry slip, or rushing
        - Reading your speed log: what actually got faster since week 1
        - Accuracy floors: why we never trade below 90 percent accuracy for speed
        - Personal weak-spot drill sheets, built from your own error log
        - Setting the phase 2 targets with the teacher
      Projects built:
        - Speed lab paper one: a timed 60-question multiplication paper, marked and logged the same day
      Practice: Redo every speed lab miss untimed with full working, then a second
      20-question timed set on just those types
      Assessment: Phase 1 milestone: timed multiplication paper compared line by line with
      the week 1 diagnostic

PHASE 2: SQUARES, CUBES AND DIVISION (MONTHS 3-4, WEEKS 9-16)

Powers and roots with Yavadunam and the duplex method, then the part most courses skip:
division done three ways, including Tirthaji's general flag method.

  Month 3: Squares, Cubes and Roots (Weeks 9-12)
    Squares Near a Base
      Topics:
        - Yavadunam: squaring by deficiency, 98 squared in one line
        - Squaring just above the base: 104 squared, 1012 squared
        - Working bases again: 48 squared using base 50
        - The algebra behind it: (base + d) squared, expanded and matched to the rule
        - Squares of numbers ending in 5 revisited and extended to 3 digits
        - Choosing between Yavadunam and the ending-in-5 rule
      Projects built:
        - Worked set: squares of every number from 91 to 109 by the fastest route, method noted for
          each
      Practice: 30 near-base squares across bases 50, 100, 500 and 1000, target under 10
      minutes
    The Duplex Method: Any Square
      Topics:
        - The duplex (Dwandwa) of a number: definition and drill
        - Squaring any 2-digit number with duplexes
        - Squaring 3-digit numbers: the five duplex terms in order
        - Keeping carries straight in duplex work
        - Duplex squares against near-base squares: picking the faster tool
        - Digit-sum checking squares, including the common square-check traps
      Projects built:
        - Duplex table: the student builds a reference table of duplexes for 1 to 3 digit forms with
          examples
      Practice: 25 general squares of 2 and 3 digit numbers by duplex, target under 12
      minutes at 90 percent accuracy
    Square Roots and Cube Patterns
      Topics:
        - Square roots of perfect squares: pairing digits and reading the first digit
        - Last-digit analysis: which digits can end a perfect square and what they tell you
        - Deciding between the two candidate roots quickly
        - Cubes near a base: 98 cubed and 102 cubed by the Nikhilam-style rule
        - The proportional (Anurupyena) cube rule for 2-digit numbers
        - Recognising perfect squares and cubes on sight
      Projects built:
        - Root-finder sheet: 20 perfect squares up to 5 digits, roots found and verified by squaring
          back
      Practice: 20 square roots of perfect squares and 10 near-base cubes, target under 15
      minutes
    Cube Roots and the Powers Checkpoint
      Topics:
        - Cube roots of perfect cubes up to 6 digits from the two ends
        - Why cube last digits are honest: the 0 to 9 cube-ending map
        - Mixed powers drill: squares, cubes and roots on one sheet
        - Where powers shortcuts show up in school exams and MCQ papers
        - Month 3 consolidation: one method chart for all powers work

- Speed log review: powers section opened and baselined
Projects built:
- Powers method chart: every squares, cubes and roots technique on one page with a worked example each
Practice: Mixed 40-question powers paper covering all month 3 techniques, target under 18 minutes
Assessment: Month 3 milestone: timed powers paper, results logged and weak types tagged for drilling

Month 4: Division Three Ways (Weeks 13-16)
Nikhilam Division
Topics:
- Dividing by 9: the pattern that starts the whole method
- Nikhilam division with divisors just below a base: 89, 98, 888
- Quotient and remainder columns, and moving carries between them
- When the remainder column overflows and how to fix it
- Why it works: complements doing subtraction's job in division
- Speed comparison against long division on the same sums
Projects built:
- Side-by-side set: 10 divisions worked both by long division and Nikhilam with times recorded for each
Practice: 25 Nikhilam divisions with divisors near 10, 100 and 1000, target under 12 minutes
Paravartya: Transpose and Apply
Topics:
- Paravartya Yojayet for divisors just above a base: 12, 112, 1023
- Transposing digits: turning the divisor's excess into negative multipliers
- Working with negative intermediate digits without panic
- Nikhilam or Paravartya: reading the divisor and choosing in two seconds
- Remainder checks with digit sums
- The algebra behind Paravartya, shown for divisor 12
Projects built:
- Choice drill sheet: 20 divisions labelled Nikhilam or Paravartya before solving, choices reviewed in class
Practice: 25 Paravartya divisions with divisors near 10, 100 and 1000, target under 14 minutes
Straight Division: The Flag Method
Topics:
- Dhvajanka, the flag digit: general division for any divisor
- Setting up the flag: splitting the divisor into main digit and flag
- The subtract-and-divide rhythm, worked slowly then at pace
- Two-digit flags for harder divisors
- Decimal answers: continuing the division past the point
- Why the flag method matters: one method that always works
Projects built:
- Worked set: 12 flag-method divisions including two carried to three decimal places
Practice: 20 flag-method divisions with mixed divisors from 13 to 87, target under 20 minutes
Divisibility and Speed Lab Two
Topics:
- Divisibility tests for 2 through 12, consolidated and drilled
- Osculation: Ekadhikena-based tests for 7, 13, 19 and other awkward primes
- Remainder thinking: Navashesh checks for division answers
- Full division mix under time: Nikhilam, Paravartya, flag, divisibility
- Error triage on division work
- Phase 3 targets set with the teacher
Projects built:
- Speed lab paper two: a timed 50-question powers and division paper, marked and logged the same day
Practice: Redo all speed lab misses untimed, then 15 divisibility questions on primes 7, 13 and 19 by osculation
Assessment: Phase 2 milestone: timed powers and division paper, logged against months 3 and 4 baselines

---
PHASE 3: FRACTIONS, ALGEBRA AND THE CAPSTONE (MONTHS 5-6, WEEKS 17-24)

The system applied where exams actually spend marks: fractions, decimals and percentages at speed, the algebra behind the sutras, and a timed capstone measured against week 1.

Month 5: Fractions, Decimals and Percentages at Speed (Weeks 17-20)
Recurring Decimals the Short Way
Topics:
- Ekadhikena Purvena on fractions: 1/19 written out in seconds
- The one-more-than-the-previous multiplier, forwards and backwards
- 1/7 and the cyclic pattern family
- Auxiliary fractions: converting awkward denominators before dividing
- Terminating or recurring: reading the denominator to know in advance
- Where recurring-decimal questions appear in school papers

Projects built:
- Decimal expansion chart: 1/7, 1/13, 1/17, 1/19 expanded by sutra and verified by flag division

Practice: 15 recurring-decimal expansions by the Ekadhikena method, each verified against straight division

Fraction Arithmetic Without the Grind

Topics:
- Adding and subtracting fractions crosswise, no LCM hunt for two terms
- When the LCM is still worth finding, honestly
- Comparing fractions instantly by cross multiplication
- Multiplying and dividing mixed numbers with vinculum thinking
- Simplifying early: spotting common factors before multiplying
- Fraction chains: working three-term expressions left to right

Projects built:
- Worked set: 20 fraction additions and comparisons done crosswise with times against the textbook method

Practice: 30 mixed fraction operations, target under 15 minutes, five of them written both ways to compare

Percentages and Ratio Shortcuts

Topics:
- Percentages as fractions: the 12.5 percent equals one-eighth family
- Flipping the sum: 8 percent of 50 as 50 percent of 8
- Percentage change chains done mentally
- Ratio splitting at speed for word problems
- Profit, loss and simple interest set up as one-line calculations
- Estimation guards: catching a wrong percentage before it costs marks

Projects built:
- Percent-fraction equivalence card: the conversion table every student memorises, self-tested twice

Practice: 40 mental percentage and ratio questions, target under 12 minutes, no written working allowed

Decimals and Speed Lab Three

Topics:
- Multiplying decimals with base methods: 9.8 x 9.7 via 98 x 97
- Placing the decimal point by estimation, not rules memorised blind
- Dividing decimals with the flag method
- Mixed arithmetic under time: the full toolkit on one paper
- Error triage across fraction, decimal and percentage work
- Month 5 consolidation chart

Projects built:
- Speed lab paper three: a timed 50-question fractions, decimals and percentages paper, marked and logged

Practice: Redo all speed lab misses untimed, then a 20-question timed set on your two weakest question types

Assessment: Month 5 milestone: timed mixed arithmetic paper, logged against the phase baselines

Month 6: Algebra Applications and the Speed-Test Capstone (Weeks 21-24)

The Sutras Meet Algebra

Topics:
- Urdhva-Tiryagbhyam on binomials: (x + 3)(x + 7) crosswise
- Multiplying larger polynomials by the same cross pattern
- Paravartya for dividing polynomials by (x - a)
- The connection made explicit: the arithmetic sutras were algebra all along
- Checking polynomial products with substitution
- Where this helps in school algebra chapters

Projects built:
- Bridge sheet: five arithmetic shortcuts and their algebraic twins worked side by side

Practice: 20 polynomial multiplications and 10 Paravartya polynomial divisions, checked by substitution at x equals 2

Equations at Speed

Topics:
- Sunyam Samyasamuccaye: spotting when a common factor makes the answer zero
- One-line solutions to equation types that usually take five lines
- Simultaneous equations by cross-multiplication patterns
- Anurupye Sunyamanyat: proportional coefficients and what they force
- Recognising equation types on sight before solving
- Honest limits: equations where the shortcuts do not apply

Projects built:
- Equation type-spotting sheet: 15 equations sorted by fastest method before any solving

Practice: 25 equations mixing shortcut types and standard types, with the method named before each solution

Choosing the Right Tool

Topics:
- Method triage: 40 mixed questions, decide the method in five seconds each
- Exam mapping: where each technique saves time in school and MCQ papers
- Where standard methods win and showing full working is required
- Building your personal shortcut handbook: what goes in, what gets dropped
- Mock speed test under full exam conditions

- Reviewing the mock: method choices, not just answers
Projects built:
- Personal shortcut handbook draft: every technique the student actually uses, in their own words and examples
Practice: Full 60-question mock speed test under timing, then a written half-page on your three best method choices

The Capstone Speed Test
Topics:
- Final timed paper: same structure as the week 1 diagnostic, full toolkit allowed
- Before and after: reading your speed log across all 24 weeks
- Accuracy audit: error rate then versus now
- Finishing the shortcut handbook: the take-away artifact of the course
- Keeping the speed: a 10-minute weekly maintenance routine
- Where to go next: exam-prep courses that use these skills daily
Projects built:
- Capstone speed test with a written before-and-after comparison against the week 1 diagnostic
- Finished personal shortcut handbook, reviewed by the teacher
Practice: Design your own maintenance drill sheet and run it once; bring the timing to the final class
Assessment: Course milestone: capstone speed test and handbook review, plus course-completion certificate review

PROJECTS THE STUDENT BUILDS AND KEEPS

- Personal speed log kept for all 24 weeks, from diagnostic to capstone
- One-page proof poster explaining why Nikhilam multiplication works
- Pattern wall chart of every month 1 shortcut in the student's own words
- Duplex reference table built by the student for general squares
- Side-by-side division sets timing Vedic methods against long division
- Decimal expansion chart for the awkward sevenths and nineteenths
- Percent-fraction equivalence card, memorised and self-tested
- Bridge sheet connecting five arithmetic sutras to their algebra twins
- Personal shortcut handbook: the student's complete method reference, finished in week 24
- Capstone speed test with a written before-and-after comparison

Total projects: 10+ artifacts, from a week 1 speed log to a complete self-written shortcut handbook

SKILLS THE STUDENT WILL HAVE AT THE END

- Base multiplication with Nikhilam, working bases and the special patterns
- General multiplication with Urdhva-Tiryagbhyam, on paper and mentally
- Squares, cubes and roots with Yavadunam, the duplex method and end-digit analysis
- Division by Nikhilam, Paravartya and the flag method, plus osculation divisibility tests
- Fractions, recurring decimals and percentages at exam speed
- Digit-sum checking as a permanent accuracy habit
- Method triage: reading a question and picking the fastest honest route

HOW A TYPICAL WEEK IS SPLIT

Live classes: 2 live one-hour classes per week, with timed drills done together in class
Practice: 20-30 minutes of drill sheets most days; short daily practice beats long weekend sessions for speed work
Review: Drill sheets reviewed with error triage: every miss classified as method, carry or rush, and drilled accordingly
Homework: A task or problem set after every class, and a monthly mixed-review assignment that deliberately folds in earlier topics

SUPPORT INCLUDED

Doubt support: WhatsApp doubt support between classes, so a stuck technique never waits a week
Progress updates: Regular progress notes to parents with the speed log attached: what got faster, what needs drilling

CERTIFICATION DETAIL

Completion: Certificate from Modern Age Coders, awarded on passing the final assessment. Fall short and there is focused revision and a free retest: the certificate certifies real learning, not attendance

WHERE THIS CAN LEAD

- Faster arithmetic that pays off directly in school maths exams from class 4 upward
- A head start for competitive-exam arithmetic sections, where calculation speed buys thinking time
- Natural progression to our school maths and exam-prep courses, with calculation no longer the bottleneck
- A strong base for algebra, since Urdhva-Tiryagbhyam and Paravartya reappear there directly
- For adults: everyday numeracy, from splitting bills to sense-checking figures at work

COMMON QUESTIONS ABOUT THIS COURSE

For anything about cost, use PART 4 and RULE 1. Do not quote two regions.

Q: What is Vedic maths, honestly?
A: It is a system of 16 sutras, short calculation rules, compiled by Bharati Krishna Tirthaji and published in 1965. Historians debate how ancient the system really is, and we say so in class, because the techniques stand on their own: they are fast, they are checkable, and every one of them has ordinary algebra underneath. We teach the methods and the algebra, not the mythology.

Q: Will this replace my child's school maths?
A: No, and it should not. School maths teaches concepts and requires standard working in answers; this course makes the arithmetic inside those answers faster and more accurate. We explicitly teach when to use a shortcut, when to show the standard method, and how to use digit-sum checks on both. Think of it as removing the calculation bottleneck from maths a student is already learning.

Q: Does Vedic maths actually help in competitive exams?
A: It helps with one specific thing: calculation speed in arithmetic-heavy sections, which frees minutes for the questions that need real thought. It does not teach exam concepts, shortcuts for reasoning, or anything a syllabus tests directly. Students preparing for MCQ exams tend to feel the benefit most in percentages, fractions and multiplication-heavy questions, which is exactly where phase 3 of this course spends its time.

Q: Will this course make my child a genius or a human calculator?
A: No, and we would rather tell you that upfront. What steady practice on this course produces is documented in each student's speed log: the same kinds of sums done faster and with fewer errors than in week 1. That is a real, useful, measurable gain. Claims beyond that, about IQ or brain development, are not ones we make.

Q: What age is right for this course?
A: We take students from age 8, once multiplication tables are reasonably solid, and there is no upper limit; adults join to sharpen mental arithmetic, sometimes in the same house as an enrolled child. Batches are grouped by age so an 8-year-old drills at a different pace from a 16-year-old preparing for entrance exams.

Q: How is Vedic maths different from abacus classes?
A: Abacus training builds mental arithmetic through a physical tool and bead visualisation, and it works best when started young, roughly ages 5 to 10. Vedic maths is paper-and-head arithmetic built on algebraic patterns, so it suits any age that knows its tables and extends naturally into algebra. Younger children often do abacus first and Vedic maths later; we run both and will honestly tell you which fits your child.

Q: My child already struggles with maths. Is a speed course a bad idea?
A: Often it is the opposite, with one condition: the struggles must be with calculation, not with concepts. A child who understands what multiplication means but dreads big numbers usually gains confidence quickly here, because the methods are short and the progress is visible in their own log. If the gaps are conceptual, we will say so after the demo class and point you to our school maths courses instead.

Q: How am I assessed, and is the certificate just for showing up?
A: No. A task follows every class with feedback, monthly reviews deliberately mix new material with earlier topics so nothing is forgotten, and the course ends with a final exam covering the whole course. Passing earns the certificate; falling short earns focused revision and a free retest. We measure real learning, not attendance.

Q: Can we try a class before enrolling?
A: Yes, the first demo class is free and carries no obligation. Book it at learn.modernagecoders.com/contact or message us on WhatsApp at +91 91233 66161. Parents are welcome to sit in, and the teacher will give you a straight opinion on whether this course or a school maths course is the better fit.

To enrol, message Shivam Sir on +91 9123366161 or send the parent this link: https://learn.modernagecoders.com/courses/vedic-maths-course-speed-calculation-mastery
For a demo: the Priority Live Demo (guaranteed, today or tomorrow) is booked at https://learn.modernagecoders.com/priority-demo . The free demo is a waiting list with no fixed date.

==========
COURSE 132 OF 137: VIBE CODING FOR COLLEGE: FULL STACK, AI & DSA (AGES 18+)
==========

Course link: https://learn.modernagecoders.com/courses/vibe-coding-for-college-fullstack-ai-dsa-career-course
Subject area: College-Level Software Engineering
Designed for: College students
Who can join: Intermediate to Advanced (Ages 18+ / College Students)
Course length: 3 months (12 weeks)

Time needed: 10-15 hours/week
Certificate: Vibe Coder, College Level Full Stack & AI Engineer Certification

PRICE FOR THIS COURSE (quote only the one that applies to the person asking)
  In India, per month: group Rs 1,499, mini batch Rs 2,999, one to one Rs 4,999
  In Canada, per month: group CAD 140, one to one CAD 210
  Anywhere else, per month: group $100, one to one $150
  Classes: group and mini batch two live classes a week, eight a month; one to one in India one live class a week, four a month; one to one outside India two live classes a week, eight a month. Each class is one hour.

WHAT THIS COURSE IS

  Live online vibe coding course for college students 18+: master the MERN stack, DSA, machine learning and system design, crack tech placements and internships.

  In one line: From Student to Software Engineer, Ship Real Code, Ace Interviews, Land the Offer.

ABOUT THE PROGRAMME

  Vibe Coding for College is the most comprehensive 3-month software engineering program for college students and fresh graduates aged 18+. 'Vibe Coding', coined by AI pioneer Andrej Karpathy in 2025, means building software by describing what you want in natural language and letting AI generate the code. In 2026, this has evolved into 'agentic engineering', orchestrating multiple AI agents to build production-grade software at startup speed. This course teaches you both: deep engineering fundamentals AND professional-grade AI development tools. You will master the MERN stack using Cursor IDE (the #1 AI code editor), accelerate development with Claude Code (Anthropic's terminal-based AI engineer), prototype at speed with Lovable and Bolt.new, and ship code with GitHub Copilot as your AI pair programmer. You'll also dive deep into DSA for placements, build ML projects, and learn System Design. But here's what separates great vibe coders from prompt-copy-pasters: understanding the code AI generates. That's why we teach you to be a developer FIRST and a vibe coder SECOND, so you can review, debug, secure, and scale what AI builds for you. Studies show 45% of AI-generated code contains security vulnerabilities (OWASP Top 10). We teach you to catch them. At Modern Age Coders, we've placed students at top tech companies. Our curriculum is designed by engineers from FAANG-adjacent companies who know exactly what interviews look for and what internships demand of you from day one.

WHAT MAKES THIS COURSE DIFFERENT

  - Industry-grade curriculum, same tools used at Google, Amazon, and top startups
  - Professional vibe coding tools: Cursor IDE, Claude Code, Windsurf, GitHub Copilot
  - AI app builders for rapid prototyping: Lovable, Bolt.new, v0.dev, Replit Agent
  - Learn to BUILD with AI AND REVIEW what AI builds, security-aware development
  - MERN Stack mastery, the most in-demand full-stack for 2026 hiring
  - DSA preparation integrated throughout, not an afterthought
  - Machine Learning with Python, scikit-learn, TensorFlow fundamentals
  - System Design basics, asked in every senior/product company interview
  - Agentic engineering workflows, orchestrating AI agents for multi-step development tasks
  - Real project deployment on cloud (AWS EC2 / Render / Vercel)
  - Code reviews by industry-experienced mentors (including AI-generated code review)
  - Placement preparation: mock interviews, resume reviews, LinkedIn optimization
  - Access to Modern Age Coders alumni network of placed students
  - Open-source contribution guidance, building a credible GitHub

THE LEARNING PATH, STEP BY STEP

  Phase 1: MERN Vibes (Weeks 1-4): MongoDB, Express.js, React.js, Node.js, build full-stack apps with Cursor IDE, GitHub Copilot & Claude Code
  Phase 2: DSA & ML Vibes (Weeks 5-8): Data Structures, Algorithms, Python ML, model deployment + vibe coding rapid prototyping with Lovable & Bolt.new
  Phase 3: Career Vibes (Weeks 9-12): System Design, agentic engineering, security for AI-generated code, Capstone, placement prep, professional launch

WHAT A STUDENT NEEDS BEFORE STARTING

  Education: College student (any year) or recent graduate, any branch welcome
  Coding experience: Familiarity with at least one programming language (Python, Java, C++, or JavaScript)
  Web basics: Basic understanding of HTML/CSS (completing Vibe Coding for Teens is ideal but not required)
  Equipment: Computer/laptop (Windows, Mac, or Linux) with stable internet
  Time commitment: 10-15 hours per week, this is an intensive program
  Motivation: Serious about building a career in software engineering

WHO THIS COURSE IS FOR

  Cs students: CS/IT/MCA students preparing for campus placements and off-campus hiring
  Non cs engineers: Engineering students from any branch (Mech, Civil, EE) switching to tech

careers
Career switchers: Recent graduates wanting to break into software development
Dsa preparation: Students who need structured DSA preparation for product company interviews
Startup founders: Aspiring founders who want to build their own MVPs at startup speed with AI tools
Freelancers: Students who want to earn through freelance full-stack development while studying

FULL CURRICULUM, WEEK BY WEEK

This is the complete teaching plan. Parents can ask about any week.

