MODERN AGE CODERS - COMPLETE KNOWLEDGE BASE FOR AI AND WHATSAPP AGENTS

PLAIN TEXT EDITION. Version 2.1. Last updated 23 October 2026.
Source of truth: generated directly from the live website codebase.
Website: https://learn.modernagecoders.com

This file is written for an AI agent, a WhatsApp bot or a support person answering parents and students. Read the rules in PART 1 before answering anything. Every course in PART 6 includes its own link, its full week by week curriculum and the projects the student builds, so a parent can be sent to the page that proves what you told them.

PART 1. RULES YOU MUST FOLLOW BEFORE ANSWERING

RULE 1. HOW TO TALK ABOUT PRICE

Work out where the person is first, then give only the price that applies to them. Never read out two different price lists. Never say "in India it is this and outside India it is that". Never compare our regions to each other. The person asked what it costs for them, so answer only that, in their currency, and stop.

  If the person is in India, quote in rupees.
  If the person is anywhere else, quote in US dollars.
  If you genuinely cannot tell, ask one short question: "Are you in India or outside India?"
  Never volunteer a price the person did not ask about.
  Never explain the pricing structure, the regions, or why prices differ.
  Give the number, say what is included, then offer a demo class (RULE 3).

RULE 2. BATCH TIMINGS ARE NEVER YOURS TO GIVE

Never invent a class time, a day or a slot. We run many batches across weekday evenings, weekend mornings and afternoons, and separate slots for other time zones. Say this, then hand over: "To fix the exact slot that suits you, please message Shivam Sir on +91 9123366161. He allocates every batch personally."

RULE 3. A DEMO CLASS IS ALWAYS THE NEXT STEP, AND THERE ARE TWO KINDS

Every conversation should end with a demo offer. Offer the Priority Live Demo first, because it is the only one we can promise a date for. It is a paid, guaranteed demo: the family picks the day and time, usually today or tomorrow, and a mentor is reserved only for them. It is a full live class of about 45 to 60 minutes, not a sales call. After it the mentor sends a written skill report and a personal learning roadmap on WhatsApp. If the family enrols, the demo fee is adjusted against the first month's fee: they send their demo Order ID on WhatsApp and our team takes it off. The fee is 499 rupees in India and 10 US dollars outside India. Quote only the figure for the person's own region, exactly as you do for course prices. It is booked at https://learn.modernagecoders.com/priority-demo

The free demo still exists, and you must describe it honestly: it is a waiting list. Our mentors teach live classes most of the day, so a free demo happens only when one of them becomes free. That can take several weeks and we cannot promise a date. No card details are asked for. Never tell a family the free demo will happen on a particular day. If they are happy to wait, collect: student name, age or class, subject wanted, and a WhatsApp number with country code.

Never pressure anyone into the paid demo, never invent a shortage of slots, and never say the free demo has been removed. Say plainly what each one is and let the family choose.

RULE 4. NEVER PROMISE THESE

- A specific teacher by name.
- A specific class date or time before Shivam Sir confirms it.
- A job, a placement, a salary or a guaranteed exam score.
- A discount you have not confirmed.
- A batch size smaller than the published cap of 10 for group classes.
- A refund outside the written policy in PART 8.

RULE 5. NEVER ASK FOR

- Aadhaar, PAN or any identity document over chat.
- Full card numbers, CVV or OTP. Payments happen only through secure links.

RULE 6. WHEN YOU DO NOT KNOW

Do not guess and do not invent a course we do not run. Say: "Let me get you the exact answer on that. Please message Shivam Sir on +91 9123366161 and he will help you personally." Hand over for: custom or corporate quotes, school partnerships, payment in a currency other than rupees

or dollars, refund disputes, and anything not in this file.

RULE 7. TONE

- Warm, plain and parent friendly. Short messages. Parents are busy.
- Use Sir or Ma'am with Indian customers. Reply in Hindi if they write in Hindi.
- Lead with how we teach, not with the price. Price is the last thing you mention.
- Never criticise another institute. State what we do and stop.
- Never use a dash to join clauses. Use a comma or a full stop.

==========

PART 2. WHO WE ARE

==========

Name: Modern Age Coders
Legal name: Modern Age Coders Education
Founded: 2020
Founder and Director: Shivam Khemka, called Shivam Sir
What we do: we teach live online coding and mathematics, and we build software for businesses.
Students taught: 10,000+
Rating: 4.9 out of 5, across 547 Google reviews
Countries we teach in: 25+
Ages we teach: 6 to 67
Languages: English and Hindi
Website: https://learn.modernagecoders.com

CONTACT

Phone and WhatsApp: +91 9123366161 (Shivam Sir)
Email: connect@modernagecoders.com
Phone hours: Monday to Saturday, 9:00 AM to 6:00 PM IST. Sunday closed.
Callback: leave a number on the website and we call back within 3 hours.
Contact form reply: within 48 hours on working days.
Registered office: 1B, JK Ambika Tower, Kolkata, West Bengal 700002, India.

Note on the office. All teaching is online. Students never travel anywhere. The Kolkata address is only our registered office, there is no campus to visit.

OUR PROMISE TO EVERY FAMILY

- A live class before you commit to a course: a free demo (a waiting list) or the paid Priority Live Demo (a guaranteed slot today or tomorrow).
- Monthly billing. Cancel any month. No six or twelve month packages.
- No registration fee and no hidden charges. The price quoted is the whole price.
- Live batches. Group is capped at 20 students, mini batch is up to 6, and one to one is one student.
- You keep everything you build. Projects, code and certificates stay yours.
- A real person on WhatsApp at +91 9123366161, not a ticket queue.

==========

PART 3. HOW CLASSES WORK

==========

- Every class is live with a real teacher. Nothing is pre recorded.
- Every class is one hour long.
- Group class and mini batch: two live classes a week, eight a month.
- One to one in India: one live class a week, four a month, with a dedicated mentor. This is the Rs 4,999 plan.
- One to one outside India: two live classes a week, eight a month.
- Tell the person only the schedule for their own plan and region, exactly as with price.
- Every class is recorded, so a missed class can be watched later.
- Students need a computer (Windows, Mac or Chromebook) and steady internet.
- Most courses run inside the browser, so nothing needs installing.
- A webcam and microphone are recommended. For maths, a notebook and pen.
- Beginner courses usually run 3 to 6 months. Advanced ones run 6 to 9 months.
- Course lengths on the course pages are counted at two classes a week. A one to one student in India has one class a week and moves at their own pace, so if they ask how long a course will take, ask Shivam Sir to estimate it.
- Students can join mid month. We either place them in a running batch or start a new one.
- Classes can be paused for exams or holidays with about a week of notice.

BATCH SIZES

Group classes: capped at 20 students.
Mini batch: up to 6 students, close to one to one attention.
One to one: one student with one dedicated mentor.
Custom group for a school or a friend group: 3 to 10 students.

WHAT EVERY PLAN INCLUDES

- Live one hour classes every week, on the schedule of the plan chosen (see above).
- Recordings of every class.
- Doubt clearing support.
- Project based learning, real builds rather than theory.
- A certificate when the course is completed.
- Progress updates for parents.

PART 4. PRICES

Read RULE 1 again before you quote anything. Give only the price for the person you are talking to. Do not read out both lists.

FOR A STUDENT IN INDIA, PER MONTH

Coding, and every subject except mathematics:
Group class: Rs 1,499 a month, two live classes a week, eight a month
Mini batch: Rs 2,999 a month, two live classes a week, eight a month
One to one: Rs 4,999 a month, one live class a week, four a month

Mathematics:
Group class: Rs 1,499 a month, two live classes a week, eight a month
Mini batch: Rs 2,999 a month, two live classes a week, eight a month
One to one: Rs 4,999 a month, one live class a week, four a month

THE ONE TO ONE (PERSONALISED) PLAN IN INDIA, EXACTLY

- Fee: Rs 4,999 per month.
- Schedule: one live class a week, four a month. Each class is one hour, private, with a dedicated mentor.
- That works out to about Rs 1,250 per class.
- The same fee and schedule apply to coding, mathematics and the AI coding agent courses.
- The class day and time are fixed around the student, and the pace and topics are set for them alone.
- It is billed monthly like every other plan. Cancel any month.
- Never describe the India one to one plan as two classes a week or eight a month.

The two AI coding agent courses (Codex and Claude Code):
Group class: Rs 1,499 a month, two live classes a week, eight a month
Mini batch: Rs 2,999 a month, two live classes a week, eight a month
One to one: Rs 4,999 a month, one live class a week, four a month

The three AI Agents with Microsoft Copilot Studio courses (one to one only):
One to one: Rs 4,999 a month, one live class a week, four a month

Build AI Agents with Google Gemini Enterprise (one to one only, its own fee):
One to one: Rs 14,999 a month, two live classes a week, eight a month

FOR A STUDENT OUTSIDE INDIA, PER MONTH

Group class: $100 a month, two live classes a week, eight a month
One to one: $150 a month, two live classes a week, eight a month

This applies to every subject including mathematics and the AI agent courses.
The one exception is Build AI Agents with Google Gemini Enterprise: one to one only, $250 a month, two live classes a week, eight a month.
Mini batch is not offered outside India. If asked, simply offer group or one to one.
We can also bill in EUR, GBP, CAD, AUD, SGD and AED. For those, hand over to Shivam Sir.

HOLIDAY CAMPS. This is a single payment, not a monthly fee.

In India: Rs 9,999 one time
Outside India: $200 one time

IN SCHOOL BOOTCAMP PROGRAMMES, India only, per month

Group: Rs 1,499
One to one: Rs 2,999

CUSTOM AND CORPORATE TRAINING

Priced on request, never fixed. Used for company teams, school partnerships, bulk enrolments and specialised technology. Take the requirement and hand over to Shivam Sir.

PAYMENT

- India pays in rupees. Everywhere else pays in US dollars.

  - We accept UPI, bank transfer and card, through secure payment links only.
  - Billing is monthly and recurring. Cancel any month.
  - Never promise a discount. If asked, say you will check any current offer with Shivam Sir.

FIGURES THAT ARE NO LONGER OUR PRICES. Never quote these.

  Rs 2,499
  Rs 7,500
  Rs 8,500
  $40
  $149.99
  $374.99
  Any lifetime plan or one time payment for a monthly course.
  Any claim that the India one to one plan is two classes a week or eight a month.

==
PART 5. QUICK COURSE INDEX (137 courses)
==

Full detail for each course, including the week by week curriculum and the projects, is in PART
6. Send parents the link so they can read it themselves.

==========

PART 6. EVERY COURSE IN FULL DETAIL

==========

Each course below is self contained. It repeats the course name, the link and the price so you never quote the wrong one. The week by week plan is exactly what the student is taught, and the projects are exactly what they build and keep.

==========

COURSE 1 OF 137: 11 PLUS MATHS PREP: UK GRAMMAR & INDEPENDENT SCHOOL ENTRY

==========

Course link: https://learn.modernagecoders.com/courses/11-plus-maths-preparation-course-uk

Subject area: Test Prep Mathematics
Designed for: Middle school
Who can join: UK students ages 9-11 (Years 5-6), grammar and independent school applicants
Course length: 8 months (32 weeks)
Time needed: 2 live classes/week + 2-3 hours practice, rising to timed papers in the final phase
Certificate: Certificate from Modern Age Coders, awarded on passing the final assessment

PRICE FOR THIS COURSE (quote only the one that applies to the person asking)
  In India, per month: group Rs 1,499, mini batch Rs 2,999, one to one Rs 4,999
  Outside India, per month: group $100, one to one $150
  Classes: group and mini batch two live classes a week, eight a month; one to one in India one live class a week, four a month; one to one outside India two live classes a week, eight a month. Each class is one hour.

WHAT THIS COURSE IS

  11 plus maths course for UK grammar and independent school entrance: live online classes, full KS2 syllabus, GL-style papers and timed exam practice.

  In one line: The maths half of the 11 plus, taught properly over eight months, so test day tests the child and not the preparation.

ABOUT THE PROGRAMME

  11 plus maths does not go beyond the national curriculum; what makes it hard is that it asks Key Stage 2 mathematics at speed, in unfamiliar wording, against children who have often prepared for years. This 8-month live course covers the full ground in a teaching order that builds: number fluency first, because a child who hesitates over 7 times 8 loses time on every question that follows; then fractions, decimals and percentages, ratio and proportion, early algebra, geometry and measures, and data. The final two months turn knowledge into test performance: multi-step word problems, timing strategy, multiple-choice technique, and a run of practice papers in the style of GL Assessment, which now sets the tests for most grammar schools in England. We are honest about the landscape. CEM stopped producing its familiar paper-based 11 plus tests in 2023 and most regions that used them have moved to GL, so we do not sell CEM prep as if those regional tests still run. Families targeting independent schools that use the online ISEB Pre-Tests or their own papers get practice aligned to those formats. And we are honest about outcomes: good preparation raises a child's chances and steadies their nerves, but grammar school places are competitive and nobody can promise one.

WHAT MAKES THIS COURSE DIFFERENT

- Aligned to the tests as they are now: GL Assessment for most grammar schools, ISEB Pre-Tests for many independents, and bespoke papers such as the CSSE in Essex, with practice matched to your target schools
- No false CEM promises: CEM's paper-based regional tests ended in 2023, and our format practice reflects what children will actually sit
- Number fluency is drilled before anything else, because test timing punishes slow arithmetic more than any missing topic
- Word problems are treated as a skill of their own: reading, extracting and choosing the operation, taught explicitly rather than assumed
- Two full months of timed technique and practice papers, with a marked review after every paper and an error log per child
- Live small classes where the teacher watches the child work, plus honest monthly notes to parents about readiness

THE LEARNING PATH, STEP BY STEP

  Phase 1: Number fluency: place value, all four operations mental and written, tables cold, factors, multiples, primes and sequences
  Phase 2: Fractions, decimals and percentages as one connected system, then ratio, proportion and best-value reasoning
  Phase 3: Early algebra, geometry, measures and data: missing numbers and simple equations, shapes, angles, area, units, charts and averages
  Phase 4: Test craft: multi-step word problems, timing strategy, multiple-choice technique and a full practice-paper cycle with marked reviews

WHAT A STUDENT NEEDS BEFORE STARTING

  Maths level: Comfortable Year 4 maths: tables mostly known and written addition and subtraction secure. The week 1 diagnostic finds the true starting point
  Target schools: Any UK grammar or independent school. Tell us the target schools and we align format practice to the tests they actually use
  Equipment: Pencil and paper, a quiet place to work, and a device with stable internet for live classes. 11 plus maths papers do not allow calculators
  Timing: Ideally started in Year 5, so the course finishes shortly before tests taken at the start of Year 6

WHO THIS COURSE IS FOR

Grammar school applicants: Children in Years 5 and 6 preparing for GL-style grammar school tests anywhere in England
Independent school applicants: Families targeting independent senior schools that use the ISEB Pre-Tests or their own entrance papers
Strong but slow: Children whose maths is sound but whose speed under timing gives their scores away
Wordy problem strugglers: Children who can compute but freeze when the question arrives as a paragraph
Parents who want structure: Families who would rather have a taught course with honest feedback than a pile of practice books and guesswork

FULL CURRICULUM, WEEK BY WEEK

This is the complete teaching plan. Parents can ask about any week.

PHASE 1: NUMBER FLUENCY (MONTHS 1-2, WEEKS 1-8)

Speed and accuracy with number come first. Every later topic, and every timed paper, leans on arithmetic that works without hesitation.

Month 1: Place Value and the Four Operations (Weeks 1-4)
Weeks 1-2: Place Value, Ordering and Mental Methods
Topics:
- Diagnostic check: where each child's number work actually stands
- Place value to millions and reading large numbers aloud
- Ordering, comparing and rounding to any power of ten
- Mental addition and subtraction strategies: partitioning, compensation, near doubles
- Column addition and subtraction with carrying and borrowing secure
- Negative numbers in context: temperature, money, number lines
Projects built:
- Speed grid week: a daily 5-minute arithmetic grid, times recorded so the child can watch their own speed climb
Practice: Daily 10-minute number work set as a routine, plus 20 mixed place value and rounding questions
Weeks 3-4: Multiplication, Division and Order of Operations
Topics:
- Times tables to 12 made automatic, with the stubborn facts targeted
- Written multiplication: two digits by two digits and beyond
- Short division and long division, including remainders in context
- Choosing between mental, jotted and written methods
- Order of operations with brackets
- Estimating first: catching wrong answers before they are written down
Projects built:
- Personal tables map: each child's slowest facts identified and drilled until they match their fastest
Practice: 25 multiplication and division questions plus daily tables sprints, errors sorted into fact errors and method errors
Assessment: Month 1 check: a 20-minute arithmetic paper, marked for accuracy first and speed second

Month 2: Number Properties and Fluency Under Time (Weeks 5-8)
Weeks 5-6: Factors, Multiples, Primes and Sequences
Topics:
- Factors and multiples, and the difference stated without hesitation
- Prime numbers to 100 and how to test for them
- Square numbers and cube numbers
- Divisibility rules for 2, 3, 4, 5, 6, 9 and 10
- Number sequences: finding the rule and the next terms
- Special sequences: triangular numbers and patterns that alternate
Projects built:
- Number detective set: 12 who-am-I number puzzles solved using properties, the kind the 11 plus loves
Practice: 24 property and sequence questions plus one puzzle set done with a parent, for fun rather than marks
Weeks 7-8: Mixed Arithmetic with the Clock Running Gently
Topics:
- Mixed four-operation problems in 11 plus wording
- Inverse operations: checking answers and finding missing digits
- Money calculations: change, totals and unit prices
- Estimation and sense checks: is this answer even possible
- Introducing gentle time pressure: untimed first, then generous, then realistic
- What to do when stuck: skip, mark and return
Projects built:
- First mini-paper: a 15-question arithmetic paper under generous timing, reviewed question by question in class
Practice: Three 15-minute mixed sets across the fortnight, each one slightly tighter on time than the last
Assessment: Phase 1 milestone: a 30-minute number paper covering both months, with a

      speed and accuracy report for parents

PHASE 2: FRACTIONS, DECIMALS, PERCENTAGES, RATIO AND PROPORTION (MONTHS 3-4, WEEKS 9-16)

The part-whole toolkit that 11 plus papers test relentlessly, taught as one connected system
rather than three separate topics, then extended into ratio and proportion.

  Month 3: Fractions, Decimals and Percentages (Weeks 9-12)
    Weeks 9-10: Fractions That Make Sense
      Topics:
        - Equivalent fractions and simplifying to lowest terms
        - Comparing and ordering fractions with different denominators
        - Adding and subtracting fractions, including mixed numbers
        - Fractions of amounts: two thirds of 96 without fear
        - Improper fractions and mixed numbers, converting both ways
        - Fraction word problems: half of a half, and shares that do not split evenly
      Projects built:
        - Fraction wall build: each child makes their own fraction wall and uses it to settle five
          comparison arguments
      Practice: 28 fraction questions from equivalence to word problems, working shown even
      when the answer is obvious
    Weeks 11-12: Decimals, Percentages and Moving Between All Three
      Topics:
        - Decimal place value and ordering decimals
        - Multiplying and dividing by 10, 100 and 1000
        - Adding, subtracting and multiplying decimals in money contexts
        - Percentages as hundredths: finding 10 percent, 5 percent and 1 percent and building the rest
        - Percentage of an amount, and simple percentage increase and decrease
        - The conversion triangle: fractions, decimals and percentages swapped fluently
      Projects built:
        - Conversion pack: a self-made table of the equivalences worth knowing cold, from a half down
          to a twentieth
      Practice: 26 decimal and percentage questions plus 10 rapid conversions daily until
      they are automatic
      Assessment: Month 3 test: a 25-minute paper across fractions, decimals and percentages
      in 11 plus style

  Month 4: Ratio, Proportion and Best Value (Weeks 13-16)
    Weeks 13-14: Ratio and Sharing
      Topics:
        - Ratio notation and what 3 to 2 actually says
        - Simplifying ratios, including with units
        - Sharing an amount in a given ratio
        - Ratio and fractions: moving between the two views
        - Scaling recipes up and down
        - Ratio word problems in test wording: sweets, marbles, paint mixes
      Projects built:
        - Recipe rescale: one real family recipe scaled for 2, 6 and 9 people, with the working
          presented neatly
      Practice: 24 ratio questions, every sharing answer checked by adding the parts back
      together
    Weeks 15-16: Proportion, Best Value and Scale
      Topics:
        - Direct proportion: the unitary method taught as a habit
        - Best value: comparing pack sizes and unit prices
        - Scale on maps and plans
        - Speed, distance and time in simple, whole-number cases
        - Proportion word problems that mix money and measures
        - Spotting proportion questions hidden inside long wording
      Projects built:
        - Supermarket challenge: real price comparisons worked as best-value problems and written up as
          answers with reasons
      Practice: 22 proportion and best-value questions plus a 20-minute mixed paper on all of
      phase 2
      Assessment: Phase 2 milestone: a 30-minute paper across fractions, decimals,
      percentages, ratio and proportion

PHASE 3: EARLY ALGEBRA, GEOMETRY, MEASURES AND DATA (MONTHS 5-6, WEEKS 17-24)

The remaining syllabus ground: missing-number thinking and simple equations, then shapes,
angles, area, units and time, and finally charts, tables and averages.

  Month 5: Early Algebra and Geometry (Weeks 17-20)
    Weeks 17-18: Missing Numbers and Simple Equations
      Topics:
        - Missing number problems as balance puzzles
        - Function machines forwards and backwards

- Simple one-step and two-step equations solved by undoing
- Substituting numbers into simple rules and formulas
- Word puzzles turned into number sentences
- Think-of-a-number problems worked backwards

Projects built:
- Puzzle exchange: each child writes three think-of-a-number puzzles and solves three written by classmates

Practice: 24 missing-number and equation questions, each answer substituted back to check itself

Weeks 19-20: Shapes, Angles and Position

Topics:
- 2D shapes and their properties: triangles by type, quadrilaterals by name
- Angle types, angles on a line, around a point and inside a triangle
- Symmetry: line and rotational
- Coordinates in all four quadrants
- Reflection and translation on a grid
- 3D shapes, faces, edges, vertices and nets

Projects built:
- Shape fact file: a one-page reference of shape and angle facts in the child's own words and drawings

Practice: 26 geometry questions with every angle answer justified by the fact used

Assessment: Month 5 test: a 25-minute paper on algebra and geometry in test style

Month 6: Measures, Time and Data (Weeks 21-24)

Weeks 21-22: Perimeter, Area, Volume and Units

Topics:
- Perimeter and area of rectangles and compound shapes
- Area of a triangle
- Volume of cuboids, counting cubes first and formula second
- Metric units and conversions: length, mass, capacity
- Reading scales and measuring instruments accurately
- Time: 24-hour clock, timetables and elapsed-time problems

Projects built:
- Room plan: the child's own room measured, drawn to scale and its floor area calculated

Practice: 24 measures questions with units written in every answer, timetable problems done against a gentle clock

Weeks 23-24: Charts, Tables and Averages

Topics:
- Reading tables, bar charts, pictograms and line graphs quickly and exactly
- Two-step chart questions: differences, totals and comparisons
- Pie charts read as fractions of a whole
- Mean, median, mode and range, and which the question is really asking for
- Simple probability language: likely, unlikely, evens, and fractions for equally likely outcomes
- The data traps: misread scales and units, and how to avoid them

Projects built:
- Family survey: a small data set collected at home, charted by hand, and turned into three test-style questions

Practice: 22 data questions plus one full mixed set covering everything taught so far

Assessment: Phase 3 milestone: a 40-minute paper across the whole syllabus, the first true full-coverage test

---

PHASE 4: PROBLEM SOLVING UNDER TIME AND THE PRACTICE-PAPER CYCLE (MONTHS 7-8, WEEKS 25-32)

The syllabus is done; now the test itself is the subject. Multi-step word problems, timing strategy and multiple-choice technique, then a full cycle of practice papers with marked reviews.

Month 7: Word Problems and Test Technique (Weeks 25-28)

Weeks 25-26: Multi-Step Word Problems

Topics:
- The four-step routine: read, extract, choose the operations, check
- Two-step and three-step problems across money, measures and time
- Problems that mix topics: a ratio inside a word problem inside a timetable
- Drawing the problem: bar models and quick sketches that untangle wording
- Spotting the trap answer: options built from common mistakes
- Logic-flavoured questions: working backwards and eliminating cases

Projects built:
- Problem autopsy set: 10 hard word problems dissected in writing, what was given, what was asked, what was the trap

Practice: 20 multi-step problems, each one annotated with the four-step routine before any arithmetic

Assessment: Month 7 opens with a timed baseline paper so the next four weeks of technique work can be measured against it

Weeks 27-28: Timing and Multiple-Choice Technique

Topics:
- How GL-style papers present maths: multiple choice with a separate answer sheet
- Answer-sheet discipline: keeping the row and the question in step

- Elimination: earning marks on questions you cannot fully solve
- Time budgeting: when to skip, how to mark for return, when to guess
- Estimation as a speed tool: rejecting three options in five seconds
- Staying calm mid-paper: the reset routine after a hard question

Projects built:
- Technique card: each child writes their own one-page test plan, timings, skip rules and reset routine included

Practice: Three timed 20-minute sections across the fortnight, answer sheets used every time, technique reviewed after each

Month 8: The Practice-Paper Cycle (Weeks 29-32)

Weeks 29-30: Full Papers, Marked and Mined

Topics:
- A full GL-style maths paper under real timing
- Marked review: every miss classified as knowledge, misread or timing
- Targeted drills built from each child's error pattern
- A second full paper, with the error log guiding the warm-up
- Format variations: standard-format papers and ISEB-style online questions for children who need them
- Parent briefing: what the scores mean and what they do not

Projects built:
- Error log finalised: each child's recurring mistakes named, with the fix written next to each

Practice: One paper in class and one at home per week, home papers sat under honest exam conditions

Assessment: Weekly full papers, each marked with a per-topic breakdown shared with parents

Weeks 31-32: Final Papers and a Calm Finish

Topics:
- Two final papers under strict test conditions
- Closing the last recurring errors, not chasing new topics
- The taper: why the last week before a test should be lighter, not heavier
- Test-day practicalities: sleep, breakfast, what to expect in the room
- Confidence talk: the test samples one morning, it does not measure the child
- Course close: readiness review with each family, honest and specific

Projects built:
- Readiness pack: the child's error log, technique card and score chart bound together as their own record of the eight months

Practice: Light mixed sets only in the final week, chosen from each child's strongest topics to finish on solid ground

Assessment: Course milestone: final full paper reviewed one to one with child and parents, plus certificate review

PROJECTS THE STUDENT BUILDS AND KEEPS

- A daily speed-grid routine with the child's own times charted across the course
- A personal tables map targeting each child's slowest number facts
- A self-made conversion pack for fractions, decimals and percentages
- A shape and angle fact file in the child's own words
- A real-data family survey turned into test-style questions
- A problem autopsy set dissecting hard word problems in writing
- A personal technique card with timings, skip rules and a reset routine
- A full practice-paper cycle with error log and score chart, bound as a readiness pack

Total projects: A complete child-built preparation record: speed charts, fact files, error log, technique card and marked paper series

SKILLS THE STUDENT WILL HAVE AT THE END

- Arithmetic speed and accuracy that hold up under test timing
- The full 11 plus maths syllabus: number, fractions and percentages, ratio, early algebra, geometry, measures and data
- A reliable routine for multi-step word problems
- Multiple-choice and answer-sheet technique for GL-style papers
- Timing strategy: skipping, returning and guessing intelligently
- Calm under test conditions, built through graduated practice rather than pressure

HOW A TYPICAL WEEK IS SPLIT

Live classes: 2 live one-hour classes per week; paper-phase sittings run longer for full timed papers

Practice: 2-3 hours weekly: a short daily number routine plus set questions, rising to weekly papers in month 8

Review: Homework marked with per-topic feedback; the error log is reviewed with the child so they own their own progress

Homework: A task or problem set after every class, and a monthly mixed-review assignment that deliberately folds in earlier topics

SUPPORT INCLUDED

Doubt support: WhatsApp doubt support between classes for both child and parents, with worked solutions for stuck problems
Progress updates: Monthly progress notes to parents with scores, the error-log summary and an honest readiness view

CERTIFICATION DETAIL

Completion: Certificate from Modern Age Coders, awarded on passing the final assessment. Fall short and there is focused revision and a free retest: the certificate certifies real learning, not attendance

WHERE THIS CAN LEAD

- Grammar school entrance tests, sat with the maths half properly prepared
- Independent school pretests and entrance papers, including ISEB-style online formats
- Key Stage 2 SATs, which draw on the same curriculum this course secures
- A confident start to secondary maths, whichever school the child joins
- Our school maths and maths-through-coding courses for children who find they enjoy the subject

COMMON QUESTIONS ABOUT THIS COURSE

For anything about cost, use PART 4 and RULE 1. Do not quote two regions.

Q: Which 11 plus test formats does the course prepare for?
A: Most grammar schools in England now use tests from GL Assessment, so GL-style multiple-choice papers with separate answer sheets are our default format practice. Tell us your target schools at the start and we align the paper phase to the formats your child will actually sit. The maths syllabus underneath is the same in every case.

Q: Do you offer CEM preparation?
A: We prepare children for the tests that exist now, and the familiar paper-based CEM regional tests are not among them: CEM stopped producing them in 2023, and most areas that used them have moved to GL Assessment. CEM continues as an online product used mainly by some independent schools, and if a target school uses it we practise accordingly. What we will not do is sell CEM-branded preparation as if the old regional tests still run, because they do not.

Q: Will this course get my child into grammar school?
A: No course can honestly promise that, and you should be wary of any that does. Grammar school places are competitive, pass marks move with each year's cohort, and admission can also depend on catchment and oversubscription rules that have nothing to do with maths. What preparation genuinely does is make sure the test measures your child's ability rather than their unfamiliarity with the format. We commit to full syllabus coverage, honest monthly reporting, and a clear readiness picture before test day.

Q: When should we start preparing, and is 8 months enough?
A: Most families start in Year 5, and this course is built for that: eight months starting in the autumn or spring of Year 5 finishes shortly before tests sat at the start of Year 6. Eight months is enough for a child with sound school maths; it allows the syllabus to be taught rather than crammed, with two full months left for timed practice. Children starting later can still join, but we compress honestly and tell you what the shorter runway does and does not allow.

Q: What maths is actually on the 11 plus?
A: Nothing beyond the national curriculum, mostly content taught up to the end of Year 5, since tests are sat early in Year 6. The difficulty comes from presentation and pace: multi-step word problems, unfamiliar wording, and timing that punishes slow arithmetic. Calculators are not allowed, so everything is built for pencil and paper.

Q: Does the course cover verbal reasoning, English and non-verbal reasoning too?
A: No, this course is the maths paper only, taught deeply rather than four subjects taught thinly. Many families pair it with their own English and reasoning practice or another provider for those papers. We would rather be excellent at one quarter of the 11 plus than mediocre at all of it, and we will always tell you honestly whether your child's remaining preparation time is better spent on maths or elsewhere.

Q: How much homework is there, and will my child burn out?
A: Two to three hours a week: a short daily number routine of about ten minutes plus one or two problem sets, rising to a weekly practice paper in the final month. We taper deliberately before test day rather than piling on, because a tired nine-year-old tests worse than a fresh one.

Q: You are based in India. Can you really prepare a child for a UK exam?
A: The 11 plus maths syllabus is published, the test formats are public, and our 11 plus teachers work with UK materials, GL-style papers and UK curriculum terminology throughout. Classes are scheduled for UK afternoons and evenings, and many of our students are British families, both in the UK and expatriates preparing for a return. What matters is whether the teaching is live, small-group and honest about progress, and that is exactly what we do.

Judge us at the free demo class. (Agent note: the free demo is a waiting list with no fixed date. The Priority Live Demo is a guaranteed class today or tomorrow, booked at https://learn.modernagecoders.com/priority-demo . Offer both, as RULE 3 says.)

Q: How am I assessed, and is the certificate just for showing up?
A: No. A task follows every class with feedback, monthly reviews deliberately mix new material with earlier topics so nothing is forgotten, and the course ends with a full mock paper as the final assessment. Passing earns the certificate; falling short earns focused revision and a free retest. We measure real learning, not attendance.

To enrol, message Shivam Sir on +91 9123366161 or send the parent this link: https://learn.modernagecoders.com/courses/11-plus-maths-preparation-course-uk
For a demo: the Priority Live Demo (guaranteed, today or tomorrow) is booked at https://learn.modernagecoders.com/priority-demo . The free demo is a waiting list with no fixed date.

==========

COURSE 2 OF 137: A LEVEL FURTHER MATHS: CORE PURE AND APPLIED OPTIONS

==========

Course link: https://learn.modernagecoders.com/courses/a-level-further-maths-course
Subject area: Exam Board Mathematics
Designed for: High school
Who can join: Year 12 and 13 students (or equivalent) taking Further Maths with AQA, Edexcel or OCR
Course length: 18 months (72 weeks), taught alongside A Level Maths
Time needed: 2 live classes/week + 3-4 hours practice, rising to full timed papers in the last two months
Certificate: Course-completion certificate from Modern Age Coders

PRICE FOR THIS COURSE (quote only the one that applies to the person asking)
In India, per month: group Rs 1,499, mini batch Rs 2,999, one to one Rs 4,999
Outside India, per month: group $100, one to one $150
Classes: group and mini batch two live classes a week, eight a month; one to one in India one live class a week, four a month; one to one outside India two live classes a week, eight a month. Each class is one hour.

WHAT THIS COURSE IS

A Level Further Maths course online: live classes in Core Pure plus mechanics, statistics or decision options for AQA, Edexcel and OCR, ending in timed papers.

In one line: The second maths A level, taught as a subject of its own: complex numbers, matrices, proof and differential equations, then the applied options your board sets.

ABOUT THE PROGRAMME

Further Maths is a full A level that sits on top of A level Maths. The boards are clear about the relationship: OCR states that learners are assumed to know the content of GCSE Mathematics and A Level Mathematics, and Pearson Edexcel says the students who benefit most are likely to hold A level Maths. In practice most students take the two side by side across Years 12 and 13, and this course is timed to run alongside our A Level Maths course or your school's. Every board splits Further Maths into a compulsory pure core and a set of options. Edexcel 9FM0 has two Core Pure papers plus two options chosen from Further Pure, Further Statistics, Further Mechanics and Decision Maths. AQA 7367 has two papers on compulsory content and a third paper on two of mechanics, statistics and discrete mathematics. OCR A H245 has Pure Core papers Y540 and Y541 plus two optional papers, and OCR MEI H645 has the Core Pure paper Y420 with a major option or a set of minor options. We teach the shared core to everyone and the options your school or exam centre has entered you for. The first nine months cover the AS-standard core and the first applied option. Months 10 to 16 take the core to full A level depth, from de Moivre's theorem to second-order differential equations, and finish the options. The final two months are revision and past papers under real timing, matched to your board's paper structure and marked against official schemes. Classes are live and small, so the teacher reads your working as you write it.

WHAT MAKES THIS COURSE DIFFERENT

- Built from the boards' own specifications: Edexcel 9FM0, AQA 7367, OCR A H245 and OCR MEI H645, with your board's paper structure driving the practice phase
- Sequenced to run alongside A Level Maths, so each Further Maths topic arrives after the A level Maths skill it leans on, not before
- Proof treated as a skill in its own right: induction, contradiction and the writing of a complete argument are practised every month, not saved for one chapter
- Options taught to your entry, whether that is mechanics, statistics, decision or discrete maths, or further pure, rather than a generic mixture
- Calculator technique for matrices, complex numbers and distributions taught explicitly, alongside the work that must be done by hand
- Two full months of past papers under real timing, marked against official mark schemes, with an error clinic after every paper

THE LEARNING PATH, STEP BY STEP

Phase 1: Core Pure, first year: proof by induction, complex numbers and the Argand diagram, matrices and transformations, roots of polynomials, series and vectors in three dimensions
Phase 2: Applied option one: the first of your board's options, taught to AS depth, then an AS-standard mock across core and option
Phase 3: Core Pure, second year: de Moivre and complex roots, further calculus, Maclaurin series, polar coordinates, hyperbolic functions and differential equations
Phase 4: Applied option two and option depth: the second option, and both options taken to full A level standard
Phase 5: Revision and the past-paper cycle: structured revision by strand, then full papers under timing with marked review

WHAT A STUDENT NEEDS BEFORE STARTING

Maths level: Studying A level Maths at the same time, or already holding it. A strong GCSE Maths grade, which we suggest is 7 or above, makes the first months far smoother. The week 1 diagnostic finds gaps and we close them inside the course
Exam board: AQA 7367, Edexcel 9FM0, OCR A H245 or OCR MEI H645. The core is shared; we teach the options your school or exam centre enters you for
Equipment: A calculator that handles matrices, complex numbers and statistical distributions, notebooks, and a device with stable internet for live classes
Timing: Best started at the beginning of Year 12 alongside A level Maths; later joiners get a catch-up plan after the diagnostic

WHO THIS COURSE IS FOR

Year 12 starters: Students starting Further Maths alongside A level Maths who want both taught in a sensible order
Schools without further maths: Students whose school or college does not teach Further Maths, who need the whole course taught and will sit the exams at an exam centre
Students needing more support: Students whose school offers Further Maths in a small, rushed or part-timetabled class and who want steady teaching beside it
International students: Students taking British A levels abroad, at international schools or as private candidates, who need live teaching across time zones
Returning adults: Adults who took A level Maths earlier and want the second maths A level for study or for its own sake

FULL CURRICULUM, WEEK BY WEEK

This is the complete teaching plan. Parents can ask about any week.

PHASE 1: CORE PURE, FIRST YEAR (MONTHS 1-5, WEEKS 1-20)

The compulsory core every board examines, taught to AS depth. Each topic is introduced after the A level Maths skill it needs, and proof is practised from the first fortnight.

Month 1: Proof and Series (Weeks 1-4)
Weeks 1-2: Diagnostic and Proof by Induction
Topics:
- Diagnostic paper on the A level Maths algebra Further Maths assumes
- The structure of a proof by induction: basis, assumption, inductive step, conclusion
- Induction on sums of series
- Induction on divisibility statements
- Induction on matrix powers, previewed for month 3
- Writing the conclusion so it would earn the final mark

Projects built:
- Proof portfolio opened: six induction proofs written to exam standard and checked line by line

Practice: 12 induction proofs of increasing difficulty, each with a written conclusion sentence
Weeks 3-4: Standard Series and the Method of Differences
Topics:
- Sigma notation and the standard results for r, r squared and r cubed
- Combining standard results to sum new series
- The method of differences and when it applies
- Partial fractions used to set up a telescoping sum
- Checking a summation formula by substitution and by induction
- Common slips: index limits and the first term

Projects built:
- Question bank entry: 15 solved series questions, each checked by a second method

Practice: 20 series problems mixing standard results and the method of differences
Assessment: Month 1 test: a 45-minute paper on induction and series, marked with method marks

Month 2: Complex Numbers (Weeks 5-8)
Weeks 5-6: Complex Arithmetic and the Argand Diagram
Topics:
- The imaginary unit and the algebra of complex numbers

- Conjugates and division of complex numbers
- Solving quadratics, cubics and quartics with complex roots
- Representing complex numbers on an Argand diagram
- Modulus and argument, and the modulus-argument form
- Multiplying and dividing in modulus-argument form

Projects built:

- Complex number reference sheet built by the student, with one worked example per rule

Practice: 25 complex arithmetic and equation problems, roots shown on an Argand diagram

Weeks 7-8: Loci and Regions

Topics:

- Loci of the form |z - a| = r as circles
- Perpendicular bisectors from |z - a| = |z - b|
- Half-lines from arg(z - a) = theta
- Shading regions defined by inequalities
- Finding greatest and least values of |z| on a locus
- Sketching accurately enough to read answers from the diagram

Projects built:

- Locus atlas: eight annotated sketches of standard loci and combined regions

Practice: 16 locus and region questions, each with a labelled sketch

Assessment: Month 2 test: a 45-minute paper on complex numbers

Month 3: Matrices (Weeks 9-12)

Weeks 9-10: Matrix Algebra and Transformations

Topics:

- Matrix addition and multiplication, and why order matters
- The identity and zero matrices
- 2 by 2 matrices as transformations of the plane
- Rotations, reflections, enlargements and stretches
- Composite transformations and the product of their matrices
- Invariant points and invariant lines

Projects built:

- Transformation catalogue: each standard 2 by 2 matrix with its effect drawn on the unit square

Practice: 20 problems on matrix products and transformations, with diagrams

Weeks 11-12: Determinants, Inverses and Linear Systems

Topics:

- Determinants of 2 by 2 and 3 by 3 matrices
- The determinant as an area or volume scale factor
- Inverse matrices and singular matrices
- Solving systems of three linear equations with matrices
- Geometric meaning of a system: three planes and how they can meet
- Calculator checking for 3 by 3 work, and what must still be shown

Projects built:

- Three-planes casebook: every arrangement of three planes, with a system that produces it

Practice: 18 problems on determinants, inverses and linear systems

Assessment: Month 3 test: a 45-minute paper on matrices

Month 4: Roots of Polynomials and Rational Functions (Weeks 13-16)

Weeks 13-14: Roots of Polynomials

Topics:

- Relationships between roots and coefficients for quadratics, cubics and quartics
- Symmetric functions of roots
- Forming a new equation whose roots are related to the original roots
- Substitution as a shortcut for transformed roots
- Complex roots of real polynomials and conjugate pairs
- Checking answers by reconstructing the polynomial

Projects built:

- Question bank entry: 12 roots questions solved two ways, by sums of roots and by substitution

Practice: 20 problems on roots and coefficients

Weeks 15-16: Curve Sketching and Inequalities

Topics:

- Rational functions and their asymptotes
- Sketching graphs of rational functions
- Solving inequalities involving rational expressions
- Graphs of y = |f(x)| and related transformations
- Conic sections in the forms your board specifies
- Using a sketch to check an algebraic answer

Projects built:

- Graph file: ten sketches with asymptotes, intercepts and turning points labelled

Practice: 16 sketching and inequality problems

Assessment: Month 4 test: a 45-minute paper on roots and curves

Month 5: Vectors and First Further Calculus (Weeks 17-20)

Weeks 17-18: Lines and Planes in Three Dimensions

Topics:

- Vector and Cartesian equations of a line in three dimensions
- The scalar product and the angle between lines
- Equations of a plane in vector and Cartesian form
- Angles between a line and a plane, and between two planes

- Intersections of lines and planes
- Shortest distances from a point to a line and to a plane

Projects built:
- 3D geometry sheet: every distance and angle method on one page with a worked example

Practice: 18 problems on lines and planes

Weeks 19-20: Volumes of Revolution and Mean Values

Topics:
- Volumes of revolution about the x-axis and the y-axis
- Volumes from parametric curves where your board includes them
- Mean value of a function over an interval
- Choosing the right integral from a description in words
- Modelling a real solid with a volume of revolution
- Accuracy and units in modelling answers

Projects built:
- Modelling task: the volume of a real container estimated by a volume of revolution and compared with its label

Practice: 14 volume and mean value problems

Assessment: Month 5 test: a 50-minute paper on vectors and first further calculus

---

PHASE 2: APPLIED OPTION ONE (MONTHS 6-9, WEEKS 21-36)

The first of the options your board and centre have chosen. The topics below show the mechanics route; statistics, decision or discrete students follow the same timetable with their own option content.

Month 6: Momentum and Impulse (Weeks 21-24)

Weeks 21-22: Momentum, Impulse and Collisions

Topics:
- Momentum and impulse in one dimension
- Conservation of momentum
- Newton's law of restitution and the coefficient of restitution
- Direct collisions between two particles
- Collisions with a fixed wall
- Loss of kinetic energy in a collision

Projects built:
- Collision file: worked solutions for every collision type, with a diagram for each

Practice: 18 momentum and restitution problems

Weeks 23-24: Successive Collisions and Impulse in Two Dimensions

Topics:
- Three-particle and successive collisions
- Deciding whether a further collision happens
- Impulse as a vector in two dimensions
- Oblique impacts with a smooth surface where your board includes them
- Setting up equations from a clear diagram
- Statistics route equivalent: discrete random variables, expectation and variance

Projects built:
- Question bank entry: 10 multi-stage collision problems with the decision points marked

Practice: 14 multi-stage problems under 10-minute timing each

Assessment: Month 6 test: a 45-minute option paper

Month 7: Work, Energy and Power (Weeks 25-28)

Weeks 25-26: Work, Energy and Power

Topics:
- Work done by a constant force
- Kinetic and gravitational potential energy
- The work-energy principle
- Power, and driving force for a vehicle
- Problems on slopes with resistance
- Statistics route equivalent: the Poisson distribution and when it models a count

Projects built:
- Energy method sheet: when to use energy and when to use Newton's second law

Practice: 18 work, energy and power problems

Weeks 27-28: Elastic Strings and Springs

Topics:
- Hooke's law for strings and springs
- Elastic potential energy
- Energy problems with elastic strings
- Finding extensions and maximum speeds
- Combining elastic energy with gravity
- Decision route equivalent: algorithms, sorting and the order of an algorithm

Projects built:
- Modelling task: a bungee jump modelled with energy methods and its assumptions criticised

Practice: 14 elastic energy problems

Assessment: Month 7 test: a 45-minute option paper

Month 8: Circular Motion and Dimensional Analysis (Weeks 29-32)

Weeks 29-30: Horizontal and Vertical Circular Motion

Topics:

- Angular speed and acceleration towards the centre
- Horizontal circles: conical pendulums and banked tracks
- Vertical circles and energy
- Conditions for completing a vertical circle
- Particles leaving a circular surface
- Statistics route equivalent: chi-squared tests for goodness of fit and contingency tables

Projects built:
- Circular motion casebook: six standard set-ups with force diagrams

Practice: 16 circular motion problems

Weeks 31-32: Dimensional Analysis and Modelling

Topics:
- Dimensions of physical quantities
- Checking a formula by its dimensions
- Finding an unknown formula by dimensional analysis
- Criticising and refining a mechanics model
- Writing assumptions the way mark schemes expect
- Decision route equivalent: graphs, networks and minimum spanning trees

Projects built:
- Model critique: one real situation modelled three ways, with the assumptions compared

Practice: 12 dimensional analysis and modelling questions

Assessment: Month 8 test: a 45-minute option paper

Month 9: AS Checkpoint (Weeks 33-36)

Weeks 33-34: Consolidation of Core and Option

Topics:
- Mixed core problems that do not announce their topic
- Proof rehearsal: induction proofs rewritten from memory
- Option problems mixed across months 6 to 8
- Reading a long question and planning before writing
- Error log review with the teacher
- Targeted re-teach of the two weakest topics per student

Projects built:
- Revision sheet set one: student-made single pages for every core topic so far

Practice: Two 40-minute mixed papers, one core and one option

Weeks 35-36: AS-Standard Mock

Topics:
- An AS-standard mock across Core Pure and the first option
- Marking against an official-style scheme
- Classifying every lost mark: knowledge, method, accuracy or reading
- Planning the second year from the mock results
- Students who sit the AS as a standalone qualification prepare for it here
- Summer bridging tasks set for the move to second-year content

Projects built:
- The mock file: marked script, error classification and a written plan

Practice: Mock review set: every lost mark reworked to full credit

Assessment: AS-standard mock, marked and reviewed one to one

PHASE 3: CORE PURE, SECOND YEAR (MONTHS 10-14, WEEKS 37-56)

The A level half of the core, where the subject becomes recognisably university mathematics:
de Moivre, further calculus, polar curves, hyperbolic functions and differential equations.

Month 10: Further Complex Numbers (Weeks 37-40)

Weeks 37-38: Exponential Form and de Moivre's Theorem

Topics:
- The exponential form of a complex number
- De Moivre's theorem and its proof by induction
- Expressing cos n theta and sin n theta in powers
- Powers of sines and cosines in terms of multiple angles
- Sums of series using complex numbers
- Choosing between Cartesian, modulus-argument and exponential form

Projects built:
- Proof portfolio entry: de Moivre's theorem proved by induction for positive integers

Practice: 18 problems on exponential form and de Moivre's theorem

Weeks 39-40: Roots of Unity and Complex Roots

Topics:
- The nth roots of unity and their symmetry
- The nth roots of any complex number
- Roots shown as regular polygons on the Argand diagram
- Geometric problems solved with complex roots
- Further loci and transformations where your board includes them
- Exam-style questions that chain several complex number techniques

Projects built:
- Roots of unity poster: the roots for n = 3 to 8 drawn and their sums explained

Practice: 16 roots problems

Assessment: Month 10 test: a 50-minute paper on complex numbers

Month 11: Further Calculus and Series (Weeks 41-44)

  Weeks 41-42: Improper Integrals and Inverse Trigonometric Functions
    Topics:
      - Improper integrals and whether they converge
      - Derivatives of inverse trigonometric functions
      - Integrals that lead to inverse sine and inverse tangent
      - Partial fractions with quadratic factors
      - Choosing an integration method from the form of the integrand
      - Accuracy in exact answers
    Projects built:
      - Calculus method map extended: every further integral form routed to its technique
    Practice: 20 further integration problems
  Weeks 43-44: Maclaurin Series
    Topics:
      - Maclaurin series from repeated differentiation
      - Standard series for exponential, sine, cosine and log functions
      - Combining and composing known series
      - Range of validity of a series
      - Using series to approximate and to find limits
      - Checking a series against a calculator value
    Projects built:
      - Series table: standard Maclaurin series with validity ranges and one application each
    Practice: 16 Maclaurin series problems
    Assessment: Month 11 test: a 50-minute paper on further calculus

Month 12: Polar Coordinates and Hyperbolic Functions (Weeks 45-48)
  Weeks 45-46: Polar Coordinates
    Topics:
      - Polar coordinates and converting to and from Cartesian form
      - Sketching polar curves such as cardioids and spirals
      - Areas enclosed by polar curves
      - Areas between two polar curves
      - Tangents parallel and perpendicular to the initial line
      - Reading symmetry from a polar equation
    Projects built:
      - Polar curve gallery: eight curves sketched by hand and checked against software
    Practice: 16 polar coordinate problems
  Weeks 47-48: Hyperbolic Functions
    Topics:
      - Definitions of sinh, cosh and tanh in terms of exponentials
      - Hyperbolic identities and Osborn's rule
      - Inverse hyperbolic functions in logarithmic form
      - Differentiating and integrating hyperbolic functions
      - Integrals that lead to inverse hyperbolic functions
      - Solving equations involving hyperbolic functions
    Projects built:
      - Hyperbolic reference sheet: definitions, identities, derivatives and integrals on one page
    Practice: 18 hyperbolic function problems
    Assessment: Month 12 test: a 50-minute paper on polar and hyperbolic work

Month 13: Differential Equations (Weeks 49-52)
  Weeks 49-50: First and Second Order Differential Equations
    Topics:
      - First-order linear equations with an integrating factor
      - Second-order linear equations with constant coefficients
      - The auxiliary equation: real, repeated and complex roots
      - Particular integrals for common right-hand sides
      - General and particular solutions from boundary conditions
      - Checking a solution by substituting it back
    Projects built:
      - Question bank entry: one solved example for every case of the auxiliary equation
    Practice: 18 differential equation problems
  Weeks 51-52: Modelling with Differential Equations
    Topics:
      - Simple harmonic motion as a second-order equation
      - Damped and forced oscillations
      - Coupled first-order systems
      - Interpreting a solution in the context of the model
      - Criticising the assumptions of a differential equation model
      - Long questions that combine setting up, solving and interpreting
    Projects built:
      - Modelling task: a damped oscillation modelled, solved and compared with measured data
    Practice: 12 modelling questions with full written interpretation
    Assessment: Month 13 test: a 50-minute paper on differential equations

Month 14: Core Pure Consolidation (Weeks 53-56)
  Weeks 53-54: Mixed Core Pure Problems
    Topics:
      - Long questions that cross complex numbers, matrices and calculus
      - Proof by induction across series, divisibility, matrices and derivatives

```
        - Further vectors where your board extends them
        - Numerical methods where your board includes them
        - Choosing the efficient method under time pressure
        - Error log review and targeted re-teach
      Projects built:
        - Revision sheet set two: single pages for every second-year core topic
      Practice: Two 60-minute mixed Core Pure papers
    Weeks 55-56: Core Pure Mock
      Topics:
        - A full Core Pure paper under timing for your board
        - Marking against an official-style scheme
        - Classifying every lost mark
        - Rewriting proofs that lost marks to full credit
        - Comparing performance with the AS-standard mock
        - Setting priorities for the final months
      Projects built:
        - The mock file updated with the Core Pure mock and a written plan
      Practice: Mock review set: every lost mark reworked
      Assessment: Core Pure mock, marked and reviewed one to one

---------------------------------------------------------------
PHASE 4: APPLIED OPTION TWO AND OPTION DEPTH (MONTHS 15-16, WEEKS 57-64)
---------------------------------------------------------------
The second option, taught at the depth your board sets, and the first option extended to full
A level standard. Students on a further pure route take their extra pure option here.

  Month 15: Second Option (Weeks 57-60)
    Weeks 57-58: Second Option Foundations
      Topics:
        - Statistics route: discrete and continuous random variables, and the geometric distribution
        - Mechanics route: further work on collisions and energy at A level depth
        - Decision route: route inspection, travelling salesperson bounds and linear programming
        - Further pure route: further vectors, number theory or groups where your board sets them
        - Calculator technique for the option
        - Reading option questions carefully: what the context is really asking
      Projects built:
        - Option reference sheet: every method in the second option on one page
      Practice: 20 problems on the second option
    Weeks 59-60: Second Option Applications
      Topics:
        - Statistics route: hypothesis tests for the Poisson and geometric distributions
        - Mechanics route: centres of mass of laminas and solids
        - Decision route: critical path analysis and network flows
        - Further pure route: further calculus and proof extensions
        - Long option questions under timing
        - Writing conclusions in context
      Projects built:
        - Question bank entry: 12 long option questions with model conclusions
      Practice: 16 option problems under timing
      Assessment: Month 15 test: a 60-minute option paper

  Month 16: Both Options at Full Depth (Weeks 61-64)
    Weeks 61-62: First Option to A Level Depth
      Topics:
        - The first option's A level content beyond the AS checkpoint
        - Mixed problems drawing on both options
        - Modelling assumptions and their criticism
        - Exam technique for multi-part option questions
        - Error log review
        - Targeted re-teach of the weakest option topics
      Projects built:
        - Revision sheet set three: single pages for every option topic
      Practice: Two 45-minute option papers, one per option
    Weeks 63-64: Options Mock
      Topics:
        - A full options paper under timing for your board
        - Marking against an official-style scheme
        - Classifying every lost mark
        - Comparing option performance with core performance
        - Planning the final revision cycle
        - Agreeing the past-paper timetable
      Projects built:
        - The mock file completed with the options mock
      Practice: Mock review set: every lost mark reworked
      Assessment: Options mock, marked and reviewed one to one

---------------------------------------------------------------
PHASE 5: REVISION AND THE PAST-PAPER CYCLE (MONTHS 17-18, WEEKS 65-72)
---------------------------------------------------------------
```

No new content. Structured revision by strand, then full past papers under real timing for your board, marked against official schemes.