PHASE 1: MERN VIBES, FULL STACK WEB DEVELOPMENT (WEEKS 1-4)

Phase 1 builds you into a full-stack MERN developer. You'll master both the frontend (React) and backend (Node.js + Express + MongoDB), learn professional API design, authentication, and deploy your first production-level web application.

Week 1: JavaScript Mastery, Node.js & Your AI Development Toolkit

Topics:

- What is Vibe Coding?, Andrej Karpathy's 2025 concept 2026's 'agentic engineering' evolution
- The professional vibe coding workflow: Intent Spec Prompt Generate Review Iterate Ship
- Setting up Cursor IDE, your primary AI-powered development environment
- Cursor Composer & Agent mode, multi-file AI development across your entire codebase
- Setting up GitHub Copilot (free for students), inline AI completions and chat
- Introduction to Claude Code, terminal-based AI that understands your full project
- Windsurf IDE overview, Cascade agent and SWE-1.5 model for lightning-fast completions
- Advanced JavaScript: ES6+ features, destructuring, spread/rest, optional chaining
- Asynchronous JavaScript: callbacks, promises, async/await deep dive
- Event loop and JavaScript's single-threaded model explained
- Node.js architecture, non-blocking I/O, the event loop in Node
- Express.js setup and first REST API, hand-coded, then rebuilt with Cursor Composer
- RESTful API design principles, GET, POST, PUT, DELETE semantics
- Comparing hand-coded vs AI-generated Express APIs, reviewing what AI produces
- Environment variables, nodemon, and development tooling

Projects built:

- Products REST API, CRUD operations for a product catalog (in-memory, no DB yet)
- URL Shortener API, shorten URLs and redirect, stored in memory
- News Aggregation Proxy, fetch and forward data from a public news API

Practice: Build a small Node.js CLI utility in Cursor, then run one Composer multi file refactor and review the diff line by line before committing.

Week 2: MongoDB & Database Design, Persistent, Scalable Data

Topics:

- SQL vs. NoSQL, when to use each, MongoDB's document model
- MongoDB Atlas setup, cloud database in 5 minutes
- CRUD operations with MongoDB shell and Compass
- Mongoose ODM, schemas, models, and data validation
- Schema design: embedded vs. referenced documents
- Population, joining documents across collections
- Indexes for performance, understanding query plans
- Aggregation pipeline, complex data transformations
- Pagination and sorting on large datasets
- Data validation with Joi / Zod
- Seeding databases with realistic test data
- Connecting MongoDB Atlas to your Express app securely

Projects built:

- Blogging Platform API, full CRUD for posts, with categories, tags, and pagination
- Student Records System, schema design with references between students, courses, grades
- E-Commerce Product Catalog, categories, variants, stock tracking in MongoDB

Practice: Design a Mongoose schema for a blog with users, posts and comments, seed it on Atlas and run every CRUD operation from a script.

Week 3: React.js, Modern Frontend Development

Topics:

- React fundamentals: JSX, components, props, and the virtual DOM
- State management with useState, reactive UI basics
- useEffect, side effects, data fetching, and cleanup
- Component composition, building UIs from small, reusable pieces
- Conditional rendering and list rendering with keys
- Event handling in React, forms, clicks, input controlled components
- React Router v6, client-side navigation and nested routes
- Custom hooks, extracting and reusing complex logic
- Context API, sharing state without prop drilling
- React Query / TanStack Query, server state management
- Tailwind CSS with React, rapid, utility-first styling
- v0.dev, generating polished React/Next.js components from text descriptions
- Vibe coding React components: using Cursor Composer to scaffold entire features

- Reading and reviewing AI-generated React code, catching anti-patterns
- Performance: React.memo, useMemo, useCallback, when and why

Projects built:
- Task Management Dashboard, Kanban-style board with drag and React state
- Movie Browser, fetches TMDB API, search, filter, detailed movie pages
- Expense Tracker, add/categorize/delete expenses, charts with Chart.js

Practice: Build a searchable product list in React with useState, useEffect data fetching and correct list keys, then deploy it to a free host.

Week 4: Full MERN, Authentication, Authorization & Deployment

Topics:
- User authentication, registration, login, logout flows
- Password hashing with bcrypt, never store plain text passwords
- JWT (JSON Web Tokens), stateless authentication explained
- Protected routes, both API endpoints and React pages
- Role-based access control (RBAC), admin vs. user permissions
- Connecting React frontend to Express backend across environments
- CORS configuration, handling cross-origin requests
- HTTP-only cookies for secure token storage
- File uploads with Multer and Cloudinary / AWS S3
- Rapid prototyping with Lovable, build a full-stack MVP by chatting with AI
- Bolt.new for speed: idea deployed app in under 30 minutes
- Understanding what AI app builders generate vs. what you need to customize
- Deploying backend on Render (with MongoDB Atlas)
- Deploying React frontend on Vercel
- CI/CD basics with GitHub Actions, auto-deploy on push

Projects built:
- Full-Stack Social Notes App, register/login, create/edit/delete notes, private per user
- Recipe Sharing Platform, MERN app with auth, image uploads, saved recipes

Practice: Add JWT based register and login plus a protected dashboard route to your MERN app, with bcrypt hashed passwords and one admin only endpoint.

PHASE 2: DSA & ML VIBES, THINK DEEPLY, BUILD INTELLIGENTLY (WEEKS 5-8)

Phase 2 is the intellectual heart of the program. We go deep into Data Structures & Algorithms for placement preparation, and simultaneously build practical Machine Learning projects that solve real problems. This phase makes you stand out in every technical interview.

Week 5: Data Structures, The Foundation of Every Interview

Topics:
- Why DSA matters, the real purpose of data structures in engineering
- Time Complexity & Big O Notation, measuring efficiency
- Space Complexity, memory analysis
- Arrays: two-pointer technique, sliding window, prefix sums
- String problems: anagrams, palindromes, pattern matching
- Hash Maps & Hash Sets, O(1) lookup and counting patterns
- Linked Lists: singly, doubly, circular, implementation and operations
- Linked list problems: reverse, detect cycle, find middle, merge sorted lists
- Stacks: implementation, use cases (balanced brackets, undo operations)
- Queues: implementation, BFS patterns
- Deque and monotonic stack patterns
- LeetCode/HackerRank strategy, how to approach problems systematically

Projects built:
- LeetCode Top 50 Arrays & Strings, solve 15 curated problems with explanations
- Custom Hash Map Implementation, build a hash map from scratch in Python
- Text Editor Undo/Redo, stack-based implementation with UI

Practice: Solve eight array and string problems using two pointers, sliding window and prefix sums, recording time and space complexity for each.

Week 6: Trees, Graphs & Advanced Algorithms

Topics:
- Binary Trees, traversals: inorder, preorder, postorder, level order
- Binary Search Trees (BSTs), operations and balancing concepts
- Tree problems: height, diameter, LCA, path sum, zigzag traversal
- Heaps & Priority Queues, min-heap, max-heap, heapify
- Graphs: representations (adjacency list vs. matrix), directed vs. undirected
- BFS, shortest path in unweighted graphs, level-order problems
- DFS, cycle detection, topological sort, connected components
- Dijkstra's Algorithm, weighted shortest path
- Union-Find (Disjoint Set Union), efficient connectivity queries
- Dynamic Programming: memoization vs. tabulation, top-down vs. bottom-up
- Classic DP patterns: Fibonacci, coin change, 0/1 knapsack, LCS, LIS
- Greedy Algorithms, interval scheduling, activity selection

Projects built:
- Graph Visualizer, interactive BFS/DFS visualization built with React
- Pathfinding Visualizer, Dijkstra's and A* in a grid, visually animated
- Course Prerequisite Checker, topological sort applied to a real problem

Practice: Solve six tree and graph problems including one BFS, one DFS and one heap problem, and explain one solution aloud as if in an interview.

Week 7: Machine Learning, Teach Python to Predict the Future
Topics:
- Machine Learning overview, supervised, unsupervised, reinforcement learning
- The ML workflow: data features model evaluate deploy
- Data exploration with pandas, statistical analysis and visualizations
- Feature engineering, creating meaningful inputs for ML models
- Train/test/validation split, avoiding overfitting and data leakage
- Linear Regression, predicting continuous values (housing prices, salaries)
- Logistic Regression, binary classification problems
- Decision Trees and Random Forests, ensemble methods
- Support Vector Machines (SVM), classification with hyperplanes
- K-Means Clustering, unsupervised customer segmentation
- Model evaluation: accuracy, precision, recall, F1, ROC-AUC
- scikit-learn pipelines, cleanly combining preprocessing and models
Projects built:
- House Price Predictor, regression model trained on real estate dataset
- Email Spam Classifier, text-based binary classification with logistic regression
- Customer Segmentation, K-means on e-commerce purchase data
Practice: Train a scikit-learn model on a public dataset with a proper train test split, reporting accuracy and one feature engineering decision.

Week 8: Deep Learning & AI Project Deployment
Topics:
- Neural Networks, neurons, layers, activation functions explained intuitively
- How deep learning trains, gradient descent, backpropagation
- TensorFlow and Keras, building and training neural networks
- Convolutional Neural Networks (CNNs), image recognition
- Transfer Learning, using pre-trained models (MobileNet, ResNet) for new tasks
- Natural Language Processing basics, tokenization, embeddings, TF-IDF
- Hugging Face Transformers, using BERT and GPT models via Python
- Model serialization, saving and loading trained models
- Deploying ML models as REST APIs with Flask/FastAPI
- Streamlit, building beautiful ML demo apps with pure Python
- Using Claude Code to scaffold ML pipelines: describe your data AI writes the training code
- Vibe coding ML dashboards: using Lovable or Bolt.new to build a frontend for your ML API
- Monitoring ML models in production, drift, versioning, logging
- AI responsible use, bias auditing and model transparency
Projects built:
- Image Classifier API, custom CNN trained on a dataset of your choice, deployed
- Sentiment Analysis Web App, Hugging Face transformer, Flask API, Streamlit UI
- Real-Time Object Detector, webcam feed with YOLO model via OpenCV
Practice: Fine tune a pre-trained CNN such as MobileNet on a small image dataset with Keras and record a short working demo.

PHASE 3: CAREER VIBES, SYSTEM DESIGN, CAPSTONE & PROFESSIONAL LAUNCH (WEEKS 9-12)

The final phase transforms a skilled developer into a career-ready software engineer. System Design, advanced cloud deployment, the grand capstone project, and an intensive placement preparation program, this phase exists to get you hired.

Week 9: System Design & Agentic Engineering, Think Like a Senior Engineer
Topics:
- What is System Design? Why it's asked in every senior tech interview
- Agentic Engineering, Karpathy's evolution of vibe coding: orchestrating AI agents for complex tasks
- Using Claude Code for large codebase navigation, AI that understands your entire project
- Cursor Agent mode: giving AI a task, letting it plan and execute across dozens of files
- Multi-agent workflows: using Cursor (planning) + Claude Code (execution) + Copilot (inline) together
- Scalability: horizontal vs. vertical scaling
- Load Balancers, distributing traffic, round-robin, least connections
- Databases at scale: sharding, replication, read replicas
- SQL vs. NoSQL selection framework, when each is right
- Caching strategies: Redis basics, cache-aside, write-through, TTL
- Content Delivery Networks (CDN), how your assets go global
- Microservices vs. Monolith, honest trade-offs, not just hype
- Docker and containerization, packaging apps for consistent deployment
- Case studies: Design Twitter, Design YouTube, Design WhatsApp, methodically
Projects built:
- System Design Document, write a complete design document for a URL shortener at scale
- Redis Caching Layer, add Redis caching to your MERN capstone app
- Docker Compose Setup, containerize your full MERN stack with Docker Compose
Practice: Give Cursor Agent or Claude Code one scoped multi file task in your capstone repo, then audit the output and document what you kept, fixed or rejected.

Week 10: Cloud, DevOps & Security for AI-Generated Code
Topics:
- AWS core services: EC2, S3, RDS, CloudFront, Route 53
- Deploying a Node.js app on EC2 with Nginx reverse proxy
- AWS S3, storing and serving static assets and user uploads at scale
- SSL/TLS certificates, HTTPS with Let's Encrypt
- CI/CD pipelines with GitHub Actions, test, build, deploy automatically
- Environment management, dev, staging, production environments
- CRITICAL: Security risks of vibe-coded apps, 45% of AI-generated code contains OWASP vulnerabilities (Wiz Security study)
- Web Application Security: OWASP Top 10 for developers, with specific AI-generated code examples
- SQL injection, XSS, CSRF in AI-generated code, what AI commonly gets wrong
- Security audit workflow: using OWASP ZAP and Snyk to scan vibe-coded apps
- Rate limiting, IP blocking, and DDoS basics
- Secrets management, never commit credentials to GitHub (AI tools often leak .env files)
- Application monitoring with Datadog / Sentry (free tiers)
- The responsible vibe coder checklist: security review before every deployment

Projects built:
- Production Deployment: Deploy your MERN capstone with HTTPS on AWS EC2 via Nginx
- Automated CI/CD: Full GitHub Actions pipeline, lint, test, deploy on merge to main
- Security Audit: Run OWASP ZAP against your app and fix at least 3 vulnerabilities

Practice: Deploy your MERN app with HTTPS on EC2 or a comparable host, and add a GitHub Actions pipeline that runs tests before every deploy.

Week 11: Placement Preparation & Professional Identity
Topics:
- The placement roadmap, on-campus and off-campus strategy for 2026
- Resume that gets shortlisted, ATS optimization, STAR format, quantification
- GitHub portfolio for job seekers, README, contributions, and credibility
- LinkedIn optimization: headline, about section, skills endorsements
- Behavioural interview prep: STAR method for tech companies
- Technical interview process, online assessment, DSA round, system design, HR
- DSA rapid revision, top 20 most frequently asked interview questions
- Mock Interview Session 1: Full 45-minute technical mock with feedback
- Mock Interview Session 2: System design mock, 30 minutes
- Negotiating your offer, salary benchmarks for fresher SDE roles India
- Freelancing as a college developer, finding clients, pricing, contracts
- Open source strategy, how meaningful contributions open career doors

Projects built:
- Professional Portfolio Website v2, updated with all 12-week projects, live, SEO-optimized
- Optimized Resume, ATS-ready, reviewed by an industry mentor
- GitHub Portfolio Cleanup, all key repos have great READMEs, demo links, and screenshots

Practice: Finish an ATS friendly one page resume, refresh your GitHub profile README and rewrite your LinkedIn headline, then get feedback from one mentor or peer.

Week 12: Grand Capstone Launch, Showcase, Certify & Conquer
Topics:
- Grand Capstone final polish, code review, performance optimization
- Writing a technical blog post about your capstone project (Medium / Dev.to)
- SEO optimization for your portfolio, getting found by recruiters
- Open source contribution: submit a PR to a real open-source project
- The modern developer identity: traditional coding + vibe coding + agentic engineering
- Your vibe coding toolkit mastery recap: Cursor, Claude Code, Windsurf, Copilot, Lovable, Bolt.new, v0.dev
- The developer mindset, growth, continuous learning, imposter syndrome
- Building in public, Twitter/X, LinkedIn, community engagement
- Advanced paths beyond Vibe Coding: Competitive Programming, ML research, DevOps, AI Engineering
- Modern Age Coders Alumni Network, joining and giving back
- Capstone presentations, live demo to a panel of industry judges
- Project feedback from industry professionals
- Receiving the Vibe Coder, College Level Certification
- Next steps: internships, placements, freelancing, and startups

Projects built:
- GRAND CAPSTONE, 'Production-Grade Vibe Project': A complete, full-stack (MERN) OR ML-powered application built using a professional vibe coding workflow (Cursor IDE + Claude Code + AI app builders for prototyping). Must include: user authentication, real data, API integrations, responsive UI, full cloud deployment, CI/CD pipeline, security audit (AI-generated code reviewed for OWASP vulnerabilities), documented on GitHub, and presented live to a panel of industry mentors with a walkthrough of both the product AND the AI-assisted development process

Assessment: Grand Capstone: Live Demo Code Review System Design Q&A Panel Feedback

PROJECTS THE STUDENT BUILDS AND KEEPS

- Phase 1 (Weeks 1-4): 8+ MERN stack projects, REST APIs, React apps, full-stack authenticated apps
- Phase 2 (Weeks 5-8): 6+ DSA visualizers + 3 ML models trained, evaluated & deployed

- Phase 3 (Weeks 9-12): System design documents, Docker/AWS deployments, Grand Capstone

Total projects: 15+ production-grade projects + 100+ DSA problems solved

SKILLS THE STUDENT WILL HAVE AT THE END

- Frontend: React 18, React Router, TanStack Query, Tailwind CSS, Vite, v0.dev
- Backend: Node.js, Express.js, REST API design, JWT auth, bcrypt, Multer
- Database: MongoDB, Mongoose, schema design, aggregation, indexing
- Vibe Coding: Cursor IDE (Composer + Agent), Claude Code, Windsurf, GitHub Copilot, Lovable, Bolt.new
- DSA: Arrays, Strings, Linked Lists, Trees, Graphs, DP, Greedy, 100+ LeetCode problems
- Machine Learning: scikit-learn, pandas, TensorFlow/Keras, Hugging Face, model deployment
- DevOps: Git, GitHub Actions, Docker, AWS EC2/S3, Nginx, CI/CD pipelines
- System Design: load balancing, caching, Redis, microservices, database scaling
- Security: OWASP Top 10, AI-generated code auditing, rate limiting, secrets management

HOW A TYPICAL WEEK IS SPLIT

Live sessions: 2 sessions (2 hours each)
Dsa practice: 3-4 hours (10+ problems/week)
Project work: 4-6 hours
Total per week: 10-15 hours

SUPPORT INCLUDED

Mentorship: Code reviews by industry-experienced mentors
Mock interviews: Technical mock interviews (DSA + System Design) with feedback
Placement support: Resume reviews, LinkedIn optimization
Community: Access to Modern Age Coders alumni network of placed students
Career guidance: Resume and interview preparation, plus portfolio and profile review.

CERTIFICATION DETAIL

Final certificate: Vibe Coder, College Level: Full Stack & AI Engineer (Modern Age Coders Certified)
Capstone required: Production-grade MERN or ML app with auth, cloud deployment, CI/CD, and security audit
Dsa milestone: 100+ LeetCode problems solved with documented approaches
Portfolio: Professional developer portfolio + optimized GitHub + LinkedIn

WHERE THIS CAN LEAD

- Full Stack Web Developer (Rs 6-18 LPA)
- Frontend Developer, React Specialist (Rs 7-20 LPA)
- Backend Developer, Node.js/Python (Rs 8-22 LPA)
- Junior Machine Learning Engineer (Rs 10-25 LPA)
- Software Development Engineer (SDE) at product companies
- Summer Internships at tech startups and MNCs
- Freelance Full Stack Developer (Rs 500-2,500/hour)
- AI/Vibe Coding Consultant, building MVPs for clients with AI tools

EARNING POTENTIAL (share only if asked, and never promise it)

Market context: The ranges below are general market salary bands for these roles in India and abroad, drawn from public industry data. They are shown for career context only and are not a promise or guarantee of income. Actual pay depends on your skills, experience, location, and the job market.
Experienced roles: Rs 15-25 LPA (with ML specialization or senior full-stack role)
Other roles: Rs 6-12 LPA (SDE-1 at product companies and MNCs); Rs 10-18 LPA (with strong portfolio and MERN skills); $40k, 100k USD (remote roles with international companies)
Freelance: Rs 500-2,500/hour based on project complexity and specialization

COMMON QUESTIONS ABOUT THIS COURSE

For anything about cost, use PART 4 and RULE 1. Do not quote two regions.

Q: What is Vibe Coding for College?
A: Vibe Coding for College is a 3-month, intensive software engineering program for college students and fresh graduates (18+). It uniquely combines deep engineering fundamentals with professional AI development tools: you master MERN stack using Cursor IDE and Claude Code, build rapid prototypes with Lovable and Bolt.new, learn DSA for placements, Machine Learning with Python, System Design, and security for AI-generated code, all taught live by industry-experienced mentors at Modern Age Coders.

Q: Who is this course for?
A: This course is for college students (any year) and recent graduates who know at least basic programming and want to break into software engineering. It's ideal for CS/IT/MCA students, but engineering students from any branch who are serious about tech can join. You

should have basic knowledge of at least one programming language (Python, Java, C++, or JavaScript).

Q: What is the MERN stack and why learn it?
A: MERN stands for MongoDB (database), Express.js (backend framework), React.js (frontend library), and Node.js (JavaScript runtime). It is the most popular and in-demand full-stack technology combination for 2026, used by top startups and tech companies worldwide. MERN skills are specifically sought in Indian product companies, MNCs, and international remote roles.

Q: How does DSA preparation fit into this course?
A: DSA is integrated throughout all 12 weeks rather than crammed at the end. Weeks 5-6 are dedicated DSA weeks, but we recommend 10 problems per week from Week 1 onwards through our parallel preparation track. By Week 12, students have typically solved 100-150 problems across LeetCode, GeeksforGeeks, and Codeforces.

Q: Will studying 3 months really prepare me for placements?
A: Three months of focused, structured preparation, building real projects, solving 100+ DSA problems, and doing mock interviews, is absolutely transformative. Join as early in your college career as possible: students who take this course in their 2nd or 3rd year have maximally more time to practice and build. Our alumni have been placed at companies including Infosys, TCS, Wipro, Freshworks, Juspay, and international remote companies.

Q: What does 'Vibe Coding' mean at the college level?
A: Vibe Coding, coined by Andrej Karpathy in 2025, means building software by describing what you want and letting AI generate the code. At the college level, this evolves into 'agentic engineering': using professional AI tools (Cursor IDE, Claude Code, Windsurf, GitHub Copilot) alongside AI app builders (Lovable, Bolt.new, v0.dev) to build production-grade software at startup speed. But the key differentiator is that you also learn to REVIEW, SECURE, and SCALE what AI generates, because 45% of AI-generated code contains security vulnerabilities. You graduate as a developer who can build with AI AND without it.

Q: Do you help with interview and career preparation?
A: Week 11 is dedicated to career preparation: resume reviews, LinkedIn optimization, mock technical interviews, system design practice, and DSA rapid revision. You also get access to our alumni network and mentor panels. We prepare you thoroughly for interviews and applications, but we do not guarantee placement.

Q: What is the time commitment?
A: We recommend 10-15 hours per week: 2 live sessions (2 hours each), weekly DSA practice (3-4 hours), and project work (4-6 hours). This is an intensive program. The more you invest, the stronger your portfolio and placement readiness will be.

Q: Is Machine Learning part of this course?
A: Yes. Weeks 7 and 8 cover applied Machine Learning with Python, scikit-learn, regression, classification, clustering, neural networks with TensorFlow/Keras, and deploying ML models as APIs and web apps. This is applied/practical ML, not theory-heavy research ML.

Q: What certification will I receive?
A: This is a credential recognized by our industry partners and verifiable online.

To enrol, message Shivam Sir on +91 9123366161 or send the parent this link: https://learn.modernagecoders.com/courses/vibe-coding-for-college-fullstack-ai-dsa-career-course
For a demo: the Priority Live Demo (guaranteed, today or tomorrow) is booked at https://learn.modernagecoders.com/priority-demo . The free demo is a waiting list with no fixed date.

==========
COURSE 133 OF 137: VIBE CODING FOR KIDS: AI, SCRATCH & GAME DEV (AGES 8-12)
==========

Course link: https://learn.modernagecoders.com/courses/vibe-coding-for-kids-beginners-ai-scratch-game-dev
Subject area: Kids Coding & Creative Technology
Designed for: Kids
Who can join: Complete Beginner (Ages 8-12)
Course length: 3 months (12 weeks)
Time needed: 4-6 hours/week
Certificate: Vibe Coder, Kids Level Certification

PRICE FOR THIS COURSE (quote only the one that applies to the person asking)
In India, per month: group Rs 1,499, mini batch Rs 2,999, one to one Rs 4,999
In Canada, per month: group CAD 140, one to one CAD 210
Anywhere else, per month: group $100, one to one $150
Classes: group and mini batch two live classes a week, eight a month; one to one in India one live class a week, four a month; one to one outside India two live classes a week, eight a month. Each class is one hour.

WHAT THIS COURSE IS

Live online vibe coding course for kids ages 8-12: learn Scratch, AI tools and game development in a 3-month beginner program, no prior experience needed.

In one line: Where Imagination Meets Code, Build Games, Stories & AI Projects!

ABOUT THE PROGRAMME

Vibe Coding for Kids is the ultimate 3-month beginner coding journey designed specifically for children aged 8 to 12. 'Vibe Coding', a term coined by AI pioneer Andrej Karpathy in 2025, means telling a computer what you want to build in plain English and letting AI create the code for you. It's the future of how software gets made, and your child can start learning it now. Through playful, visual, and project-driven learning, kids discover the magic of creating their own games, animated stories, music with code, and real AI-powered apps, no complex typing required to get started! Kids begin with visual block coding (Scratch) to learn how computers think, then graduate to actual vibe coding using tools like Replit, Bolt.new, and Google Gemini, the same AI tools professionals use today. At Modern Age Coders, we believe every child is a natural creator. Our expert instructors blend visual block programming, creative exploration, and real AI app-building tools to make coding feel like play. By the end of 12 weeks, your child will have built 15+ original projects, including apps they built by talking to AI, and gained real digital superpowers.

WHAT MAKES THIS COURSE DIFFERENT

- 100% project-based, kids build something real every single week
- Age-appropriate content designed for 8-12 year olds
- No prior experience or technical knowledge needed
- Visual block coding (Scratch, Code.org), no complex syntax to start
- Real vibe coding: kids build apps by talking to AI (Replit, Bolt.new)
- Includes AI tools, music coding, and creative art projects
- Live classes with expert instructors, never pre-recorded videos
- Weekly written progress notes to parents
- Portfolio of 15+ completed projects at course end
- Fun, encouraging, and bully-free classroom environment

THE LEARNING PATH, STEP BY STEP

Phase 1: Foundation Vibes (Weeks 1-4): Scratch basics, animations, storytelling with code
Phase 2: Game Dev Vibes (Weeks 5-8): Game mechanics, score systems, interactive adventures
Phase 3: AI & Vibe Coding Vibes (Weeks 9-12): Real vibe coding with AI app builders (Replit, Bolt.new), AI tools, music coding, capstone project showcase

WHAT A STUDENT NEEDS BEFORE STARTING

Age: 8-12 years old
Experience: Absolutely none, complete beginner friendly
Equipment: A computer or laptop with internet connection
Software: All tools are free and browser-based, nothing to install
Parental support: Parents encouraged to engage and review weekly projects

WHO THIS COURSE IS FOR

Curious kids: Children aged 8-12 who are curious about how games and apps are made
Creative kids: Kids who love drawing, storytelling, music, or building things
Screen time shift: Parents who want to turn screen time into productive learning time
Future ready: Families who want to give their child a head start in technology and AI
Struggling learners: Children with dyslexia, ADHD, or other learning differences, vibe coding removes syntax barriers

FULL CURRICULUM, WEEK BY WEEK

This is the complete teaching plan. Parents can ask about any week.

PHASE 1: FOUNDATION VIBES, SCRATCH & CREATIVE CODING (WEEKS 1-4)

Kids dive into the colourful world of Scratch and block-based programming. They create their first animations, interactive stories, and simple games while learning the core ideas of coding, loops, events, and conditionals, through hands-on fun.

Week 1: Welcome to Vibe Coding!, Your First Animations

Topics:

- What is Vibe Coding?, Telling computers what to build using your words (coined by AI scientist Andrej Karpathy in 2025)
- The two ways to code: Block Coding (Scratch) and Vibe Coding (talking to AI), we'll learn both!
- How computers think, understanding instructions step by step
- Introduction to Scratch 3.0, navigating the interface
- Sprites, stages, and backdrops, building your digital world
- Basic motion blocks: move, turn, glide

- Looks blocks: say, think, costumes, effects
- Sound blocks: play music, record your voice
- Your first animation: Make a character walk and talk
- Saving and sharing your Scratch project
- Online safety and being a kind digital citizen
- Setting up your Vibe Coder profile

Projects built:
- Animated Greeting Card, make a character say hello to the world
- Dancing Pet, a sprite that moves to your favourite music
- About Me Story, an interactive presentation about yourself

Practice: Build a mini dance party in Scratch where your sprite changes costume and moves each time you press an arrow key, then show someone at home.

Week 2: Storytelling with Code, Scenes, Dialogues & Adventures

Topics:
- Creating multi-scene stories with backdrop changes
- Broadcasting messages between sprites, making characters talk to each other
- Using the 'ask and answer' block for interactive dialogue
- Timing animations, wait blocks and synchronized stories
- Creating sprite costumes for character emotions
- Adding background music and sound effects
- Text-to-speech: making your characters speak in different voices
- Importing your own images and drawings as sprites
- Drawing custom sprites with the Scratch paint editor
- Story planning: beginning, middle, and end
- Sharing your story with family and friends

Projects built:
- A 3-Scene Adventure Story, hero, challenge, and victory
- Interactive Storybook, click to turn pages
- Talking Animal Show, two animals have a funny conversation

Practice: Create a two scene story where characters talk to each other using broadcast messages and ask the viewer one question with the ask block.

Week 3: Events & Interactivity, Making Things Happen!

Topics:
- Event blocks: when green flag clicked, when key pressed, when sprite clicked
- Keyboard controls, making characters move with arrow keys
- Mouse events, click-to-activate actions
- Creating clickable buttons and navigation menus
- Introduction to conditionals: If-Then logic blocks
- Touching and color detection, collision basics
- Creating interactive art, drawing with mouse movements
- Building a virtual musical keyboard
- Combining multiple events for complex interactions
- User input with 'ask' and storing answers
- Debugging basics: What to do when something goes wrong

Projects built:
- Virtual Piano, play notes by pressing keyboard keys
- Click-and-Colour Art Canvas, draw with code
- Interactive Quiz, 5 questions with right/wrong feedback

Practice: Make a clickable pet that reacts differently to a click, a key press and the green flag, using at least one if then block.

Week 4: Loops & Patterns, The Magic of Repetition

Topics:
- Forever loops, making things go on and on
- Repeat loops with a specific number of times
- Nested loops, loops inside loops for complex patterns
- Drawing geometric shapes with pen blocks
- Creating spirals, stars, and kaleidoscopes with loops
- The Stamp tool, making repeating patterns
- Color effects and graphic transformations
- Thinking like a computer: breaking big tasks into small loops
- Efficiency, doing more with less code
- Creating a looping background animation
- Phase 1 Review & Project Planning

Projects built:
- Geometric Art Machine, generates beautiful patterns automatically
- Spinning Galaxy, looping space animation
- Pattern Puzzle, create a design and challenge friends to recreate it

Practice: Draw a star, a spiral and one invented pattern with pen blocks inside repeat loops, and name your favorite creation.

PHASE 2: GAME DEV VIBES, BUILD YOUR OWN GAMES! (WEEKS 5-8)

Now the real fun begins! Kids learn the building blocks of game development: scoring, lives, enemies, levels, and game loops. By the end of Phase 2, every child will have built a complete, playable video game from scratch.

Week 5: Variables & Score Systems, 'You Win!' Moments
  Topics:
    - What are variables? Understanding data storage in simple terms
    - Creating score, lives, and timer variables
    - Changing variable values, adding points, losing lives
    - Using random numbers, the element of surprise in games
    - Countdown timers and time-based challenges
    - Displaying variables on screen as a score HUD
    - Win conditions: What happens when you reach a goal?
    - Game Over conditions: Lives system and health bars
    - High score saving basics
    - Creating power-ups that boost your score
    - Playtesting your games, the 'fun factor' check
  Projects built:
    - Catch the Falling Stars, catch sprites to earn points
    - Number Guessing Game, with hints and score tracking
    - Speed Challenge, collect 10 items before the timer runs out
  Practice: Add a score, lives and a countdown timer to a simple catch the apple game and play test it three times.

Week 6: Collision Detection & Game Mechanics, Real Game Feels
  Topics:
    - Touching detection, sprites interacting with each other
    - Color collision, detecting when you touch a wall or obstacle
    - Gravity simulation using loops and variables
    - Jumping mechanics, platformer physics basics
    - Enemy movement, creating obstacles that move and follow
    - Projectile mechanics, shooting and throwing
    - Boundary detection, keeping sprites inside the screen
    - Creating a scrolling background effect
    - Power-up pickups and damage effects
    - Sound effects for collisions, wins, and game over
    - Making your game feel satisfying, game juice basics
  Projects built:
    - The Endless Runner, dodge obstacles as you run
    - Space Invaders Jr., shoot incoming aliens
    - Trampoline Jump, bounce as high as you can game
  Practice: Give your game character a gravity powered jump and one moving enemy that ends the game on touch.

Week 7: Level Design & Multi-Screen Games, The Full Experience
  Topics:
    - What makes a great game level? Flow, challenge, and reward
    - Designing level 1, level 2, and level 3 with increasing difficulty
    - Using backdrops as levels, switching on game events
    - Creating boss levels and final challenges
    - Save and load game states using cloud variables
    - Cutscenes and story sequences between levels
    - Sound design, choosing music for different game moods
    - UI design: Start screen, game over screen, victory screen
    - Multiple character selection screens
    - Accessibility in games, making your game easy to understand
    - Beta testing with classmates and collecting feedback
  Projects built:
    - 3-Level Maze Adventure, escape each dungeon to advance
    - Fruit Ninja Clone, 3 difficulty levels with progressive speed
    - Boss Battle Game, survive the final boss to win
  Practice: Design level 1 and a harder level 2 for your game using two backdrops that switch when the player wins.

Week 8: Complete Game Jam, Build Your Dream Game!
  Topics:
    - Game design document, planning your game on paper first
    - Asset creation, custom sprites, backgrounds, and sounds
    - Implementing full game loop: start, play, lose, win
    - Bug hunting and debugging strategies
    - Game polishing, making it look professional
    - Writing game instructions for players
    - Creating a game thumbnail and cover art
    - Publishing your game to the Scratch community
    - Presenting your game to classmates
    - Getting featured on the Modern Age Coders showcase
    - Reflecting on your journey from Week 1 to Week 8
  Projects built:
    - PHASE 2 CAPSTONE, My Dream Game: A complete, original game with: custom sprites, 2+ levels, score system, sound effects, start and end screens
  Assessment: Phase 2 Game Development Assessment, completed game review with instructor feedback

---
PHASE 3: AI & REAL VIBE CODING, BUILD APPS BY TALKING TO AI! (WEEKS 9-12)

In the final phase, kids experience the real magic of vibe coding, they train their own machine learning models, build real apps by describing ideas to AI tools like Replit and Bolt.new, create music with code, design with AI, and build their capstone 'Vibe Showcase' project. This is where kids learn the skill that Andrej Karpathy says will define the future: telling AI what to build and watching it come to life.

Week 9: AI for Kids, Teaching Computers to See, Hear & Build!
Topics:
- What is Artificial Intelligence? A fun, simple explanation
- What is Vibe Coding?, The story of Andrej Karpathy and how AI writes code for you
- The vibe coding loop: Describe AI Builds You Test You Improve
- Machine Learning, teaching computers by showing examples
- Google Teachable Machine: train your first image model
- Training an AI to recognize your hand gestures
- Training an AI to recognize sounds
- Using your trained model in a Scratch project
- Introduction to Google Gemini, chatting with AI safely
- How to write good prompts, being clear and specific with AI
- What is bias in AI? Why AI needs diverse data
- Machine Learning for Kids (ML4Kids) platform
- AI ethics for kids, being responsible with technology
- The future of AI, jobs, creativity, and possibilities

Projects built:
- Rock Paper Scissors AI, a computer that plays against you using real ML
- Emotion Detector, AI that reads your facial expression
- AI Chat Experiment, ask Google Gemini to explain your favourite topic and fact-check its answers

Practice: Train a Teachable Machine model to tell two hand signs apart using ten photos of each, then test it and count how many it gets right.

Week 10: Vibe Coding Your First Apps, Build by Talking to AI!
Topics:
- Welcome to real vibe coding!, building apps by describing them in English
- Introduction to Replit, your browser-based coding playground
- Replit Agent, tell it what to build and watch it create your app live
- Writing great prompts: being specific about what you want (colours, buttons, features)
- Building your first vibe-coded app: a simple calculator
- Introduction to Bolt.new, type what you want, see it instantly
- Building a game with Bolt.new, describe the rules, AI codes it
- Testing your AI-built app, does it do what you asked?
- Fixing problems by telling AI what went wrong (iterating)
- Understanding the code AI wrote, reading what it made for you
- Comparing: Scratch (you drag blocks) vs. Vibe Coding (you describe in words)
- When AI makes mistakes, learning to spot and fix errors

Projects built:
- My Calculator App, tell Replit Agent to build a colourful calculator and customize it
- Quiz Game App, describe a quiz game to Bolt.new with topics you love
- Vibe-Coded Story App, describe an interactive story app and watch AI build it

Practice: Describe a tiny app to Replit Agent, like a compliment generator, then ask it for two improvements: a new color and an extra button.

Week 11: Music Coding, AI Art & Portfolio, Create Like a Pro
Topics:
- Introduction to Sonic Pi, coding music like a DJ
- Notes, beats, and rhythms in code, loops for musical patterns
- Live coding music, composing a 30-second original track
- Using AI to help compose: describe a mood, get a melody suggestion
- Introduction to AI image generation for kids (safe, educational tools)
- Design principles for kids: colour, space, balance, contrast
- Canva for Kids, templates, elements, and publishing
- Creating game covers and posters for your projects
- Vibe coding a portfolio: use Bolt.new to build your own showcase page
- Adding your Scratch games and vibe-coded apps to your portfolio
- Presentation design, making your showcase slides look amazing
- Building your Digital Portfolio, showcasing all 12 weeks of work

Projects built:
- My Vibe Track, compose an original beat in Sonic Pi
- Vibe-Coded Portfolio Website, tell Bolt.new to create a page showcasing your best projects
- Game Cover Design, a professional-looking cover for your dream game in Canva

Practice: Compose a 30 second Sonic Pi loop with two different beats and generate one AI artwork to be its album cover.

Week 12: Grand Vibe Showcase, Your Moment to Shine!
Topics:
- Finalizing your capstone Vibe Project, choosing your best idea

- Combining everything: block coding, vibe coding, AI, design, and music
- Project polishing and bug-free testing
- Writing a project description, SEO basics even for kids!
- Recording a demo video of your project
- Creating a 2-minute presentation pitch
- Peer review, giving kind and helpful feedback
- Receiving your Vibe Coder Kids Certification
- Sharing your work on the Modern Age Coders Hall of Fame
- What's next?, Preview of Vibe Coding for Teens
- Celebration and graduation ceremony

Projects built:
- GRAND CAPSTONE 'Vibe Project': An original multi-element creation combining Scratch game OR a vibe-coded app (built with Replit/Bolt.new), AI model, original music, and Canva design, presented live to parents and peers

Assessment: Final Capstone Assessment + Vibe Coder Kids Certification awarded

PROJECTS THE STUDENT BUILDS AND KEEPS

- Phase 1 (Weeks 1-4): 9+ Scratch animations, stories & interactive projects
- Phase 2 (Weeks 5-8): 9+ games including Dream Game capstone
- Phase 3 (Weeks 9-12): 6+ AI, vibe coding & creative projects + Grand Capstone

Total projects: 15+ creative projects + Grand Vibe Showcase Capstone

SKILLS THE STUDENT WILL HAVE AT THE END

- Block Coding: Scratch 3.0, sprites, backdrops, motion, looks, sound blocks
- Programming Logic: loops, conditionals, events, variables, collision detection
- Game Development: score systems, lives, levels, enemy AI, game physics
- Vibe Coding: Replit Agent, Bolt.new, building apps by describing in English
- AI & Machine Learning: Google Teachable Machine, ML4Kids, Google Gemini
- Music Coding: Sonic Pi, beats, loops, live coding
- Digital Design: Canva, portfolio building, presentation skills
- Prompt Engineering: writing clear instructions for AI tools

HOW A TYPICAL WEEK IS SPLIT

Live classes: 2 sessions (1.5 hours each)
Independent projects: 1-3 hours
Vibe challenge: 1 fun weekly challenge
Total per week: 4-6 hours

SUPPORT INCLUDED

Live instruction: Expert-led live classes, never pre-recorded videos
Age appropriate: Content designed specifically for ages 8-12
Safe environment: Fun, encouraging, and bully-free classroom
Community: Access to Modern Age Coders kids community
Progress updates: Weekly written progress notes to parents

CERTIFICATION DETAIL

Final certificate: Vibe Coder, Kids Level (Modern Age Coders Certified)
Capstone required: Grand Vibe Showcase project combining coding, AI, music & design
Portfolio: 15+ completed projects showcased in digital portfolio

WHERE THIS CAN LEAD

- Digital Creator & Storyteller
- Junior Game Designer
- Creative Technologist
- AI Explorer
- Ready for Vibe Coding for Teens program

COMMON QUESTIONS ABOUT THIS COURSE

For anything about cost, use PART 4 and RULE 1. Do not quote two regions.