Month 17: Structured Revision (Weeks 65-68)
Weeks 65-66: Core Pure Revision by Strand
Topics:
- Rapid re-teach of each student's weakest core topics, chosen from the error log
- Mixed core sets that do not announce their topic
- Formula booklet fluency: what is given and what must be known
- Proof rehearsal from memory
- Accuracy audit: the slips each student makes, named and drilled
- Show-that questions worked backwards honestly

Projects built:
- Final revision pack: the student's revision sheets combined and tidied

Practice: One 75-mark core paper self-timed, plus a drill on two weak strands

Weeks 67-68: Option Revision by Strand
Topics:
- Rapid re-teach of the weakest option topics
- Mixed option sets under timing
- Model assumptions and conclusions rehearsed
- Calculator checks for the option
- Long questions planned before writing
- Error log closed out topic by topic

Projects built:
- Option revision pack completed

Practice: One full option paper self-timed

Assessment: Revision checkpoint: a mixed 60-minute paper across core and options

Month 18: Past Papers Under Timing (Weeks 69-72)
Weeks 69-70: Full Past Papers, Core
Topics:
- Full Core Pure past papers for your board under real timing
- Marking against the official mark scheme
- Error clinic after every paper
- Time management across long questions
- Which questions to attempt first
- Checking strategies in the final minutes

Projects built:
- Past paper score chart started

Practice: Two full core papers under exam timing

Weeks 71-72: Full Past Papers, Options and Final Review
Topics:
- Full option past papers for your board under real timing
- Marking and error clinic
- Final review of the error log
- Exam-day routine and equipment
- Last proof rehearsal
- A calm plan for the final weeks before the exams

Projects built:
- Completed mock file: every marked paper, error classification and score chart

Practice: Two full option papers under exam timing

Assessment: Final past paper series, marked and reviewed

PROJECTS THE STUDENT BUILDS AND KEEPS

- A proof portfolio: every induction proof type and de Moivre's theorem written to exam standard
- A personal question bank: solved exam-style questions for every core and option topic
- A locus atlas and a polar curve gallery, sketched by hand
- A calculus method map covering every further integral form
- Three modelling tasks: a container volume, a bungee jump and a damped oscillation
- A personal error log kept from the first month and used to steer revision
- An AS-standard mock, a Core Pure mock and an options mock, all marked
- The completed mock file with a past-paper score chart

Total projects: A complete revision system for Further Maths: proof portfolio, question bank, sketches, method map, error log and marked mock file

SKILLS THE STUDENT WILL HAVE AT THE END

- The full Further Maths content for your board: Core Pure and two options
- Proof by induction and the writing of complete mathematical arguments
- Complex numbers, matrices and vectors used as tools, not just topics
- Further calculus, Maclaurin series, polar coordinates and hyperbolic functions
- Setting up, solving and interpreting differential equation models
- Timed paper craft and self-marking against official schemes

HOW A TYPICAL WEEK IS SPLIT

Live classes: 2 live one-hour classes per week; paper-phase sittings run longer for full timed papers
Practice: 3-4 hours weekly of problem sets, proofs and question-bank building, rising with timed papers in the final months
Review: Homework marked with method-mark commentary; error logs reviewed with the teacher monthly

SUPPORT INCLUDED

Doubt support: WhatsApp doubt support between classes, with worked solutions for stuck problems
Progress updates: Monthly progress notes to parents with test scores and the error-log summary

CERTIFICATION DETAIL

Completion: Course-completion certificate from Modern Age Coders, alongside the student's marked mock series

WHERE THIS CAN LEAD

- University courses that lean heavily on mathematics, such as mathematics, physics, engineering, computer science and economics; entry requirements differ by course, so check each one directly
- A head start on first-year university topics that Further Maths introduces, including matrices, complex numbers and differential equations
- Our statistics and programming courses, which put the applied mathematics to work

COMMON QUESTIONS ABOUT THIS COURSE

For anything about cost, use PART 4 and RULE 1. Do not quote two regions.

Q: Is Further Maths harder than A level Maths?
A: It goes further rather than simply faster. The boards assume you already know A level Maths: OCR's specification says learners are assumed to know the content of GCSE Mathematics and A Level Mathematics. Many students find the step up is in abstraction and in writing complete arguments, which is why we practise proof every month.

Q: Can I take Further Maths online?
A: You can be taught Further Maths online, and this course covers the full content live with a teacher. The exams themselves are sat in person, either at your school or college or at an exam centre that accepts private candidates. We teach the course; your school or exam centre makes the exam entry.

Q: Do I need Further Maths for a maths degree?
A: It depends on the university and the course. Some mathematics courses require Further Maths, some prefer it and some do not ask for it. Check the current entry requirements on the page of each course you are interested in. We teach the subject; we do not give admissions advice.

Q: Which exam boards do you cover?
A: AQA 7367, Edexcel 9FM0, OCR A H245 and OCR MEI H645. All four have a compulsory pure core and a choice of applied or further pure options. Edexcel has two Core Pure papers and two option papers. AQA has two papers on compulsory content and a third on two optional applications. OCR A has Pure Core papers Y540 and Y541 and two optional papers. OCR MEI has the Core Pure paper Y420 plus a major option or minor options. We teach the core to everyone and your entered options in detail.

Q: Can I study Further Maths without A level Maths?
A: Not sensibly on its own. Pearson Edexcel lists no formal prior learning requirement, but says the students who benefit most are likely to hold A level Maths, and OCR assumes its content throughout. If you are not yet studying A level Maths, our A Level Maths course runs alongside this one.

Q: Which options do you teach: mechanics, statistics or decision?
A: All of them, matched to your board: further mechanics, further statistics, decision or discrete mathematics, and further pure options. Tell us which options your school or exam centre has chosen and those are the ones we teach in depth. If the choice has not been made yet, the first lessons include a conversation about which route suits you.

Q: My school does not offer Further Maths. Can I still do it?
A: Yes. This course teaches the whole qualification, and you can sit the exams as a private candidate at an exam centre that accepts private candidates. You arrange the entry with the centre; we make sure the teaching covers every paper on your board's specification.

Q: When should I start?
A: The beginning of Year 12, alongside A level Maths, is the natural point, because Further Maths topics are timed to follow the A level Maths skills they need. Students who join later take a diagnostic in the first week and get a catch-up plan.

Q: How are the classes run?
A: Live online classes with a real teacher, either in a group of 15 to 20 students at a similar level or one to one. Homework is marked with method-mark comments, and there is WhatsApp support between classes. Current fees for your region are shown in the pricing section of this page.

Q: Can I try a lesson before enrolling?
A: Yes. Book a free demo class first. The teacher works through some Further Maths with you, finds where you are, and suggests whether group or one-to-one teaching fits better. There is no obligation to enrol. (Agent note: the free demo is a waiting list with no fixed date. The Priority Live Demo is a guaranteed class today or tomorrow, booked at https://learn.modernagecoders.com/priority-demo . Offer both, as RULE 3 says.)

To enrol, message Shivam Sir on +91 9123366161 or send the parent this link: https://learn.modernagecoders.com/courses/a-level-further-maths-course
For a demo: the Priority Live Demo (guaranteed, today or tomorrow) is booked at https://learn.modernagecoders.com/priority-demo . The free demo is a waiting list with no fixed date.

==========

COURSE 3 OF 137: A-LEVEL MATHS: PURE, MECHANICS, STATISTICS (EDEXCEL/AQA)

==========

Course link: https://learn.modernagecoders.com/courses/a-level-maths-course-pure-mechanics-statistics
Subject area: Exam Board Mathematics
Designed for: High school
Who can join: A-Level students (Years 12-13 or equivalent), Edexcel, AQA and OCR
Course length: 18 months (72 weeks), joinable any month
Time needed: 2 live classes/week + 3-4 hours practice, rising to full timed papers in the final phase
Certificate: Course-completion certificate from Modern Age Coders

PRICE FOR THIS COURSE (quote only the one that applies to the person asking)
In India, per month: group Rs 1,499, mini batch Rs 2,999, one to one Rs 4,999
Outside India, per month: group $100, one to one $150
Classes: group and mini batch two live classes a week, eight a month; one to one in India one live class a week, four a month; one to one outside India two live classes a week, eight a month. Each class is one hour.

WHAT THIS COURSE IS

A-Level Maths course online: live small-batch classes covering Pure, Mechanics & Statistics for Edexcel, AQA & OCR, from AS foundations to timed past papers.

In one line: Two years of the hardest school maths there is, taught in order, at a pace that holds, with past papers at the end instead of panic.

ABOUT THE PROGRAMME

A-Level Maths is a linear qualification: every exam comes at the end, and the content is set nationally by the Department for Education, so Edexcel, AQA and OCR students all study the same mathematics. What differs is how each board arranges its three two-hour papers, and we adjust practice to your board when the paper phase arrives. This 18-month live course follows the natural AS then A2 structure. The first nine months cover AS content: the pure core of algebra, coordinate geometry, trigonometry, exponentials and logarithms, first calculus and vectors, followed by AS statistics with the board's large data set and AS mechanics with kinematics and Newton's laws. Months 10 to 16 cover the A2 material where most grades are won and lost: functions, sequences and series, the full trigonometric toolkit, parametric equations, advanced differentiation and integration, numerical methods, the normal distribution, moments, friction and projectiles. The final two months are given entirely to structured revision and past papers under real timing, marked against official schemes. Classes are live and small, so the teacher sees your working, not just your answers. Method marks decide grades at A-Level, and we treat how a solution is written as seriously as whether it is right.

WHAT MAKES THIS COURSE DIFFERENT

- Built around the real qualification: linear assessment, three two-hour papers, roughly two thirds pure and one third applied, with your board's paper structure driving the practice phase
- AS content is finished and consolidated with an AS-standard mock before A2 begins, so the second year is built on checked ground rather than assumed ground
- The large data set is taught from the first statistics week, because boards write exam questions that assume familiarity with it, and students who meet it in the exam hall lose easy marks
- Calculator technique is taught explicitly: statistical distributions, iteration and equation solving on the calculator are part of the syllabus, not an afterthought
- Two full months of past papers under real 2-hour timing, marked against official mark schemes, with an error clinic after every paper

- Method-mark discipline throughout: solutions are written the way examiners award marks, with working shown at every step

THE LEARNING PATH, STEP BY STEP

Phase 1: AS Pure: algebra, quadratics, coordinate geometry, binomial expansion, trigonometry, exponentials and logarithms, differentiation, integration and 2D vectors
Phase 2: AS Applied: sampling and the large data set, probability, the binomial distribution and hypothesis testing, then kinematics, variable acceleration and Newton's laws, closed by an AS-standard mock
Phase 3: A2 Pure: proof by contradiction, functions, partial fractions, sequences and series, radians and the full trig toolkit, parametrics, advanced calculus, numerical methods and 3D vectors
Phase 4: A2 Applied: conditional probability, the normal distribution and hypothesis tests for means and correlation, then resolving forces, friction, moments and projectiles
Phase 5: Revision and the past-paper cycle: structured revision by strand, then full papers under timing with marked review, matched to your board's paper structure

WHAT A STUDENT NEEDS BEFORE STARTING

Maths level: A strong GCSE or IGCSE Maths pass, ideally grade 6 or above. The week 1 diagnostic finds any gaps and we patch them inside the course
Exam board: Edexcel, AQA or OCR. The content is identical across boards; we align paper practice to yours in the final phase
Equipment: A calculator with statistical distributions and an iterative function, notebooks, and a device with stable internet for live classes
Timing: Best started at the beginning of Year 12 or its equivalent; later joiners get a catch-up plan after the diagnostic

WHO THIS COURSE IS FOR

Year 12 starters: Students beginning A-Level Maths who want the full two years taught in order, with revision built in rather than bolted on
Students without strong school support: Students whose school sets the exams but whose classroom teaching is rushed, oversized or patchy
International students: Students taking A-Levels outside the UK, at international schools or as private candidates, who need structured teaching across the time zones
Retake students: Students resitting A-Level Maths who need the gaps found honestly and closed, not the whole course replayed at the same speed
Applied strugglers: Students comfortable with pure maths who lose marks in statistics wording and mechanics diagrams, or the other way around

FULL CURRICULUM, WEEK BY WEEK

This is the complete teaching plan. Parents can ask about any week.

PHASE 1: AS PURE MATHEMATICS (MONTHS 1-5, WEEKS 1-20)

The pure core that every later topic stands on: algebra done properly, coordinate geometry, trigonometry, exponentials and logarithms, and the first calculus. Roughly two thirds of the A-Level is pure mathematics, and it starts here.

Month 1: Algebra Foundations (Weeks 1-4)
Weeks 1-2: Indices, Surds and Quadratics
Topics:
- Diagnostic paper on GCSE essentials: algebra, trigonometry, graphs
- Laws of indices including negative and fractional powers
- Surds: simplifying, expanding and rationalising denominators
- Quadratic graphs, completing the square and the turning point
- Solving quadratics by factorising, formula and completing the square
- The discriminant and what it says about roots
Projects built:
- Question bank entry: 15 solved exam-style questions on indices, surds and quadratics, written to full method standard
Practice: 30 mixed problems across indices, surds and quadratics, with every quadratic solved by the method the question rewards
Weeks 3-4: Simultaneous Equations, Inequalities and First Proof
Topics:
- Simultaneous equations: linear pairs and linear with quadratic
- Where a line meets a curve, algebraically and in a sketch
- Linear and quadratic inequalities with set notation
- Representing inequality regions graphically
- Proof by deduction and by exhaustion
- Disproof by counter example, with the write-up done properly
Projects built:
- Proof portfolio opened: four short proofs written out to exam standard, checked line by line
Practice: 20 simultaneous and inequality problems plus 6 proof questions, working shown in full every time

Assessment: Month 1 test: a 40-minute paper on all algebra so far, marked with method marks the way an examiner would

Month 2: Polynomials, Graphs and Coordinate Geometry (Weeks 5-8)
Weeks 5-6: Polynomials and Curve Sketching
Topics:
- Algebraic division and the factor theorem
- Factorising and sketching cubics and quartics
- Reciprocal graphs and their asymptotes
- Graph transformations: translations and stretches, alone and read from equations
- Points of intersection between curves
- Interpreting sketches: what a question actually wants from a graph

Projects built:
- Sketching sheet: 10 polynomial and reciprocal curves sketched with intercepts, turning behaviour and asymptotes labelled

Practice: 25 problems on the factor theorem, division and transformations, each sketch drawn before any algebra is checked

Weeks 7-8: Straight Lines and Circles
Topics:
- Gradient, midpoint and distance between points
- Equations of straight lines in all three forms
- Parallel and perpendicular lines, with proofs of perpendicularity
- The equation of a circle, centre and radius by completing the square
- Tangents, chords and the perpendicular from the centre
- Modelling with straight lines: interpreting gradient and intercept in context

Projects built:
- Question bank entry: 12 solved coordinate geometry questions, including one full circle-tangent problem

Practice: 22 line and circle problems with a labelled sketch for each, plus 2 modelling questions answered in context

Assessment: Month 2 test: a 40-minute paper on polynomials and coordinate geometry with one unstructured multi-step question

Month 3: Binomial Expansion and Trigonometry (Weeks 9-12)
Weeks 9-10: The Binomial Expansion
Topics:
- Factorial notation and nCr, on paper and on the calculator
- Pascal's triangle and where the coefficients come from
- Expanding (a + bx)^n for positive integer n
- Finding a specific coefficient without expanding everything
- Using expansions for numerical approximations
- The sign and power slips that cost marks, and how to catch them

Projects built:
- Question bank entry: 10 solved binomial questions, including two find-the-coefficient problems worked two ways

Practice: 20 binomial problems, each coefficient answer checked by an independent second method

Weeks 11-12: Trigonometry: Ratios, Identities and Equations
Topics:
- Sine and cosine rules and the area of a triangle
- Graphs of sin, cos and tan, and exact values worth memorising
- The identities tan x = sin x / cos x and sin squared plus cos squared equals 1
- Solving trig equations in degrees over a given interval
- Quadratics in sin, cos or tan
- Finding all solutions: the CAST diagram and graph methods compared

Projects built:
- Solution-count drill: 12 trig equations where the number of solutions in the interval is predicted before solving

Practice: 28 trig problems from triangle work to multi-step equations, every lost solution traced back to its cause

Assessment: Month 3 test: a 45-minute paper on binomial expansion and trigonometry, marked for method as well as answers

Month 4: Exponentials, Logarithms and First Calculus (Weeks 13-16)
Weeks 13-14: Exponentials and Logarithms
Topics:
- The graphs of a^x and e^x, and why e matters
- Logarithms as the inverse of exponentials, and the log laws
- Solving equations of the form a^x = b
- Natural logarithms and equations with e
- Exponential modelling: growth, decay and interpreting the constants
- Reducing relationships to linear form with logs, and reading data plots

Projects built:
- Modelling write-up: one exponential growth or decay problem solved and interpreted in three or four written sentences

Practice: 24 log and exponential problems including 4 modelling questions where the interpretation carries the marks

Weeks 15-16: Differentiation from First Principles
Topics:

- The gradient of a curve and differentiation from first principles
- Differentiating powers of x, sums and constants
- Tangents and normals to a curve at a point
- Increasing and decreasing functions
- Stationary points and their nature, using the second derivative
- Simple optimisation: setting up and solving maximum and minimum problems

Projects built:
- First-principles proof: the derivative of x squared and x cubed derived and written out to exam standard

Practice: 26 differentiation problems ending with 4 optimisation questions set up from scratch

Assessment: Month 4 test: a 45-minute paper on logs, exponentials and differentiation with one modelling question

Month 5: Integration, Vectors and the AS Pure Finish (Weeks 17-20)

Weeks 17-18: Integration

Topics:
- Integration as the reverse of differentiation
- Indefinite integrals of powers of x and the constant of integration
- Finding the constant from a point on the curve
- Definite integrals and what the answer means
- Areas under curves, including regions below the axis
- Areas between a curve and a straight line

Projects built:
- Area problem set: 8 shaded-region questions where the region is sketched and decomposed before any integration

Practice: 24 integration problems, definite integrals checked for sign sense against the sketch every time

Weeks 19-20: Vectors in Two Dimensions

Topics:
- Vector notation, magnitude and direction
- Adding vectors and multiplying by scalars
- Position vectors and the vector between two points
- Distance between points using vectors
- Geometric problems: parallelograms, ratios and collinearity
- Where vectors reappear: a preview of their role in mechanics

Projects built:
- Question bank entry: 10 solved vector problems including two geometric proofs

Practice: 20 vector problems with a diagram drawn for each, plus a mixed AS Pure warm-down set of 15 questions

Assessment: Phase 1 milestone: a 90-minute AS Pure paper covering all five months, marked against an official-style scheme

---

PHASE 2: AS STATISTICS AND MECHANICS (MONTHS 6-9, WEEKS 21-36)

The applied third of the qualification begins: statistics with the board's large data set, probability and hypothesis testing, then mechanics from kinematics to Newton's laws. The phase closes with a full AS-standard mock.

Month 6: Sampling, Data and the Large Data Set (Weeks 21-24)

Weeks 21-22: Sampling and Data Presentation

Topics:
- Populations, samples and why sampling method matters
- Simple random, systematic, stratified, quota and opportunity sampling
- The large data set: what your board pre-releases and how exams use it, with Edexcel's weather-station data as the worked example
- Histograms, frequency polygons and cumulative frequency diagrams
- Box plots and comparing distributions
- Outliers: the standard rules and when to clean data

Projects built:
- Large data set field notes: a one-page profile of your board's data set in your own words, variables, units and quirks included

Practice: 18 data presentation problems plus a guided exploration session inside the large data set itself

Weeks 23-24: Location, Spread and Interpretation

Topics:
- Mean, median and mode from lists and grouped tables
- Quartiles, percentiles and interpolation
- Variance and standard deviation, by formula and by calculator
- Coding data and what it does to mean and spread
- Scatter diagrams, correlation and interpreting a regression line in context
- Writing statistical conclusions in sentences, not just numbers

Projects built:
- Comparison write-up: two groups from the large data set compared on location and spread, in four marked sentences

Practice: 20 location and spread problems, calculator statistics mode drilled until it is faster than the formula

Assessment: Month 6 test: a 40-minute statistics paper with one large-data-set question

in board style

Month 7: Probability, the Binomial and Hypothesis Testing (Weeks 25-28)
  Weeks 25-26: Probability and the Binomial Distribution
    Topics:
      - Venn diagrams and tree diagrams done cleanly
      - Mutually exclusive and independent events, and how to test for independence
      - Discrete random variables and probability distributions
      - The conditions for a binomial model, checked in words
      - Calculating binomial probabilities on the calculator
      - Cumulative binomial probabilities and careful inequality reading
    Projects built:
      - Model-check drill: 8 scenarios judged binomial or not, with the failing condition named each time
    Practice: 24 probability and binomial problems, inequality direction stated in words before the calculator is touched
  Weeks 27-28: Hypothesis Testing with the Binomial
    Topics:
      - Null and alternative hypotheses, written correctly
      - One-tailed and two-tailed tests and significance levels
      - Critical regions and actual significance level
      - Carrying out a test and stating the conclusion in context
      - The wording that earns the final mark, and the wording that loses it
      - Common traps: wrong tail, wrong inequality, conclusions that overclaim
    Projects built:
      - Question bank entry: 8 full hypothesis tests written to exam standard, conclusions in context every time
    Practice: 14 complete hypothesis tests, each conclusion checked against a mark-scheme model sentence
    Assessment: Month 7 test: a 45-minute paper from probability through hypothesis testing

Month 8: Mechanics: Modelling and Motion (Weeks 29-32)
  Weeks 29-30: Modelling and Kinematics
    Topics:
      - SI units and the standard modelling assumptions: particle, light string, smooth surface
      - Displacement, velocity and acceleration as vectors
      - Displacement-time and velocity-time graphs, and what areas and gradients mean
      - The suvat equations: where they come from and when they apply
      - Vertical motion under gravity
      - Choosing a positive direction and sticking to it
    Projects built:
      - Graph story set: 6 motion graphs translated into written descriptions of the trip and back again
    Practice: 22 kinematics problems, the suvat quantities listed and the equation chosen before any algebra
  Weeks 31-32: Variable Acceleration
    Topics:
      - Why suvat fails when acceleration changes
      - Velocity and acceleration by differentiation
      - Displacement by integration, with limits or constants
      - Maximum velocity and turning points of motion
      - Sketching motion from its equations
      - Mixed problems that decide between suvat and calculus
    Projects built:
      - Decision drill: 10 motion problems sorted into suvat or calculus, with the deciding clue underlined
    Practice: 18 variable acceleration problems plus a mixed set of 10 where the method is not announced
    Assessment: Month 8 test: a 40-minute kinematics paper mixing graphs, suvat and calculus methods

Month 9: Forces, Newton's Laws and the AS Checkpoint (Weeks 33-36)
  Weeks 33-34: Forces and Newton's Laws
    Topics:
      - Force diagrams drawn before anything else
      - Newton's laws and F = ma along a line
      - Weight, tension, thrust and normal reaction
      - Connected particles: cars and trailers, lifts and scale pans
      - Pulleys: the standard setups and their equations
      - Forces written as vectors in i and j form
    Projects built:
      - Question bank entry: 10 solved force problems, every one opened with a complete labelled diagram
    Practice: 20 forces problems, the diagram marked before the algebra is even read
  Weeks 35-36: AS Consolidation and Mock
    Topics:
      - Structured revision across all AS pure and applied content
      - Mixed problem sets that do not announce their topic
      - A full AS-standard mock under real timing

- Marking workshop against an official-style scheme
- Error clinic: every miss classified as concept, method or accuracy
- The A2 map: what changes in year two and what carries over

Projects built:
- Personal error log formalised: every mock miss classified and matched to a drill

Practice: Redo every mock miss untimed with full working, then one targeted drill set on your weakest AS topic

Assessment: Phase 2 milestone: full AS-standard mock, marked and reviewed one to one

---

PHASE 3: A2 PURE MATHEMATICS (MONTHS 10-14, WEEKS 37-56)

The second-year pure content where most A-Level grades are decided: functions, series, the full trig toolkit, parametrics, advanced calculus, numerical methods and 3D vectors.

Month 10: Proof, Fractions and Functions (Weeks 37-40)

Weeks 37-38: Proof by Contradiction and Partial Fractions

Topics:
- Proof by contradiction: the irrationality of root 2 and the infinitude of primes
- Simplifying algebraic fractions
- Algebraic division revisited with remainders
- Partial fractions with distinct linear factors
- Partial fractions with a repeated factor
- Where partial fractions pay off later: series and integration previewed

Projects built:
- Proof portfolio extended: both classic contradiction proofs written from memory to exam standard

Practice: 18 partial fraction decompositions checked by recombining, plus 4 proof questions

Weeks 39-40: Functions and the Modulus

Topics:
- Mappings, domain and range stated precisely
- Composite functions and order of application
- Inverse functions, their graphs and the line y = x
- The modulus function: graphs of |f(x)| and f(|x|)
- Solving modulus equations and inequalities
- Combined transformations applied in the right order

Projects built:
- Question bank entry: 12 solved function questions including two full modulus problems with sketches

Practice: 24 function problems, domain and range written for every inverse found

Assessment: Month 10 test: a 45-minute paper on proof, partial fractions and functions

Month 11: Sequences, Series and Radian Trigonometry (Weeks 41-44)

Weeks 41-42: Sequences and Series

Topics:
- Arithmetic sequences and series, and the standard formulae
- Geometric sequences and series
- Sum to infinity and the convergence condition
- Sigma notation read and written fluently
- Recurrence relations: increasing, decreasing and periodic sequences
- Modelling with series: savings, loans and depreciation

Projects built:
- Modelling write-up: one savings or loan problem solved with a series and explained in plain sentences

Practice: 26 series problems including 4 modelling questions and 4 sigma notation translations

Weeks 43-44: Radians, Sectors and New Trig Functions

Topics:
- Radian measure and exact values in radians
- Arc length and sector area
- Solving trig equations in radians
- Small angle approximations and where they come from
- Secant, cosecant and cotangent: graphs and identities
- Inverse trig functions and their restricted domains

Projects built:
- Question bank entry: 10 solved radian and sector problems including one segment area question

Practice: 22 problems across radians, sectors and reciprocal trig, calculator mode checked before every set

Assessment: Month 11 test: a 45-minute paper on series and radian trigonometry

Month 12: The Full Trig Toolkit and Parametric Equations (Weeks 45-48)

Weeks 45-46: Compound Angles and the R Form

Topics:
- Compound angle formulae and where they come from
- Double angle formulae and their rearrangements
- Writing a sin x + b cos x in R form
- Using the R form for maxima, minima and equation solving
- Proving trig identities with a clear strategy

- Choosing the right identity: a decision routine for messy equations
Projects built:
- Identity toolkit card: every identity on one page with a note on when each earns its keep
Practice: 24 identity and equation problems, each proof annotated with the identity used at every step
Weeks 47-48: Parametric Equations
Topics:
- Curves defined parametrically and why anyone bothers
- Converting between parametric and Cartesian forms
- Trig parametrics and identity-based conversion
- Sketching parametric curves and finding intersections
- Points where a parametric curve crosses the axes
- Parametric modelling questions in exam style
Projects built:
- Question bank entry: 10 solved parametric problems including two conversions each way
Practice: 18 parametric problems, every conversion checked by substituting a point
Assessment: Month 12 test: a 45-minute paper on advanced trigonometry and parametrics

Month 13: Advanced Differentiation and Integration (Weeks 49-52)
Weeks 49-50: Differentiation Methods
Topics:
- The chain, product and quotient rules, and how to spot which one
- Derivatives of trig, exponential and log functions
- Implicit differentiation
- Parametric differentiation
- Rates of change and connected rates
- Tangents and normals on harder curves
Projects built:
- Method map: one page routing any function to its differentiation method, tested against 20 unseen functions
Practice: 30 differentiation problems climbing from single-rule to mixed-rule questions
Weeks 51-52: Integration Methods
Topics:
- Standard integrals of trig and exponential functions
- Integration by substitution
- Integration by parts
- Integrating with partial fractions
- Areas between curves and the trapezium rule
- Differential equations with separable variables, solved and interpreted
Projects built:
- Question bank entry: 12 solved integrals labelled by method, including one differential equation in context
Practice: 28 integration problems, the method named in the margin before each attempt
Assessment: Month 13 test: a 60-minute calculus paper across both differentiation and integration methods

Month 14: Numerical Methods, 3D Vectors and the General Binomial (Weeks 53-56)
Weeks 53-54: Numerical Methods
Topics:
- Locating roots by change of sign, and when that argument fails
- Fixed point iteration and rearranging into iterative form
- Staircase and cobweb diagrams
- The Newton-Raphson method and its failure cases
- Iteration on the calculator, done quickly and accurately
- Numerical integration revisited and error direction from sketches
Projects built:
- Root hunt: one equation solved three ways, change of sign, iteration and Newton-Raphson, with results compared
Practice: 16 numerical methods problems with calculator iteration technique drilled to fluency
Weeks 55-56: 3D Vectors and the Binomial for Any Power
Topics:
- Vectors in three dimensions: notation, magnitude and distance
- Geometric problems in 3D
- The binomial expansion for negative and fractional indices
- Validity intervals stated every time
- Expansions built through partial fractions
- Using expansions for approximations, with accuracy discussed
Projects built:
- Question bank entry: 10 solved problems split between 3D vectors and general binomial expansions
Practice: 20 problems across 3D vectors and the general binomial, validity written before any expansion
Assessment: Phase 3 milestone: a 90-minute A2 Pure paper across all five months of this phase

---
PHASE 4: A2 STATISTICS AND MECHANICS (MONTHS 15-16, WEEKS 57-64)

The second-year applied content: conditional probability, the normal distribution and its hypothesis tests, then resolving forces, friction, moments and projectiles.

Month 15: The Normal Distribution and Hypothesis Tests (Weeks 57-60)
Weeks 57-58: Conditional Probability and the Normal Distribution
Topics:
- Set notation for probability and the conditional probability formula
- Conditional probability from tables, trees and Venn diagrams
- The normal distribution: shape, parameters and what they control
- Calculating normal probabilities on the calculator
- The inverse normal: finding values from probabilities
- Standardising and finding unknown mean or standard deviation

Projects built:
- Question bank entry: 10 solved normal distribution problems including two unknown-parameter questions

Practice: 22 probability and normal distribution problems, a sketch of the shaded region drawn for every normal question

Weeks 59-60: Testing Means and Correlation
Topics:
- When the normal approximates the binomial, and the continuity correction
- The distribution of the sample mean
- Hypothesis tests for the mean of a normal distribution
- Correlation coefficients and what they do and do not claim
- Hypothesis tests for zero correlation using tables of critical values
- Large data set questions in A2 style, revisited

Projects built:
- Question bank entry: 8 full hypothesis tests for means and correlation, conclusions written in context

Practice: 14 complete tests plus one large-data-set question under a 15-minute clock
Assessment: Month 15 test: a 45-minute A2 statistics paper

Month 16: Resolving Forces, Friction, Moments and Projectiles (Weeks 61-64)
Weeks 61-62: Resolving Forces and Friction
Topics:
- Resolving forces at angles into components
- Equilibrium of a particle under coplanar forces
- Motion on an inclined plane
- Friction and the coefficient of friction
- Limiting equilibrium: on the point of moving
- Connected systems revisited with angles and friction

Projects built:
- Question bank entry: 10 solved problems on inclined planes and friction, every diagram complete before the algebra

Practice: 20 resolving and friction problems, components table filled in before any equation is written

Weeks 63-64: Moments and Projectiles
Topics:
- Moments and the conditions for equilibrium of a rigid body
- Rods on supports and tilting problems
- Projectile motion: splitting velocity into components
- Time of flight, range and greatest height
- The projectile modelling assumptions and their limits
- Motion in two dimensions with vectors and calculus

Projects built:
- Question bank entry: 10 solved moments and projectile problems, including one full tilting question

Practice: 18 moments and projectile problems plus a mixed mechanics set of 10 with no topic labels
Assessment: Phase 4 milestone: a 60-minute A2 applied paper across statistics and mechanics

---
PHASE 5: REVISION AND THE PAST-PAPER CYCLE (MONTHS 17-18, WEEKS 65-72)

No new content, on purpose. Structured revision by strand, then full past papers under real 2-hour timing, matched to your board's paper structure and marked against official schemes.

Month 17: Structured Revision (Weeks 65-68)
Weeks 65-66: Pure Revision by Strand
Topics:
- Rapid re-teach of the weakest pure topics, driven by each student's error log
- Mixed pure problem sets that do not announce their topic
- Formula booklet fluency: what is given, what must be known
- Proof rehearsal: contradiction and identity proofs rewritten from memory
- Algebra accuracy audit: the slips that cost each student marks, named and drilled
- Show-that questions: working backwards from a given answer honestly

Projects built:
- Revision sheet set one: student-made single pages for every pure strand

Practice: One mixed pure paper of 50 marks self-timed, plus a targeted drill on your

two weakest strands
Weeks 67-68: Applied Revision and Board Alignment
Topics:
- Statistics mixed sets: distributions, tests and interpretation together
- Mechanics mixed sets: forces, moments, projectiles and kinematics together
- Large data set refresh: the facts worth having cold
- Calculator technique final pass: distributions, iteration, equation solving
- Your board's paper structure: exactly which content sits in which paper for Edexcel, AQA and OCR
- Time budgeting: marks per minute across a 100-mark paper
Projects built:
- Revision sheet set two: single pages for statistics and mechanics, completing the personal revision pack
Practice: One applied sectional paper self-timed plus 20 calculator-technique drills
Assessment: Month 17 checkpoint: two sectional papers marked against official schemes, error logs updated

Month 18: The Past-Paper Cycle (Weeks 69-72)
Weeks 69-70: Papers Under Real Timing
Topics:
- A full past paper from your board in one timed 2-hour sitting
- Marking against the official scheme, method marks understood
- Error clinic one: concept gaps separated from timing and accuracy losses
- A second full paper under timing
- Question selection: order of attack and when to park a question
- The unstructured problem: making progress when no method is named
Projects built:
- Mock file opened: each paper filed with its marked script, error classification and one-line fix per miss
Practice: One additional past paper at home under honest timing, brought marked to class
Weeks 71-72: Final Mocks and Exam Craft
Topics:
- Two final full papers under strict conditions, spaced for recovery
- Error clinic two: closing the last recurring mistakes
- Presentation final pass: notation, working, exact answers where demanded
- The last week: what to revise, what to leave alone
- Exam-day routine for a three-paper series, walked through calmly
- Course close: the mock series reviewed with each student and family
Projects built:
- Completed mock file: the full paper series with scores charted, kept by the student as evidence of readiness
Practice: Light targeted drills only, set individually from each student's final error log
Assessment: Course milestone: final full past paper marked and reviewed one to one, plus certificate review

PROJECTS THE STUDENT BUILDS AND KEEPS

- A personal question bank: 10-15 solved exam-style questions per topic, built across the whole course
- A proof portfolio: every required proof type written to exam standard and rewritten from memory
- A large data set profile and comparison write-ups in the student's own words
- A calculus method map routing any function to the right technique
- A personal error log maintained from the first month and used to steer revision
- Student-made single-page revision sheets for every strand
- An AS-standard mock at month 9 and a full past-paper series in month 18
- The completed mock file: marked scripts, error classifications and a score chart

Total projects: A complete self-built revision system: question bank, proof portfolio, revision sheets, error log and marked mock file

SKILLS THE STUDENT WILL HAVE AT THE END

- The full A-Level Maths content: pure, statistics and mechanics to A2 standard
- Method-mark discipline: solutions written the way official mark schemes pay
- Calculator fluency for distributions, iteration and equation solving
- Large data set familiarity of the kind exam questions quietly assume
- Timed paper craft across three two-hour papers
- Self-review: marking your own work against a scheme and classifying your own errors

HOW A TYPICAL WEEK IS SPLIT

Live classes: 2 live one-hour classes per week; paper-phase sittings run longer for full timed papers
Practice: 3-4 hours weekly of problem sets and question-bank building, rising with timed papers in the final months
Review: Homework marked with method-mark commentary; error logs reviewed with the teacher

monthly

SUPPORT INCLUDED

Doubt support: WhatsApp doubt support between classes, with worked solutions for stuck problems
Progress updates: Monthly progress notes to parents with test scores and the error-log summary

CERTIFICATION DETAIL

Completion: Course-completion certificate from Modern Age Coders, alongside the student's marked mock series

WHERE THIS CAN LEAD

- University degrees that ask for A-Level Maths: mathematics, engineering, physics, economics and computer science
- A stronger position for degrees that quietly reward it, from architecture to psychology
- A foundation for university admissions tests such as STEP, MAT and TMUA, which build on A-Level content
- Further Maths, for students who discover they want more
- Our statistics and programming courses, which pick up exactly where the applied content leaves off

COMMON QUESTIONS ABOUT THIS COURSE

For anything about cost, use PART 4 and RULE 1. Do not quote two regions.

Q: Which exam boards does the course cover?
A: Edexcel, AQA and OCR, including OCR's MEI specification by arrangement. The content of A-Level Maths is prescribed nationally, so all boards examine the same mathematics; what differs is how the three two-hour papers are arranged and the house style of the questions.

Q: What is the difference between AS Maths and the full A-Level?
A: AS Maths is a separate, standalone qualification covering roughly the first year of content. Since the reforms, AS results do not count towards the full A-Level: the A-Level is linear, and everything rests on the papers at the end of year two. Our course follows the AS then A2 structure because it is the natural teaching order, and students who want to sit the AS exam as a standalone qualification at the end of year one are prepared for exactly that.

Q: Can you improve my predicted grade?
A: We should be straight about what predicted grades are: they are set by your school or college, not by us, and no tutor can promise to change them. What we can do is give your teachers better evidence: marked tests through the course, an AS-standard mock, and a full past-paper series with scores charted. Students who improve their actual performance tend to see predictions follow, but the honest version is that we prepare you and your school predicts you.

Q: I am retaking A-Level Maths. Does this course work for resits?
A: Yes, and retakes are one of the cases we handle best, because the course does not assume you are starting from nothing. A retake student begins with the diagnostic and their old scripts if available, we map exactly which strands cost the marks, and the plan compresses the content you already hold and expands where you lost ground. Resit students usually join mid-course into the phase that matches their gaps rather than starting at week 1.

Q: What calculator do I need, and do you teach how to use it?
A: We teach calculator technique explicitly, because binomial and normal probabilities, iteration and equation solving on the calculator are worth real marks and are consistently undertaught in schools.

Q: What is the large data set and why does it matter?
A: Each exam board pre-releases a large data set, Edexcel's is weather-station data for example, and students are expected to have worked with it during the course. Exam questions are written assuming that familiarity: knowing the variables, the units and the quirks can turn a long question into a short one.

Q: We are in the UK. How do class timings work with an India-based academy?
A: Classes are scheduled to suit the student, and UK afternoons and evenings fall comfortably inside our teaching hours. Most of our A-Level students take classes on weekday evenings or weekend mornings UK time. Classes are live and interactive in every case, and the same teacher stays with the student through the course.

Q: Can I join in Year 13, or partway through my studies?
A: Yes. The 18-month plan assumes a Year 12 start, but the course is modular enough to enter at the A2 phase or the revision phase. A Year 13 joiner sits the diagnostic, we agree which AS strands need patching, and the plan is compressed to fit the months remaining before the exams. What we will not do is pretend a student ten weeks from their papers can cover two years of content; if the timeline is unrealistic we say so at the demo stage.

To enrol, message Shivam Sir on +91 9123366161 or send the parent this link: https://learn.modernagecoders.com/courses/a-level-maths-course-pure-mechanics-statistics
For a demo: the Priority Live Demo (guaranteed, today or tomorrow) is booked at https://learn.modernagecoders.com/priority-demo . The free demo is a waiting list with no fixed date.

==========

COURSE 4 OF 137: ABACUS & MENTAL MATHS FOR KIDS: FROM FIRST BEADS TO ANZAN

==========

Course link: https://learn.modernagecoders.com/courses/abacus-mental-maths-course-for-kids
Subject area: Mental Maths for Kids
Designed for: Elementary school
Who can join: Ages 5 to 10, no prior maths needed beyond counting
Course length: 8 months (32 weeks)
Time needed: 2 live classes/week + 10-15 minutes of bead practice daily
Certificate: Certificate from Modern Age Coders, awarded on passing the final assessment

PRICE FOR THIS COURSE (quote only the one that applies to the person asking)
In India, per month: group Rs 1,499, mini batch Rs 2,999, one to one Rs 4,999
Outside India, per month: group $100, one to one $150
Classes: group and mini batch two live classes a week, eight a month; one to one in India one live class a week, four a month; one to one outside India two live classes a week, eight a month. Each class is one hour.

WHAT THIS COURSE IS

Abacus classes for kids ages 5-10: live online mental maths course from first beads to anzan visualisation and mental-only sums. Small batches, free demo.

In one line: First the beads move on the desk. Then they move in the head.

ABOUT THE PROGRAMME

The abacus is one of the oldest maths teaching tools still in serious use, and it earns its place: a child who adds on an abacus is not memorising answers, they are physically moving quantities and watching place value work. This 8-month live course takes children aged 5 to 10 from holding the abacus correctly to anzan, the stage where the abacus is imagined and sums are done entirely in the head. The progression is deliberate and unhurried. Months 1 and 2 build bead fluency and the small-friend pairs that make 5. Months 3 and 4 cross the tens with big friends and take numbers to three digits. Months 5 and 6 begin visualisation: eyes closed, imaginary beads, short mental rows that grow week by week. Months 7 and 8 add multiplication on the abacus and finish with a mental-only graded test the child can be genuinely proud of. We are straightforward about what this course builds: real arithmetic fluency, comfortable number sense, and the habit of focused daily practice. Those are worth having on their own. We do not dress them up as brain development or IQ gains, because those claims are not ours to make.

WHAT MAKES THIS COURSE DIFFERENT

- A real progression to anzan: visualisation is trained deliberately from month 5, not left to chance after a year of bead drills
- Small-friend and big-friend rules are taught as number bonds, so the abacus work strengthens school maths instead of sitting beside it
- Live classes built for young attention spans: short activity blocks, bead races, dictation games, and a teacher who can see every child's abacus on camera
- Daily practice is 10-15 minutes by design, small enough that families actually keep it up for eight months
- Honest milestones: parents see dictation scores and row lengths, not vague level names
- Class pace grouped by age, because a 5-year-old and a 9-year-old need different speeds through the same material

THE LEARNING PATH, STEP BY STEP

Phase 1: Bead basics and number sense: setting and reading numbers, place value on the rods, and the small friends that make 5
Phase 2: Crossing the tens: big friends, borrowing and carrying, three-digit numbers, and dictation drills at growing speed
Phase 3: Anzan begins: imaginary beads, short mental rows, flash number practice, and listening sums done without touching the abacus
Phase 4: Multiplication on the abacus and the mental-only capstone: longer mental rows and a graded test done entirely in the head

WHAT A STUDENT NEEDS BEFORE STARTING

Maths level: Counting to 10 comfortably. Everything else, including number bonds, is built in the course
Age: 5 to 10. Batches are grouped by age; the youngest children benefit from a parent nearby

during class
Equipment: A student abacus, 17-rod soroban style, which costs a few hundred rupees; we send parents a buying guide before class 1
Reading: Not required. Instructions are spoken and shown; worksheets use numbers, not sentences

WHO THIS COURSE IS FOR

Young starters: Children aged 5 to 7 meeting numbers for the first time, who learn best with something to hold and move
Primary students: Children aged 8 to 10 who want arithmetic to feel easy before bigger school maths arrives
Children who dislike worksheets: Kids who switch off at written sums but light up when maths is beads, races and games
Focus builders: Children whose parents want a short, structured daily practice habit with visible progress
Future mental calculators: Kids who will enjoy the quiet magic of doing sums with an abacus nobody can see

FULL CURRICULUM, WEEK BY WEEK

This is the complete teaching plan. Parents can ask about any week.

PHASE 1: BEAD BASICS AND NUMBER SENSE (MONTHS 1-2, WEEKS 1-8)

The abacus in hand: setting and reading numbers, place value on the rods, and the small-friend pairs that make 5. Everything later stands on the fluency built here.

Month 1: Meeting the Abacus (Weeks 1-4)
Weeks 1-2: Beads, Fingers and First Numbers
Topics:
- The parts of the abacus: frame, rods, the bar, one upper bead worth 5, four lower beads worth 1
- Holding and clearing the abacus the correct way, every time
- Finger rules: thumb pushes ones up, index finger brings them down, index works the 5-bead
- Setting and reading the numbers 1 to 9
- Bead patterns as pictures: seeing 7 as 5 and 2 without counting
- Simple bead races: who can set the called number first

Projects built:
- My abacus card: the child draws bead pictures for the numbers 1 to 9 and reads them back from the drawing

Practice: Ten minutes daily: set and read 20 called numbers between 1 and 9, parent calls, child sets, fingers checked in class
Weeks 3-4: Tens, Place Value and First Sums
Topics:
- The tens rod: setting 10 to 99 and reading two-digit numbers
- Place value felt physically: why 34 is three beads on one rod and four on another
- Direct addition: sums like 2 + 6 where beads simply move up
- Direct subtraction: taking beads away without touching the 5-bead
- Mixed setting drills: 3, 30, 33 and hearing the difference
- Number dictation games at a gentle pace

Projects built:
- Two-digit dictation sheet: 20 numbers set from hearing alone, scored and kept as the month 1 record

Practice: Ten minutes daily: 15 direct additions and subtractions within each rod, plus 10 two-digit setting drills
Assessment: Month 1 check: set and read two-digit numbers from dictation, plus 10 direct sums, done live in class

Month 2: Small Friends, the Pairs That Make 5 (Weeks 5-8)
Weeks 5-6: Adding with Small Friends
Topics:
- The small friends: 1 and 4, 2 and 3, the pairs that make 5
- Why 3 + 4 needs a trick when only two lower beads are free
- The small-friend move: add 5, take away the friend
- One rule at a time: +4 as +5 take 1, then +3, +2, +1 cases
- Saying the move aloud while doing it, so the rule settles in
- Friend flashcards: answering the make-5 partner instantly

Projects built:
- Make-5 rainbow chart: the child's own picture of the pairs that make 5, used at home during practice

Practice: Ten minutes daily: 20 small-friend additions with the rule spoken aloud, plus one round of make-5 flashcards
Weeks 7-8: Subtracting with Small Friends
Topics:
- The reverse move: take 5, give back the friend
- Subtraction cases one at a time: -4, -3, -2, -1 through the 5-bead
- Mixing direct sums and small-friend sums in one row

- Rows of three numbers: 4 + 3 - 2 worked straight through
- Accuracy first, speed second: the rule for the whole course
- Month 2 games: friend bingo and beat-the-teacher rows

Projects built:
- Row book started: a notebook of daily rows with date and score, kept for the rest of the course

Practice: Ten to fifteen minutes daily: 15 mixed small-friend sums and 5 three-number rows, logged in the row book

Assessment: Month 2 check: 20 mixed direct and small-friend sums plus three-number rows, done live with finger technique reviewed

---

PHASE 2: CROSSING THE TENS (MONTHS 3-4, WEEKS 9-16)

Big friends, the pairs that make 10, open up sums that cross rods: carrying, borrowing, three-digit numbers and dictation at growing speed.

Month 3: Big Friends, the Pairs That Make 10 (Weeks 9-12)

Weeks 9-10: Adding Over Ten

Topics:
- The big friends: 1 and 9, 2 and 8, 3 and 7, 4 and 6, 5 and 5
- Why 8 + 5 cannot stay on one rod, shown with beads
- The big-friend move: add 10 on the next rod, take away the friend
- Cases in order: +9, +8, +7 down to +1 through ten
- Carrying seen physically: the tens rod clicking up
- Make-10 flashcards until the pairs are instant

Projects built:
- Make-10 rainbow chart to sit beside the make-5 chart at home

Practice: Ten to fifteen minutes daily: 20 big-friend additions with the move spoken aloud, plus make-10 flashcards

Weeks 11-12: Subtracting Across Ten

Topics:
- The reverse move: take 10, give back the friend
- Borrowing felt on the rods: why 12 - 5 reaches to the tens rod
- Subtraction cases in order: -9 through -1 across ten
- Mixed rows using direct, small-friend and big-friend moves together
- Reading the row before moving: planning which rule each number needs
- Steady dictation: teacher calls a row of four one-digit numbers

Projects built:
- Mixed-rules row sheet: 15 rows solved and marked with which friend rule each step used

Practice: Fifteen minutes daily: 15 mixed sums crossing ten and 5 dictated rows, all logged in the row book

Assessment: Month 3 check: 20 sums mixing all rules so far, plus a live dictation round of four-number rows

Month 4: Combined Moves and Three-Digit Numbers (Weeks 13-16)

Weeks 13-14: When Both Friends Work Together

Topics:
- Combined cases: sums like 6 + 7 that need the 5-bead and the tens rod in one move
- Working the combined move slowly, then at row speed
- Two-digit plus one-digit sums: 34 + 8 across the rods
- Two-digit plus two-digit: working rod by rod from the left
- Row stamina: five-number rows of one-digit numbers
- Speed ladders: same row sheet, three timed attempts across the week

Projects built:
- Speed ladder record: one row sheet attempted three times with times and scores charted by the child

Practice: Fifteen minutes daily: 12 combined-move sums and 6 two-digit additions, plus one speed ladder attempt

Weeks 15-16: Three Digits and Real-Life Numbers

Topics:
- The hundreds rod: setting and reading 100 to 999
- Three-digit addition and subtraction, one rod at a time
- Money sums: rupees and coins set on the abacus
- Simple word problems answered on the abacus: bought, spent, left
- Dictation with two-digit numbers in the rows
- Phase 2 wrap-up: every rule on one revision mat

Projects built:
- Shop game record: a pretend-shop worksheet of five purchases totalled and checked on the abacus

Practice: Fifteen minutes daily: 10 three-digit sums, 5 money questions and one dictated row, logged in the row book

Assessment: Month 4 milestone: mixed paper of 30 questions covering all bead rules up to three digits, done in class

---

PHASE 3: ANZAN, THE ABACUS IN THE HEAD (MONTHS 5-6, WEEKS 17-24)

The step this whole course points at: the physical abacus is set aside and the child moves

imaginary beads. Rows start tiny and grow week by week.

  Month 5: Picture the Beads (Weeks 17-20)
    Weeks 17-18: First Imaginary Beads
      Topics:
        - What anzan is: seeing the abacus with eyes closed and moving beads that are not there
        - Air abacus: fingers moving over an empty desk while the mind keeps the picture
        - Setting single numbers mentally and saying them back
        - First mental sums: rows of two small numbers, beads imagined
        - Checking every mental answer on the real abacus straight after
        - Why we slow down here: the picture must be solid before speed
      Projects built:
        - Eyes-closed challenge card: ten single-number settings done mentally and verified, signed off
          in class
      Practice: Ten minutes daily: 10 two-number mental rows with immediate abacus checks,
      plus air-abacus warm-ups
    Weeks 19-20: Flash Numbers and Longer Pictures
      Topics:
        - Flash practice: numbers shown briefly on screen, set mentally
        - Rows of three one-digit numbers done fully in the head
        - Keeping the bead picture steady when a friend rule fires
        - Two-digit numbers held mentally: tens and ones rods imagined together
        - Confidence rules: wrong answers are checked on beads, never scolded
        - Month 5 game: slow-speed flash rounds as a class
      Projects built:
        - Flash round scorecard: three class flash rounds with scores tracked by the child
      Practice: Ten to fifteen minutes daily: 10 three-number mental rows and one flash
      practice round on the family device
      Assessment: Month 5 check: live mental round of three-number rows plus flash settings,
      real abacus used only for verifying

  Month 6: Mental Rows That Grow (Weeks 21-24)
    Weeks 21-22: Five-Number Rows and Listening Sums
      Topics:
        - Rows of four, then five one-digit numbers done mentally
        - Listening anzan: the teacher speaks the row, nothing is shown
        - Holding the running answer while the next number arrives
        - Two-digit mental sums: one addition at a time, pictured on two rods
        - Recovering a lost picture: reset, breathe, rebuild the beads
        - Personal pace: row length moves up only when accuracy holds
      Projects built:
        - Listening log: ten dictated mental rows across the fortnight with scores and row lengths
          recorded
      Practice: Fifteen minutes daily: 8 mental rows at your current length and 2 listening
      rows read out by a parent
    Weeks 23-24: Level Test One, Fully Mental
      Topics:
        - Test craft for small people: neat answers, skipped questions returned to, no rubbing out
          storms
        - Mixed mental paper practice: rows, flash settings, listening sums
        - Two-digit rows of three numbers for the stronger picture-holders
        - Class review of the phase: what got longer, what got faster
        - Preparing the level test with a practice run
        - Celebrating honestly: certificates say what the child can actually do
      Projects built:
        - Level test one: a graded mental-only paper of rows, flash and listening sums, marked and kept
      Practice: Fifteen minutes daily: one full practice paper across the week, split into
      daily pieces, logged in the row book
      Assessment: Phase 3 milestone: level test one, mental-only, with results shared with
      parents alongside the row book

PHASE 4: MULTIPLICATION AND THE MENTAL-ONLY CAPSTONE (MONTHS 7-8, WEEKS 25-32)

Multiplication arrives on the abacus once addition is second nature, and the course closes
with longer mental rows and a graded test done entirely in the head.

  Month 7: Multiplication on the Abacus (Weeks 25-28)
    Weeks 25-26: Tables Meet the Beads
      Topics:
        - Multiplication as repeated addition, shown with bead groups first
        - Tables 2 to 5 practised with bead patterns and chants
        - Setting up a multiplication on the abacus: where each number lives
        - Two-digit times one-digit: 23 x 3 worked rod by rod
        - Answer sense: is 23 x 3 nearer 60 or 600, asked before working
        - Keeping addition sharp: short mental rows as every class's warm-up
      Projects built:
        - Table pattern cards: bead-picture cards for the 2, 3, 4 and 5 tables made by the child
      Practice: Fifteen minutes daily: one table chanted, 8 abacus multiplications and 4

mental warm-up rows
Weeks 27-28: The Harder Tables
Topics:
- Tables 6 to 9 with bead patterns, taken at each child's pace
- Two-digit times one-digit across the harder tables
- Carrying inside multiplication: when a product spills to the next rod
- Sharing sums: simple division as dealing beads into groups, kept light
- Mixed papers: additions, subtractions and multiplications together
- Month 7 dictation: rows now include a times question
Projects built:
- Mixed paper folder: three 20-question mixed papers completed, marked and filed across the fortnight
Practice: Fifteen minutes daily: 10 multiplications across tables 6 to 9 and one short mixed paper piece
Assessment: Month 7 check: 20-question mixed paper including two-digit multiplications, done live in class

Month 8: The Mental-Only Capstone (Weeks 29-32)
Weeks 29-30: Longer, Faster, Still Accurate
Topics:
- Mental rows pushed to each child's honest edge: longer or faster, not both at once
- Two-digit mental rows for ready students, one-digit mastery for the rest
- Mental one-digit multiplication for the strongest picture-holders
- Flash rounds at higher speeds, accuracy floor held at 80 percent
- Reading the row book: eight months of scores tell the child's own story
- Capstone paper structure walked through, no surprises
Projects built:
- Row book review page: the child charts their own week 8 versus week 30 row length and speed
Practice: Fifteen minutes daily: capstone-style mixed mental practice split across the week, logged in the row book
Weeks 31-32: The Graded Mental Test and Family Show
Topics:
- Final practice run of the capstone paper with review
- The capstone: a graded mental-only test of rows, flash, listening and times questions
- Family demonstration: each child performs three mental sums for the class and parents
- What the certificate says: the exact skills demonstrated, nothing inflated
- Keeping the skill: a 10-minute weekly routine for after the course
- What comes next: higher abacus levels, school maths courses, and later Vedic maths
Projects built:
- Capstone graded mental-only test, marked and reported to parents with the full row book
- Family demonstration: three mental sums performed live
Practice: Gentle final week: one short mental round daily and rest before the test, confidence over cramming
Assessment: Course milestone: capstone mental-only test and family demonstration, plus certificate review

PROJECTS THE STUDENT BUILDS AND KEEPS

- My abacus card: bead pictures for the numbers 1 to 9
- Make-5 and make-10 rainbow charts for home practice
- The row book: a daily practice log kept across all eight months
- Two-digit dictation sheets scored month by month
- Speed ladder records: the same sheet timed three times
- Shop game money worksheets totalled on the abacus
- Eyes-closed challenge card marking the start of anzan
- Flash round and listening logs through phase 3
- Table pattern cards for the 2 to 9 times tables
- The capstone graded mental-only test and family demonstration

Total projects: 10+ records and artifacts, from first bead pictures to a graded mental-only test

SKILLS THE STUDENT WILL HAVE AT THE END

- Correct bead technique: setting, reading and clearing with proper fingering
- Small-friend and big-friend rules, which are the number bonds school maths needs anyway
- Addition and subtraction to three digits on the abacus, including money sums
- Anzan: mental rows, flash numbers and listening sums with the abacus imagined
- Times tables 2 to 9 and two-digit by one-digit multiplication on the abacus
- A daily practice habit measured in a row book the child keeps themselves

HOW A TYPICAL WEEK IS SPLIT

Live classes: 2 live classes per week of 45-60 minutes, run in short activity blocks suited to ages 5 to 10
Practice: 10-15 minutes of bead or mental practice daily; short and daily beats long and occasional at this age
Review: Row books and dictation sheets reviewed weekly; technique corrected live on camera before habits set
Homework: A task or problem set after every class, and a monthly mixed-review assignment that

deliberately folds in earlier topics

SUPPORT INCLUDED

Doubt support: WhatsApp support for parents between classes, including short videos when a finger rule needs re-showing
Progress updates: Regular progress notes to parents with dictation scores and row lengths, so improvement is visible, not asserted

CERTIFICATION DETAIL

Completion: Certificate from Modern Age Coders, awarded on passing the final assessment. Fall short and there is focused revision and a free retest: the certificate certifies real learning, not attendance

WHERE THIS CAN LEAD

- Higher abacus levels: longer rows, faster flash work and bigger multiplications
- A smoother start in school maths, with number bonds and place value already solid
- Our school mathematics courses, entered with arithmetic fluency already in place
- Vedic maths from around age 8, once tables are strong, for a second speed system
- Mental maths competitions and school arithmetic quizzes, if the child enjoys performing

COMMON QUESTIONS ABOUT THIS COURSE

For anything about cost, use PART 4 and RULE 1. Do not quote two regions.

Q: Is 5 really old enough for abacus classes?
A: Yes, provided the class is built for that age, and this one is: short activity blocks, bead races instead of lectures, and a teacher watching each child's fingers on camera. A 5-year-old needs to count to 10 and sit for a game-length activity; that is the whole entry bar. For the youngest children we ask a parent to stay nearby for the first few weeks, mostly to help with camera angles and finding dropped beads.