Q: What is Vibe Coding for Kids?
A: Vibe Coding for Kids is a 3-month, project-based program at Modern Age Coders designed for children aged 8-12. 'Vibe Coding' means building apps and software by describing what you want in plain English and letting AI create the code, a term coined by AI pioneer Andrej Karpathy in 2025 (Collins Dictionary Word of the Year!). Kids start with Scratch to learn coding fundamentals, then graduate to real vibe coding using AI tools like Replit, Bolt.new, and Google Gemini to build their own apps.

Q: What age is this course designed for?
A: This course is specifically designed for children aged 8 to 12. The content, pace, and teaching style are all optimized for this age group, with age-appropriate projects and

language.

Q: Does my child need any prior coding experience?
A: Absolutely not! Vibe Coding for Kids is a complete beginner program. We start from zero, no prior coding or technical knowledge is required. All you need is curiosity and a computer!

Q: What tools and platforms will my child use?
A: Your child will use Scratch 3.0, Code.org, Replit (AI-powered browser coding), Bolt.new (AI app builder with instant preview), Google Gemini (AI chat), Google Teachable Machine, Sonic Pi (music coding), Canva, and ML4Kids. All of these are free, safe, and browser-based, nothing to install. These are the same AI tools professionals use for vibe coding in 2026.

Q: How many hours per week does the course require?
A: We recommend 4-6 hours per week, which includes 2 live classes (1.5 hours each) plus 1-3 hours of independent project time. Small batches make missed classes easy to recover: the mentor recaps in the next session, notes and the week's challenge are shared over WhatsApp, and longer absences get a short free catch-up slot.

Q: What will my child have built by the end of the course?
A: By the end of 12 weeks, your child will have built 15+ projects including animated stories, original video games, a trained AI model, apps built using real vibe coding (AI app builders), original music tracks, their own portfolio website, and a full digital portfolio, all showcased at a Grand Vibe Showcase event.

Q: Is there a certificate at the end?
A: Yes! Every student who completes the course and their capstone project receives the official 'Vibe Coder, Kids Level' certification from Modern Age Coders.

Q: What comes after this course?
A: Upon completing Vibe Coding for Kids, students are ready for the Vibe Coding for Teens program, where they learn real programming languages (Python, JavaScript), build apps, and explore advanced AI, building directly on the foundation from this course.

To enrol, message Shivam Sir on +91 9123366161 or send the parent this link: https://learn.modernagecoders.com/courses/vibe-coding-for-kids-beginners-ai-scratch-game-dev
For a demo: the Priority Live Demo (guaranteed, today or tomorrow) is booked at https://learn.modernagecoders.com/priority-demo . The free demo is a waiting list with no fixed date.

==========

COURSE 134 OF 137: VIBE CODING FOR TEENS: PYTHON, WEB DEV & AI (AGES 13-17)

==========

Course link: https://learn.modernagecoders.com/courses/vibe-coding-for-teens-python-web-ai-projects-course
Subject area: Teen Coding & Web Development
Designed for: Teens
Who can join: Beginner to Intermediate (Ages 13-17)
Course length: 3 months (12 weeks)
Time needed: 6-8 hours/week
Certificate: Vibe Coder, Teens Level Certification

PRICE FOR THIS COURSE (quote only the one that applies to the person asking)
In India, per month: group Rs 1,499, mini batch Rs 2,999, one to one Rs 4,999
In Canada, per month: group CAD 140, one to one CAD 210
Anywhere else, per month: group $100, one to one $150
Classes: group and mini batch two live classes a week, eight a month; one to one in India one live class a week, four a month; one to one outside India two live classes a week, eight a month. Each class is one hour.

WHAT THIS COURSE IS

Live online vibe coding course for teens 13-17: learn Python, HTML, CSS, JavaScript and AI projects, build real apps and a portfolio in a 3-month program.

In one line: Stop Scrolling. Start Building. Your Code. Your World.

ABOUT THE PROGRAMME

Vibe Coding for Teens is the definitive 3-month coding program for ages 13-17 who want to go from beginner (or block-coding graduate) to building actual websites, Python apps, and AI-powered projects using the most cutting-edge tools in tech. 'Vibe Coding', coined by AI pioneer Andrej Karpathy in 2025 (Collins Dictionary Word of the Year!), means building software by describing what you want in natural language and letting AI generate the code. But here's the secret the pros know: the best vibe coders are also great traditional coders. That's why this course teaches you BOTH, you'll learn Python and JavaScript fundamentals AND master AI-powered development tools like Cursor IDE, GitHub Copilot, v0.dev, Bolt.new, and Lovable. At Modern Age Coders, we've designed this curriculum around what teens actually want to build: apps that solve real problems, games they can share with friends, websites that look professional, and AI tools that feel like the future. You'll use the same tools that

professional developers use every day, not toy platforms. Graduate with a portfolio of 12+ real projects that proves you can code, with AND without AI assistance.

WHAT MAKES THIS COURSE DIFFERENT

- Real languages: Python and JavaScript, not toy platforms
- Real vibe coding tools: Cursor IDE, GitHub Copilot, v0.dev, Bolt.new, Lovable
- Learn BOTH ways: traditional coding fundamentals + AI-assisted vibe coding
- Project-first approach, you build something real every single week
- Portfolio focus, graduate with 12+ projects for college/job applications
- Industry-relevant tools: Cursor, VS Code, Git, GitHub, APIs
- AI-integrated projects, use and build AI tools
- Prompt engineering, learn to communicate with AI effectively
- Peer coding sessions, collaborate like real dev teams
- 1-on-1 code reviews with expert instructors
- Access to the Modern Age Coders teen developer community
- Hackathon preparation and coding competitions support

THE LEARNING PATH, STEP BY STEP

Phase 1: Python Vibes (Weeks 1-4): Python fundamentals with GitHub Copilot, functions, games, and automation scripts
Phase 2: Web Dev Vibes (Weeks 5-8): HTML, CSS, JavaScript + vibe coding with v0.dev and Bolt.new, build responsive websites and web apps
Phase 3: AI & Vibe Coding Mastery (Weeks 9-12): Cursor IDE, AI-powered development, Lovable for app building, final portfolio, deployment & showcase

WHAT A STUDENT NEEDS BEFORE STARTING

Age: 13-17 years old
Experience: Complete beginner friendly, no prior coding needed (Vibe Coding for Kids graduates will move faster)
Equipment: Computer or laptop (Windows, Mac, or Linux) with stable internet
Software: All tools are free, Cursor IDE, VS Code, GitHub Copilot (free for students), Python, Git
Motivation: Curiosity and willingness to build real projects every week

WHO THIS COURSE IS FOR

Complete beginners: Teens aged 13-17 with zero coding experience who want to start building real projects
Scratch graduates: Kids who completed block coding and want to learn real programming languages
Aspiring developers: Teens who dream of building their own apps, games, or websites
College prep: Students who want a strong portfolio for CS/tech college applications
Hackathon enthusiasts: Teens interested in coding competitions, hackathons, and tech clubs
Creative builders: Anyone who wants to bring ideas to life using code and AI

FULL CURRICULUM, WEEK BY WEEK

This is the complete teaching plan. Parents can ask about any week.

PHASE 1: PYTHON VIBES, THINK LIKE A DEVELOPER (WEEKS 1-4)

Teens dive deep into Python, the world's most popular and versatile programming language. From variables and loops to building actual games and automation tools, Phase 1 transforms a complete beginner into a confident Python programmer.

Week 1: Python Unlocked, Your Developer Setup & First Programs

Topics:
- Why Python? The language of AI, data, and the web
- What is Vibe Coding?, Andrej Karpathy's 2025 concept that changed software forever
- The vibe coding workflow: Describe AI Generates You Review Iterate Ship
- Setting up VS Code & Cursor IDE, your professional AI-powered developer environment
- Setting up GitHub Copilot (free for students!), your AI pair programmer
- Python basics: print(), variables, strings, integers, floats
- String manipulation, slicing, formatting, f-strings
- Getting user input with input() function
- Basic arithmetic and math operations in Python
- Boolean logic: True, False, and comparisons
- Your first command-line programs
- Understanding error messages, the developer's best friend
- Running Python files from the terminal
- Introduction to Git, saving your code like a pro
- Creating your GitHub profile and first repository

Projects built:
- Personal Bio Generator, asks 5 questions and prints a formatted story about you
- Simple Calculator, performs all 4 operations with user input

- Mad Libs Creator, fill-in-the-blank story generator
Practice: Set up your editor, write a Python script that asks the user three questions and prints a profile card, then commit it to a new GitHub repo.

Week 2: Flow Control, Making Smart Programs
Topics:
- If, elif, else, decision-making in code
- Nested conditionals for complex logic
- While loops, repeating until a condition is met
- For loops, iterating over sequences
- Range() function, generating number sequences
- Loop control: break, continue, pass
- Lists, storing multiple values in one variable
- List methods: append, remove, sort, reverse, index
- Tuples and when to use them
- String loops, processing text character by character
- Nested loops for patterns and grids
- Debugging with print() statements and VS Code debugger
Projects built:
- Number Guessing Game, with hints, attempts counter, and high score
- Times Table Generator, print any multiplication table on demand
- Password Strength Checker, analyses a password and gives a strength rating
Practice: Build a number guessing game with a while loop and if elif else hints for higher or lower, counting the attempts taken.

Week 3: Functions & Modules, Writing Clean, Reusable Code
Topics:
- Defining functions with def keyword
- Parameters and arguments, passing data to functions
- Return values, getting data back from functions
- Default parameters and keyword arguments
- Scope: local vs. global variables
- Importing Python's built-in modules: math, random, datetime, os
- The random module, creating unpredictable programs
- Working with the datetime module for time-based features
- Writing your own modules and importing them
- Docstrings, documenting your functions properly
- Lambda functions, quick, anonymous functions
- Recursion basics, functions that call themselves
Projects built:
- Dice Rolling Simulator, roll any number of sides, track statistics
- Tip Calculator, restaurant bill splitter with formatted output
- Word Counter, analyses a paragraph for word count, unique words, and top 5 most used
Practice: Refactor your guessing game into functions with parameters and return values, then add a play again option.

Week 4: Data Structures & File Handling, Real Persistent Apps
Topics:
- Dictionaries, key-value pairs for structured data
- Dictionary methods: get, keys, values, items, update
- Nested dictionaries, representing complex real-world data
- Sets, unique collections and set operations
- List comprehensions, Pythonic one-line transformations
- Dictionary comprehensions
- Reading and writing text files with open()
- File modes: r, w, a, r+ explained
- Working with CSV files, reading datasets
- JSON files in Python, the language of the web
- Error handling with try, except, finally
- Building a simple contact book, CRUD operations
Projects built:
- Contact Manager, add, search, update, delete contacts saved to a file
- Student Grade Tracker, stores grades in JSON and calculates averages
- Vocabulary Flash Card App, add words, quiz yourself, track score
Practice: Create a contact book app that stores entries in a dictionary and saves them to a file so they survive a restart.

PHASE 2: WEB DEV VIBES, BUILD THE INTERNET (WEEKS 5-8)

Now teens build things the whole world can see. Phase 2 covers HTML, CSS, and JavaScript, the core technologies of every website on the internet. By Week 8, students will have built fully responsive, beautifully designed websites deployed live on the internet.

Week 5: HTML, Structure is Everything
Topics:
- How the web works, browsers, servers, HTTP basics
- HTML document structure: DOCTYPE, html, head, body
- Semantic HTML: header, nav, main, section, article, footer

- Text elements: h1-h6, p, strong, em, blockquote
- Links and navigation: anchor tags, href, relative vs. absolute URLs
- Images: img tag, alt text for accessibility and SEO
- Lists: ordered, unordered, nested lists
- Tables, displaying structured data
- HTML Forms: input types, labels, buttons, textareas
- HTML attributes: id, class, style
- Accessibility basics: ARIA roles, alt text, heading hierarchy
- Vibe Coding HTML: using v0.dev to generate page layouts from descriptions
- Comparing hand-written HTML vs AI-generated HTML, understanding what AI creates
- Validating your HTML with W3C Validator

Projects built:
- Personal Portfolio Page v1, bio, skills, and contact section in pure HTML
- Recipe Website, multi-page site with ingredients and instructions
- Event Landing Page, HTML structure for a fictional school event

Practice: Hand code a semantic personal profile page with a header, nav, three sections and a contact link, without any AI assistance.

Week 6: CSS, Make It Look Amazing

Topics:
- CSS syntax: selectors, properties, values
- The Box Model: margin, padding, border, content
- CSS colours: hex, RGB, HSL, and CSS variables
- Typography: fonts, Google Fonts integration, font-size, line-height
- CSS Flexbox, modern, powerful layout system
- CSS Grid, two-dimensional layout mastery
- Responsive design with Media Queries
- Mobile-first design principles
- CSS animations and transitions
- Pseudo-classes: hover, focus, active, nth-child
- CSS custom properties (variables) for design systems
- Dark mode implementation with CSS
- Vibe Coding CSS: using v0.dev and Bolt.new to generate beautiful UI components from text prompts
- Reading AI-generated Tailwind CSS, understanding utility-first styling

Projects built:
- Fully Styled Portfolio, transform Week 5's HTML into a beautiful, responsive portfolio
- Product Card Component, an Instagram-worthy card with hover effects
- Responsive Navigation Bar, a professional nav that collapses on mobile

Practice: Style your profile page with Flexbox, a Google Font and CSS variables, and make sure it still looks right at phone width.

Week 7: JavaScript, Bring Your Website to Life

Topics:
- What is JavaScript and why it makes the web interactive
- JS basics: variables (let, const), data types, operators
- Functions in JavaScript, declarations, expressions, arrow functions
- Arrays and array methods: map, filter, reduce, forEach
- Objects in JavaScript, structuring real-world data
- The DOM, Document Object Model explained simply
- Selecting elements: getElementById, querySelector
- Changing content and styles with JavaScript
- Event listeners: click, mouseover, input, submit
- Form validation with JavaScript
- Fetch basics, getting data from the internet
- Local Storage, persisting data in the browser

Projects built:
- Interactive To-Do App, add, complete, and delete tasks (persists with LocalStorage)
- Quiz App, 10-question quiz with timer, score, and results screen
- Real-time Character Counter, live word/character counts as you type

Practice: Add a dark mode toggle and a live character counter to your page using DOM events, plus one array method such as map or filter.

Week 8: APIs & Full Web Projects, Connect to the Real World

Topics:
- What is an API? REST APIs explained with real examples
- Fetch API, making HTTP GET requests in JavaScript
- Async/await, handling asynchronous operations cleanly
- JSON parsing, working with API response data
- Error handling in fetch requests
- Public APIs: Weather, Quotes, Space, Pokemon, SpaceX
- Displaying API data dynamically in your webpage
- API keys, working with authenticated APIs safely
- Introduction to the OpenWeather API
- Deploying your website with Netlify, live in 60 seconds
- Custom domain basics
- Vibe Coding a full web app: using Bolt.new to build and deploy a project in minutes
- Comparing your hand-coded projects vs vibe-coded projects, understanding the trade-offs
- Phase 2 portfolio review, making your projects job-ready

Projects built:
- Live Weather App, fetch real weather data for any city using OpenWeather API
- Random Quote Machine, fetches and displays random motivational quotes
- Space Explorer, displays real NASA photo of the day with Astronomy API

Practice: Fetch data from a free public API, such as weather or jokes, and render it on your page with async await and visible error handling.

PHASE 3: AI & VIBE CODING MASTERY, BUILD YOUR FUTURE (WEEKS 9-12)

The most exciting phase, teens master real vibe coding tools (Cursor IDE, Lovable, Claude/Gemini APIs), combine Python + Web skills to build AI-powered projects, set up their professional developer portfolio, and prepare for real-world opportunities: internships, hackathons, and competitive coding. This is where you become a true vibe coder, someone who can build anything by combining traditional coding skills with AI-powered development.

Week 9: AI Tools & Vibe Coding Mastery, Build with AI Like a Pro

Topics:
- Introduction to AI APIs, using AI as a superpower
- Working with the Google Gemini API (or Claude API), setup and authentication
- Chat Completion API, building a simple AI chatbot
- System prompts, guiding AI behaviour for your use case
- Deep dive into Cursor IDE, the #1 AI-powered code editor for vibe coding
- Cursor Composer: describe a feature in English Cursor writes the code across multiple files
- Cursor Tab: AI auto-completes your code as you type
- GitHub Copilot Chat, asking your AI pair programmer questions about your code
- Prompt engineering for code: writing clear, specific prompts that get better results
- AI for text: summarization, sentiment analysis, translation
- Image generation API basics with teen-legal tools (Firefly and Bing Image Creator APIs, concepts first)
- Comparing AI models: Claude Sonnet (best for code), GPT-4, Gemini, which to use when
- AI ethics for teen developers, bias, transparency, and responsibility

Projects built:
- AI Study Buddy, paste any topic, get an explanation in simple language (Python + Gemini API)
- Mood Journal Analyser, enter your journal entry, AI analyses the mood and gives advice
- Vibe-Coded AI App, use Cursor Composer to build an entire AI tool from a single description

Practice: Build a small chatbot on the Gemini or Claude API with a system prompt that gives it a personality, and note one prompt improvement you made.

Week 10: Vibe Coding Full Apps, Lovable, Bolt.new & Full Stack

Topics:
- Lovable, the AI app builder that generates clean React code from conversation
- Building a complete web app with Lovable: describe features AI codes you iterate
- Bolt.new deep dive, building and deploying apps entirely through AI prompts
- When to vibe code vs. hand code, understanding the trade-offs and limitations
- Introduction to Flask, Python for the web (understanding what AI builds for you)
- Setting up a Flask app, routes and views
- Connecting your AI Python code to a web frontend
- Building a simple AI web app, Python backend + HTML frontend
- Environment variables and .env files, keeping API keys safe
- Introduction to databases: SQLite with Python basics
- Deploying your apps: Replit, Vercel, Netlify, Render (free tier)
- Security basics: why vibe-coded apps need human review before going live
- Planning your capstone project, choosing between vibe-coded or hand-coded

Projects built:
- Lovable App, build a complete app by chatting with AI (e.g., habit tracker, expense tracker)
- AI Chatbot Web App, a proper web interface for your Week 9 AI chatbot using Flask
- Bolt.new Speed Build, go from idea to deployed app in under 30 minutes

Practice: Build the same to do app twice, once by hand and once with Lovable or Bolt.new, and write down three differences you noticed in the code.

Week 11: Developer Portfolio & Professional Presence

Topics:
- What is a developer portfolio and why every teen dev needs one
- Structuring your portfolio: projects, about, skills, contact
- Writing project descriptions that impress, STAR format
- README files on GitHub, making your repos presentable
- Vibe coding your portfolio website: use v0.dev or Lovable to build a stunning portfolio in minutes
- Picking your best 4 projects for the portfolio (mix of hand-coded and vibe-coded)
- GitHub profile optimization, pins, README profile, contributions graph
- LinkedIn basics for teen developers, setting up a professional profile
- Personal branding, your developer identity and niche
- Technical interview basics, what companies actually ask
- Writing a tech resume for internships and college applications
- Open source contribution basics, finding good first issues
- Hackathons: how to find, join, and win at hackathons

Projects built:
- Professional Developer Portfolio Website, multi-section, deployed, polished and live

- GitHub Profile README, a custom animated profile readme showcasing your skills
- Project README Collection, professional documentation for all 4 key portfolio projects

Practice: Draft your portfolio site with three project cards, STAR style descriptions and a proper README on your best repo.

Week 12: Grand Vibe Showcase, Launch Your Career!