Q: Does abacus training increase IQ or develop the brain?
A: We do not make those claims. What we can show you is what the course actually builds: arithmetic fluency, solid number bonds and place value, mental calculation through anzan, and a daily practice habit, all documented in each child's row book and dictation scores. Those are real and worth eight months. Grander claims about IQ belong to marketing, not to our classroom.

Q: Will abacus methods confuse my child at school?
A: In our experience the two reinforce each other, because the abacus friend rules are exactly the number bonds schools drill: pairs that make 5 and pairs that make 10. A child carrying on the abacus is doing the same regrouping school column methods use, just physically. We name that connection in class so children see one maths, not two competing systems.

Q: When does my child start doing sums mentally?
A: Anzan begins in month 5, after four months of physical bead fluency, and starts tiny: two-number rows with the answer checked on the real abacus. By the end of the course most children handle rows of four or five one-digit numbers mentally, and stronger picture-holders manage two-digit rows. The pace genuinely varies by child, which is why row length only increases when accuracy holds.

Q: How do live online classes work for children this young?
A: Classes run 45 to 60 minutes in short blocks: a warm-up game, a new bead rule, drills, a race or dictation round, and a calm close. Batches are capped at 20 so the teacher can watch every child's abacus and fingers on camera, and correct technique before a habit sets. Parents of the youngest children sit nearby at first; most find they are not needed within a few weeks.

Q: How much home practice is expected?
A: Ten to fifteen minutes a day, logged in a row book the child keeps. At this age short daily practice beats long weekend sessions by a wide margin, and the routine itself, sitting down for ten focused minutes, is one of the most useful things the course leaves behind. Parents mostly just call out numbers for dictation rows; no maths knowledge is needed to help.

Q: How is my child assessed, and is the certificate just for attending?
A: No. A task follows every class with feedback, monthly reviews deliberately mix new material with earlier topics so nothing is forgotten, and the course ends with a friendly final assessment of everything learned. Passing earns the certificate; falling short earns focused revision and a free retest. We measure real learning, not attendance.

Q: Can we try a class before enrolling?
A: Yes, the first demo class is free and carries no obligation. Book it at learn.modernagecoders.com/contact or message us on WhatsApp at +91 91233 66161. Bring the child, with or without an abacus, and the teacher will tell you honestly whether they are

ready now or better served starting in a few months.

To enrol, message Shivam Sir on +91 9123366161 or send the parent this link: https://learn.modernagecoders.com/courses/abacus-mental-maths-course-for-kids
For a demo: the Priority Live Demo (guaranteed, today or tomorrow) is booked at https://learn.modernagecoders.com/priority-demo . The free demo is a waiting list with no fixed date.

==========

COURSE 5 OF 137: ACT MATH PREP: LIVE CLASSES FOR THE ACT MATHEMATICS SECTION

==========

Course link: https://learn.modernagecoders.com/courses/act-math-prep-course
Subject area: Test Prep Mathematics
Designed for: High school
Who can join: Grades 9-12 (ages 14 to 18), all starting scores
Course length: 5 months (20 weeks)
Time needed: 2 live one-hour classes per week + weekly timed practice
Certificate: Certificate from Modern Age Coders, awarded on passing the final assessment

PRICE FOR THIS COURSE (quote only the one that applies to the person asking)
In India, per month: group Rs 1,499, mini batch Rs 2,999, one to one Rs 4,999
Outside India, per month: group $100, one to one $150
Classes: group and mini batch two live classes a week, eight a month; one to one in India one live class a week, four a month; one to one outside India two live classes a week, eight a month. Each class is one hour.

WHAT THIS COURSE IS

Live online ACT Math prep for ages 14 to 18: every ACT reporting category, from algebra and functions to geometry and statistics, plus pacing and full timed sections.

In one line: Forty-five questions in fifty minutes. We rebuild the maths underneath, then train the pace.

ABOUT THE PROGRAMME

The ACT mathematics section has 45 questions to answer in 50 minutes, and a calculator is allowed. ACT describes it as testing the skills students have typically acquired in courses taken up to the beginning of grade 12, which means a student sitting it in grade 11 often meets topics they have not been taught yet, or learned once and forgot. At a little over a minute per question, there is no time to rebuild an idea in the exam room. This 5-month live course follows ACT's own published reporting categories. Preparing for Higher Math makes up about 80 percent of the section and is split into Number and Quantity, Algebra, Functions, Geometry, and Statistics and Probability. Integrating Essential Skills makes up about 20 percent: rates, percentages, proportional relationships, area and volume, averages and medians, combined in multi-step problems. Modeling questions are counted across the other categories. We teach every category, starting from a diagnostic so time goes where the points are being lost. The last month turns knowledge into a score you can repeat: pacing plans, calculator strategy for both handheld calculators and the Desmos calculator built into the online ACT, and full timed math sections with question-by-question review. ACT scores are based on the number of questions answered correctly, with no penalty for wrong answers, so students also learn when to move on and how to make sure no question is left blank. We never promise a score; we show the evidence from each timed section so families can see exactly where things stand.

WHAT MAKES THIS COURSE DIFFERENT

- Built on ACT's own published content categories, with time weighted toward Preparing for Higher Math, which makes up about 80 percent of the section
- A diagnostic in week one and an error log kept all course, so teaching goes where points are actually being lost
- Understanding first: topics a student has not yet met in school, such as logarithms, matrices or conic sections, are taught from the start
- Pacing trained explicitly for 45 questions in 50 minutes, with a plan for which questions to bank and which to leave for the second pass
- Calculator strategy for permitted handheld models and for the Desmos calculator in the online ACT
- Honest progress reporting from timed sections, never invented score promises

THE LEARNING PATH, STEP BY STEP

Phase 1: Diagnostic and Integrating Essential Skills: the format, pacing basics, rates, percentages, proportions, area and volume, averages and medians
Phase 2: Preparing for Higher Math: Number and Quantity, Algebra, Functions, Geometry, and Statistics and Probability, each taught then tested under time
Phase 3: Modeling and test craft: modeling questions, calculator and pacing strategy, full timed math sections and a test-week plan

WHAT A STUDENT NEEDS BEFORE STARTING

Education: Grades 9-12 (ages 14 to 18), or students between school and college retaking the ACT
Math background: School algebra at any comfort level; the diagnostic finds the real starting point
Equipment: A computer with stable internet and a permitted calculator. Students taking the ACT online also practise with the Desmos graphing calculator
Time commitment: 2 live hours plus 2-3 practice hours weekly
English: Course taught in English
Motivation: A target test date, or our help choosing one

WHO THIS COURSE IS FOR

Score raisers: Students whose practice results show content gaps in algebra, functions or geometry that need rebuilding, not more drilling
Early testers: Grade 10 and 11 students meeting topics such as logarithms, matrices or conic sections before school has taught them
Strong at school: Students with good grades whose timed results do not match, usually a pacing and method gap
Sat switchers: Students who found the ACT suits them better than the SAT and need ACT-specific pacing
Retakers: Students whose first attempt did not reflect what they know and who want a clear method for the next one

FULL CURRICULUM, WEEK BY WEEK

This is the complete teaching plan. Parents can ask about any week.

PHASE 1: DIAGNOSTIC AND INTEGRATING ESSENTIAL SKILLS (WEEKS 1-6)

Find the starting point, learn how the section works, and secure the multi-step essential skills questions that appear throughout the test.

Weeks 1-2: Diagnostic and How ACT Math Works

Topics:
- The format: 45 questions in 50 minutes, calculator allowed
- ACT's reporting categories and roughly how much of the section each one covers
- How scores work: number correct, no penalty for wrong answers, and why no question should be left blank
- A timed diagnostic section and a category-by-category breakdown of the result
- Setting up an error log: content gap, misread question or careless slip
- A first pacing check: where the minutes actually went

Projects built:
- Personal diagnostic report: score by category, top three content gaps and a starting pacing target
- Error log opened with every diagnostic miss classified and corrected

Practice: Rework every diagnostic miss without a time limit and note whether the problem was knowledge, reading or speed

Weeks 3-4: Rates, Percentages and Proportional Reasoning

Topics:
- Unit rates and converting between units
- Percent increase, decrease and successive percentage changes
- Ratios and proportional relationships set up from words
- Distance, rate and time problems
- Reading tables and charts to find the quantity a question needs
- Multi-step problems: planning the chain of steps before calculating

Projects built:
- Word problem translation sheet: twenty phrasings mapped to the equation each one means
- Timed essential skills set with every step written out for review

Practice: Complete a 20-question rates and percentages set under time and log every miss

Weeks 5-6: Area, Volume, Averages and Number Forms

Topics:
- Area of triangles, rectangles, circles and composite figures
- Surface area and volume of prisms, cylinders, cones and spheres
- Mean, median and the effect of adding or removing a value
- Expressing numbers in different forms: fractions, decimals, percents and scientific notation
- Estimation as a check on calculator answers
- Spotting when a question is simpler than it looks

Projects built:
- Formula and method sheet written by the student, with one worked example per idea
- Mixed essential skills timed set reviewed question by question

Practice: Finish a mixed essential skills set and write one sentence on the fastest method for each question

Assessment: Phase 1 checkpoint: a timed mixed set on essential skills with a written review of every miss

---
PHASE 2: PREPARING FOR HIGHER MATH (WEEKS 7-16)

The categories that make up most of the section, taught in the order they build on each other: number, algebra, functions, geometry, then statistics and probability.

Weeks 7-8: Number and Quantity
Topics:
- Integer and rational exponents and the exponent rules
- Simplifying radicals and converting between radical and exponent form
- Complex numbers: i, arithmetic with complex numbers and conjugates
- Vectors: components, addition and magnitude
- Matrices: dimensions, addition and multiplication
- Number properties: factors, multiples, primes and absolute value

Projects built:
- Exponent and radical rule card built from worked examples
- Number and Quantity timed set with errors classified in the log

Practice: Complete a 15-question Number and Quantity set, solving each matrix question by hand and checking with a calculator

Weeks 9-10: Algebra
Topics:
- Linear equations and inequalities, including absolute value
- Systems of linear equations solved by substitution, elimination and graphing
- Writing equations from words and from tables
- Quadratic equations by factoring, completing the square and the quadratic formula
- Radical and exponential equations
- Checking for extraneous solutions

Projects built:
- Algebra method map: which method to reach for first for each equation type
- Two timed algebra sets, the second solved with a calculator check strategy

Practice: Work a 20-question algebra set and rebuild two missed questions with a different method

Weeks 11-12: Functions
Topics:
- Function notation, domain and range, and composition
- Linear, polynomial and radical functions and their graphs
- Piecewise functions read from equations and graphs
- Exponential and logarithmic functions and the link between them
- Transformations: shifts, stretches and reflections
- Key features from graphs: intercepts, maximums, minimums and end behaviour

Projects built:
- Function family gallery: a sketch, an equation and a key feature for each family
- Functions timed set with a graph-first solution for every miss

Practice: Complete a functions set and sketch the graph for every question before choosing an answer

Assessment: Mid-course checkpoint: a full timed math section, compared category by category with the diagnostic

Weeks 13-14: Geometry and Trigonometry
Topics:
- Angles, parallel lines, congruence and similarity
- Right triangles, the Pythagorean theorem and special right triangles
- Trigonometric ratios, the unit circle and simple trigonometric equations
- Circles: arcs, sectors, chords and equations of circles
- Equations of conic sections: circles, parabolas and ellipses
- Coordinate geometry: distance, midpoint, slope and parallel and perpendicular lines

Projects built:
- Geometry recognition sheet: diagrams that signal similar triangles, special right triangles or circle facts
- Geometry timed set reviewed for drawing and labelling habits

Practice: Finish a geometry set, redrawing every figure larger and labelling everything given before solving

Weeks 15-16: Statistics and Probability
Topics:
- Center and spread: mean, median, mode, range and standard deviation as an idea
- Data collection methods: surveys, experiments, samples and bias
- Bivariate data, scatterplots and lines of best fit
- Probability of single and combined events
- Sample spaces, counting outcomes and two-way tables
- Expected value in simple situations

Projects built:
- Statistics vocabulary and method sheet with one example of each idea
- Statistics and probability timed set with every miss rewritten as a lesson

Practice: Complete a statistics and probability set and explain each answer in one plain sentence

Assessment: Phase 2 checkpoint: a timed mixed Preparing for Higher Math set with a

written review of every miss

PHASE 3: MODELING AND TEST CRAFT (WEEKS 17-20)

Knowledge becomes a repeatable score: modeling questions, calculator workflows, pacing under real timing, and full timed sections with honest review.

Weeks 17-18: Modeling, Calculators and Pacing

Topics:

- Modeling questions: building, reading, judging and improving a model
- Handheld calculator strategy and which features are not permitted
- Using the Desmos calculator built into the online ACT
- A two-pass pacing plan for 45 questions in 50 minutes
- When to guess, flag and move on, since there is no penalty for wrong answers
- Checking answers in the last minutes without losing time

Projects built:

- Personal pacing plan tested and adjusted across two timed sections
- Calculator workflow notes: which question types are faster with the calculator and which are faster by hand

Practice: Sit one full timed math section using the pacing plan and record the time spent on each question

Weeks 19-20: Full Timed Sections and Test Week

Topics:

- Full timed math sections under exact conditions
- Question-by-question review against the reasoning, not just the answer key
- Turning the error log into a final list of fixes
- Last topics targeted from the log
- Test week plan: sleep, timing, calculator check and what to bring
- Deciding whether and when to retake, using the evidence

Projects built:

- Two full timed math sections with complete written reviews
- Final error log summary with the five fixes that matter most

Practice: Sit one full timed section each week and bring the reviewed paper to class

Assessment: Final assessment: a full timed math section plus a review conversation on pacing and method choices

PROJECTS THE STUDENT BUILDS AND KEEPS

- Personal diagnostic report by ACT reporting category
- Error log kept and reviewed across the whole course
- Formula, method and recognition sheets written by the student
- Personal pacing plan and calculator workflow notes
- Full timed math sections with written reviews

Total projects: A complete ACT math prep kit: diagnostic report, method sheets, error log and reviewed timed sections

SKILLS THE STUDENT WILL HAVE AT THE END

- Integrating Essential Skills: rates, percentages, proportions, area, volume, averages and medians
- Number and Quantity: exponents, radicals, complex numbers, vectors and matrices
- Algebra: linear, quadratic, radical and exponential equations and systems
- Functions: linear, polynomial, radical, piecewise and logarithmic, with transformations
- Geometry: similarity, right triangles, trigonometry, circles and conic sections
- Statistics and Probability: center, spread, data collection, bivariate data and sample spaces
- Modeling questions across all categories
- Pacing and calculator strategy for a 50-minute section

HOW A TYPICAL WEEK IS SPLIT

Live classes: 2 live one-hour classes with your teacher
Timed practice: 1-2 timed sets or a full math section each week
Review: Every timed set reviewed for reasoning, not just answers
Total per week: About 4-5 focused hours
Homework: A problem set after every class, and a monthly mixed-review assignment that brings back earlier categories

SUPPORT INCLUDED

Live sessions: 8 live one-hour classes every month, 2 per week
Mentorship: One teacher across the whole course
Progress tracking: Error log and timed-section results shared with parents
Flexibility: Slots move around school exams and family plans

CERTIFICATION DETAIL

Completion: Certificate from Modern Age Coders, awarded on passing the final assessment. Fall

short and there is focused revision and a free retest: the certificate certifies real learning, not attendance

WHERE THIS CAN LEAD

- Readiness for test day, with every ACT math category practised under real timing
- Ready for AP Precalculus, AP Calculus or AP Statistics, with algebra and functions secure
- Our SAT Math course, if a student decides to sit both tests
- College mathematics courses, started with fewer gaps

COMMON QUESTIONS ABOUT THIS COURSE

For anything about cost, use PART 4 and RULE 1. Do not quote two regions.

Q: What is on the ACT math section?
A: 45 questions in 50 minutes, and a calculator is allowed. ACT reports two main categories: Preparing for Higher Math, about 80 percent, split into Number and Quantity, Algebra, Functions, Geometry, and Statistics and Probability; and Integrating Essential Skills, about 20 percent, covering rates, percentages, proportional relationships, area and volume, and averages and medians. Modeling questions are counted across the other categories.

Q: Can I use a calculator on the ACT math section?
A: Yes. ACT allows four-function, scientific and graphing calculators unless a model is prohibited, and calculators with computer algebra system functionality are not allowed. Students taking the ACT online have the Desmos graphing calculator built into the testing platform during the math section. We teach both, and we teach which questions are faster by hand. Always check ACT's current calculator policy before test day.

Q: Is there a penalty for wrong answers?
A: No. ACT scores are based on the number of questions answered correctly, with no penalty for incorrect answers. That is why our pacing plan makes sure every question gets an answer, even the ones a student flags and leaves for the end.

Q: My child has not taken pre-calculus yet. Is that a problem?
A: It is common. ACT says the section covers skills typically acquired in courses up to the beginning of grade 12, so many grade 11 students meet topics such as logarithms, matrices, complex numbers or conic sections before school has covered them. The course teaches those topics from the start rather than assuming them.

Q: How does the math section affect the composite score?
A: ACT's Composite score is the average of the English, math and reading scores, rounded to the nearest whole number. Science is optional and is not part of the Composite. Scores run up to 36 for the Composite and for each section.

Q: Should my child take the ACT or the SAT?
A: Both are widely accepted, and the right choice depends on the student. We suggest taking a practice test of each and comparing. If the SAT turns out to suit better, we also run a SAT Math course, and much of the algebra and function work carries across.

Q: When should we start?
A: Ideally five months before the planned test date, so all categories and the full timed sections fit before test day. Students with less time get a shortened plan based on their diagnostic, focused on the categories where they are losing the most points.

Q: Do you guarantee a score increase?
A: No, and we would be wary of anyone who does. What we do promise is a clear diagnostic, teaching aimed at the categories where points are being lost, regular timed sections, and honest reporting so you can see the progress for yourself.

Q: How are the classes run?
A: Live online classes, twice a week, with a real teacher, in a group of 15 to 20 students, a mini batch of up to 6, or one to one. Current fees for your region are shown in the pricing section of this page.

Q: Can we try a class first?
A: Yes. Book a free demo class. The teacher works through some ACT-style questions with your child, sees where they are, and suggests a plan and whether group, mini batch or one-to-one classes fit best. There is no obligation to enrol. (Agent note: the free demo is a waiting list with no fixed date. The Priority Live Demo is a guaranteed class today or tomorrow, booked at https://learn.modernagecoders.com/priority-demo . Offer both, as RULE 3 says.)

To enrol, message Shivam Sir on +91 9123366161 or send the parent this link: https://learn.modernagecoders.com/courses/act-math-prep-course
For a demo: the Priority Live Demo (guaranteed, today or tomorrow) is booked at https://learn.modernagecoders.com/priority-demo . The free demo is a waiting list with no fixed date.

==========
COURSE 6 OF 137: ADVANCED GIT & GITHUB MASTERCLASS FOR PROFESSIONALS

==========

Course link: https://learn.modernagecoders.com/courses/git-github-advanced-version-control-masterclass-for-professionals
Subject area: Version Control & Developer Tools
Designed for: College students
Who can join: Intermediate to advanced (working professionals; basic Git assumed or fast-tracked)
Course length: 24 classes (12 weeks · 2 classes/week)
Time needed: 4-5 hours/week recommended
Certificate: Certificate from Modern Age Coders, awarded on passing the final assessment

PRICE FOR THIS COURSE (quote only the one that applies to the person asking)
  In India, per month: group Rs 1,499, mini batch Rs 2,999, one to one Rs 4,999
  Outside India, per month: group $100, one to one $150
  Classes: group and mini batch two live classes a week, eight a month; one to one in India one live class a week, four a month; one to one outside India two live classes a week, eight a month. Each class is one hour.

WHAT THIS COURSE IS

  Advanced Git & GitHub masterclass for professionals: master Git internals, interactive rebase, trunk-based team workflows, monorepos, GitHub Actions CI/CD and repository security in 24 live online classes for working developers.

  In one line: Stop fearing Git. Build the mental model, master history surgery, and become the engineer your team calls when version control goes wrong.

ABOUT THE PROGRAMME

  Most working developers rely on the same handful of Git commands and quietly avoid everything else: rebase feels risky, reflog is a mystery, and a leaked secret in history triggers panic. This masterclass fixes that permanently, the way professionals need it fixed: from the inside out. In 24 live, instructor-led classes you first learn how Git actually stores data (blobs, trees, commits, refs, the three trees), because once the model is clear, nothing Git does is scary. Then you go deep into history mastery (interactive rebase, cherry-pick, bisect run, reflog rescues), team workflow design at scale (trunk-based development vs GitFlow, branch protection rulesets, CODEOWNERS, monorepo tooling, release management), and full GitHub platform automation: GitHub Actions matrix builds and reusable workflows, gated deployments, Dependabot, secret scanning, CodeQL, signed commits, hooks, and GitHub CLI scripting. You finish with a leadership phase covering team migrations, disaster recovery with git filter-repo, and AI-assisted review workflows, then a capstone where you design and defend a complete production-grade workflow on a real repository. Git is free, open source, and created by Linus Torvalds in 2005 for Linux kernel development; two decades later, deep fluency in it remains one of the most durable skills a working developer can build.

WHAT MAKES THIS COURSE DIFFERENT

  - Internals-first: you learn the object model, refs, and the three trees before any advanced command, so rebase, reset, and reflog become predictable instead of frightening.
  - Built for professionals: every class is framed around real workplace scenarios, the broken main branch, the leaked API key, the 3,000-line PR, the release that must ship tonight.
  - Live, interactive classes with a real instructor: you run the commands, break real repositories, and recover them under guidance, never passive video watching.
  - Full platform depth, not just commands: branch protection rulesets, CODEOWNERS, merge queues, GitHub Actions, environments, OIDC deploys, CodeQL, and the gh CLI are covered as thoroughly as Git itself.
  - Living Syllabus: the curriculum is updated continuously as Git and GitHub ship new features, so you always learn the current toolchain, not a frozen snapshot.
  - A capstone you can apply at work on Monday: you leave with a fully hardened reference repository (workflow, CI/CD, security, release process) and the reasoning behind every choice.

WHAT A STUDENT NEEDS BEFORE STARTING

  Device: A laptop or desktop (Windows, Mac, or Linux) with a terminal and a reliable internet connection; every tool used in the course is free
  Coding experience: You should already write code in some language and have touched Git (clone, add, commit, push). Rusty is fine: Classes 1-4 rebuild everything from the ground up, just at a professional pace
  Accounts: A free GitHub account covers the entire course: the Free plan includes unlimited public and private repositories and 2,000 GitHub Actions minutes per month, which is more than the exercises need
  Mindset: Willingness to break repositories on purpose. The course is built around controlled disasters and recoveries, because that is how the fear goes away

WHO THIS COURSE IS FOR

  Working developers: Developers who use Git daily but lean on the same few commands and want the deep fluency that makes everything else routine
  Team leads: Leads and managers who need to design branching, review, and release workflows

for a team and enforce them with the right guardrails
Career switchers: Career switchers who already code and want the professional Git and GitHub habits that interviews and first jobs quietly assume
Devops and platform engineers: Engineers moving toward DevOps or platform roles who need GitHub Actions, deployment gating, and supply chain security in depth
Open source maintainers: Maintainers and aspiring maintainers who want clean history, scalable review, and a professional release process for their projects

FULL CURRICULUM, WEEK BY WEEK

This is the complete teaching plan. Parents can ask about any week.

PHASE 1: THE GIT MENTAL MODEL

Learn how Git actually works underneath: the object database, refs and HEAD, the staging area, and the plumbing commands that make every advanced operation predictable instead of scary.

Class 1: How Git Actually Stores Data: The Object Model
Topics:
- Git as a content-addressable database: every file, folder, and commit is an object named by the hash of its content
- The four object types: blobs (file contents), trees (directories), commits (snapshots plus parent pointers), and annotated tags
- SHA-1 vs SHA-256 object formats: why the hash is the identity, and what the ongoing SHA-256 transition means for repositories
- Guided tour of the .git directory: objects/, refs/, HEAD, index, config, and what actually changes on disk when you commit
- Inspecting any object with plumbing: git cat-file -t <sha> and git cat-file -p <sha> to walk from a commit to its tree to a blob by hand
- Writing objects manually with git hash-object -w, and why Git stores whole snapshots, never diffs
- Loose objects vs packfiles: git gc, delta compression, and why full history costs less disk than people assume
Projects built:
- Trace one of your own commits end to end with git cat-file: from the commit SHA to the root tree to a specific blob, and diagram the object graph you found
Practice: Run git cat-file -p HEAD, then cat-file -p the tree it references, and keep descending until you reach a blob.
Assessment: Explain the four Git object types and draw the object graph for a two-file commit from memory.

Class 2: Refs, HEAD, Detached HEAD and the Three Trees
Topics:
- What a branch really is: a tiny file in refs/heads containing one commit SHA, nothing more
- HEAD as a symbolic ref: git symbolic-ref HEAD, and what detached HEAD actually means (HEAD pointing at a SHA instead of a branch)
- Working safely in detached HEAD: inspecting old commits, building from a tag, and rescuing new work with git switch -c
- Revision syntax fluency: HEAD~2 vs HEAD^2, @{upstream}, main@{yesterday}, and resolving any expression with git rev-parse
- The three trees model: HEAD, the index (staging area), and the working directory, and how every core command moves content between them
- git reset --soft vs --mixed vs --hard explained precisely through the three trees, plus git restore and git switch as the modern split of checkout
- Remote-tracking refs: refs/remotes/origin/main as your last-known snapshot of the server, and how fetch vs pull update it
Projects built:
- Build a personal reset cheat card: run soft, mixed, and hard resets on a scratch repository and document exactly what happened to HEAD, index, and working tree in each case
Practice: Check out a raw commit SHA, make a commit in detached HEAD, then rescue it onto a new branch with git switch -c.
Assessment: Predict the exact effect of git reset --mixed HEAD~1 on all three trees before running it, then verify your prediction.

Class 3: Porcelain vs Plumbing and the Staging Area Deep Dive
Topics:
- Porcelain vs plumbing: the user-facing commands vs the scriptable core, and why plumbing output stays stable for automation
- Reading the index directly: git ls-files -s shows mode, SHA, and stage number for every staged file
- Building a commit with pure plumbing: git update-index, git write-tree, and git commit-tree, so commits stop being magic
- Surgical staging: git add -p hunk selection (y, n, s to split, e to edit the hunk) for clean, reviewable commits
- Unstaging and untracking precisely: git restore --staged vs git rm --cached vs git rm, and what each leaves on disk
- gitignore mechanics: pattern rules, negation with !, why an already-tracked file ignores

.gitignore, and debugging with git check-ignore -v
- Scripting-safe status: git status --porcelain=v2 and git diff --name-only as building blocks for your own tools

Projects built:
- Create a real commit using only plumbing commands (update-index, write-tree, commit-tree), then verify it with git log and git cat-file

Practice: Take a deliberately messy working directory and use git add -p to split it into two clean, single-purpose commits.

Assessment: Explain the difference between git rm --cached and git restore --staged, and demonstrate both on a test file.

Class 4: Config Layers, Aliases and Diff/Merge Tooling

Topics:
- The config cascade: system, global, local, and worktree levels, audited with git config --list --show-origin
- Conditional includes with includeIf gitdir: separate work and personal identities (name, email, signing key) automatically per directory
- Power aliases: a graph log alias, and shell aliases with the ! prefix for anything Git cannot do natively
- Better conflicts by default: merge.conflictStyle zdiff3 to see the common ancestor inside conflict markers
- rerere (reuse recorded resolution): letting Git remember how you resolved a conflict and replay it automatically next time
- Wiring difftool and mergetool: using VS Code or your editor of choice for three-way merges instead of raw conflict markers
- Cross-platform hygiene: core.autocrlf and .gitattributes eol rules so Windows, Mac, and Linux teammates stop fighting over line endings

Projects built:
- Ship a dotfiles-quality global .gitconfig: identities via includeIf, five aliases you will actually use, zdiff3 conflict style, rerere enabled, and a configured mergetool

Practice: Trigger the same merge conflict twice in a scratch repo and watch rerere resolve it automatically the second time.

Assessment: Show git config --list --show-origin and explain which layer each of your key settings comes from and why it lives there.

PHASE 2: HISTORY MASTERY

Rewrite, rescue, and interrogate history with confidence: interactive rebase, cherry-pick and revert, reflog and stash recovery, automated bisect, and blame and pickaxe archaeology.

Class 5: Interactive Rebase: Rewriting History with Intent

Topics:
- git rebase -i HEAD~n: the todo list (pick, reword, edit, squash, fixup, drop) and how Git replays commits one at a time
- The autosquash workflow: git commit --fixup=<sha>, git rebase -i --autosquash, and rebase.autosquash true to make it the default
- Splitting a commit with edit: stop mid-rebase, git reset HEAD~1, restage in pieces, then git rebase --continue
- exec lines in the todo list: running your test suite after every replayed commit so each commit in the branch builds
- git rebase --update-refs: rewriting a stack of dependent branches in a single pass
- Precision transplants with git rebase --onto: moving a branch from one base to another exactly
- The golden rule: never rewrite pushed shared history, and git push --force-with-lease as the seatbelt when rewriting your own branch

Projects built:
- Take a deliberately messy 10-commit feature branch and rebase it into 3 clean, logical, test-passing commits using fixup, squash, reword, and an exec test line

Practice: Use git commit --fixup plus rebase --autosquash to fold a typo fix into the commit where it belongs.

Assessment: Explain when rebase is safe versus dangerous, and demonstrate --force-with-lease rejecting a push over a stale remote.

Class 6: Cherry-pick, Revert and Fixing Shared History

Topics:
- git cherry-pick <sha> and ranges (A..B vs A^..B): replaying exact changes onto another branch
- cherry-pick -x for traceability back to the original commit, and -n (--no-commit) to batch several picks into one commit
- Backporting in practice: moving a hotfix from main onto a release branch without dragging unrelated work along
- git revert: the only safe undo on shared history, and why it adds a new commit instead of deleting anything
- Reverting a merge commit with revert -m 1: what mainline means, and the trap waiting when you later re-merge that branch
- Reverting a revert: bringing previously reverted work back cleanly
- Conflict handling mid-operation: --continue, --abort, and --skip, and reading the conflict to know which side you actually want

Projects built:

- Simulate a release: branch release/1.2 from an older commit, cherry-pick two hotfixes onto it with -x, then revert a bad feature merge on main with revert -m 1

Practice: Cherry-pick a range of three commits onto a clean branch and resolve the one conflict it produces.

Assessment: State when to use revert versus reset versus rebase on a shared branch, with one concrete scenario for each.

Class 7: Reflog Rescues, Lost Commits and Stash Mastery

Topics:

- git reflog: the private journal of everywhere HEAD has been, plus per-branch reflogs with git reflog show <branch>
- Undoing a bad reset --hard: locate the pre-reset entry and restore with git reset --hard HEAD@{1}
- Resurrecting a deleted branch: recover its tip SHA from the reflog and recreate it with git branch <name> <sha>
- Deep recovery: git fsck --lost-found and dangling commits when the reflog cannot help, and how reflog expiry works
- Stash beyond the basics: git stash push -m with a message, --include-untracked, and stashing selected hunks with stash push -p
- apply vs pop, inspecting a stash with git stash show -p stash@{n}, and turning an old stash into a branch with git stash branch
- Built-in bookmarks: ORIG_HEAD and @{1}, the markers Git leaves behind before every dangerous operation

Projects built:

- Run a rescue drill: deliberately destroy work three different ways (reset --hard, branch -D, dropped stash) and recover all three using reflog and fsck

Practice: Stash only half of your working changes with stash push -p, then apply them on a different branch.

Assessment: Given a repo where a branch was force-deleted an hour ago, recover it fully and explain each command you used.

Class 8: git bisect: Finding the Exact Commit That Broke It

Topics:

- Binary search over history: why bisect pinpoints the bad commit in a handful of steps instead of hundreds of diff readings
- The manual loop: git bisect start, git bisect bad, git bisect good <sha>, test, mark, repeat, then git bisect reset
- git bisect skip for commits that cannot build, and how Git routes the search around them
- Full automation: git bisect run ./test.sh, with exit code 0 meaning good, 1-124 meaning bad, and 125 meaning skip
- Bisecting anything scriptable: failing unit tests, performance regressions via a timing script, even bundle size growth
- git bisect terms with --term-old and --term-new for hunts about behavior changes rather than breakage
- Reading the verdict: the first-bad-commit report, then git show and git blame on it to understand the real cause

Projects built:

- In a prepared repository with a hidden regression, write a small test script and let git bisect run find the first bad commit completely automatically

Practice: Bisect the same repository manually and count your steps to feel the binary search converge.

Assessment: Explain the meaning of exit codes 0, 1, and 125 in a bisect run script and give a case where you would return each.

Class 9: History Archaeology: blame, Pickaxe and Log Forensics

Topics:

- git blame beyond basics: -w to ignore whitespace, -C -C to track code moved between files, and -L 10,30 for a line range
- Keeping blame honest: blame.ignoreRevsFile with a .git-blame-ignore-revs file so mass reformatting commits stop hiding real authors
- The pickaxe: git log -S 'someString' to find every commit that added or removed a string, with -p to see the diffs
- Regex archaeology: git log -G '<pattern>' for changes matching a pattern even when the occurrence count stayed the same
- Function-level history: git log -L :myFunction:path/to/file to follow one function through time, and --follow across renames
- Shaping output for investigation: --oneline --graph --all, --author, --since, --grep, and custom --pretty=format: strings
- Choosing the right tool: pickaxe when you know the code, bisect when you know the symptom, blame when you know the line

Projects built:

- Answer three archaeology questions on a real open source repository (when was X introduced, who last changed Y and why, which commit removed Z) using blame, -S, and -G, citing exact SHAs

Practice: Use git log -L to follow one function through several refactors and renames.

Assessment: Given a mystery behavior change, produce the introducing commit SHA plus the command trail that found it.

PHASE 3: TEAM WORKFLOWS AT SCALE

Design how a whole team uses Git: pick the right branching strategy, enforce it with
protection rules and CODEOWNERS, build a PR culture that scales, tame big repositories, and
run professional releases.

  Class 10: Branching Strategies: Trunk-Based vs GitFlow vs GitHub Flow
    Topics:
      - GitHub Flow: branch, PR, review, merge, deploy, the default loop for continuously deployed
        products
      - GitFlow honestly assessed: develop, release, and hotfix branches, where it still fits
        (versioned, installed software) and where it hurts
      - Trunk-based development: short-lived branches merged to main within a day or two, backed by
        strong CI
      - Feature flags as the enabler: shipping incomplete work safely to main instead of letting
        branches age for weeks
      - Merge strategy tradeoffs: merge commits vs squash-merge vs rebase-merge, and what each does
        to history, bisect, and blame
      - Long-lived branch pathology: drift, giant conflicts, and review fatigue, and how batch size
        drives team speed
      - A decision framework: choosing a strategy from team size, release cadence, deployment model,
        and compliance requirements
    Projects built:
      - Write a one-page branching strategy proposal for a team you know: chosen model, merge
        strategy, branch naming, and the reasoning behind each decision
    Practice: Merge the same two branches three ways (merge, squash, rebase) in a scratch
    repo and compare git log --graph for each result.
    Assessment: Defend a recommended strategy for two scenarios: a 4-person startup deploying
    daily, and a 40-person team shipping quarterly releases.

  Class 11: Branch Protection, Rulesets and CODEOWNERS
    Topics:
      - Branch protection rules vs the newer rulesets: what each can enforce, and why rulesets can
        layer and apply across an organization
      - Required pull request reviews: approval counts, dismissing stale approvals on new commits,
        and requiring review from Code Owners
      - Required status checks: making green CI a hard merge gate, and strict mode requiring the
        branch to be up to date first
      - CODEOWNERS syntax in depth: path patterns, teams vs individuals, and the gotchas (last
        matching rule wins, owners need write access)
      - Blocking force pushes and deletions on protected branches, plus require linear history and
        how it interacts with squash and rebase merges
      - Bypass lists and enforcement for admins: granting emergency exceptions without switching
        protection off
      - Push protection and required signed commits as organization policy: stopping secrets and
        unverified commits at the door
    Projects built:
      - Configure a demo repository with a full ruleset: required reviews with code owners, required
        status checks, linear history, and a CODEOWNERS file covering two teams, then prove each rule
        blocks what it should
    Practice: Open a PR that violates each rule in turn (no review, failing check, force
    push) and document exactly what GitHub blocks.
    Assessment: Explain last-match-wins in CODEOWNERS using a worked example of a pattern
    ordering that surprises people.

  Class 12: Pull Request Culture That Scales
    Topics:
      - PR templates in .github/PULL_REQUEST_TEMPLATE.md: prompting authors for context, testing
        notes, and rollout risk every time
      - Draft PRs for early feedback, and converting to ready-for-review once CI is green
      - Review mechanics that save hours: committable suggested changes, batching comments into one
        review, and viewed-files tracking
      - Writing reviews people accept: comment on the code not the person, separate blocking issues
        from nits, always explain the why
      - Keeping PRs small and stacked: splitting a large change into a chain of dependent PRs and
        landing them in order
      - Auto-merge and merge queues: letting approved, green PRs land themselves without last-minute
        conflicts on busy repositories
      - Review load balancing: round-robin and load-based team review assignment so reviews never
        bottleneck on one senior
    Projects built:
      - Design a complete PR playbook for a repository: template, review checklist, size guidelines,
        and auto-merge or merge queue settings, then run one real PR through it end to end
    Practice: Review a prepared flawed PR and leave at least five comments, using committable
    suggestions wherever possible.
    Assessment: Split a provided large change into a sensible stack of three PRs and explain
    the landing order.

  Class 13: Monorepos, Submodules and Scaling Big Repositories

Topics:
- Monorepo vs polyrepo: atomic cross-project changes and a single-version policy versus independent cadence and access isolation
- Submodules honestly: git submodule add, update --init --recursive, how the parent pins an exact SHA, and the classic detached-HEAD-inside-a-submodule trap
- git subtree as the low-ceremony alternative: vendoring a repository with history and pushing changes back upstream
- sparse-checkout in cone mode: git sparse-checkout init --cone and set <dirs> to work on one slice of a huge monorepo
- Partial clone: git clone --filter=blob:none for full history without full content, versus shallow --depth 1 clones and their limitations
- Git LFS for large binaries: git lfs track, .gitattributes, and migrating existing history with git lfs migrate import
- Repo health at scale: git maintenance start, the commit-graph, and background prefetch to keep big repositories fast

Projects built:
- Rescue a bloated demo repo: move its binary assets to Git LFS with lfs migrate, set up cone-mode sparse-checkout for one team's directory, and measure clone size before and after using --filter=blob:none

Practice: Add the same dependency repo as a submodule on one branch and a subtree on another, update upstream, and pull the change in both ways.

Assessment: Recommend monorepo or polyrepo for a described organization and name the specific Git features that make your choice workable.

Class 14: Release Management: Tags, SemVer and Changelogs

Topics:
- Semantic versioning as a contract: what MAJOR.MINOR.PATCH each promise to consumers, plus pre-release and build metadata suffixes
- Annotated vs lightweight tags: git tag -a v2.1.0 -m, why releases always get annotated (or signed with -s) tags, and pushing them explicitly
- git describe: turning any commit into a human-readable version string for build stamping and support tickets
- GitHub Releases: creating a release from a tag, attaching artifacts, and auto-generated release notes configured via release.yml categories
- Conventional Commits (feat:, fix:, BREAKING CHANGE:) and how they enable automated changelogs and version bumping
- Release branches and the hotfix flow: cutting release/2.1, hardening it, and backporting fixes with cherry-pick -x
- Tag discipline: why a published tag must never be moved, and the correct recovery when a bad tag ships

Projects built:
- Run a full release cycle on your own project: conventional commits, cut a release branch, create an annotated signed v1.0.0 tag, publish a GitHub Release with categorized auto-generated notes, then ship a v1.0.1 hotfix

Practice: Rewrite five real commit messages into Conventional Commits format and predict the version bump each one implies.

Assessment: Explain the difference between annotated and lightweight tags and demonstrate why release tooling only trusts the former.

PHASE 4: AUTOMATION, CI/CD & SECURITY

Automate everything and lock it down: GitHub Actions from fundamentals to reusable workflows, secret management and gated deployments, supply chain security, signed commits, hooks, and GitHub CLI scripting.

Class 15: GitHub Actions: The Core Model

Topics:
- Anatomy of a workflow: .github/workflows/*.yml, events, jobs, steps, runners, and reading logs in the Actions tab
- Trigger fluency: on push with branch and path filters, pull_request vs pull_request_target (and why the latter is dangerous), workflow_dispatch with inputs, and schedule with cron
- Jobs and runners: ubuntu, windows, and macos images, needs: for dependencies between jobs, and parallel-by-default execution
- Using marketplace actions safely: actions/checkout and setup actions, and pinning by tag versus full commit SHA
- Contexts and expressions: github and runner contexts, if: conditions, and wiring step outputs into later steps
- The GITHUB_TOKEN: what it can touch, and shrinking it with workflow-level and job-level permissions: blocks
- The free tier in real numbers: GitHub Free includes 2,000 Actions minutes per month plus unlimited public and private repositories, so every exercise in this course runs at no cost

Projects built:
- Build a CI workflow from scratch for a small app: lint, test, and build on every pull request, with path filters so documentation-only changes skip CI

Practice: Add a workflow_dispatch trigger with an input and use its value inside a step expression.

Assessment: Read an unfamiliar failing workflow run and identify the failing job, step, and root cause from the logs alone.

Class 16: Advanced Actions: Matrix Builds, Caching and Reusable Workflows
  Topics:
    - strategy.matrix: testing across language versions and operating systems from one job definition, with include and exclude for edge cells
    - fail-fast and max-parallel: controlling what happens to the rest of the matrix when one cell fails
    - actions/cache: key design with hashFiles on your lockfile, restore-keys fallback chains, and verifying the cache actually saves time
    - Artifacts vs cache: upload-artifact and download-artifact for passing build outputs between jobs and preserving test reports
    - Reusable workflows with workflow_call: one CI definition shared across many repositories, with inputs and secrets passed explicitly
    - Composite actions: bundling repeated step sequences into your own action under .github/actions/
    - concurrency groups with cancel-in-progress: stopping superseded runs on the same PR instead of burning minutes
  Projects built:
    - Upgrade your Class 15 pipeline: a six-cell OS-by-version matrix, dependency caching, a test-report artifact, and the whole pipeline extracted into a reusable workflow called from a second repository
  Practice: Measure one workflow's runtime with a cold cache and a warm cache and record the difference.
  Assessment: Design a cache key strategy for a given project and justify the restore-keys ordering.

Class 17: Secrets, Environments and Deployment Pipelines
  Topics:
    - The secrets hierarchy: repository, organization, and environment secrets, plus log masking and its limits
    - GitHub environments: production vs staging with required reviewers, wait timers, and environment-scoped secrets
    - Deployment jobs: attaching environment: production to a job and tracking deploy history in the repository's Environments view
    - OIDC federation: short-lived cloud credentials for AWS, Azure, or GCP instead of storing long-lived keys as secrets
    - The build-once pattern: build a single artifact, deploy that same artifact to staging, then promote it to production through an approval gate
    - Deploying to GitHub Pages: free static site hosting wired directly from an Actions workflow
    - Rollback and safety: re-running a previous successful deployment, and protecting the deploy branch so only reviewed code ships
  Projects built:
    - Build a two-stage deploy pipeline: build an artifact, auto-deploy to a staging environment, then a production deploy to GitHub Pages gated behind a required reviewer
  Practice: Rotate a repository secret and confirm the workflow picks up the new value with no file changes.
  Assessment: Explain why OIDC beats long-lived cloud keys in CI and sketch the trust relationship that makes it work.

Class 18: Supply Chain Security: Dependabot, Secret Scanning and CodeQL
  Topics:
    - The modern threat model: most of a repository's code is dependencies, and attacks arrive through them and through leaked credentials
    - Dependabot alerts and security updates: automatic PRs that bump vulnerable dependencies, and triaging them without alert fatigue
    - dependabot.yml version updates: scheduled freshness PRs per ecosystem and directory, with grouping to cut the noise
    - Secret scanning and push protection: GitHub detecting known credential patterns and blocking the push before the secret ever lands
    - CodeQL code scanning: enabling default setup, reading alerts as data-flow paths, and gating PRs on newly introduced alerts
    - Hardening Actions themselves: pinning third-party actions to full commit SHAs, least-privilege GITHUB_TOKEN, and reviewing workflow changes like code
    - Dependency review on pull requests: seeing new and changed dependencies with their advisories before merge
  Projects built:
    - Fully harden a demo repository: Dependabot alerts plus weekly grouped version updates, push protection, and CodeQL default setup, then deliberately introduce a vulnerable dependency and a planted fake secret and document what each defense caught
  Practice: Triage three Dependabot alerts: decide update now, ignore, or investigate, and justify each call.
  Assessment: Explain the difference between Dependabot alerts, version updates, and security updates in plain language.

Class 19: Signed Commits, 2FA, Hooks and the pre-commit Framework
  Topics:
    - Why signing matters: anyone can set user.name and user.email to any value, so signatures are the only real authorship proof
    - SSH-based signing, the easy modern path: gpg.format ssh, user.signingkey, commit.gpgsign

true, and registering the key as a signing key on GitHub
- The Verified badge and vigilant mode: making unsigned commits attributed to you stand out
- Account hygiene: two-factor authentication, and fine-grained personal access tokens with minimal scopes and expiry dates
- Client-side hooks: pre-commit, commit-msg, and pre-push, why they are per-clone by default, and sharing them with core.hooksPath
- The pre-commit framework: .pre-commit-config.yaml, pre-commit install, and running formatters, linters, and secret detectors on staged files only
- Server-side thinking: what pre-receive hooks do, and how GitHub replaces them for hosted repos with protection rules and push protection

Projects built:
- Set up verified signed commits with an SSH key, then add a pre-commit configuration running a formatter, a linter, and a secret detector, and prove a planted fake credential cannot be committed

Practice: Write a commit-msg hook that rejects messages not matching Conventional Commits format, and test it both ways.
Assessment: Show a Verified badge on your own GitHub commit and explain the chain of trust that produces it.

Class 20: GitHub CLI (gh) and API Automation
Topics:
- gh auth login and gh auth status: authenticated automation from any terminal once, then scriptable forever
- The PR workday without a browser: gh pr create --fill, gh pr checkout, gh pr view --web, gh pr review --approve, gh pr merge --squash
- Issue automation: gh issue list --label bug --json number,title for structured output, and gh issue create from scripts
- Watching CI from the terminal: gh run list, gh run watch, and gh run rerun --failed
- Raw API access: gh api repos/{owner}/{repo}/pulls with --jq filters and --paginate for full result sets
- GraphQL for the hard questions: gh api graphql for data the REST API returns poorly, like nested review threads
- Gluing it together: gh inside shell scripts and Actions workflows via GH_TOKEN, plus gh alias set for daily shortcuts

Projects built:
- Write a morning-review script with gh: list PRs awaiting your review with their CI status and age as a clean table, then alias it to a single command

Practice: Open, review, and squash-merge a pull request entirely from the terminal without touching the browser.
Assessment: Use gh api with --jq to answer a repository question (for example, the five most recently updated open PRs) in one command.

PHASE 5: LEADERSHIP & CAPSTONE

Operate at the level teams depend on: migrate an organization to GitHub, recover from disasters and leaked secrets, run AI-assisted review workflows responsibly, and ship a capstone workflow you can defend.

Class 21: Migrating a Team to GitHub and Teaching Git Well
Topics:
- Migration inventory: repositories, history depth, binaries destined for LFS, users and permissions, CI jobs, and the integrations that will break
- Full-fidelity moves: git clone --mirror plus git push --mirror to carry every branch and tag, and importer tooling for other hosts
- Cutover planning: freeze windows, read-only on the old host, repointing remotes with git remote set-url, and a tested rollback plan
- Designing team conventions: branch naming, commit style, PR rules, and a CONTRIBUTING.md people actually read
- Teaching Git so it sticks: mental model first (objects, refs, three trees), commands second, and running an internal workshop
- The failure modes you will meet: force-push accidents, giant binary commits, enormous PRs, and the specific guardrail that prevents each
- Measuring adoption: PR cycle time, review coverage, and revert rate as signals the new workflow is actually working

Projects built:
- Produce a complete migration runbook for a fictional 10-developer team moving to GitHub: timeline, mirror commands, permission mapping, guardrail configuration, and a one-hour onboarding workshop outline

Practice: Mirror-migrate a multi-branch repository between two remotes and verify every branch and tag arrived intact.
Assessment: Deliver a five-minute explanation of the three trees model as you would to a junior teammate, without notes.

Class 22: Disaster Recovery: filter-repo, Leaked Secrets and Corrupt Repos
Topics:
- First rule of a leaked secret: rotate the credential immediately, because forks and clones already have the history, cleanup is step two
- git filter-repo, the maintained replacement for filter-branch: removing a file from all

history with --path plus --invert-paths
      - Redacting content everywhere: filter-repo --replace-text to scrub passwords and keys from every commit that ever contained them
      - The aftermath of a rewrite: every SHA changes, force-push coordination, teammates re-clone or hard-reset, and open PRs need rebasing
      - Recovering from a bad force-push: your own reflog, teammates' clones as backups, and why --force-with-lease should be muscle memory
      - Corrupt repository triage: reading git fsck output, copying missing objects from a healthy clone's .git/objects, and knowing when to re-clone
      - Prevention as the real strategy: push protection, pre-commit secret detectors, and protected branches make most of this class unnecessary
    Projects built:
      - Run a leak drill: plant a fake API key five commits deep, then execute the full response: rotate (simulated), scrub with filter-repo --replace-text, force-push, and verify with git log -S that no trace remains
    Practice: Break a scratch repository by deleting an object file, diagnose it with git fsck, and repair it from a second clone.
    Assessment: Write the incident checklist you would follow for a production secret leak, in the correct order, with commands.

  Class 23: AI-Assisted Git Workflows: Copilot and Coding Agents
    Topics:
      - Copilot code review on GitHub: requesting an AI review on a pull request and treating its findings as a first pass, never a verdict
      - Access reality: GitHub Copilot has a free tier you can practice with; check github.com/features/copilot for what the current plans include before relying on any feature
      - Coding agents that open PRs: routing AI-authored branches through the same protection rules, status checks, and CODEOWNERS as human code
      - Git hygiene for agent work: small scoped branches per task, descriptive PR bodies, and never letting an agent force-push shared history
      - AI-generated commit messages and PR summaries: where they genuinely help, and why the diff remains the source of truth
      - Team policy for AI code: disclosure, review depth, and the license and provenance questions your organization must answer
      - The reviewer's edge: your archaeology skills (blame, pickaxe, bisect) are exactly what keeps AI-speed development safe
    Projects built:
      - Run one feature through an AI-assisted flow: have an AI tool draft the change on a branch, then apply your full professional gauntlet (protection rules, CI, line-by-line review) before merging, and write up what the AI got right and wrong
    Practice: Request a Copilot review on a pull request and compare its findings against your own review of the same diff.
    Assessment: Draft a one-page AI usage policy for a team's Git workflow covering branches, review requirements, and accountability.

  Class 24: Capstone: Design a Complete Team Workflow + Certification
    Topics:
      - The capstone brief: take a real repository, yours or a provided one, and productionize it end to end
      - Workflow layer: a written branching strategy, protected main with a ruleset, CODEOWNERS, a PR template, and an auto-merge or merge queue decision
      - CI/CD layer: a matrix test workflow with caching, a build artifact, and a staged deploy behind an environment approval gate
      - Security layer: Dependabot, secret scanning with push protection, CodeQL, signed commits, and actions pinned to SHAs
      - Release layer: Conventional Commits, an annotated signed tag, and a GitHub Release with generated notes
      - The defense: walk a mentor through every choice and justify it against the alternatives, exactly like an architecture review
      - Certification: present the finished repository and earn the Modern Age Coders Advanced Git & GitHub certificate
    Projects built:
      - Ship the capstone: one repository with the complete workflow, CI/CD, security, and release stack configured and demonstrably working, plus a README section documenting every design decision
    Practice: Do a dry-run presentation of your capstone to a classmate and incorporate at least one piece of their feedback.
    Assessment: Final review: every guardrail demonstrated live (a blocked push, a failing check gate, a gated deploy) earns the certificate.

PROJECTS THE STUDENT BUILDS AND KEEPS

- Phase 1: a hand-traced object graph of your own commit, a three-trees reset cheat card, a commit built from pure plumbing commands, and a dotfiles-quality .gitconfig with identities, aliases, zdiff3, and rerere
- Phase 2: a messy 10-commit branch rebased into 3 clean test-passing commits, a simulated release with cherry-picked hotfixes and a merge revert, a three-way rescue drill recovered via reflog and fsck, an automated bisect run hunt, and three archaeology questions answered with cited SHAs

- Phase 3: a written branching strategy proposal, a fully enforced ruleset with CODEOWNERS proven by blocked PRs, a complete PR playbook run end to end, an LFS plus sparse-checkout rescue of a bloated repo, and a full v1.0.0 release cycle with a signed tag and generated notes
- Phase 4: a from-scratch CI workflow, a matrix build with caching extracted into a reusable workflow, a two-stage gated deploy to GitHub Pages, a fully hardened repo that catches a planted vulnerability and secret, a signed-commit plus pre-commit guardrail setup, and a gh-powered morning-review script
- Phase 5: a complete team migration runbook, a leak drill scrubbed with filter-repo and verified clean, one feature shipped through a professionally reviewed AI-assisted flow, and the capstone: a production-grade repository with workflow, CI/CD, security, and release layers demonstrated live
- Total: 24 hands-on projects, one per class, finishing with a production-grade capstone repository

Total projects: 24 hands-on projects, one per class, finishing with a production-grade capstone repository

SKILLS THE STUDENT WILL HAVE AT THE END

- Git Internals: the object model, refs and HEAD, the three trees, and plumbing commands like cat-file and rev-parse
- History Surgery: interactive rebase with autosquash and exec, cherry-pick, revert on shared history, and filter-repo rewrites
- Rescue Operations: reflog recovery, fsck, automated git bisect run, advanced stash workflows, and corrupt repo triage
- Team Workflow Design: trunk-based development vs GitFlow, rulesets, CODEOWNERS, PR templates, stacked PRs, and merge queues
- Repositories at Scale: monorepo tooling, sparse-checkout, partial clone, submodules vs subtree, and Git LFS migration
- CI/CD with GitHub Actions: matrix builds, caching, artifacts, reusable workflows, environments, OIDC, and gated deployments
- Security: Dependabot, secret scanning with push protection, CodeQL, signed commits, and the pre-commit framework
- Automation and Leadership: GitHub CLI and API scripting, team migrations, release management, and teaching Git to others

HOW A TYPICAL WEEK IS SPLIT

Live classes: 2 live classes per week, about 1 hour each, across 12 weeks
Hands on git work: 1.5-2 hours running the commands from class on your own repositories, including the deliberate break-and-recover drills
Project time: 1-1.5 hours completing each class project on your own machine
Review and doubts: 30-60 minutes reviewing your work and clearing doubts over WhatsApp before the next class
Homework: A task or problem set after every class, and a monthly mixed-review assignment that deliberately folds in earlier topics

SUPPORT INCLUDED

Doubt support: WhatsApp doubt support between classes for stuck rebases, workflow errors, and setup questions
Small batches: Small batches, with mini-batch and 1-on-1 options, so every professional gets individual attention
Mentor guidance: Live guidance from mentors who run these workflows on real production repositories
Project feedback: Feedback on every class project and a personal capstone review before certification
Living syllabus: Curriculum updated as Git and GitHub ship new features, at no extra cost

CERTIFICATION DETAIL

Completion: Certificate from Modern Age Coders, awarded on passing the final assessment. Fall short and there is focused revision and a free retest: the certificate certifies real learning, not attendance

WHERE THIS CAN LEAD

- Senior developer trusted with repository administration, history surgery, and release management
- Team lead or engineering manager who designs and rolls out the team's branching and review workflow
- DevOps or platform engineer building CI/CD pipelines and deployment gates with GitHub Actions
- Build, release, or developer-experience engineer at organizations running large or monorepo codebases
- The go-to Git person on any team: the one who rescues lost work instead of suggesting a re-clone

COMMON QUESTIONS ABOUT THIS COURSE

For anything about cost, use PART 4 and RULE 1. Do not quote two regions.

Q: Is this Git course too advanced if I only know basic commands like add, commit, and push?
A: No, that is exactly the starting profile it is designed for. The course assumes you have used basic Git at work or in projects, and Classes 1-4 rebuild your understanding from the object model up, so the advanced material lands on solid ground. If you can clone a repo and make a commit, you are ready.

Q: How is this different from a beginner Git and GitHub course?
A: Beginner courses teach you the commands; this one teaches you the system. We cover Git internals, interactive rebase, reflog recovery, branch protection rulesets, monorepo tooling, GitHub Actions CI/CD, and repository security, the skills of the person a team calls when Git goes wrong. Our separate college-students course covers the foundations track.