Topics:

- Final capstone project polish, code review and bug fixes
- Code documentation best practices
- Recording a 3-minute project demo video
- The art of the technical demo, explaining code to non-coders
- Preparing for Q&A, answering questions about your code
- The vibe coding toolkit recap, Cursor, Copilot, v0.dev, Bolt.new, Lovable: when to use each
- Introduction to competitive coding: HackerRank, LeetCode, CodeChef
- What's next?, College applications with a portfolio, internships, freelancing
- Vibe Coding for College preview, MERN, DSA, Machine Learning, Claude Code, Windsurf, and more
- Networking with the Modern Age Coders alumni community
- Receiving the Vibe Coder Teens Certification
- Graduation ceremony and class showcase

Projects built:

- GRAND CAPSTONE, 'Vibe Project Launch': A complete, full-stack (or AI-powered) web application built using a combination of traditional coding and vibe coding tools (Cursor, Lovable, or Bolt.new). Must be deployed live, documented on GitHub, and presented at the showcase with a 3-minute live demo explaining both what you built AND how you used AI to build it

Assessment: Final Capstone Code Review + Live Demo + Panel Q&A

PROJECTS THE STUDENT BUILDS AND KEEPS

- Phase 1 (Weeks 1-4): 9+ Python CLI projects, games, calculators, automation tools
- Phase 2 (Weeks 5-8): 9+ web projects, portfolio, responsive sites, API-connected apps
- Phase 3 (Weeks 9-12): 6+ AI & vibe-coded projects + Grand Capstone deployed live

Total projects: 12+ real projects deployed live + professional portfolio

SKILLS THE STUDENT WILL HAVE AT THE END

- Python: variables, loops, functions, OOP basics, file handling, JSON, error handling
- Web Development: HTML5, CSS3, Flexbox, Grid, responsive design, JavaScript ES6+
- JavaScript: DOM manipulation, event listeners, Fetch API, LocalStorage, async/await
- Vibe Coding Tools: Cursor IDE, GitHub Copilot, v0.dev, Bolt.new, Lovable
- AI & APIs: Google Gemini API, Claude API, prompt engineering, chatbot development
- Backend Basics: Flask, Jinja2, SQLite, REST API concepts
- DevOps: Git, GitHub, deployment on Netlify, Vercel, Render
- Professional Skills: portfolio building, README writing, LinkedIn optimization

HOW A TYPICAL WEEK IS SPLIT

Live sessions: 2 sessions (1.5-2 hours each)
Independent projects: 3-4 hours
Vibe challenge: 1 weekly creative challenge
Total per week: 6-8 hours

SUPPORT INCLUDED

Live instruction: Expert-led live classes, never pre-recorded videos
Code reviews: 1-on-1 code reviews with instructors
Peer coding: Collaborative coding sessions with classmates
Community: Access to Modern Age Coders teen developer community
Hackathon prep: Guidance for coding competitions and hackathons

CERTIFICATION DETAIL

Final certificate: Vibe Coder, Teens Level (Modern Age Coders Certified)
Capstone required: Complete full-stack or AI-powered web app, deployed live, presented at showcase
Portfolio: 12+ completed projects + professional developer portfolio website

WHERE THIS CAN LEAD

- Junior Web Developer (freelance or internship)
- Python Developer Intern
- Tech Entrepreneur / App Creator
- Competitive Programmer (ICPC, CodeChef, HackerRank)
- Freelance Web Developer (Rs 500-1,500/hour)
- Tech Club Leader / School Tech Projects
- Ready for Vibe Coding for College, MERN, DSA, ML & more

COMMON QUESTIONS ABOUT THIS COURSE

For anything about cost, use PART 4 and RULE 1. Do not quote two regions.

Q: What is Vibe Coding for Teens?
A: Vibe Coding for Teens is a 3-month, project-first coding program for ages 13-17. 'Vibe Coding', coined by AI pioneer Andrej Karpathy in 2025 (Collins Dictionary Word of the Year!), means building software by describing what you want in natural language and letting AI generate the code. Teens learn both traditional coding (Python, HTML/CSS/JavaScript) AND modern vibe coding tools (Cursor IDE, GitHub Copilot, v0.dev, Bolt.new, Lovable). You graduate with 12+ real projects and the ability to build anything, with or without AI assistance.

Q: Do I need to have done Vibe Coding for Kids first?
A: No! Vibe Coding for Teens is designed to welcome complete beginners aged 13-17. If you completed Vibe Coding for Kids, you'll find Phase 1 comes very naturally to you and you'll move faster. But anyone with curiosity and a laptop can join from zero.

Q: What programming languages and AI tools will I learn?
A: You will learn Python (Phases 1 and 3) and the core web trio, HTML, CSS, and JavaScript (Phase 2). But what makes this course special is the vibe coding tools: Cursor IDE (the #1 AI code editor), GitHub Copilot (free for students!), v0.dev (AI UI generator by Vercel), Bolt.new (AI app builder), and Lovable (builds full-stack React apps from conversation). You'll also learn AI APIs (Gemini / Claude), Git, and GitHub. By the end, you'll know which tool to use for any project.

Q: Will I be able to build real websites and apps by the end?
A: Absolutely. By Week 12, you will have built and deployed multiple live websites and web applications that anyone can visit on the internet. You'll also have Python CLI apps, an AI-powered project, and a professional portfolio on GitHub.

Q: How much time should I set aside each week?
A: We recommend 6-8 hours per week: 2 live sessions (1.5-2 hours each) plus 3-4 hours of independent project work. The more time you put in, the more impressive your portfolio will be.

Q: What tools and software will I need?
A: You need a computer (Windows, Mac, or Linux) and a stable internet connection. All primary tools are free: Cursor IDE (free tier), VS Code, GitHub Copilot (free for students via GitHub Education), Python, Git, v0.dev (free tier), Bolt.new (free tier), Lovable (free tier), and Replit (free tier). We walk through every setup in Week 1. No paid subscriptions are required.

Q: Can this help with college applications or internship applications?
A: Yes! A strong developer portfolio with real, deployed projects is an incredible differentiator in college applications (especially for CS/tech programs) and internship applications. Our Week 11 module specifically teaches you how to present your portfolio professionally.

Q: What comes after Vibe Coding for Teens?
A: Graduates are ready for Vibe Coding for College, which dives into Data Structures & Algorithms, full MERN stack development, Machine Learning with Python, cloud deployment, professional AI tools (Claude Code, Windsurf), and building production-grade applications with advanced vibe coding and agentic engineering workflows.

To enrol, message Shivam Sir on +91 9123366161 or send the parent this link: https://learn.modernagecoders.com/courses/vibe-coding-for-teens-python-web-ai-projects-course
For a demo: the Priority Live Demo (guaranteed, today or tomorrow) is booked at https://learn.modernagecoders.com/priority-demo . The free demo is a waiting list with no fixed date.

==========

COURSE 135 OF 137: WATERLOO MATH CONTESTS: GAUSS TO EUCLID

==========

Course link: https://learn.modernagecoders.com/courses/waterloo-math-contests-gauss-to-euclid-course
Subject area: Competition Mathematics & Olympiad Training
Designed for: Middle school
Who can join: Students roughly aged 11 to 18 (Grades 7 to 12) who are comfortable with school math and want harder problems, in a Gauss track (Grades 7 and 8), a Grades 9 and 10 track and a Grades 11 and 12 track
Course length: 6 months (24 weeks) per season, joinable any month and timed to the CEMC contests each student will write
Time needed: 2 live classes/week + weekly problem sets, written solutions and timed practice rounds
Certificate: Certificate from Modern Age Coders, awarded on passing the final assessment (this is not a CEMC certificate or result)

PRICE FOR THIS COURSE (quote only the one that applies to the person asking)
In India, per month: group Rs 1,499, mini batch Rs 2,999, one to one Rs 4,999
In Canada, per month: group CAD 140, one to one CAD 210
Anywhere else, per month: group $100, one to one $150
Classes: group and mini batch two live classes a week, eight a month; one to one in India one live class a week, four a month; one to one outside India two live classes a week, eight a month. Each class is one hour.

WHAT THIS COURSE IS

Live online prep for CEMC's Waterloo math contests, ages 11 to 18: Gauss, Pascal, Cayley, Fermat, Euclid, Fryer, Galois, Hypatia, CIMC and CSMC, with grade tracks and proof writing.

In one line: One problem-solving toolkit, three grade tracks: from the first Gauss counting ideas to the clear, complete written solutions the Euclid asks for.

ABOUT THE PROGRAMME

The Centre for Education in Mathematics and Computing (CEMC) at the University of Waterloo runs a family of math contests "Designed by teams of expert mathematicians and educators for Grades 5 to 12". Each contest is matched to a grade. The Gauss Contest is for "Students in Grades 7 and 8.", and CEMC adds that "Motivated students in lower grades are welcome to write the contest." The Pascal, Cayley and Fermat Contests are for Grade 9, Grade 10 and Grade 11. The Fryer, Galois and Hypatia Contests are for the same three grades, with "4 questions; a mix of final answer-only and full-solution." The Euclid Contest is for "Students in their final year of secondary school or CÉGEP students." and has "10 questions; a mix of final answer only and full-solution." The CIMC is for Grades 9 and 10 and the CSMC for Grades 11 and 12 and CÉGEP students, each with "9 questions; 6 are answer only and 3 are full-solution." For the 2026/27 contest year CEMC lists the CIMC and CSMC on Wednesday, November 18, 2026; the Pascal, Cayley and Fermat Contests on Tuesday, February 23, 2027 and Wednesday, February 24, 2027; the Euclid on Tuesday, April 6, 2027; the Fryer, Galois and Hypatia on Wednesday, April 7, 2027; and the Gauss from Monday, May 10, 2027 to Friday, May 21, 2027 (dates for North and South America). Students write through their school: CEMC says "It is not possible for students to individually register for a contest" and "all students must participate through their school." This course teaches the mathematics behind all of these contests in three grade tracks, and it teaches the two skills they test in different ways: fast, accurate work on multiple-choice and answer-only questions, and full solutions that explain every step. Practice comes from two places: our own original problems written for each topic, and CEMC's free past contests, which CEMC publishes with no registration or fee and which students work where CEMC publishes them. We never copy CEMC problems into our materials. We teach the ideas and the habits, and we make no promise of scores, certificates of distinction, prizes, scholarships or admissions.

WHAT MAKES THIS COURSE DIFFERENT

- Built around CEMC's contests by grade: Gauss for Grades 7 and 8, then Pascal, Cayley, Fermat, Fryer, Galois, Hypatia, CIMC, CSMC and Euclid
- Three grade tracks taught in separate batches, so every student works on problems at the right level
- Full-solution writing taught directly: stating the idea, showing every step and checking the answer, as the full-solution contests require
- Our own original problems for every topic, plus CEMC's free past contests used as practice where CEMC publishes them
- A timed practice round every month, in the format of the contest each student will write next
- Honest about entry and results: students write through their school, and we promise learning, not scores

THE LEARNING PATH, STEP BY STEP

Phase 1: The shared toolkit for every track: careful reading, number sense, algebra, counting, geometry, multiple-choice technique and the first full written solutions
Phase 2: The grade tracks: Gauss for Grades 7 and 8; Pascal, Cayley, Fryer, Galois and CIMC for Grades 9 and 10; Fermat, Hypatia, CSMC and Euclid for Grades 11 and 12
Phase 3: Contest season: timed rounds, full-solution polish, contest-day routine for each 2026/27 contest, then review and next steps

WHAT A STUDENT NEEDS BEFORE STARTING

Math level: Comfortable with school math for the student's grade, and happy to spend time on a hard problem
Age: Roughly 11 to 18 (Grades 7 to 12). The track is chosen by grade and level after a short diagnostic
Equipment: A computer with stable internet, paper and a pencil, and a way to share photos of written solutions
Contest entry: CEMC contests are written through a school; check that your school (or another local school) is taking part
Timing: Weekdays or weekends, flexible: choose your batch, or for a very personalised plan choose 1-on-1 at your convenience, weekend mornings or weekdays

WHO THIS COURSE IS FOR

Gauss students: Grade 7 and 8 students who enjoy puzzles and want to write the Gauss with real preparation
Grade 9 and 10 students: Students preparing for the Pascal, Cayley, Fryer, Galois or CIMC
Grade 11 and 12 students: Students preparing for the Fermat, Hypatia, CSMC or Euclid, including full-solution writing

Returning contest writers: Students who wrote a CEMC contest before and want to reach the harder questions
Students who want more: Students who find school math easy and want problems that make them think

FULL CURRICULUM, WEEK BY WEEK

This is the complete teaching plan. Parents can ask about any week.

PHASE 1: THE SHARED TOOLKIT (MONTHS 1-2, WEEKS 1-8)

Everything all three tracks need: how to read a contest problem, the core ideas of number, algebra, counting and geometry, and the first full written solutions.

Month 1: Reading Problems, Number Sense and Algebra (Weeks 1-4)

Weeks 1-2: How the Waterloo Contests Work and First Problems

Topics:

- The CEMC contest family by grade, and which contests each student will write this year
- A short diagnostic to place each student on the Gauss, Grades 9 and 10, or Grades 11 and 12 track
- Multiple-choice, answer-only and full-solution questions, and what each one rewards
- Reading a problem twice: listing what is given, what is asked and what is hidden
- Trying small cases, drawing a diagram and making a table before calculating
- Starting an error log on day one

Projects built:

- A personal starting profile: track, target contests for the year and ten solved warm-up problems

Practice: Ten short original problems, each with the idea written in one sentence before the answer

Weeks 3-4: Number Sense and Algebra Habits

Topics:

- Fractions, ratios, percentages and averages handled exactly
- Factoring and expanding to make calculations short
- Setting up an equation from a word problem
- Systems of two equations solved by substitution and elimination
- Working backwards and guess-and-check used on purpose
- Checking an answer by substituting it back

Projects built:

- A word-problem pack of original problems, each solved with a clear equation and a check

Practice: A first CEMC past contest at the student's level, from CEMC's site, attempted untimed with a written review

Assessment: Month 1 timed round: a short practice round of original problems

Month 2: Counting, Geometry and Writing a Full Solution (Weeks 5-8)

Weeks 5-6: Counting and Geometry Foundations

Topics:

- Systematic lists, tree diagrams and the multiplication rule
- Counting by complements: count what you do not want and subtract
- Angles in triangles, parallel lines and polygons
- Area and perimeter of composite figures
- The Pythagorean theorem and when to look for a right triangle
- Patterns and sequences: finding the rule and testing it

Projects built:

- A counting and geometry problem set of original problems, with a labelled diagram for every geometry question

Practice: Mixed problems timed at a few minutes each, then reviewed for method, not only answers

Weeks 7-8: Full Solutions and Multiple-Choice Technique

Topics:

- What a full solution looks like: the idea, every step and a final statement
- Writing in complete sentences with clear algebra and labelled diagrams
- Explaining why, not only what: justifying each step
- Multiple-choice technique: estimation, checking options and eliminating wrong ones
- Pacing a 60-minute, 25-question multiple-choice paper
- Reviewing a paper: sorting mistakes into careless, method and knowledge

Projects built:

- Rewrite three of your own earlier answers as full solutions, then compare them with a model write-up

Practice: One full-solution question each class, marked with written comments on clarity and completeness

Assessment: Phase 1 assessment: a timed round with multiple-choice and full-solution questions, reviewed question by question

---

PHASE 2: THE GRADE TRACKS (MONTHS 3-4, WEEKS 9-16)

The tracks run in parallel in separate batches. Each track builds the mathematics and the question types of the contests its students will write.

Months 3-4, Gauss Track (Grades 7 and 8): Building the Gauss Toolkit (Weeks 9-16)
  Weeks 9-10: Number Theory for Grades 7 and 8
    Topics:
      - Factors, multiples, primes and prime factorization
      - Divisibility rules and why they work
      - Greatest common factor and least common multiple in word problems
      - Remainders and repeating patterns in long lists
      - Digits and place value puzzles
      - Choosing an organized list instead of guessing
    Projects built:
      - An original number puzzle pack, each solution explained in two or three sentences
    Practice: Gauss-style multiple-choice sets of original problems, with a written check for every answer
  Weeks 11-12: Ratios, Rates and Algebra in Words
    Topics:
      - Ratios and rates, including speed, distance and time
      - Percent increase and decrease done in one step
      - Averages: using the total instead of the list
      - Writing and solving one-variable equations from words
      - Simple patterns turned into algebraic rules
      - Units and reasonableness checks
    Projects built:
      - A ratio and rate problem set solved two ways: once with a table, once with an equation
    Practice: Timed sets of ten problems, with every miss logged and redone
  Weeks 13-14: Counting and Probability
    Topics:
      - Counting arrangements and choices with the multiplication rule
      - Counting without double counting
      - Simple probability as favourable outcomes over equally likely outcomes
      - Probability with two dice, coins and spinners
      - Logic puzzles and careful case checking
      - Spotting a counting question inside a story
    Projects built:
      - Design and solve three original counting problems for a classmate
    Practice: Counting and probability problems, each with a list or tree drawn first
  Weeks 15-16: Geometry and Measurement
    Topics:
      - Angle facts in triangles, quadrilaterals and regular polygons
      - Area of triangles, trapezoids and circles, and shaded-region questions
      - Surface area and volume of prisms and cylinders
      - The Pythagorean theorem in two-step problems
      - Coordinates on a grid: distance and area
      - Drawing the diagram accurately before calculating
    Projects built:
      - A shaded-region problem pack of original problems, each with a labelled diagram
    Practice: A full 60-minute, 25-question practice paper of original problems
    Assessment: Gauss track assessment: a full timed paper reviewed question by question

Months 3-4, Grades 9 and 10 Track: Pascal, Cayley, Fryer, Galois and CIMC (Weeks 9-16)
  Weeks 9-10: Algebra for Contests
    Topics:
      - Linear equations, systems and inequalities set up from words
      - Factoring quadratics and the difference of squares
      - Exponent laws and simplifying powers
      - Substitution to make a hard expression simple
      - Linear relations: slope, intercepts and lines on a grid
      - Writing an algebra argument as a full solution
    Projects built:
      - An original algebra problem set with full written solutions for the last three questions
    Practice: Mixed multiple-choice and answer-only problems of original design, timed and reviewed
  Weeks 11-12: Number Theory and Counting
    Topics:
      - Prime factorization and counting divisors
      - Remainders and simple modular reasoning
      - The multiplication rule, arrangements and selections
      - Counting with restrictions, and counting by complements
      - Probability from counting
      - Organized casework and how to check every case is covered
    Projects built:
      - A casework problem pack where each solution lists its cases clearly
    Practice: Counting problems at several minutes each, with the counting method named before the answer
  Weeks 13-14: Geometry with Reasons
    Topics:
      - Similar triangles and ratios of lengths and areas
      - The Pythagorean theorem in two and three dimensions
      - Circles: radius, chords and angles, with reasons given

- Coordinate geometry: distance, midpoint and area on the plane
- Justifying each geometry step in words
- Choosing between a coordinate approach and a pure geometry approach

Projects built:

- Three original geometry problems solved with full written reasons

Practice: Geometry full-solution questions in the style of the Fryer and Galois, marked with written comments

Weeks 15-16: Full Solutions and Mixed Rounds

Topics:

- The answer-only and full-solution mix of the Fryer, Galois and CIMC
- Writing a full solution under time without losing clarity
- Showing that an answer is the only one, not just that it works
- Pacing a 60-minute, 25-question Pascal or Cayley style paper
- Partial progress on a hard question: writing down what you can prove
- Reviewing and rewriting a solution after feedback

Projects built:

- A personal model-solution file: five of your own best full solutions, rewritten after feedback

Practice: A full timed practice paper of original problems in the style of the student's next contest

Assessment: Grades 9 and 10 track assessment: a timed mixed paper plus one full solution marked in detail

Months 3-4, Grades 11 and 12 Track: Fermat, Hypatia, CSMC and Euclid (Weeks 9-16)

Weeks 9-10: Functions, Equations and Inequalities

Topics:

- Quadratic functions: vertex form, roots and the discriminant
- Systems of equations, including non-linear systems
- Functions and their graphs, and reading information from a graph
- Exponential and logarithmic equations
- Inequalities and how to prove one holds
- Writing a function argument as a full solution

Projects built:

- An original functions problem set with full written solutions for every question

Practice: Answer-only and full-solution questions of original design, timed and reviewed

Weeks 11-12: Sequences, Number Theory and Counting

Topics:

- Arithmetic and geometric sequences and their sums
- Divisibility, remainders and integer solutions
- Counting arrangements and selections, and the binomial coefficients
- Probability built from counting
- Recognizing a pattern and proving it holds in general
- Casework that is complete and clearly organized

Projects built:

- A sequences and counting pack where each solution proves its pattern, not just finds it

Practice: Mixed problems at the level of the later answer-only questions, with the idea written first

Weeks 13-14: Trigonometry and Geometry

Topics:

- Trigonometric ratios, the sine law and the cosine law
- Trigonometric equations and identities
- Circle geometry with full reasons
- Coordinate geometry: lines, circles and distances
- Areas and lengths by more than one method
- Labelling a diagram so a written solution is easy to follow

Projects built:

- Three original geometry problems, each solved by two different methods and written up in full

Practice: Geometry and trigonometry full-solution questions, marked with written comments

Weeks 15-16: Proof Writing for Full-Solution Contests

Topics:

- Direct proof, proof by cases and proof by contradiction
- Proving that every case is covered, and that an answer is the only one
- Writing for a reader: definitions, steps and a clear conclusion
- The Euclid's mix of answer-only and full-solution questions over 2.5 hours
- The CSMC and Hypatia full-solution questions and how to earn partial marks
- Reviewing and rewriting a proof after feedback

Projects built:

- A personal proof file: five of your own full solutions, each rewritten after detailed feedback

Practice: A full timed practice paper of original problems in the style of the student's next contest

Assessment: Grades 11 and 12 track assessment: a timed mixed paper plus one proof marked in detail

---

PHASE 3: CONTEST SEASON (MONTHS 5-6, WEEKS 17-24)

Timed rounds in the format of each student's next contest, polish on full solutions, the contest-day routine, then review and a plan for the next contest.