Q: Do I need a paid GitHub plan to take this course?
A: No. If you are a verified student at a degree or diploma granting school, the free GitHub Student Developer Pack adds further benefits while you study.

Q: Does this course cover GitHub Actions and CI/CD pipelines?
A: Yes, in depth: six full classes. You go from workflow anatomy and triggers through matrix builds, caching, artifacts, and reusable workflows, to secrets, environments with approval gates, OIDC cloud deployments, and supply chain security with Dependabot, secret scanning, and CodeQL. By the capstone you build a complete gated deploy pipeline yourself.

Q: Are the classes live or pre-recorded?
A: Every class is live and interactive with a real instructor, never pre-recorded videos. Group batches are capped at 20 professionals, with mini-batch and 1-on-1 options, and you get WhatsApp doubt support between classes. Modern Age Coders has taught live online classes this way since 2020.

Q: Does the course teach how to remove a leaked password or API key from Git history?
A: Yes, Class 22 is a full disaster recovery session. You run a complete leak drill: rotate the credential first, scrub every trace from history with git filter-repo --replace-text, coordinate the force-push, and verify the cleanup with git log -S. You also set up the defenses (push protection and pre-commit secret detectors) that stop the leak from happening again.

Q: Can my company enrol a team for corporate Git training?
A: Yes. Book a free demo class and we will discuss batch scheduling for your team's timezone; we have taught learners across 25+ countries. (Agent note: the free demo is a waiting list with no fixed date. The Priority Live Demo is a guaranteed class today or tomorrow, booked at https://learn.modernagecoders.com/priority-demo . Offer both, as RULE 3 says.)

Q: What certificate do I get after completing the course?
A: You earn the Modern Age Coders 'Advanced Git & GitHub' certificate by presenting and defending your Class 24 capstone: a repository with a complete workflow, CI/CD, security, and release stack that you demonstrate live. You also leave with the repository itself and a GitHub profile full of verified signed commits, which usually says more than the certificate does.

Q: How am I assessed, and is the certificate just for showing up?
A: No. A task follows every class with feedback, monthly reviews deliberately mix new material with earlier topics so nothing is forgotten, and the course ends with a final project defended live, plus a written assessment. Passing earns the certificate; falling short earns focused revision and a free retest. We measure real learning, not attendance.

To enrol, message Shivam Sir on +91 9123366161 or send the parent this link: https://learn.modernagecoders.com/courses/git-github-advanced-version-control-masterclass-for-professionals
For a demo: the Priority Live Demo (guaranteed, today or tomorrow) is booked at https://learn.modernagecoders.com/priority-demo . The free demo is a waiting list with no fixed date.

==========
COURSE 7 OF 137: AI AGENTS WITH MICROSOFT COPILOT STUDIO FOR COLLEGE STUDENTS
==========

Course link: https://learn.modernagecoders.com/courses/ai-agents-with-microsoft-copilot-studio-course-for-college-students
Subject area: AI Agents & Automation
Designed for: College students
Who can join: Intermediate (college students and early-career, ages 18+; no prior agent experience needed)
Course length: 24 classes (12 weeks · 2 classes/week)
Time needed: 4-5 hours/week recommended
Certificate: Certificate from Modern Age Coders, awarded on passing the final assessment

PRICE FOR THIS COURSE (quote only the one that applies to the person asking)
In India, per month: one to one Rs 4,999
Outside India, per month: one to one $150
Classes: one to one in India one live class a week, four a month; one to one outside India two live classes a week, eight a month. Each class is one hour.

Note: this course is taught one to one only. There is no group or mini batch option.
Note: the course length above is counted at two classes a week. In India the one to one plan is one class a week, so if an Indian family asks how long it will take, hand over to Shivam Sir.

WHAT THIS COURSE IS

Build business-grade AI agents in Microsoft Copilot Studio: 24 live 1-on-1 online classes on knowledge grounding, connectors, agent flows, MCP, autonomous triggers, multi-agent orchestration and a recruiter-ready published capstone.

In one line: Recruiters no longer ask whether you have used AI. They ask what you have built with it. Build, ground, automate and publish real business agents, in private 1-on-1 classes.

ABOUT THE PROGRAMME

Every placement season now has a new line on the checklist: AI agents. Microsoft Copilot Studio is the graphical, low-code studio enterprises use to build and manage AI-powered agents and workflows, and by Microsoft's own count 90% of the Fortune 500 use it. This course takes a college student from zero to a business-grade, published agent in 24 live 1-on-1 classes. You start with agent fundamentals done properly: instructions that steer behaviour, test sets, and the model lineup behind every agent (GPT-4.1 as the default, GPT-5.5 Chat, and Anthropic Claude models among them). Then you go deep where business agents actually live: knowledge grounding across SharePoint, Dataverse and connector-indexed enterprise data with citations users can check; conversation design with topics, entities, condition groups and adaptive cards; and generative orchestration, where the model plans across your topics, knowledge and tools. Phase 4 is the employability core: tools built from Copilot Studio's library of more than 1,400 connectors, deterministic agent flows for work that must run the same every time, custom connectors and REST APIs, Model Context Protocol (MCP) tools, autonomous event triggers with the security discipline they demand, multi-agent design with child agents and the agent-to-agent (A2A) protocol, and analytics with agent evaluations to prove your agent works. You finish by publishing to real channels, passing a professional pre-flight checklist, and defending a capstone agent built for a real club, department or small business, with a documentation packet a recruiter can actually read. The syllabus is a Living Syllabus, updated as Copilot Studio ships, and it maps directly to Microsoft's credential ladder: PL-900, the Applied Skills labs, and the AI Agent Builder Associate certification (exam AB-620).

WHAT MAKES THIS COURSE DIFFERENT

- 1-on-1 only, by design: your mentor reviews your actual instructions, knowledge sources, flows and test logs line by line every class, and points every project at your real placement goals, which a group batch cannot do honestly.
- The full business toolchain, not a demo tour: connectors, custom connectors, REST APIs, Model Context Protocol, agent flows, event triggers, multi-agent design and agent evaluations, each one practised on a project you keep.
- Certification-mapped: the syllabus vocabulary tracks Microsoft's PL-900 exam (which added a dedicated Copilot Studio agents domain in July 2026) and the AI Agent Builder Associate certification (exam AB-620), so course time doubles as credential prep.
- Autonomy taught with adult supervision of the risks: event triggers run with the maker's credentials, so you learn the security reasoning enterprises are hiring for, not just the wow demo.
- Evidence over vibes: from Class 4 you keep fixed test sets, and by Phase 4 you use analytics outcomes and agent evaluations to prove improvements with numbers, the habit that separates builders from users.
- Living Syllabus: Copilot Studio ships continuously (MCP tools, the A2A protocol, agent evaluations and new models all landed within the last year), and the curriculum is re-verified against Microsoft's documentation as features land.

WHAT A STUDENT NEEDS BEFORE STARTING

Device: A laptop or desktop (Windows, Mac or Linux) with the Chrome or Edge browser and a reliable internet connection; Copilot Studio runs fully in the browser
Coding experience: None required. Copilot Studio is a graphical, low-code studio, and the course teaches every concept from first principles. Students who do code will get further faster in the REST, custom connector and MCP classes, but the syllabus assumes nothing
Accounts: Copilot Studio uses a Microsoft work or school (Entra ID) account rather than a personal email. Most college email addresses qualify for the 30-day self-serve trial (note: trial environments cannot publish agents). Where a college account is not available, we arrange a practice environment for the duration of the course
Mindset: The willingness to test before you trust, and to treat instructions, sources and logs as engineering artifacts. The course rewards students who ask for evidence

WHO THIS COURSE IS FOR

Placement seekers: Final and pre-final year students who want a demonstrable AI agent skill on their resume, with a published capstone and documentation packet recruiters can actually inspect
Business and commerce students: BBA, BCom and management students who will never be full-time

programmers but will absolutely be asked to automate processes and build departmental agents
Engineering students: CS and IT students who know code but not the low-code agent stack enterprises deploy, and want the governance and orchestration vocabulary interviews now probe
Club and fest organisers: Students already running societies and fests who have real users, real FAQs and real processes, the perfect training ground for business-grade agents
Early career professionals: Recent graduates in operations, support or analyst roles who want to become the person on the team who ships the agent instead of requesting one

FULL CURRICULUM, WEEK BY WEEK

This is the complete teaching plan. Parents can ask about any week.

PHASE 1: AGENT FOUNDATIONS

Understand agents in business terms, tour Microsoft Copilot Studio properly, write instructions that actually steer behaviour, test like a professional, and meet the models and harnesses underneath every agent.

Class 1: Agents as a Business Skill, Not a Toy
Topics:
- Chatbot vs assistant vs agent: instructions, knowledge, tools and autonomous action, defined precisely
- Why this is on placement checklists: Microsoft reports 90% of the Fortune 500 use Copilot Studio, and Gartner projects a third of enterprise software will include agentic AI by 2028
- Microsoft Copilot Studio in one sentence: a graphical, low-code studio for building and managing AI-powered agents and workflows
- The studio tour that matters: agents, knowledge, topics, tools, triggers, channels, analytics, and the Build, Preview, Evaluate and Monitor surfaces
- Where Copilot Studio sits: low-code SaaS on Power Platform, beside Microsoft Foundry for pro-code teams, and how the two interoperate
- Access done honestly: Copilot Studio needs a Microsoft work or school account; most college emails qualify for the 30-day trial, and your mentor sets your practice environment up with you
- Choosing your capstone candidate: a real club, department or small business whose problem you will ship an agent for in Class 24

Projects built:
- Agent teardown, business edition: analyse one real customer-facing agent (bank, airline, university helpdesk), reverse-engineer its probable instructions, knowledge and tools, and write a one-page teardown

Practice: Draft five agent ideas from your college and internship life and rank them by business value and by how much real knowledge each needs.
Assessment: Define agent, knowledge grounding and tool in your own words, with one business example each.

Class 2: Your First Agent, Built Properly
Topics:
- Describe-to-create: starting an agent from a plain-English description and reading what the platform scaffolds for you
- The instruction stack for business agents: identity, audience, scope, tone, format rules and refusals, in that order
- The test panel as your workbench: probing the agent the moment it exists, and logging behaviour instead of trusting memory
- One-change iteration: modify a single instruction line, retest, compare, keep or revert
- Names and descriptions users trust: why a precise agent description is both UX and findability
- What the model actually does with instructions: system prompts, context and why wording changes behaviour
- Version discipline from day one: keeping instruction versions outside the tool

Projects built:
- Build 'Placement FAQ v1': an agent with hand-written instructions that answers questions about one real company's hiring process in a tone you designed

Practice: Write three instruction variants for the same agent and record exactly how each changes the answers to a fixed set of five questions.
Assessment: Show a before-and-after instruction change with the precise behaviour difference it caused.

Class 3: Instructions at Business Depth
Topics:
- Scope fences: declaring what the agent must not do, and proving the fence holds under pressure
- Refusal design for business contexts: legal, HR and personal-data questions the agent must decline gracefully
- Brand voice as an instruction problem: the same agent for students, recruiters and professors
- Format contracts: forcing answers into steps, tables or short summaries that busy readers actually use
- Instruction smells: vague verbs, contradictions, and rules that fight each other in production
- The deep reasoning preview, honestly framed: Microsoft's reasoning models are in preview and

triggered by the keyword 'reason' in instructions, and current syllabi treat them as preview, not promises
- A/B instruction testing: scoring two instruction sets against the same 10 questions

Projects built:
- The Refusal Gauntlet, corporate edition: 10 questions your Placement FAQ agent must refuse or redirect (offer-letter legal advice, personal data, salary speculation), tuned until all 10 are handled gracefully

Practice: Have two friends try to drag your agent out of scope for ten minutes each; log every breach and patch the instructions.

Assessment: Defend each line of your instruction stack: what specific failure appears if that line is deleted?

Class 4: Testing Like Someone Whose Name Is on It

Topics:
- Fixed test sets: 15 questions with expected behaviour written before you run them
- Happy path, edge case, adversarial: three question classes every business agent must survive
- Grading answers on four axes: correctness, tone, format and scope
- Manual regression: rerunning the full set after every meaningful change, and why professionals never skip it
- Recognising hallucination before grounding exists to fix it: confident nonsense and how to catch it
- The test log as an artifact: question, expected, actual, verdict, and why recruiters respond to this document
- Preview of Class 20: Copilot Studio's agent evaluations automate exactly this habit, so building it by hand first makes the tool obvious later

Projects built:
- Build the permanent 15-question test set for Placement FAQ, run it twice in one week, and file the two most instructive failures with root causes

Practice: Write five adversarial questions designed to make your agent overstep, and score how it handles each.

Assessment: Given a conversation transcript, mark every agent turn pass or fail against the written instructions, with reasons.

Class 5: Models, Harnesses and What You Are Actually Running On

Topics:
- The model picker: GPT-4.1 as the current default, GPT-5 Chat and GPT-5.5 Chat generally available, and Anthropic Claude models (Sonnet 4.6, Opus 4.6 and 4.7) in the lineup
- Why model choice is a design decision: retesting your fixed set across two models and defending the differences
- Harnesses in plain words: the runtime between your design and the model, with a standard harness for topics and flows and a GitHub Copilot harness for reasoning-heavy work
- Environments: why your practice environment is separate from a company's production environment, and what that separation protects
- Copilot Credits, first pass: agent usage is metered (classic answers, generative answers and actions cost different amounts), and designers are expected to know it
- Platform guardrails you inherit: content filtering and responsible-AI defaults that run before your instructions
- Phase 1 systems map: from a user's message through harness, instructions and model to the answer, labelled by what you control

Projects built:
- Model comparison memo: run your full Placement FAQ test set on two available models and write a one-page recommendation with evidence

Practice: Draw the full journey of one question through your agent and annotate the three points where you can change the outcome.

Assessment: Phase 1 gate: rebuild a small agent from a written spec in 20 minutes, with instructions, refusals and a five-question test.

PHASE 2: KNOWLEDGE & GROUNDING AT BUSINESS DEPTH

Ground agents in the knowledge sources enterprises actually use: SharePoint, documents, Dataverse and connector-indexed enterprise data, with citations, conflict handling and accuracy audits you publish.

Class 6: Grounding vs Guessing, the Business Version

Topics:
- Why ungrounded agents are unemployable: training data vs your organisation's data
- The knowledge source lineup: public websites, uploaded documents, SharePoint, Dataverse, and enterprise data indexed through connectors
- Generative answers: how the agent searches sources and composes answers, and where citations come from
- The 'Allow ungrounded responses' setting and why business agents keep it off
- Real limits that force curation: website and SharePoint URL caps, file ceilings, and a hard maximum of knowledge sources per agent
- Source selection as a professional judgment: authoritative, current, small enough to verify
- Grounding plan for your capstone: the source list you will defend on demo day

Projects built:
- Ground Placement FAQ in the target company's public website and prove five answers now carry citations a recruiter could check

Practice: Ask your grounded agent five questions its sources cannot answer and document its behaviour at the edge of knowledge.
Assessment: Explain grounding, citations and hallucination in interview language: two minutes, no notes.

Class 7: SharePoint and Documents Done Right
Topics:
- SharePoint as a knowledge source: pointing an agent at the document library a team actually maintains
- Writing documents for retrieval: headings, one fact per paragraph, consistent names, and why messy docs produce messy agents
- Document formats that ground well, and the file-size and count ceilings that shape what you upload
- Precision testing: questions whose answers live in one exact paragraph, and verifying the agent finds that paragraph
- Update behaviour: what happens when the source changes, and designing so the agent never lags the truth
- Confidentiality first pass: what must never enter an agent's knowledge, and who decides
- The curation principle: five great pages beat fifty mediocre ones, measurably

Projects built:
- Build 'Society Desk': an agent for a real college society grounded in a clean 3-document knowledge pack you author, with a 10-question proof test

Practice: Deliberately degrade one knowledge document, measure the answer-quality drop on your test set, then fix and remeasure.
Assessment: Given two versions of the same document, predict which grounds better and prove it with tests.

Class 8: Dataverse, Enterprise Data and Source Conflicts
Topics:
- Dataverse as structured knowledge: when tabular business data beats documents
- Enterprise data through connectors: sources indexed by Microsoft Search, and why enterprises fund this path
- Multi-source agents: how the agent chooses between website, documents and structured data
- Conflict behaviour: engineering for the day two sources disagree, because they will
- Scoping by instruction: routing question types to the right source deliberately
- Freshness strategy: which source type updates fastest and which facts must follow it
- Auditing knowledge like an owner: what is in, what is out, what is stale, on one page

Projects built:
- Build a two-source Internship Tracker knowledge base (structured table plus policy document) and document exactly how the agent behaves when they conflict

Practice: Write five questions that force a source choice and log which source wins each, then adjust scoping instructions.
Assessment: Defend your capstone source list: authority, freshness and maintenance plan for each source.

Class 9: Accuracy Audits, Bias and the Trust Contract
Topics:
- The accuracy audit: scoring 20 grounded answers against source text and publishing the number
- Bias in, bias out: how one-sided source lists produce one-sided agents, and the audit that catches it
- Uncertainty language: agents that say 'my sources do not cover that' instead of improvising
- Data protection instincts: personal data, minimisation, and what a business agent must forget
- The trust contract with users: transparency about being an agent, about sources, and about limits
- What enterprises layer on top: evaluation suites and monitoring, previewed honestly before you meet them in Class 20
- Phase 2 wrap: the grounding checklist you now apply to every agent

Projects built:
- Publish an accuracy audit of Society Desk: 20 scored answers with cited source paragraphs, an accuracy figure, and the three fixes it demanded

Practice: Add an uncertainty rule to every agent you own and collect three real out-of-scope responses that handled it well.
Assessment: Phase 2 gate: design a complete knowledge plan (sources, scoping, refusals, accuracy test) for a given business brief, in writing.

PHASE 3: CONVERSATION & ORCHESTRATION

Design conversations that hold up under real users: topics and trigger phrases, entities and variables, condition groups, adaptive cards, and a deliberate choice between generative and classic orchestration.

Class 10: Topics and Trigger Phrases
Topics:
- Topics as designed conversation paths: one topic per job the agent does
- Trigger phrases: capturing the many phrasings of one request (topics support up to 200)
- System topics you inherit: greeting, escalate, goodbye, and when to customise them
- The authoring canvas: message nodes, question nodes and flow, built live
- Topics vs generative answers: control for the critical paths, flexibility for the long tail

- The YAML beneath the canvas: every topic is also code, your first bridge from low-code to pro-code
- The topic map for a business agent: the five jobs users will actually bring

Projects built:
- Build 'Fest Helpdesk' with three designed topics for a real event: schedule lookup, registration help and venue directions

Practice: Collect ten real phrasings of one request from classmates and tune trigger phrases until recognition is reliable.

Assessment: Given three user messages, predict the triggered topic and verify live, explaining each miss.

Class 11: Entities, Variables and Slot Filling

Topics:
- Question nodes that collect exactly what a process needs, one clean question at a time
- Entities: extracting dates, numbers and choices from messy human sentences
- Variables: carrying user answers through the conversation and into confirmations
- Slot filling: skipping questions the user already answered in one breath
- Choice questions vs open questions: constraining input where structure matters
- Validation: what happens when the user answers a date question with 'whenever works'
- Session memory: what the agent remembers within a conversation and what it must not

Projects built:
- Upgrade Internship Tracker: an add-application topic that collects company, role, deadline and status through entities, confirming with a variable-built summary

Practice: Test one topic with cooperative, messy and hostile input styles; log extraction failures and tighten the questions.

Assessment: Trace a conversation on paper naming the entity and variable at each step, then verify live.

Class 12: Condition Groups and Branch Design

Topics:
- Condition nodes: branching on variables to route the conversation
- Condition groups: combining tests cleanly (role is internship AND deadline within a week) without spaghetti
- Paper first: flow diagrams before canvas, the habit that prevents dead ends
- The escalation branch: recognising 'this needs a human' and handing off with context
- Default branches: designing for everything you did not predict
- Branch coverage testing: one scripted conversation per path, no path untested
- Refactoring: splitting one bloated topic into three maintainable ones

Projects built:
- Rebuild Fest Helpdesk registration as a condition-driven flow: student vs guest vs volunteer paths, each with its own confirmation and an escalation branch

Practice: Hand your flow diagram to a friend and let them hunt for a reachable dead end; fix what they find.

Assessment: Find and fix the planted logic bug in a provided flow diagram within one session.

Class 13: Adaptive Cards and Business-Grade Responses

Topics:
- Adaptive cards: structured, tappable answers for information that deserves better than a paragraph
- Card anatomy: titles, fact sets, images and actions, and when each earns its place
- Mobile first: your agent will mostly be read on phones, so cards are designed for small screens
- Card actions that continue the conversation: buttons feeding back into topics
- A small card style guide: consistency that makes an agent look engineered, not assembled
- Accessibility: alt text and reading order as professional defaults, not afterthoughts
- Restraint: the cases where plain text beats a card, chosen deliberately

Projects built:
- Give Internship Tracker a card-based pipeline view: each application a card with company, role, deadline and a status-update action

Practice: Convert your three most-used responses to cards and A/B them with two real users against the text versions.

Assessment: Improve a deliberately bad card (dense text, no hierarchy, dead buttons) and justify every change.

Class 14: Generative Orchestration vs Classic, Chosen Deliberately

Topics:
- Two execution brains: classic orchestration where trigger phrases pick topics, generative orchestration where the model plans across topics, knowledge and tools
- What generative orchestration unlocks: multi-intent requests, dynamic tool choice, and the event triggers you will use in Phase 4
- The trade: less predictability, reined back in with instructions and scope fences
- Reading the plan: inspecting how the agent decided which topic, source or tool to use, and debugging from that trace
- Mixing modes: designed topics for critical business paths, generative flexibility for the long tail
- Re-running the guardrail suite: refusals and fences retested under the new orchestrator, because behaviour moved
- Phase 3 wrap: the conversation-design checklist from trigger phrases to orchestration choice

Projects built:
- Migrate Fest Helpdesk to generative orchestration, rerun the full test set, and file a keep-or-fix verdict on every behaviour change

Practice: Write three multi-intent messages ('register me, what time is the keynote, can my cousin come') and tune until all three resolve in one turn.

Assessment: Phase 3 gate: design a five-topic business agent on paper (topics, entities, conditions, cards, orchestration mode) and defend it.

PHASE 4: TOOLS, AUTOMATION & MULTI-AGENT

The employability core: connectors and Prompt tools, deterministic agent flows, REST and custom connectors, Model Context Protocol, autonomous event triggers with real security discipline, multi-agent design with A2A, and analytics with agent evaluations.

Class 15: The Tool Menu and Connector Library

Topics:
- The tool types in Copilot Studio: Prompt, Agent flow, Custom connector, Model Context Protocol and REST API, plus prebuilt connectors
- The connector library: more than 1,400 prebuilt connections to real services, standard and premium
- Your first Prompt tool: one transformation done perfectly (summarise, extract, rewrite), reusable across agents
- Tool descriptions as an interface: the orchestrator chooses tools by reading descriptions, so you write them like contracts
- Discipline over abundance: the platform allows up to 128 tools per agent, Microsoft recommends staying near 25 to 30, and professionals use far fewer
- Authorisation questions before wiring anything: what may this tool touch, and who approved that
- Tool plan for your capstone: usually two tools, chosen from evidence, not excitement

Projects built:
- Add a 'JD decoder' Prompt tool to Placement FAQ: paste any job description, get requirements, keywords and preparation gaps in a fixed format

Practice: Write two versions of one tool description and demonstrate how the wording changes when the orchestrator invokes it.

Assessment: Explain, unaided, how an agent under generative orchestration decides between answering, searching knowledge and calling a tool.

Class 16: Agent Flows: Automation That Runs the Same Every Time

Topics:
- Agent flows: deterministic, step-based automations your agent calls as tools
- Flow anatomy: trigger, actions, conditions and outputs returned to the conversation
- When flows beat models: approvals, notifications, record updates, anything that must be identical every run
- Building a notification flow: collect structured details in conversation, send a formatted email or Teams message
- Error paths: what the user sees when a step fails, and why silent failure is disqualifying
- Reading a flow run: inputs, outputs and the exact step that broke
- Flows vs topics vs Prompt tools: a decision rubric you can defend in interviews

Projects built:
- Build 'Expense Slip': Society Desk collects reimbursement details through entities, an agent flow emails a formatted claim to the treasurer, and the agent confirms with the flow's real result

Practice: Break your flow with bad input on purpose, then add the error path that turns the failure into a graceful message.

Assessment: Given three automation briefs, classify each as flow, topic or Prompt tool with a three-sentence justification.

Class 17: REST APIs, Custom Connectors and Governance

Topics:
- REST in one hour: request in, JSON out, and how an agent turns a response into an answer
- Adding a REST API as a tool: authentication, parameters and response handling
- Custom connectors: wrapping any API so every maker in an organisation can reuse it safely
- Authentication in plain words: what 'connect your account' grants, and why least privilege is the default
- DLP governance: connector access is policy-controlled in real tenants, so 'can' and 'may' are different questions
- Reading API documentation like a builder: finding the one endpoint your agent needs
- The integration mindset recruiters probe: the least-powerful tool that does the job

Projects built:
- Wire a public REST API into a practice agent as a tool (weather, holidays or exchange rates) and demonstrate a grounded conversation using live data

Practice: Design on paper the API tool your capstone needs: endpoint, parameters, auth, tool description and three test utterances.

Assessment: Sketch one tool call end to end: utterance, orchestration decision, call, response, answer, and where it can fail.

Class 18: Model Context Protocol and Computer Use

Topics:

- Model Context Protocol (MCP): the open standard for connecting tool servers to agents, added from the same Add-a-tool menu
- MCP tools and resources: what a server exposes, and toggling individual tools with the Allow all switch
- Why MCP transfers: the same protocol appears in Claude, IDEs and other agent platforms, so this class compounds
- Governance continuity: MCP runs over Power Platform connectors, so DLP policies govern it like any other connector
- Computer use, surveyed honestly: agents that operate real user interfaces, generally available since May 2026, with per-step metering and premium model options
- The governance stack around computer use: allow-lists, HTTPS enforcement, stored credentials and human supervision
- Choosing integration styles: prebuilt connector vs REST vs custom connector vs MCP, as a decision table

Projects built:
- Connect an MCP server to a practice agent, inventory the tools it exposes, disable all but two deliberately, and demonstrate both in conversation

Practice: Write a one-page comparison: the same integration built as REST tool vs MCP tool, with the governance implications of each.
Assessment: Explain to your mentor what MCP standardises, and why DLP still applies to it.

Class 19: Autonomous Agents: Event Triggers and the Security They Demand
Topics:
- Event triggers: agents that act with no user in the chat, on events like an item created in SharePoint, a file added to OneDrive, a completed Planner task, or a Recurrence schedule
- The trigger payload: event data arriving as input, and instructions deciding what happens next
- Generative orchestration as a prerequisite: why autonomy needs the planning brain from Class 14
- The security fact enterprises underline: triggers run with the maker's credentials, so every autonomous action is effectively signed by you
- Designing the first autonomous job: small, observable, reversible, logged
- Human-in-the-loop: which actions pause for approval, and how the pause is built
- Idempotence in plain words: running twice must not double the damage

Projects built:
- Build 'Status Reporter': an autonomous agent that watches a shared project folder and posts a tidy weekly summary on a Recurrence trigger, with an approval pause on anything destructive

Practice: Feed your autonomous agent five events while away from the keyboard, then audit and score all five actions from the log.
Assessment: Explain maker-credential risk and name the two design rules you applied because of it.

Class 20: Multi-Agent Design, Analytics and Evaluations
Topics:
- Multi-agent options: child agents, connected Copilot Studio agents, and agents joined over the A2A protocol, generally available since April 2026
- When one agent becomes two: Microsoft's own rule of thumb, split when an agent nears 30 to 40 choices of tools, topics and agents
- Orchestrating specialists: a front-desk agent delegating to a bookings agent and a policy agent, cleanly
- The analytics view: sessions, outcomes (resolved, escalated, abandoned), satisfaction and themes
- Transcripts as design feedback: reading real sessions respectfully and mining the gaps
- Agent evaluations, generally available since March 2026: test sets and graders that automate the discipline you have run by hand since Class 4
- The improvement loop with numbers: hypothesis, one change, evaluation rerun, verdict

Projects built:
- Split Fest Helpdesk into a parent agent with one child specialist, then run an analytics-and-evaluations sprint on a week of real usage and ship two evidenced improvements

Practice: Define your capstone's three success metrics and build the evaluation set that will measure them before you build the agent.
Assessment: Phase 4 gate: from provided transcripts and evaluation results, diagnose the top failure and prove your one-line fix moved the number.