Month 5: Timed Rounds and Contest Craft (Weeks 17-20)
Weeks 17-18: Pacing Each Contest Format
Topics:
- Pacing a 60-minute, 25-question multiple-choice paper: Gauss, Pascal, Cayley and Fermat
- Pacing a 75-minute, 4-question paper: Fryer, Galois and Hypatia
- Pacing a 2-hour, 9-question paper: CIMC and CSMC
- Pacing a 2.5-hour, 10-question paper: Euclid
- Deciding when to move on from a stuck question
- Using CEMC's past contests from the last 10 years as timed practice on CEMC's site

Projects built:
- Two full timed practice papers, each followed by a written pacing review

Practice: One full timed paper a week at the student's level, then a careful review of every miss

Weeks 19-20: Review and Weak-Spot Repair
Topics:
- Redoing every missed question unaided after a timed paper
- Reading the error log to find the real weak spot
- Targeted mini-lessons on each student's weakest topic
- Polishing full solutions: shorter, clearer and complete
- A short personal checklist for the last minutes of a paper
- Making sure the school has the student on its contest order

Projects built:
- A personal weak-spot plan with three topics, each with a problem set completed

Practice: Original problem sets on each student's weak topics

Assessment: Month 5 assessment: a full timed paper reviewed one to one with the teacher

Month 6: Final Practice, Contest Days and Next Steps (Weeks 21-24)
Weeks 21-22: Final Practice Papers
Topics:
- Final timed papers in the exact format of the student's next contest
- Calm starts: reading the whole paper and choosing an order
- Checking answers and units in the last minutes
- Full-solution presentation one last time: idea, steps, conclusion
- Rest and practice balance in the last two weeks
- Reading CEMC's current instructions for the contest together

Projects built:
- A final practice paper with a written contest-day plan

Practice: Light, steady practice: short problems that keep skills sharp

Weeks 23-24: Contest Week and After
Topics:
- Contest-day routine for the 2026/27 dates: CIMC and CSMC on November 18, 2026; Pascal, Cayley and Fermat on February 23 and 24, 2027; Euclid on April 6, 2027; Fryer, Galois and Hypatia on April 7, 2027; Gauss from May 10 to May 21, 2027
- After the contest: reviewing the paper once CEMC publishes it
- What the student learned from the contest, whatever the result
- Choosing the next contest in the CEMC calendar
- Moving up a track for the next season when ready
- Presenting a favourite solution of the season to the class

Projects built:
- A next-contest plan based on the error log and the practice-paper history

Practice: Write a full solution to your favourite problem of the season for a newer student

Assessment: Final assessment: a last timed paper plus a short conversation about the student's method choices

PROJECTS THE STUDENT BUILDS AND KEEPS

- Starting profile with track and target contests for the year
- Word-problem, counting and geometry packs of original problems
- Full solutions rewritten after feedback
- Number theory, ratio and shaded-region packs (Gauss track)
- A model-solution file of full solutions (Grades 9 and 10 track)
- A proof file of full solutions (Grades 11 and 12 track)
- Timed practice papers with written pacing reviews and a next-contest plan

Total projects: A season of solved original problems, reviewed CEMC past contests, a file of the student's own full solutions, an error log and a practice-paper history

SKILLS THE STUDENT WILL HAVE AT THE END

- Reading unfamiliar problems carefully and choosing an idea
- Number sense, number theory and algebra for contests
- Counting, probability and organized casework
- Geometry and trigonometry with written reasons
- Sequences, functions and inequalities (Grades 11 and 12 track)
- Writing clear full solutions and proofs

- Pacing multiple-choice, answer-only and full-solution papers

HOW A TYPICAL WEEK IS SPLIT

Live classes: 2 live one-hour classes per week, each grade track in its own batches
Practice: A problem set after every class, with core and stretch problems
Review: Written feedback on full solutions, a timed round every month and a monthly error log check

SUPPORT INCLUDED

Doubt support: WhatsApp doubt support between classes, with hints first and full solutions after a real attempt
Progress updates: A monthly progress note to parents with practice-paper results and next steps
Free past contests: CEMC's past contests from the last 10 years, free with no registration, used as practice where CEMC publishes them

CERTIFICATION DETAIL

Completion: Certificate from Modern Age Coders, awarded on passing the final assessment. It records real learning and is not a CEMC certificate or contest result. Fall short and there is focused revision and a free retest

WHERE THIS CAN LEAD

- A second season of this course, moving up a track or deeper into full-solution writing
- Senior school math such as Ontario's MHF4U and MCV4U, through our Grade 12 university math course
- Contest programming, such as the Canadian Computing Competition, through our CCC preparation course
- University mathematics, computer science or engineering, with strong problem-solving habits
- Further math contests and personal problem-solving projects

COMMON QUESTIONS ABOUT THIS COURSE

For anything about cost, use PART 4 and RULE 1. Do not quote two regions.

Q: What are the Waterloo math contests?
A: They are the math contests run by CEMC (the Centre for Education in Mathematics and Computing) at the University of Waterloo, "Designed by teams of expert mathematicians and educators for Grades 5 to 12". This course covers the Gauss, Pascal, Cayley, Fermat and Euclid Contests, the Fryer, Galois and Hypatia Contests, and the CIMC and CSMC. CEMC also says: "Our contests are not tests or exams. There is no passing or failing score."

Q: Which contest should my child write?
A: CEMC matches each contest to a grade. Gauss is for "Students in Grades 7 and 8." Pascal is for Grade 9, Cayley for Grade 10 and Fermat for Grade 11. Fryer, Galois and Hypatia are for Grades 9, 10 and 11. The CIMC is for Grades 9 and 10, the CSMC for Grades 11 and 12 and CÉGEP students, and the Euclid for "Students in their final year of secondary school or CÉGEP students." In the first two weeks we place each student on a track and plan the contests for the year.

Q: When are the 2026/27 contests?
A: CEMC lists these dates for North and South America: CIMC and CSMC on Wednesday, November 18, 2026; Pascal, Cayley and Fermat on Tuesday, February 23, 2027 and Wednesday, February 24, 2027; Euclid on Tuesday, April 6, 2027; Fryer, Galois and Hypatia on Wednesday, April 7, 2027; and Gauss from Monday, May 10, 2027 to Friday, May 21, 2027. Schools order the contests before CEMC's deadlines, so check the current dates on CEMC's site with your school.

Q: How do we register for a contest?
A: Through a school, not through us. CEMC says "It is not possible for students to individually register for a contest" and "all students must participate through their school." If a student's school does not take part, CEMC suggests that "students can look for another local school that will allow them to join as a participant". We remind families to check the school's order early.

Q: What is the difference between multiple-choice and full-solution contests?
A: Gauss, Pascal, Cayley and Fermat each have 25 multiple-choice questions in 60 minutes, so speed and accuracy matter most. Fryer, Galois and Hypatia have "4 questions; a mix of final answer-only and full-solution." in 75 minutes, and the Euclid has "10 questions; a mix of final answer only and full-solution." in 2.5 hours. On a full-solution question the reasoning is marked, not just the answer, so we teach students to write clear, complete solutions.

Q: Do you use CEMC past contests?
A: Yes, the way CEMC intends. CEMC says "There is no registration or fee required to access these materials." and its past contests page says "Below you will find resources from the last 10 years." We set those past contests as practice, which students work on CEMC's site, and review them in class beside our own original problems. We never copy CEMC problems into

our materials.

Q: Will this course get my child a certificate of distinction or a top score?
A: No course can promise that, and we do not. Results depend on the student, the paper and the day. What the course gives is steady practice, timed rounds, written feedback on full solutions and an error log, so progress is visible month by month.

Q: Do the Waterloo contests matter for university?
A: They are a good challenge, not a requirement. The University of Waterloo's Computer Science page says writing the CSMC or Euclid "is not required for admission, but writing one of these contests is required for some scholarships offered by the Faculty of Mathematics." Waterloo's Admission Information Form also says "This form asks about any Waterloo mathematics contests you've participated in". Always check each university's current pages. We make no admission or scholarship promises.

Q: Can a younger student write the Gauss?
A: CEMC says "Motivated students in lower grades are welcome to write the contest." This course starts at about age 11. A younger student who is strong in math can join the Gauss track after the free demo class, if the teacher agrees the level fits. (Agent note: the free demo is a waiting list with no fixed date. The Priority Live Demo is a guaranteed class today or tomorrow, booked at https://learn.modernagecoders.com/priority-demo . Offer both, as RULE 3 says.)

Q: Does my child need to be top of the class in math?
A: No. A student should be comfortable with school math for their grade and willing to work on problems that take time. Contest problems feel unfamiliar at first for almost everyone; the course builds the habits that make them approachable, one idea at a time.

Q: How are the classes run?
A: Live online classes, twice a week, with a real teacher, in a group of 15 to 20 students, a mini batch of up to 6, or 1-on-1. Each grade track is taught in its own batches. Weekdays or weekends, flexible: choose your batch, or for a very personalised plan choose 1-on-1 at your convenience, weekend mornings or weekdays. Current fees for your region are shown in the pricing section of this page.

Q: Can we try a class first?
A: Yes. Book a free demo class. The teacher works through a short original problem with your child, suggests the right track and contests for the year, and recommends group, mini batch or 1-on-1 classes. There is no obligation to enrol. (Agent note: the free demo is a waiting list with no fixed date. The Priority Live Demo is a guaranteed class today or tomorrow, booked at https://learn.modernagecoders.com/priority-demo . Offer both, as RULE 3 says.)

To enrol, message Shivam Sir on +91 9123366161 or send the parent this link: https://learn.modernagecoders.com/courses/waterloo-math-contests-gauss-to-euclid-course
For a demo: the Priority Live Demo (guaranteed, today or tomorrow) is booked at https://learn.modernagecoders.com/priority-demo . The free demo is a waiting list with no fixed date.

==========

COURSE 136 OF 137: WEB DEVELOPMENT FOR KIDS: BUILD REAL WEBSITES

==========

Course link: https://learn.modernagecoders.com/courses/kids-ai-web-development-course
Subject area: Kids Coding
Designed for: Kids
Who can join: Complete beginner, ages 9 to 12
Course length: 8-10 months (32-40 weeks)
Time needed: 2 live classes/week + 2-3 hours practice
Certificate: Certificate from Modern Age Coders, awarded on passing the final exam

PRICE FOR THIS COURSE (quote only the one that applies to the person asking)
In India, per month: group Rs 1,499, mini batch Rs 2,999, one to one Rs 4,999
In Canada, per month: group CAD 140, one to one CAD 210
Anywhere else, per month: group $100, one to one $150
Classes: group and mini batch two live classes a week, eight a month; one to one in India one live class a week, four a month; one to one outside India two live classes a week, eight a month. Each class is one hour.

WHAT THIS COURSE IS

Web development course for kids aged 9-12: HTML, CSS and first JavaScript in live online classes, with real published websites in 8-10 months.

In one line: The moment a child types real code and a real website appears is unforgettable. Eight months from that first tag to published sites they built themselves.

ABOUT THE PROGRAMME

There is a special kind of pride in a child saying "I made this website", and meaning typed,

real, published code. This live online course gives that to children aged 9 to 12: HTML learned as the structure of every page, CSS as the art layer, layouts with flexbox and grid, responsive design tested on the family phone, and first JavaScript, the sparks that make pages respond. Every project is hand-typed by the child; this course builds real skill, not copy-paste. Publishing is the heartbeat: pages go live to real web addresses the family can visit, and the course ends with a capstone site, planned, built, polished and presented at demo day. Near the end, one honest week looks ahead at how professional developers use AI assistants, including why those tools have age rules (most are 13+, some 18+) and why the skills built in this course are exactly what will make such tools useful later. Nothing in the course requires any AI account, because nine-year-olds should be building their own skill, and the tools' own rules agree. The pace is honest and kid-sized: eight months at two live classes a week plus two to three hours of playful practice, with two more months in hand when needed. Homework after every class, a mixed challenge at the end of each month, and a final exam, a capstone demo plus a friendly viva, that decides the certificate, with a free retest after revision. Real code, real websites, real pride.

WHAT MAKES THIS COURSE DIFFERENT

- Real typed code from day one: no drag-and-drop site builders, no copy-paste dependence
- Publishing as a habit: children's pages go live at real web addresses their family can visit
- Kid-sized honest pace: 8 months at 2 classes a week, with 2 more in hand when needed
- Age-honest about AI: one look-ahead week explains how developers use AI assistants and why those tools are 13+ and 18+, no child accounts required or used
- Design taste built alongside code: spacing, color and layout judged out loud, kindly
- Real assessment, gently done: monthly mixed challenges and a final capstone exam with a free retest

THE LEARNING PATH, STEP BY STEP

Phase 1: HTML world (Months 1-2): structure, text, images, links, forms and multimedia, hand-typed from the first day
Phase 2: CSS magic (Months 3-4): color, typography, the box model, flexbox and grid
Phase 3: JavaScript sparks (Months 5-6): responsive design, then first real programming: logic, loops and little games
Phase 4: Real sites (Months 7-8): functions and DOM magic, publishing properly, the AI look-ahead, and the capstone exam

WHAT A STUDENT NEEDS BEFORE STARTING

Coding experience: None. The course starts at the very first tag
Reading typing: Comfortable reading; typing improves fast within the course
Equipment: A computer or laptop with a stable internet connection; every tool used is free
Age: 9 to 12. Younger children start better in our Kids Coding (Scratch-first) course
Time commitment: 2 live classes plus 2-3 hours of playful practice a week

WHO THIS COURSE IS FOR

Young builders: Children who want to make real things the whole family can visit online
Scratch graduates: Kids who finished block coding and are hungry for real typed code
Creative kids: Children who love drawing and design, CSS is where art meets code
Future teens: Kids who will roll naturally into our teen web and full-stack courses
Proud families: Parents who want screen time producing published, showable work

FULL CURRICULUM, WEEK BY WEEK

This is the complete teaching plan. Parents can ask about any week.

PHASE 1: HTML WORLD (MONTHS 1-2, WEEKS 1-8)

The structure of every website, hand-typed: text, images, links, forms, tables and multimedia, each week ending with a page to show the family.

Month 1: First Pages (Weeks 1-4)
Welcome to Web Development
Topics:
- What is a website? How does the internet work (kid-friendly explanation)
- Setting up your coding playground: VS Code with fun themes
- Installing colorful extensions and emoji support
- Your first HTML file: Hello World with emojis!
- Understanding tags: like LEGO blocks for websites
- Creating a personal 'About Me' page
- HTML structure: <html>, <head>, <body> explained with stories
- Saving and viewing your first webpage
- Celebrating your first website with screenshots!
- Typing practice for young coders: a little every day
Projects built:
- Build a digital pet profile page
- Make a birthday invitation webpage

HTML Elements Zoo - Text, Images & Links
Topics:
- Heading tags (h1-h6): Creating titles like newspaper headlines
- Paragraph tag: Writing stories on your webpage
- Making lists: Favorite games, friends, hobbies (ul, ol, li)
- Bold and italic: Making text stand out (strong, em)
- Adding images: Your photos, drawings, and GIFs
- Image attributes: alt text for accessibility
- Creating links: Connect your pages like a treasure map
- Link to other websites: YouTube, games, educational sites
- Making a photo album webpage
- Building a collection of favorite things

Projects built:
- Digital photo album with captions
- My favorite YouTube videos collection
- Interactive storybook with multiple pages
- School project presentation website

Practice: Build 5 themed pages (animals, sports, hobbies, etc.)
Assessment: Month 1 check: build a small page live from a sketch, plus a fun take-home challenge

Month 2: HTML Powers (Weeks 5-8)
Fun with Forms & Tables
Topics:
- Creating forms: Like making a quiz for friends
- Input types: text, email, password, number
- Fun input types: color picker, date picker, range slider
- Checkboxes for multiple choices: Pizza toppings selector
- Radio buttons for single choice: Favorite superhero poll
- Dropdown menus: Choose your adventure options
- Textarea: Writing stories and comments
- Tables for organizing information: Sports scores, schedules
- Making tables pretty with borders and colors
- Building interactive surveys

Projects built:
- Friend information collector form
- Class schedule table
- Restaurant menu with order form

Practice: Create 5 different interactive forms
Multimedia Magic - Audio, Video & Canvas
Topics:
- Adding videos to your webpage: YouTube embeds
- HTML5 video tag: Playing your own videos
- Audio elements: Adding music and sound effects
- Creating playlists on your webpage
- Canvas basics: Drawing on webpages
- Embedding games and interactive content
- iframe: Windows to other websites
- Making a multimedia gallery
- Creating a personal YouTube-style page
- Building an online portfolio of creations

Projects built:
- Personal video channel page
- Music playlist website
- Digital art gallery with canvas
- Multimedia learning resource page

Practice: Add multimedia to all previous projects
Assessment: Month 2 check: a multimedia page built live, with quiz questions reaching back to month 1

PHASE 2: CSS MAGIC (MONTHS 3-4, WEEKS 9-16)

The art layer: colors, fonts, the box model, then the two great layout tools, flexbox and grid, used to make pages genuinely beautiful.

Month 3: Style Arrives (Weeks 9-12)
CSS Basics - Making Websites Beautiful
Topics:
- What is CSS? The fashion designer for HTML
- Three ways to add CSS: inline, internal, external stylesheets
- CSS syntax: selector { property: value; }
- Selecting elements: tags, classes, and IDs
- Colors everywhere: background-color, color
- Color codes: named colors, hex codes, RGB
- Font families: Changing how text looks
- Google Fonts: Adding fun fonts to websites
- Text size, weight, and style
- Text alignment and decoration

```
      Projects built:
        - Rainbow text website
        - Colorful mood board page
        - Typography playground
      Practice: Style 10 HTML pages with different themes
    CSS Box Model & Spacing Magic
      Topics:
        - The Box Model: Every element is a box!
        - Padding: Space inside the box
        - Margin: Space outside the box
        - Border: The box's frame (styles, colors, radius)
        - Width and height: Sizing your boxes
        - Making round corners with border-radius
        - Creating shapes with CSS: circles, triangles
        - Box shadows for 3D effects
        - Background images and patterns
        - Building card-based layouts
      Projects built:
        - Trading card collection webpage
        - Social media profile page clone
        - Product showcase with cards
        - CSS art project with shapes
      Practice: Create 10 different card designs
      Assessment: Month 3 check: style a plain page live to match a design, plus mixed review

  Month 4: Layout Superpowers (Weeks 13-16)
    Flexbox - The Flexible Layout System
      Topics:
        - Introduction to Flexbox: Making layouts flexible
        - Flex container and flex items
        - Flex-direction: row, column, reverse
        - Justify-content: Spacing items horizontally
        - Align-items: Spacing items vertically
        - Creating navigation bars with Flexbox
        - Building photo galleries
        - Flexbox games: Flexbox Froggy, Flexbox Defense
        - Making responsive card layouts
        - Creating hero sections
      Projects built:
        - Responsive navigation menu
        - Pinterest-style photo gallery
        - Flexible dashboard layout
        - Game character selection screen
      Practice: Complete all Flexbox Froggy levels
    CSS Grid - The Ultimate Layout Tool
      Topics:
        - CSS Grid basics: Rows and columns
        - Grid-template-columns and grid-template-rows
        - Grid gaps: Adding space between items
        - Placing items in specific grid cells
        - Grid areas: Naming your layout sections
        - Creating magazine-style layouts
        - Building game boards with Grid
        - Grid Garden game for practice
        - Combining Flexbox and Grid
        - Responsive grids with auto-fit
        - Creating complex layouts easily
      Projects built:
        - Magazine homepage layout
        - Tic-tac-toe game board
        - Calendar layout with Grid
        - Minecraft-style inventory grid
      Practice: Build 10 different grid layouts
      Assessment: Month 4 check: build a card layout live with flexbox or grid, plus mixed
      review

----------------------------------------------------------------
PHASE 3: JAVASCRIPT SPARKS (MONTHS 5-6, WEEKS 17-24)
----------------------------------------------------------------
Pages that fit every screen, then the big step: first real programming, decisions, loops and
little games, in the language of the web.

  Month 5: Every Screen, First Code (Weeks 17-20)
    Responsive Design - Mobile First!
      Topics:
        - What is responsive design? One site for all devices
        - Mobile-first approach: Start small, go big
        - Media queries: Different styles for different screens
        - Breakpoints: Phone, tablet, desktop
```

```
        - Responsive units: %, vw, vh, rem, em
        - Responsive images: srcset and picture element
        - Responsive typography: Scaling text
        - Testing on different devices
        - Chrome DevTools device simulator
        - Mobile-friendly navigation patterns
        - Touch-friendly button sizes
      Projects built:
        - Responsive portfolio website
        - Mobile-first blog layout
        - Adaptive gaming website
        - Responsive school project site
      Practice: Make all previous projects responsive
    JavaScript Basics - Making Websites Interactive
      Topics:
        - What is JavaScript? The brain of websites
        - Adding JavaScript to HTML pages
        - Console.log: Talking to the computer
        - Variables: Storing information (let, const)
        - Data types: Numbers, strings, booleans
        - Basic math operations
        - String concatenation: Joining words
        - Template literals: Easy text formatting
        - Comments in JavaScript
      Projects built:
        - Interactive calculator
        - Mad libs story generator
        - Age calculator with messages
        - Simple greeting program
      Practice: Write 20 simple JavaScript programs
      Assessment: Month 5 check: make a page respond to a click live, plus mixed review of
      earlier months

  Month 6: Logic, Loops and Little Games (Weeks 21-24)
    JavaScript Logic & Decisions
      Topics:
        - If statements: Making decisions
        - Else and else if: Multiple choices
        - Comparison operators: >, <, ==, ===
        - Logical operators: AND (&&), OR (||), NOT (!)
        - Switch statements for multiple cases
        - Ternary operator: Quick decisions
        - Random numbers with Math.random()
        - Building simple games with logic
        - Creating quiz logic
        - Score keeping systems
      Projects built:
        - Rock, Paper, Scissors game
        - Number guessing game
        - Quiz with scoring
        - Adventure choice game
      Practice: Build 10 decision-based programs
    Loops & Arrays - Handling Multiple Items
      Topics:
        - Arrays: Lists of items
        - Accessing array elements
        - Array methods: push, pop, length
        - For loops: Repeating actions
        - While loops: Keep going until...
        - Looping through arrays
        - forEach: Modern array looping
        - Creating patterns with loops
        - Nested loops for complex patterns
        - Building lists dynamically
        - Array-based games
      Projects built:
        - Todo list manager
        - Student grade calculator
        - Pattern generator
        - Memory card game logic
      Practice: Solve 20 loop and array challenges
      Assessment: Phase check: a little browser game built live, plus a mixed challenge
      spanning phases 1-3

------------------------------------------------------------
PHASE 4: REAL SITES (MONTHS 7-8, WEEKS 25-32)
------------------------------------------------------------
Functions and DOM magic, proper publishing, one honest look at how professionals use AI, and
the capstone site presented at demo day.
```

Month 7: DOM Magic (Weeks 25-28)
Functions - Reusable Code Blocks
Topics:
- What are functions? Code recipes
- Creating simple functions
- Parameters: Giving functions information
- Return values: Getting answers back
- Function expressions vs declarations
- Arrow functions: Modern syntax
- Scope: Where variables live
- Built-in functions: Math, String methods
- Creating a function library
- Organizing code with functions
Projects built:
- Utility function library
- Calculator with functions
- Text analyzer tool
- Game with multiple functions
Practice: Create 30 useful functions
DOM Manipulation - Changing Websites with JavaScript
Topics:
- What is the DOM? The website's structure
- Selecting elements: getElementById, querySelector
- Changing text content dynamically
- Changing styles with JavaScript
- Adding and removing CSS classes
- Creating new elements
- Adding elements to the page
- Removing elements
- Show/hide elements
- Building dynamic interfaces
- Click, hover and keyboard events: pages that listen
Projects built:
- Dynamic content generator
- Interactive story with choices
- Color theme switcher
- DOM-based game
Practice: Manipulate DOM in 20 different ways
Assessment: Month 7 check: add an interactive feature to an old page live, plus mixed review

Month 8: Publish, Look Ahead, and the Finale (Weeks 29-32)
Publish and Shine
Topics:
- Publishing properly: your site at a real web address
- The pre-launch checklist: links, images, spelling, phones
- Accessibility for kind builders: alt text, contrast, readable fonts
- THE HONEST AI LOOK-AHEAD: how professional developers use AI assistants today
- Why the big AI chatbots are 13+ and some tools 18+, and why waiting is fine
- Watching the teacher pair with an AI assistant on a class demo, then spotting its mistake together
- The skills that will make AI useful later: exactly what you are building now
Projects built:
- Every good page from the course, live at real addresses
- A class "spot the AI mistake" detective session
Practice: Send your favorite live link to three family members
Capstone and the Final Exam
Topics:
- Choosing the capstone: a site about something you love
- Planning pages on paper before typing
- Building with everything: HTML, CSS layouts, JavaScript sparks
- Polish: spacing, colors, small screens
- Rehearsing the demo: what it is, how it works, what was hard
Projects built:
- THE CAPSTONE: a complete multi-page website, published and presented at demo day
Practice: A little building every day; keep it always working
Assessment: FINAL EXAM: capstone demo plus a friendly viva and a mixed quiz from the whole course. Passing earns the certificate; a child who falls short gets focused revision and a free retest

PROJECTS THE STUDENT BUILDS AND KEEPS

- Phase 1: hand-typed pages about hobbies, pets and heroes, each shown at home the same week
- Phase 2: styled and laid-out pages, card galleries and a small design portfolio
- Phase 3: responsive pages and first JavaScript games
- Phase 4: interactive features, published sites, and the capstone presented at demo day

Total projects: 25+ hand-built pages and mini-sites, crowned by a published capstone website

SKILLS THE STUDENT WILL HAVE AT THE END

- HTML: real structure, typed by hand, validator-clean
- CSS: color, typography, the box model, flexbox and grid
- Responsive design: pages tested on the family phone
- First JavaScript: logic, loops, functions and DOM magic
- Publishing: real sites at real addresses, with a launch checklist
- AI honesty: how developers use assistants, and why those tools wait until 13+

HOW A TYPICAL WEEK IS SPLIT

Live classes: 2 live one-hour classes per week, typing along with the teacher
Homework: A small build after every class, and a mixed challenge at the end of every month
Practice: 2-3 hours of playful practice between classes
Review: Every page reviewed with teacher feedback; wobbly skills reopened in class

SUPPORT INCLUDED

Doubt support: WhatsApp doubt support between classes, for the page that suddenly went sideways
Progress updates: Regular progress notes to parents, with live links to what your child published

CERTIFICATION DETAIL

Completion: Certificate from Modern Age Coders, awarded on passing the final exam, a capstone demo plus a friendly viva. A child who falls short gets focused revision and a free retest: the certificate certifies skills, not attendance

WHERE THIS CAN LEAD

- Full Stack for Teens: the direct continuation once they turn 13
- Python for Kids: a second language while the web skills settle
- JavaScript for Teens: deepening the sparks lit here
- School projects that suddenly look professional
- The family website: every club, trip and pet now has a webmaster

COMMON QUESTIONS ABOUT THIS COURSE

For anything about cost, use PART 4 and RULE 1. Do not quote two regions.

Q: What will my child build in this web development course?
A: More than 25 hand-typed pages and mini-sites across eight months: hobby pages, styled galleries, responsive layouts, first JavaScript games, and finally a capstone, a complete multi-page website about something they love, published to a real web address and presented at demo day. Everything is typed by the child; there are no drag-and-drop shortcuts and no copy-paste dependence.

Q: What age is right for this course?
A: Ages 9 to 12. Web development involves real typing, and this range handles it well and grows fast. Younger children are better served by our Kids Coding course, which starts with blocks and builds toward exactly this. Batches are grouped by age so the pace fits the room.

Q: How long does it take a child to learn web development?
A: Eight months at 2 live classes a week plus 2 to 3 hours of playful practice takes a child from first tag to a published multi-page capstone. The course keeps two more months in hand for children who need more repetition, no rushing and no penalty. The first live published page happens within the first month, and the pride is immediate.

Q: How is my child assessed? Is the certificate just for attending?
A: No, and it is all gentle: classwork in every session, a small build after every class, a monthly mixed challenge that revisits earlier skills, and a final exam at the end, a capstone demo plus a friendly viva and short quiz. Passing earns the certificate; a child who falls short gets focused revision and a free retest. Real skills, kindly tested.

Q: Does this course use AI tools like ChatGPT?
A: No, deliberately, and we are open about why: the major AI chatbots require users to be 13 or older (some tools 18+), and a nine-year-old building their own skill should be doing exactly that. The course includes one honest look-ahead week where children see how professional developers use AI assistants, watch the teacher demo one, and learn why the skills they are building are what will make such tools useful when they are old enough.

Q: Will my child's websites really be on the internet?
A: Yes: publishing is a habit here, not a finale. Pages go live to real addresses on free hosting through the course, and the capstone launches properly with a checklist. Grandparents can visit the URL; that moment is usually the one that hooks a child for good.

Q: Is any paid software needed?

A: No. VS Code, the browser and free hosting cover the entire course. Any reasonably recent computer or laptop is enough; web pages are the lightest thing a computer can build.

Q: Is there a free trial class?
A: Yes, a free demo class with no commitment: book at learn.modernagecoders.com/contact or message us on WhatsApp at +91 91233 66161. Your child will type and see a real page inside the demo itself. (Agent note: the free demo is a waiting list with no fixed date. The Priority Live Demo is a guaranteed class today or tomorrow, booked at https://learn.modernagecoders.com/priority-demo . Offer both, as RULE 3 says.)

Q: Are classes live or recorded?
A: Live, always: small groups with a real teacher who sees your child's code as they type it, never pre-recorded videos. At this age the teacher's eyes matter most, catching the missing bracket before it becomes tears.

To enrol, message Shivam Sir on +91 9123366161 or send the parent this link: https://learn.modernagecoders.com/courses/kids-ai-web-development-course
For a demo: the Priority Live Demo (guaranteed, today or tomorrow) is booked at https://learn.modernagecoders.com/priority-demo . The free demo is a waiting list with no fixed date.

==========

COURSE 137 OF 137: WESTERN CANADA GRADE 12 MATH: PRE-CALCULUS 12 AND MATH 30-1

==========

Course link: https://learn.modernagecoders.com/courses/western-canada-grade-12-math-pre-calculus-12-math-30-1-course
Subject area: Western Canada High School Mathematics
Designed for: High school
Who can join: Students in Grade 12 (roughly ages 16 to 18) taking Pre-calculus 12 in British Columbia or Math 30-1 in Alberta
Course length: 6 months (24 weeks) per plan, joinable any month and paced to your school course
Time needed: 2 live classes/week + short practice sets between classes
Certificate: Certificate from Modern Age Coders, awarded on passing the final assessment (this is not a high school credit in British Columbia, Alberta or any province)

PRICE FOR THIS COURSE (quote only the one that applies to the person asking)
In India, per month: group Rs 1,499, mini batch Rs 2,999, one to one Rs 4,999
In Canada, per month: group CAD 140, one to one CAD 210
Anywhere else, per month: group $100, one to one $150
Classes: group and mini batch two live classes a week, eight a month; one to one in India one live class a week, four a month; one to one outside India two live classes a week, eight a month. Each class is one hour.

WHAT THIS COURSE IS

Live online help for BC Pre-calculus 12 and Alberta Math 30-1, ages 16 to 18, taught alongside school: functions, logarithms, trigonometry and counting. We do not grant credits.

In one line: A second teacher for Grade 12 math in British Columbia and Alberta: functions, logarithms, trigonometry and counting understood properly, in step with your school course.

ABOUT THE PROGRAMME

Pre-calculus 12 is one of the Grade 12 courses on British Columbia's mathematics course list, beside Foundations of Mathematics 12 and Calculus 12. In Alberta, Mathematics 30-1 is one of the courses with a provincial diploma exam, and the diploma exam counts for a large share of the final mark. Alberta's diploma exams overview says "The weighting of diploma exams returned to 30% effective September 1, 2023." and "70% of the final mark comes from course work. The remaining 30% comes from the diploma exam." Alberta's provincial achievement tests page adds that "students write diploma exams and provincial achievement tests in a digital environment rather than pencil and paper". This course runs alongside the student's own Pre-calculus 12 or Math 30-1 class, and we follow the order of the student's school course outline so what is learned here is used in class the same week. What our course teaches: functions and their transformations, including inverses; polynomial, radical and rational functions; exponential and logarithmic functions; trigonometry in radians, with identities and equations; and permutations, combinations and the binomial theorem. Every topic starts from meaning, with graphs and small examples, before the algebra. For Alberta students we add exam technique for the Math 30-1 diploma exam, practised on screen; for BC students we prepare for the school's own unit tests and final exam. Tests and assignments stay the student's own work: we explain, question and review, and the student does the math. Please read this plainly: Modern Age Coders teaches alongside school and does not grant high school credits in British Columbia, Alberta or any other province. Families who need the credit take the course through their school or an approved provider. What we add is understanding, practice and confidence, in live classes with a real teacher. We make no promise of marks or diploma exam results.

WHAT MAKES THIS COURSE DIFFERENT

- Built for BC Pre-calculus 12 and Alberta Math 30-1 students, following the student's own school course outline week by week

- Meaning before algebra: graphs, tables and small examples come first, then the rules
- Exam technique for the Alberta Math 30-1 diploma exam, which counts for 30% of the final mark, practised on screen
- Honest about credits: we teach alongside school and do not grant high school credits
- Tests and assignments stay the student's own work: we explain and review, we never do school work for them
- A mistakes list and timed review papers, so revision targets what each student actually gets wrong

THE LEARNING PATH, STEP BY STEP

Phase 1: Functions and transformations, then polynomial, radical and rational functions
Phase 2: Exponential and logarithmic functions, then trigonometry in radians with identities and equations
Phase 3: Permutations, combinations and the binomial theorem, combining functions, and exam review for school finals and the Alberta diploma exam

WHAT A STUDENT NEEDS BEFORE STARTING

School course: Currently taking, or about to take, Pre-calculus 12 in British Columbia or Math 30-1 in Alberta
Math level: Comfortable with the Grade 11 math that came before, which we refresh in the first two weeks
Age: Roughly 16 to 18 (Grade 12)
Equipment: A computer with stable internet, a scientific or graphing calculator, and a way to share photos of written work
Timing: Weekdays or weekends, flexible: choose your batch, or for a very personalised plan choose 1-on-1 at your convenience, weekend mornings or weekdays

WHO THIS COURSE IS FOR

Bc pre calculus 12 students: BC students in Pre-calculus 12 who want functions, logarithms and trigonometry to make sense
Alberta math 30 1 students: Alberta students in Math 30-1 preparing for unit tests and the diploma exam
Students who feel behind: Students who missed a unit or lost confidence and want to catch up calmly
Students aiming higher: Students who are doing well and want cleaner, more complete written solutions
Future stem students: Students heading toward calculus and science, engineering or computer science programs

FULL CURRICULUM, WEEK BY WEEK

This is the complete teaching plan. Parents can ask about any week.

PHASE 1: FUNCTIONS, TRANSFORMATIONS AND POLYNOMIAL, RADICAL AND RATIONAL FUNCTIONS (MONTHS 1-2, WEEKS 1-8)

The function toolkit every Grade 12 topic depends on, then the polynomial, radical and rational families.

Month 1: Functions and Transformations (Weeks 1-4)
Weeks 1-2: Starting Point and the Function Toolkit
Topics:
- A starting conversation and short diagnostic: the province, the school, the course outline, the next test and the Grade 11 ideas to refresh
- Function notation, domain and range, and reading a graph carefully
- Parent functions and their key points
- Factoring review: common factors, trinomials and the difference of squares
- Solving quadratic equations by factoring and by formula
- Setting up a clean notebook system for definitions, examples and mistakes

Projects built:
- A one-page function toolkit summary, with a sketch of each parent function and its key points

Practice: Short daily sets that mix new work with one or two Grade 11 refresher questions
Weeks 3-4: Transformations and Inverses
Topics:
- Translations, stretches and reflections, and the order to apply them
- Mapping notation for points on a transformed graph
- Writing the equation of a transformed function from its graph
- Inverse functions: finding them, graphing them and restricting the domain
- Reflections in the line y = x
- Common mistakes with horizontal stretches and shifts

Projects built:
- A transformation set: ten graphs transformed by hand from mapping rules, then checked with graphing technology

Practice: For every transformation, write the mapping rule before sketching
Assessment: Month 1 check: a short written test on functions, transformations and

inverses, reviewed with written feedback

Month 2: Polynomial, Radical and Rational Functions (Weeks 5-8)
Weeks 5-6: Polynomial Functions
Topics:
- Degree, leading coefficient and end behaviour
- Long division and synthetic division
- The remainder theorem and the factor theorem
- Zeros and their multiplicity, and how the graph behaves at each one
- Sketching a polynomial from its factored form
- Writing an equation from a graph or from given zeros

Projects built:
- A polynomial sketch set with end behaviour, zeros and intercepts explained for each graph

Practice: Factor theorem and sketching sets, each answer checked by substitution or graph

Weeks 7-8: Radical and Rational Functions
Topics:
- Square root functions and their transformations
- Graphing y equal to the square root of a function, and its domain
- Rational functions: vertical asymptotes, horizontal asymptotes and holes
- Sketching rational functions from their factored form
- Solving radical and rational equations graphically and algebraically
- Checking for extraneous roots and restricted values

Projects built:
- A radical and rational function set with every restriction, asymptote and hole labelled

Practice: For every rational function, list restrictions and asymptotes first, then sketch

Assessment: Phase 1 assessment: a timed test on functions, transformations and polynomial, radical and rational functions, marked with comments

---

PHASE 2: EXPONENTIAL AND LOGARITHMIC FUNCTIONS, AND TRIGONOMETRY (MONTHS 3-4, WEEKS 9-16)

Growth, decay and logarithms, then trigonometry in radians with identities and equations.

Month 3: Exponential and Logarithmic Functions (Weeks 9-12)
Weeks 9-10: Exponential Functions
Topics:
- Exponential functions and their graphs
- Transformations of exponential functions
- Solving exponential equations with a common base
- Growth and decay: population, half-life and compound interest
- Choosing between a linear and an exponential model
- Reading an exponential graph to answer a question in context

Projects built:
- An applications pack: three real growth or decay situations modelled and solved in full

Practice: Mixed exponential equation sets, with answers checked on a graph

Weeks 11-12: Logarithms
Topics:
- The logarithm as the inverse of an exponential function
- Graphs of logarithmic functions and their transformations
- Laws of logarithms and when each one applies
- Solving exponential and logarithmic equations, and checking for extraneous roots
- Changing the base of a logarithm
- Logarithmic scales: sound, earthquakes and pH

Projects built:
- A logarithm laws file: ten equations solved in full, with each law named at the step where it is used

Practice: One log law proof and three equations every day

Assessment: Month 3 check: a written test on exponential and logarithmic functions, reviewed with written feedback

Month 4: Trigonometry in Radians, Identities and Equations (Weeks 13-16)
Weeks 13-14: Radians, the Unit Circle and Trigonometric Graphs
Topics:
- Radian measure, arc length and converting between radians and degrees
- The unit circle and exact values for special angles
- Graphs of sine, cosine and tangent
- Amplitude, period, phase shift and vertical displacement
- Writing a sinusoidal equation from a graph or a situation
- Modelling periodic situations such as tides and daylight hours

Projects built:
- A sinusoidal model of a real periodic situation, with the equation built from the data and explained

Practice: Unit circle and graph sets, each answer checked against a quick sketch

Weeks 15-16: Identities and Trigonometric Equations
Topics:
- Reciprocal, quotient and Pythagorean identities
- Sum, difference and double angle identities

- Proving identities: working one side and writing each step clearly
- Solving first and second degree trigonometric equations
- Finding all solutions in an interval, and the general solution
- Non-permissible values and common mistakes that lose solutions

Projects built:
- An identity proof file: ten identities proved in full, with the strategy for each written first

Practice: One identity proof and two equations every day, with every solution in the interval listed

Assessment: Phase 2 assessment: a mixed review paper on logarithms and trigonometry, marked with written comments

---

PHASE 3: PERMUTATIONS AND COMBINATIONS, COMBINING FUNCTIONS AND EXAM REVIEW (MONTHS 5-6, WEEKS 17-24)

Careful counting, combining functions, then exam review for school finals and, for Alberta students, the Math 30-1 diploma exam.

Month 5: Permutations, Combinations and Combining Functions (Weeks 17-20)

Weeks 17-18: Permutations, Combinations and the Binomial Theorem

Topics:
- The fundamental counting principle
- Permutations, including arrangements with repeated items and with restrictions
- Combinations, and how to tell a combination problem from a permutation problem
- Factorial notation and solving equations with factorials
- Pascal's triangle and the binomial theorem
- Finding a specific term in a binomial expansion

Projects built:
- A counting pack: twelve problems sorted by method, each solved with the reason for the method written first

Practice: Mixed counting sets, each starting with the question: does order matter?

Weeks 19-20: Combining Functions

Topics:
- Sums, differences, products and quotients of functions, and their graphs
- Composition of functions and its domain
- Sketching a combined function from the graphs of its parts
- Writing a function as a composition of simpler functions
- Domain restrictions that come from combining functions
- Links back to transformations, logarithms and trigonometry

Projects built:
- A combining functions set with graphs, equations and domains explained for each

Practice: Short daily sets that combine two functions from earlier units

Assessment: Month 5 check: a written test on counting and combining functions, reviewed with written feedback

Month 6: Exam Review Technique (Weeks 21-24)

Weeks 21-22: Mixed Review and Written Solutions

Topics:
- Making a one-page summary for each unit of the school course
- Mixed review sets that move between units without warning
- Full written solutions that show every step
- Using graphing technology to check, not to replace, the algebra
- Building and using a personal mistakes list
- Reading the teacher's exam outline so revision matches what will be assessed

Projects built:
- A personal review pack: unit summaries and a mistakes list with a corrected example for each mistake

Practice: A mixed review set after every class, with every mistake written up and fixed

Weeks 23-24: Timed Practice for School Finals and the Alberta Diploma Exam

Topics:
- Timed review papers in the style of school final exams, with careful review afterwards
- For Alberta students: pacing a long exam and checking answers before moving on
- For Alberta students: practising on screen, since diploma exams are written in a digital environment
- Reading Alberta's current diploma exam schedule and instructions together
- For BC students: matching revision to the school's own final exam outline
- A calm exam-week routine: sleep, short practice and one last review of the mistakes list

Projects built:
- Two reviewed timed papers and a written exam-week plan

Practice: A timed mixed review each week, reviewed in class

Assessment: Final assessment: a timed review paper plus a short live walk-through of two of the student's own solutions

PROJECTS THE STUDENT BUILDS AND KEEPS

- A function toolkit summary and a transformation set
- Polynomial, radical and rational function sketch sets
- Exponential applications pack and a logarithm laws file
- A sinusoidal model and an identity proof file

- A counting pack sorted by method
- A combining functions set
- A personal review pack and two reviewed timed papers

Total projects: A file of worked solutions, sketch sets, proofs and review papers, all the student's own work

SKILLS THE STUDENT WILL HAVE AT THE END

- Functions, transformations and inverses
- Polynomial, radical and rational functions
- Exponential and logarithmic functions and their applications
- Trigonometry in radians, identities and equations
- Permutations, combinations and the binomial theorem
- Combining functions
- Full written solutions and exam review technique

HOW A TYPICAL WEEK IS SPLIT

Live classes: 2 live one-hour classes per week, paced to the student's school course outline
Practice: Short practice sets after every class, separate from school assignments
Review: Practice work reviewed with written comments, and a monthly check that mixes in earlier topics

SUPPORT INCLUDED

Doubt support: WhatsApp doubt support between classes, with hints and questions first so the student does the thinking
Progress updates: A monthly progress note to parents with what was covered, what is strong and what to practise next

CERTIFICATION DETAIL

Completion: Certificate from Modern Age Coders, awarded on passing the final assessment. It records real learning and is not a high school credit. Fall short and there is focused revision and a free retest

WHERE THIS CAN LEAD

- Calculus at school or in first-year university, on a solid base
- University science, engineering, computer science or mathematics programs
- Math contests for senior students, through our Waterloo math contests course
- Further study in data science and programming, where functions and logarithms are used every day
- Our other high school math courses for the next step

COMMON QUESTIONS ABOUT THIS COURSE

For anything about cost, use PART 4 and RULE 1. Do not quote two regions.

Q: Does this course give my child a high school credit in BC or Alberta?
A: No. Modern Age Coders teaches alongside school and does not grant high school credits in British Columbia, Alberta or any other province. A family who needs the Pre-calculus 12 or Math 30-1 credit takes the course through the student's school or an approved provider. Our course helps the student understand and do well in the school course they are already taking.

Q: Which courses is this for?
A: Pre-calculus 12 in British Columbia, which is on BC's mathematics course list, and Mathematics 30-1 in Alberta, which is on Alberta's list of diploma exam courses. Both are Grade 12 courses heavy in functions, so we teach them together while following each student's own school course outline.

Q: What topics does the course teach?
A: Functions and transformations, including inverses; polynomial, radical and rational functions; exponential and logarithmic functions; trigonometry in radians, with identities and equations; and permutations, combinations and the binomial theorem, plus combining functions. Your school's course outline gives the exact list and order for your class, and we follow it.

Q: How much is the Math 30-1 diploma exam worth?
A: Alberta's diploma exams overview says "The weighting of diploma exams returned to 30% effective September 1, 2023." and "70% of the final mark comes from course work. The remaining 30% comes from the diploma exam." Mathematics 30-1 is one of the diploma exam courses on that page.

Q: Do you prepare Alberta students for the Math 30-1 diploma exam?
A: Yes, alongside their school course. We teach the mathematics, then exam technique: pacing, checking and timed practice papers with careful review. Alberta says "students write diploma exams and provincial achievement tests in a digital environment rather than pencil and paper", so some practice is done on screen. Exam schedules can change, so we read Alberta's

current diploma exam information with each student. We make no promise of marks or results.

Q: What comes after Pre-calculus 12?
A: BC's mathematics course list also includes Calculus 12, and many university programs in science, engineering and computer science build on pre-calculus. The functions, logarithms and trigonometry in this course are exactly what calculus uses. Always check each university's current admission page for its own requirements.

Q: Does the course follow my school's order?
A: Yes. Schools order the units differently, so we use the student's own course outline and next test date to set the pace. The plan on this page shows our standard sequence, and each batch follows the order of its students' schools as closely as possible.

Q: Will you do my child's assignments or tests?
A: No. School work stays the student's own. We explain concepts, ask questions, review work the student has written and suggest how to improve it, and we follow the school's rules on outside help. That is also the only kind of help that lasts into the exam room.

Q: Can my child join partway through the school year?
A: Yes, the course is joinable any month. We start from the student's current unit and next test, fill gaps from earlier units as needed, and keep pace with the school course from then on.

Q: How are the classes run?
A: Live online classes, twice a week, with a real teacher, in a group of 15 to 20 students, a mini batch of up to 6, or 1-on-1. Weekdays or weekends, flexible: choose your batch, or for a very personalised plan choose 1-on-1 at your convenience, weekend mornings or weekdays. Current fees for your region are shown in the pricing section of this page.

Q: Can we try a class first?
A: Yes. Book a free demo class. The teacher looks at where your child is in Pre-calculus 12 or Math 30-1, works through a short problem with them, and suggests whether group, mini batch or 1-on-1 classes fit best. There is no obligation to enrol. (Agent note: the free demo is a waiting list with no fixed date. The Priority Live Demo is a guaranteed class today or tomorrow, booked at https://learn.modernagecoders.com/priority-demo . Offer both, as RULE 3 says.)

To enrol, message Shivam Sir on +91 9123366161 or send the parent this link: https://learn.modernagecoders.com/courses/western-canada-grade-12-math-pre-calculus-12-math-30-1-course
For a demo: the Priority Live Demo (guaranteed, today or tomorrow) is booked at https://learn.modernagecoders.com/priority-demo . The free demo is a waiting list with no fixed date.

==========
PART 7. HOW SOMEONE JOINS
==========

THE STEPS, IN ORDER

1. First chat. Find out the age, the subject, the current level and the goal.
2. Demo class. Priority Live Demo (paid, guaranteed, today or tomorrow) or the free waiting list. A real teacher either way. Parent may sit in.
3. Pick a plan. Group, mini batch or one to one.
4. Shivam Sir matches the student to a batch that fits their timetable.
5. Pay the first month through a secure link.
6. The student gets dashboard access, the class link and the recordings.
7. Classes begin.
8. Progress updates go to the parent every month.

WHAT TO COLLECT BEFORE HANDING A LEAD OVER

- Student full name.
- Age, and school class or grade.
- School and board if it is a school subject (CBSE, ICSE, IGCSE, IB, state board).
- Parent name.
- Parent WhatsApp number, with the country code.
- City and country, so we know the time zone.
- Subject wanted: coding, maths, or both.
- The goal: school marks, board exam, hobby, Olympiad, college prep, a job.
- Roughly when they are free: weekdays or weekends, morning or evening.
- Preferred language: English or Hindi.

WHAT THE PRIORITY LIVE DEMO ACTUALLY IS

- A paid, guaranteed demo class. The family picks the day and time, usually today or tomorrow.
- A mentor is reserved only for that family, and we confirm on WhatsApp within the hour.
- A full live class of about 45 to 60 minutes with a real teacher. Not a sales call.
- Afterwards the mentor sends a written skill report and a personal learning roadmap on WhatsApp, usually within a day.
- If the family enrols, the demo fee is adjusted against the first month. They send the demo

Order ID on WhatsApp and our team applies it. It does not show as a discount on the payment page.
- One-time fee: 499 rupees in India, 14 Canadian dollars in Canada, 10 US dollars everywhere else. Quote only the person's own region.
- Booking it does not commit the family to any course.

WHAT THE FREE DEMO ACTUALLY IS

- A waiting list. Mentors teach live all day, so a free demo happens only when one becomes free.
- The wait can be several weeks and we cannot promise a date, or that one will open at all.
- When it happens it is a live class with a real teacher, not a sales call and not a recording.
- Free. No card details are ever asked for.
- The parent is welcome to watch.
- It doubles as a placement check, so the teacher recommends the right starting point.
- One free demo per student.
- If the child does not enjoy it, the family walks away owing nothing.

If a parent wants to judge us before booking, offer this: they can watch recordings of real, unedited classes first.

PART 8. REFUND AND CANCELLATION. READ THIS OUT EXACTLY, DO NOT REWORD IT

REFUND POLICY

Modern Age Coders offers a 7 day money back guarantee on all online courses, provided you have not completed more than 20 percent of the course content.

To be eligible:
- The request must come within 7 days of the original purchase date.
- Refunds apply to the first purchase only, not to renewals or repeat subscriptions.

Not refundable:
- Courses where more than 20 percent of the content has been viewed or downloaded.
- One to one mentorship sessions that have already been taught.
- Customised bootcamps or special arrangements.
- Payment gateway charges: 2.5 percent of the fee, added at checkout and shown on the bill before paying. A refund covers the fee itself, so someone who paid 100 plus 2.5 in gateway charges gets 100 back.

Once a refund is approved it goes back to the original payment method. The credit appears within 7 to 10 business days, depending on the card issuer.

To request one, email connect@modernagecoders.com with the order details and the reason.

CANCELLATION POLICY

- Enrolment can be cancelled at any time. A cancellation after a live batch has started, or after materials have been accessed, falls under the refund policy above.
- A recurring subscription can be cancelled any time from the account dashboard. It takes effect at the end of the current billing cycle and there is no further charge.
- We may cancel or reschedule a course if too few students enrol or something unforeseen happens. Those students get a full refund or a transfer to another schedule.
- After cancelling, access continues until the end of the billing period already paid for.
- To cancel: use account settings, or email connect@modernagecoders.com.

IF SOMEONE ASKS "WHAT IF WE ARE NOT HAPPY?"

Say: "There is a 7 day money back guarantee. If in the first week you have used less than 20 percent of the course and it is not right for you, we refund the fee in full (the 2.5 percent payment gateway charges added at checkout are not refunded). And before you pay for a month you can see a full live class, either through the Priority Live Demo, whose fee is adjusted against your first month if you join, or through the free demo waiting list."

==========
PART 10. GENERAL QUESTIONS AND THE ANSWERS TO GIVE
==========

Q: What is Modern Age Coders?
A: We teach live online coding and mathematics to learners aged 6 to 67. Kids, teens, college students, working professionals and corporate teams. We also build software for businesses, which is how our advanced students get real project experience.

Q: Does my child need any experience?
A: No. Our beginner courses start from the very beginning and most of our students start with zero experience.

Q: Are the classes live or recorded?
A: Every class is live with a real teacher. Recordings are provided as well, so a missed class can be caught up.

Q: What does my child need at home?
A: A computer, Windows, Mac or Chromebook, and steady internet. Most courses run in the browser so nothing needs installing. A webcam and microphone help, and for maths a notebook and pen.

Q: How many classes a week?
A: Every class is one hour and live. Group class and mini batch: two live classes a week, eight a month. One to one: in India one live class a week, four a month; outside India two live classes a week, eight a month. Give the person only the line for their own plan and region.

Q: What do we get in one to one classes?
A: A dedicated mentor teaching only your child, in private live one hour classes. In India that is one live class a week, four a month. The day and time are fixed around the student, and the pace and topics are planned for them alone. It is billed monthly and can be cancelled any month.

Q: How big are the batches?
A: Group classes are capped at 20 students. A mini batch is up to 6. One to one is a single student with their own mentor.

Q: How long does a course take?
A: Beginner courses usually run 3 to 6 months. Advanced ones run 6 to 9 months. Custom programmes are flexible.

Q: What ages do you teach?
A: From 6 to 67. Kids are 6 to 12, teens are 13 to 18, and then college students and adults.

Q: Is there a free class?
A: Yes, one free demo per student with a real teacher, and we never ask for card details. It is a waiting list, because our mentors teach live all day, so we cannot promise a date. If you want a class today or tomorrow, the Priority Live Demo is a paid, guaranteed slot: a full class of about 45 to 60 minutes with a written skill report afterwards, and the fee is adjusted against your first month if you enrol. Parents are welcome to sit in on either.

Q: What if we miss a class?
A: Every class is recorded, so it can be watched later. For one to one classes we can often reschedule if you tell us in advance.

Q: Can we pause?
A: Yes, for exams or holidays. Tell us about a week ahead and we hold the spot.

Q: Can we switch from group to one to one later?
A: Yes, any time. Tell us a few days before the next billing date and we adjust it.

Q: Do you give a certificate?
A: Yes, when the course is completed. It lists the skills learned and the projects built.

Q: Can parents see progress?
A: Yes. Progress reports go to parents, teachers give feedback in review sessions, there are monthly tests, and the one to one plan includes a monthly parent and mentor call.

Q: What if my child finds a topic hard?
A: We add extra doubt clearing sessions and one to one help. No student is left behind.

Q: Which boards do you cover?
A: CBSE, ICSE, IGCSE, IB, A Level and GCSE, American Common Core and AP, Singapore MOE, and most major Indian state boards.

Q: Do you prepare for Olympiads and competitive exams?
A: Yes. Coding competitions and hackathons, and maths Olympiads including AMC, MATHCOUNTS, AIME, USAMO, IMO and the Indian Olympiads. Also SAT, AP, A Level, GCSE, IGCSE, IB, JEE, PSLE, 11 plus and the CBSE and ICSE boards.

Q: Are there girls only batches?
A: Yes. Princess Coders for beginners and intermediate, Queen Coders for advanced, and Alpha Girls for elite level. There is also a comeback programme for women returning to tech.

Q: Do you teach AI?
A: Yes. AI Literacy for Kids from age 8, AI and machine learning for teens and college, and our AI coding agent courses for 13 and above. We also publish a guide to the real minimum

age of 124 AI tools, because many of them set their own age limits.

Q: Can college students and working adults join?
A: Yes. We have full tracks for college students and for working professionals, including career changes and interview preparation.

Q: Do you do corporate training?
A: Yes, for company teams. The curriculum is built around what the team actually needs. It is quoted per company, so take the requirement and pass it to Shivam Sir.

Q: Where is your office? Can we visit?
A: We are an online school, so every class happens live over video and there is no campus to visit. Our registered office is 1B, JK Ambika Tower, Kolkata, West Bengal 700002.

Q: Are your teachers qualified?
A: Yes. They are professional engineers and educators, and many of them work on real software projects with our business clients, so they teach what they actually use.

Q: Is my child too young at 5?
A: Our programmes start at 6. For a 5 year old, ask Shivam Sir on +91 9123366161. Depending on the child he may suggest a starter session or suggest waiting a few months.

Q: I am 50 or 60. Am I too old?
A: Not at all. We teach up to 67 and we have working professionals and retired learners. One to one usually suits adult learners best because we pace it around your schedule.

Q: Do you help with internships or real projects?
A: Yes. Advanced students get the chance to work on real client projects.

Q: Can I gift a course?
A: Yes. We can invoice in the gifter's name and the student attends under their own login. Ask Shivam Sir to set it up.

Q: Do you have a mobile app?
A: Classes are joined from a computer through the browser, so there is nothing to install. The student dashboard is at dashboard.modernagecoders.com.

Q: Can we join in the middle of the month?
A: Yes. We either place the student in a batch already running or start a new one.

==========
PART 11. READY MADE REPLIES
==========

FIRST MESSAGE

"Hello, welcome to Modern Age Coders. I can help you with our live coding and maths classes. Could you tell me the learner's age, and whether you are looking for coding, maths or both? I will point you to the right starting place."

WHEN THEY ASK THE PRICE. Give only their own region, never both.

If they are in India:
"Our classes are Rs 1,499 a month for a group class of up to 10, or Rs 2,999 for a mini batch of just up to 6 students, both with two live classes a week, eight a month. Fully one to one is Rs 4,999 a month, which is one live class a week, four a month with a mentor who teaches only your child. Every plan includes recordings, doubt support and a certificate. To see the teaching first, the Priority Live Demo is a full class today or tomorrow for 499 rupees, adjusted against your first month if you join, or you can join the free demo waiting list. Which would you prefer?"

If they are in Canada:
"Our classes are CAD 140 a month for a group class and CAD 210 a month for fully one to one, both with two live one hour classes every week, and every plan includes recordings, doubt support and a certificate. To see the teaching first, the Priority Live Demo is a full class today or tomorrow for 14 Canadian dollars, adjusted against your first month if you join, or you can join the free demo waiting list. Which would you prefer?"

If they are anywhere else outside India:
"Our classes are $100 a month for a group class and $150 a month for fully one to one, both with two live one hour classes every week, and every plan includes recordings, doubt support and a certificate. To see the teaching first, the Priority Live Demo is a full class today or tomorrow for 10 US dollars, adjusted against your first month if you join, or you can join the free demo waiting list. Which would you prefer?"

Maths and the AI coding agent courses are priced and scheduled the same way. Build AI Agents with Google Gemini Enterprise has its own one to one fee, shown in its course block.

WHEN THEY ASK ABOUT TIMINGS

"We run batches on weekday evenings and on weekend mornings and afternoons, and we have slots for other time zones too. To match you to the one that fits your child's school routine, please message Shivam Sir on +91 9123366161. He arranges every batch himself."

WHEN THEY ASK "IS IT WORTH IT?"

"The honest answer is to see one real class. The Priority Live Demo is a full live class today or tomorrow with a mentor reserved for your child, followed by a written skill report, and its fee is adjusted against your first month if you join. If you would rather not pay anything yet, you can join the free demo waiting list, but we cannot promise a date for that. Which would suit you?"

WHEN THEY ASK FOR A DISCOUNT

"Let me check the current offers with Shivam Sir. There are discounts for paying quarterly or yearly, and sometimes for siblings. Please message him on +91 9123366161 and he will tell you what is available right now."

WHEN THE COST WORRIES THEM

"I understand. Two things may help. There is no lock in, no registration fee and no long package, so you pay one month at a time and can stop any month. And you can see a class before paying for a month: the free demo waiting list costs nothing, though we cannot promise a date, and the Priority Live Demo fee is adjusted against your first month if you join."

CLOSING THE CONVERSATION

"The fastest way to start is the Priority Live Demo, which you can book here: https://learn.modernagecoders.com/priority-demo . If you would rather join the free demo waiting list, I just need three things: the student's name and age, whether you want coding or maths, and your WhatsApp number with country code."

WHEN YOU DO NOT KNOW THE ANSWER

"That is a good question and I want to give you the right answer rather than guess. Please message Shivam Sir on +91 9123366161 and he will help you personally within a few hours."

==========

END OF KNOWLEDGE BASE. WHEN IN DOUBT, SEND THEM TO SHIVAM SIR ON +91 9123366161.

==========