PHASE 5: PUBLISH, CREDENTIALS & CAPSTONE

Publish to the channels businesses use, pass a professional pre-flight checklist, then build and defend a business-grade capstone agent, leaving with a mapped Microsoft credential roadmap.

Class 21: Channels and the Agent Store
Topics:
- The channel lineup: Microsoft Teams and Microsoft 365 Copilot, SharePoint, demo website, custom website, and WhatsApp in business configurations
- Publishing flow: from studio to a shareable demo website, then toward Teams where organisations actually work
- The Agent Store: how a published agent reaches Microsoft 365 Copilot after an admin approves

it, a live lesson in enterprise governance
    - Identity for agents: Microsoft now issues Entra Agent IDs to new agents, making agents governable like users, mandatory since July 2026
    - Channel-fit design: the same agent on a phone, a website and inside Teams, and what changes per surface
    - Versioning discipline: what re-publishing replaces, and how not to break live users
    - Your capstone's launch plan: channel, audience, access and rollback, on one page
  Projects built:
    - Publish Internship Tracker to the demo website, run a supervised session with two real users on their phones, and file the structured feedback
  Practice: Write the one-paragraph launch plan for your capstone: channel, audience, access decision and rollback trigger.
  Assessment: Explain what changes and what stays identical when one agent ships to two channels.

Class 22: The Pre-Flight Checklist: Security, Cost and Honesty
  Topics:
    - The professional pre-flight: scope fences retested, refusals verified, citations on, personal data audited, evaluation suite green
    - Prompt injection: how malicious content tries to hijack instructions through knowledge and inputs, and the mitigations that blunt it
    - Data minimisation: collecting the least, retaining the least, and being able to say so
    - Cost awareness in Copilot Credits: metered usage (generative answers, actions, flow actions) means design choices change the bill, and capacity has enforcement limits
    - Transparency obligations: users know they are talking to an agent, what it can do, and where its knowledge ends
    - Kindness and accessibility passes: language level, error tone, and the user having a bad day
    - The signed go / no-go: a written audit your mentor countersigns before capstone launch
  Projects built:
    - Run the full 20-point pre-flight checklist against your published agent, fix every failure, and produce the signed one-page audit
  Practice: Attempt three prompt-injection attacks on your own agent through its knowledge and inputs, document outcomes, and add one mitigation.
  Assessment: Audit a deliberately flawed agent spec and catch at least four of its five planted problems.

Class 23: Capstone Build Week
  Topics:
    - Freezing the spec: job, users, sources, tools, trigger, channel and success metrics on one page
    - Build order that works: knowledge first, topics second, tools third, trigger last
    - Timeboxing with a mentor: what gets cut when reality bites, and why the core loop is protected
    - The evaluation suite as safety net: rerun at every milestone, no green no merge
    - Professional polish: greeting, description, card consistency, error tone and escalation paths
    - Dress rehearsal: the timed demo run with one planned failure recovery
    - Documentation packet: spec, source list, tool contracts, test log, audit page, ready for a recruiter
  Projects built:
    - Build the complete capstone: a business-grade agent for a real club, department or small business, grounded, tooled, evaluated, published and documented
  Practice: Run the dress rehearsal for an outsider and cut or fix the two weakest moments they identify.
  Assessment: Milestone gate: the capstone passes its own evaluation suite and pre-flight audit before demo day.

Class 24: Demo Day and the Credential Roadmap
  Topics:
    - The live demo: your capstone on a real channel, citations showing, one failure recovered gracefully
    - Defending design decisions: these sources, these tools, this orchestration mode, this trigger, and why
    - The retrospective: what you would build differently, the slide interviewers respect most
    - Portfolio packaging: capstone plus project history, browsable by a recruiter in five minutes
    - The Microsoft credential ladder mapped to what you now know: PL-900 with its new Copilot Studio agents domain, the Applied Skills labs 'Build an agent in Microsoft Copilot Studio' and 'Enhance agents with autonomous capabilities', and the AI Agent Builder Associate certification (exam AB-620)
    - The market you are entering: Gartner projects that by 2029 at least half of knowledge workers will need to work with, govern or create AI agents
    - Certificate, feedback and the Living Syllabus promise: what changed in Copilot Studio while you were learning it
  Projects built:
    - Deliver the capstone demo and hand over the complete packet: spec, source list, tool contracts, evaluation results, audit page and a two-minute recorded walkthrough
  Practice: Draft your AB-620 preparation plan: which exam domains your coursework already covers and what remains.
  Assessment: Final evaluation: capstone demo, design defence and documentation packet, graded against the Class 20 rubric.

PROJECTS THE STUDENT BUILDS AND KEEPS

- Phase 1: a business agent teardown, Placement FAQ v1 with designed instructions, a corporate refusal gauntlet, a permanent 15-question test set, and a model comparison memo with evidence
- Phase 2: a citation-backed Placement FAQ grounded in a real company site, Society Desk with an authored 3-document knowledge pack, a two-source Internship Tracker with conflict handling, and a published accuracy audit
- Phase 3: Fest Helpdesk with designed topics, entity-driven application capture, a condition-driven registration flow with escalation, a card-based pipeline view, and a generative-orchestration migration with verdicts on every change
- Phase 4: a JD-decoder Prompt tool, the Expense Slip agent flow with graceful errors, a live REST API tool, an MCP server connected with deliberately scoped tools, the autonomous Status Reporter with approval pauses, and a multi-agent split with an evaluations sprint
- Phase 5: a published agent tested by real users, a signed 20-point pre-flight audit, the complete business capstone, and a demo-day defence with a recruiter-ready documentation packet
- Total: 24 hands-on projects, one per class, finishing with a published business-grade capstone agent

Total projects: 24 hands-on projects, one per class, finishing with a published business-grade capstone agent

SKILLS THE STUDENT WILL HAVE AT THE END

- Agent design: instructions, scope fences, refusals, and brand-appropriate tone
- Knowledge grounding at business depth: SharePoint, documents, Dataverse and connector-indexed enterprise data, with citations
- Conversation design: topics, trigger phrases, entities, variables, condition groups and adaptive cards
- Generative vs classic orchestration, selected and defended per use case
- Tools: Prompt tools, prebuilt and custom connectors, REST APIs and Model Context Protocol
- Agent flows: deterministic automation with error paths and readable runs
- Autonomous agents: event triggers, Recurrence schedules, maker-credential security reasoning and human-in-the-loop design
- Multi-agent architecture: child agents, connected agents and the A2A protocol
- Analytics and agent evaluations: outcomes, transcripts, graders and evidence-driven iteration
- Publishing and governance: channels, the Agent Store approval path, Entra Agent IDs, DLP awareness and Copilot Credits cost literacy

HOW A TYPICAL WEEK IS SPLIT

Live classes: 2 private 1-on-1 classes per week, about 1 hour each, across 12 weeks
Hands on agent work: 1.5-2 hours building and testing in Copilot Studio between classes
Project time: 1-1.5 hours completing each class project, usually inside your own agents
Review and doubts: 30-45 minutes reviewing feedback and clearing doubts over WhatsApp before the next class
Homework: A task or problem set after every class, and a monthly mixed-review assignment that deliberately folds in earlier topics

SUPPORT INCLUDED

Dedicated mentor: The same mentor for all 24 classes, who knows exactly where your agents, portfolio and preparation stand
Whatsapp doubts: Doubt support between classes over WhatsApp
Practice environment: Help setting up your Copilot Studio environment in Class 1, including the trial path for college accounts and an arranged practice environment where needed
Session recordings: Class recordings available for revision, so a missed detail is never lost

CERTIFICATION DETAIL

Completion: Certificate from Modern Age Coders, awarded on passing the final assessment. Fall short and there is focused revision and a free retest: the certificate certifies real learning, not attendance

WHERE THIS CAN LEAD

- AI agent builder or automation specialist roles, the job titles now appearing in listings as enterprises staff their agent programmes
- Power Platform maker and business technologist tracks, where Copilot Studio fluency is the differentiator
- Microsoft's credential ladder with course-to-exam mapping: PL-900 Power Platform Fundamentals, the Applied Skills labs (APL-6006 and APL-6000), and Microsoft Certified: AI Agent Builder Associate (AB-620)
- Operations, support and analyst roles upgraded: the person who automates the workflow rather than performing it manually
- A bridge to pro-code agent work through our Codex + Claude Code masterclass, with MCP knowledge that transfers directly

COMMON QUESTIONS ABOUT THIS COURSE

For anything about cost, use PART 4 and RULE 1. Do not quote two regions.

Q: Do I need to know how to code to take this Copilot Studio course?
A: No. Microsoft Copilot Studio is a graphical, low-code studio: agents are designed with plain-English instructions, curated knowledge sources and a visual canvas. The course teaches everything from first principles. If you do code, the REST API, custom connector and Model Context Protocol classes give you room to go deeper, but no class assumes programming.

Q: What will I actually build during the 24 classes?
A: One real project per class: a placement FAQ agent grounded in a real company's site with checkable citations, a society helpdesk with designed topics and condition logic, an internship tracker with entity-driven capture and card views, an expense automation built on an agent flow, a live REST API tool, an MCP server integration, an autonomous status reporter running on event triggers with approval pauses, a multi-agent split, and a published business-grade capstone with a full documentation packet.

Q: Why is this course 1-on-1 only?
A: Because the skill lives in artifacts that need individual review: your instructions, source lists, flow designs, tool contracts and evaluation results. A private mentor reads and critiques all of them every class, and rebuilds projects around your actual clubs, departments and placement goals. That review loop is what produces students who can defend their design decisions in interviews, and it cannot be delivered honestly to a batch.

Q: What Microsoft account do I need, and is there a free way to practise?
A: Copilot Studio uses a Microsoft work or school (Entra ID) account rather than a personal email. Most college email addresses qualify for Microsoft's 30-day self-serve trial, which covers in-studio building and testing but cannot publish agents. Where a suitable account is not available, we arrange a practice environment for the duration of the course. Your mentor completes the setup with you in Class 1.

Q: Does this course prepare me for Microsoft certifications?
A: Yes, deliberately. The syllabus vocabulary maps to PL-900 Power Platform Fundamentals, which added a dedicated Copilot Studio agents domain in its July 2026 skills update, and to the hands-on Applied Skills labs 'Build an agent in Microsoft Copilot Studio' and 'Enhance agents with autonomous capabilities'. The headline credential is Microsoft Certified: AI Agent Builder Associate (exam AB-620), whose domains (plan and configure, integrate and extend, test and manage) mirror Phases 2 through 5, and Class 24 ends with your personal AB-620 preparation plan.

Q: Is Copilot Studio genuinely an employable skill or a passing trend?
A: The deployment numbers are unusually concrete: Microsoft states that 90% of the Fortune 500 use Copilot Studio, and reported more than 230,000 organizations building with it as far back as April 2025. Gartner projects that by 2029 at least half of knowledge workers will need skills to work with, govern or create AI agents, and that a third of enterprise software will include agentic AI by 2028. The course also teaches the governance and evaluation discipline that outlasts any single platform.

Q: How current is the syllabus, given how fast the platform changes?
A: It is a Living Syllabus, re-verified against Microsoft's official documentation and What's New pages as features ship. The current syllabus covers generative orchestration, the present model lineup (GPT-4.1 default, GPT-5.5 Chat, and Anthropic Claude models), Model Context Protocol tools, the A2A multi-agent protocol, agent evaluations and Entra Agent IDs, all of which reached the platform within roughly the last year.

Q: How is this different from your Codex + Claude Code course?
A: They are complementary tracks. Codex + Claude Code is pro-code: you drive AI coding agents from the command line to ship software. This course is the low-code business track: you design, ground and govern agents in Microsoft Copilot Studio, the way operations, support and business teams deploy them. MCP knowledge transfers between both. Many students take this course first for the portfolio and vocabulary, then go pro-code.

Q: How am I assessed, and is the certificate just for showing up?
A: No. A task follows every class with feedback, monthly reviews deliberately mix new material with earlier topics so nothing is forgotten, and the course ends with a final project defended live, plus a written assessment. Passing earns the certificate; falling short earns focused revision and a free retest. We measure real learning, not attendance.

To enrol, message Shivam Sir on +91 9123366161 or send the parent this link: https://learn.modernagecoders.com/courses/ai-agents-with-microsoft-copilot-studio-course-for-college-students
For a demo: the Priority Live Demo (guaranteed, today or tomorrow) is booked at https://learn.modernagecoders.com/priority-demo . The free demo is a waiting list with no fixed date.

==========
COURSE 8 OF 137: AI AGENTS WITH MICROSOFT COPILOT STUDIO FOR TEENS
==========

Course link: https://learn.modernagecoders.com/courses/ai-agents-with-microsoft-copilot-studio-course-for-teens

Subject area: AI Agents & Automation
Designed for: Teens
Who can join: Beginner (ages 13-18; no coding experience needed)
Course length: 24 classes (12 weeks · 2 classes/week)
Time needed: 3-4 hours/week recommended
Certificate: Certificate from Modern Age Coders, awarded on passing the final assessment

PRICE FOR THIS COURSE (quote only the one that applies to the person asking)
  In India, per month: one to one Rs 4,999
  Outside India, per month: one to one $150
  Classes: one to one in India one live class a week, four a month; one to one outside India two live classes a week, eight a month. Each class is one hour.
  Note: this course is taught one to one only. There is no group or mini batch option.
  Note: the course length above is counted at two classes a week. In India the one to one plan is one class a week, so if an Indian family asks how long it will take, hand over to Shivam Sir.

WHAT THIS COURSE IS

  Build real AI agents with Microsoft Copilot Studio in 24 live 1-on-1 online classes for ages 13-18: knowledge grounding, topics, connectors, agent flows, autonomous triggers and a published capstone agent. No heavy coding needed.

  In one line: Stop just chatting with AI. Design, ground, and publish your own AI agents on the platform 90% of the Fortune 500 already use, in private 1-on-1 classes built around your ideas.

ABOUT THE PROGRAMME

  Every teenager has used a chatbot. Almost none of them have built an agent: an AI that knows a specific subject deeply, follows instructions it was given, uses tools, and acts on its own when something happens. That is exactly the skill this course teaches, on Microsoft Copilot Studio, the graphical low-code studio Microsoft describes as the way to build and manage AI-powered agents and workflows. Across 24 live 1-on-1 classes you go from your very first agent (described in plain English, tested the same hour) to agents grounded in real knowledge sources with citations, conversation design with topics and trigger phrases, tools built from connectors and agent flows, an autonomous agent that wakes up on an event trigger and works without you, and a published capstone agent demonstrated live on a website and shared for feedback. Along the way you learn the ideas that make agents trustworthy: grounding versus guessing, why an agent should cite its sources, what an agent should refuse to do, and how professionals measure whether an agent actually helped. Because every class is private, your mentor builds the whole course around agents you actually care about: a study buddy grounded in your own class notes, a quiz coach for your next exam, a club FAQ agent, a family trip planner. The syllabus is a Living Syllabus, updated as Copilot Studio ships new features, so you learn the current platform, never a frozen snapshot of last year's tool.

WHAT MAKES THIS COURSE DIFFERENT

  - 1-on-1 only, by design: agent building is a design discipline, and a private mentor can review your instructions, your knowledge sources, and your conversation maps line by line, which a group class simply cannot do.
  - Real platform, real skills: you work in Microsoft Copilot Studio itself, the same low-code agent studio used across enterprises, with topics, knowledge, tools, triggers and analytics, not a toy sandbox.
  - No heavy coding needed: Copilot Studio is a graphical, low-code studio, so the course runs on clear thinking and good instructions; teens who do code can go further with connectors and REST APIs in the same syllabus.
  - Agents that act, not just answer: by Phase 4 your agent responds to event triggers (a file added, a task completed, a schedule) and works autonomously, which is the difference between a chatbot and an agent.
  - Honest AI habits from Class 1: grounding answers in sources, keeping citations on, deciding what an agent must refuse, and testing before publishing, the same responsible-AI defaults professionals are held to.
  - Living Syllabus: Copilot Studio ships new models and features continuously (the current lineup includes GPT-5.5 Chat and Anthropic Claude models), and the curriculum is updated as they land, so nothing you learn is stale.

WHAT A STUDENT NEEDS BEFORE STARTING

  Device: A laptop or desktop (Windows, Mac or Linux) with the Chrome or Edge browser and a reliable internet connection; Copilot Studio runs fully in the browser
  Coding experience: None needed. Copilot Studio is a graphical, low-code studio; clear thinking and good writing matter far more than syntax. Teens who already code can go deeper into connectors and REST tools inside the same syllabus
  Accounts: Copilot Studio uses a Microsoft work or school account rather than a personal email. Many students already have one from school; if you do not, we arrange access to a practice environment for the course, and for students under 18 a parent or guardian accepts Microsoft's terms
  Mindset: Curiosity about how AI actually works, and the patience to test before you trust. The course rewards students who ask 'how do I know this answer is right?'

WHO THIS COURSE IS FOR

Curious builders: Teens who use ChatGPT or Copilot daily and are ready to move from asking AI questions to building AI that answers them
Future professionals: Students eyeing careers in technology, product or business who want the agent-building vocabulary employers now test, on the platform 90% of the Fortune 500 use
Non coders: Teens who thought AI was locked behind programming: Copilot Studio's low-code canvas makes design thinking, not syntax, the superpower
Young coders: Students from our Python or web development courses who want to see where low-code agents meet APIs, REST and Model Context Protocol
Portfolio hunters: Teens building a portfolio for internships or university applications who want a published, working agent to show, not a certificate alone

FULL CURRICULUM, WEEK BY WEEK

This is the complete teaching plan. Parents can ask about any week.

PHASE 1: YOUR FIRST AGENTS

Understand what an AI agent actually is, tour Microsoft Copilot Studio, build your first agent from a plain-English description, and learn how instructions and testing really work.

Class 1: What an AI Agent Really Is (and What It Is Not)
Topics:
- Chatbot vs assistant vs agent: an agent has instructions, knowledge, tools and can act, not just answer
- Agents you already meet every week: support bots, order trackers, school helpdesks, and what they get right and wrong
- Microsoft Copilot Studio in one sentence: a graphical, low-code studio for building and managing AI-powered agents and workflows
- The guided tour: agents, knowledge, topics, tools, triggers, channels and analytics, and what each tab is for
- How access works honestly: Copilot Studio uses a Microsoft work or school account, and your mentor gets your practice environment ready with you in this class
- The anatomy of every agent you will build: name, description, instructions, knowledge, tools, and where each lives
- Setting the course goal: the capstone agent you will publish in Class 24, chosen from your own school, club or family life
Projects built:
- Agent safari: analyse two real agents you have used (a support bot, a game helper), map what their instructions and knowledge must look like, and write a one-page teardown
Practice: List five agent ideas from your own week (study, club, family, hobby) and rank them by how much real knowledge each would need.
Assessment: Explain the difference between a chatbot and an agent in two sentences, using the words instructions, knowledge and tools correctly.

Class 2: Your First Agent in One Hour
Topics:
- Describe-to-create: starting an agent from a plain-English description of what it should do
- Writing your first instructions: role, audience, tone, and the three behaviours your agent must always show
- The test panel: talking to your agent the moment it exists, and reading its answers critically
- Iteration as the core loop: change one instruction line, retest, compare, keep or revert
- Naming, descriptions and icons: why a clear agent description matters for users and for you
- What the model does with your instructions: a teen-friendly picture of how a large language model follows a system prompt
- Saving versions of your instruction text outside the tool, the habit that saves every project later
Projects built:
- Build 'Study Buddy v1': an agent with instructions for your real timetable and subjects that answers revision questions in a tone you designed
Practice: Rewrite your agent's instructions three different ways and record how each version changes the same test question's answer.
Assessment: Show a before-and-after: one instruction change and the exact behaviour difference it caused in the test panel.

Class 3: Instructions That Actually Steer Behaviour
Topics:
- The instruction stack: identity, scope, tone, format rules, and refusals, in that order
- Scope fences: telling an agent what it must NOT do, and testing that the fence holds
- Tone control for real audiences: the same agent for classmates vs teachers vs grandparents
- Format discipline: making answers arrive as steps, tables or short paragraphs on demand
- Refusal design: choosing the questions your agent should decline (medical advice, personal data, exam cheating) and wording the refusal kindly
- Instruction smells: vague verbs, contradictions, and instructions that fight each other
- A/B testing instructions: running the same 10 questions against two instruction sets and

scoring the answers
Projects built:
- The Refusal Gauntlet: write 10 questions your Study Buddy must refuse or redirect, then tune instructions until all 10 are handled gracefully
Practice: Take a classmate's (or parent's) three trickiest questions and tune your instructions until the answers pass their review.
Assessment: Present your instruction stack and defend each line: what breaks if it is removed?

Class 4: Testing Like a Professional
Topics:
- Why 'it answered nicely once' is not evidence: building a fixed test set of 15 questions
- Happy path, edge case, and adversarial questions: three test types every agent needs
- Reading answers critically: correctness, tone, format, and whether the agent stayed in scope
- Regression testing by hand: rerunning your test set after every meaningful change
- Keeping a test log: question, expected behaviour, actual behaviour, verdict
- When the agent is confidently wrong: recognising hallucination before you have knowledge sources to fix it
- The professional habit this course grades you on: no change ships without a retest
Projects built:
- Build your permanent 15-question test set for Study Buddy, with expected behaviour written down before you run it
Practice: Run your full test set twice this week and log every verdict; bring the two failures you found to class.
Assessment: Given a transcript of an agent conversation, mark every line as pass or fail against the written instructions.

Class 5: How the Platform Thinks: Environments, Models and Harnesses
Topics:
- Where agents live: environments, and why your practice environment is separate from a company's production one
- The model picker: Copilot Studio agents run on a chosen model (the lineup currently includes GPT-4.1 as default, GPT-5.5 Chat, and Anthropic Claude models), and what changing it does
- Harnesses in plain words: the runtime between your design and the model, and why Microsoft now ships more than one
- What is free and what costs money: Copilot Credits exist, adults pay for capacity, and testing in class is covered by your practice environment
- Responsible-AI defaults you inherit: content filters and guardrails the platform applies before your instructions even run
- Saving and organising agents so week-12-you can find what week-2-you built
- Checkpoint: everything in one map, from your typed instruction to the model's answer
Projects built:
- Draw the journey of one question through your agent: user, harness, instructions, model, answer, and label the parts you control
Practice: Try the same three test questions on two different models in the picker and write down every difference you can defend.
Assessment: Phase 1 review: rebuild a small agent from a written spec in 20 minutes, with instructions, a refusal, and a 5-question test.

PHASE 2: KNOWLEDGE & GROUNDING

Give your agent real knowledge: websites, documents and SharePoint sources, citations users can check, and the discipline of grounding answers instead of guessing.

Class 6: Grounding vs Guessing
Topics:
- Why a bare model guesses: training data vs your data, in a picture a friend could follow
- Knowledge sources in Copilot Studio: public websites, uploaded documents, SharePoint, Dataverse, and connector-indexed enterprise data
- Generative answers: how the agent searches your sources and composes an answer from what it found
- Citations: why the little source link is the most trustworthy pixel on the screen
- The 'Allow ungrounded responses' setting, and why this course keeps it off by default
- Limits that shape design: sources per agent, website counts, and file size ceilings exist, so knowledge is curated, not dumped
- Choosing knowledge for your capstone: authoritative, current, and small enough to verify
Projects built:
- Ground Study Buddy in one real source (your school's public website or a subject site) and prove three answers now cite it
Practice: Ask your grounded agent five questions its source cannot answer and observe exactly how it behaves at the edge of its knowledge.
Assessment: Explain grounding, citation and hallucination to a parent in under two minutes; they grade you.

Class 7: Document Knowledge Done Right
Topics:
- Uploading documents as knowledge: what formats work well and what makes a document searchable
- Writing documents FOR agents: headings, one fact per paragraph, and names spelled

consistently
- The curation habit: five great pages beat fifty messy ones, every time
- Testing document knowledge: questions whose answers live in one exact paragraph
- Updating knowledge: what happens when the source document changes and the agent must not lag behind
- Privacy first pass: what should never go into an agent's knowledge (family data, friends' names, anything you would not print)
- Building the knowledge pack for your own subjects: notes that become a genuinely useful revision agent

Projects built:
- Create a clean 3-document knowledge pack from your own class notes and ground a Revision Coach agent in it, with a 10-question proof test

Practice: Deliberately break one document (vague headings, mixed topics), watch answer quality drop, then fix it and retest.

Assessment: Given two versions of the same document, predict which grounds better and verify by testing both.

Class 8: Multi-Source Knowledge and Conflicts

Topics:
- Combining sources: website plus documents plus a SharePoint folder, and how the agent picks
- When sources disagree: seeing conflicting-answer behaviour and designing around it
- Source scoping: pointing a question type at the right source with instructions
- Freshness: preferring the source that updates (a website) for facts that change
- The web question: what 'Use information from the web' changes, and when a curated agent should leave it off
- Auditing an agent's knowledge like a librarian: what is in, what is out, what is stale
- Knowledge design for the capstone: writing the source list you will defend in Class 24

Projects built:
- Build 'Club Desk': an agent for a real club or activity grounded in two sources, with documented behaviour when sources conflict

Practice: Write five questions that force your agent to choose between its sources and log which one wins each time.

Assessment: Defend your capstone source list: for each source, why it is authoritative and how you will keep it current.

Class 9: Honest Agents: Accuracy, Bias and Boundaries

Topics:
- Measuring accuracy properly: scoring 20 grounded answers against the source text itself
- Bias in, bias out: how a one-sided source list produces a one-sided agent
- Uncertainty language: making the agent say 'my sources do not cover that' instead of improvising
- Personal data rules for minors, in plain words: what an agent about your life may never store or repeat
- Academic honesty: a revision agent that teaches you vs one that does your homework, and where this course draws the line
- What professionals add later: evaluation suites and monitoring, previewed honestly so you know where this road goes
- Phase 2 wrap: the grounding checklist you will apply to every agent from now on

Projects built:
- Accuracy audit: score 20 answers from Revision Coach against the actual source paragraphs and publish your agent's accuracy number with examples

Practice: Add an uncertainty rule to every agent you own and collect three real 'my sources do not cover that' responses.

Assessment: Phase 2 exam: given a topic, design the full knowledge plan (sources, scoping, refusals, accuracy test) in writing.

PHASE 3: CONVERSATION DESIGN

Design conversations deliberately: topics and trigger phrases, questions and variables, condition logic, adaptive cards, and the two orchestration modes that decide how your agent thinks.

Class 10: Topics and Trigger Phrases

Topics:
- What a topic is: a designed conversation path for one job your agent does
- Trigger phrases: teaching the agent the many ways people ask for the same thing (topics support up to 200)
- The topics you get for free: greeting, goodbye, escalate, and why system topics exist
- Building a topic on the authoring canvas: message nodes, question nodes, and the flow between them
- When to use a topic vs when to let generative answers handle it: control vs flexibility
- Peeking under the canvas: every topic is also code (YAML), the first hint that low-code and pro-code meet
- Designing your agent's topic map: the five jobs users will actually ask it to do

Projects built:
- Build a 'Homework Planner' agent with three hand-designed topics: add a task, list this week, and what should I do first

Practice: Collect ten real phrasings of one request from friends or family and add the

best ones as trigger phrases, then test recognition.
Assessment: Given three user messages, predict which topic each will trigger and verify live.

Class 11: Questions, Entities and Variables
Topics:
- Question nodes: asking for exactly the information a topic needs, one clean question at a time
- Entities: how the agent extracts a date, a number, a choice from a messy sentence
- Variables: storing what the user said and reusing it later in the conversation
- Slot filling: when a user gives three answers in one sentence and the agent skips already-answered questions
- Choice questions vs open questions: constraining answers when structure matters
- Validating input: what happens when the user answers a date question with 'idk, whenever'
- Conversation memory across a session: what your agent remembers and what it forgets

Projects built:
- Upgrade Homework Planner: the add-a-task topic now collects subject, due date and effort through entities and confirms with a summary using variables

Practice: Test the same topic with cooperative, messy and hostile answers; log where extraction fails and tighten the questions.
Assessment: Trace a conversation on paper: name the entity and variable at each step before running it live.

Class 12: Condition Logic and Branching
Topics:
- Condition nodes: sending the conversation down different paths based on variables
- Condition groups: combining tests (subject is maths AND due tomorrow) without spaghetti
- Designing branches on paper first: a flow diagram before ever touching the canvas
- The escalation branch: recognising 'this needs a human' and saying so
- Default branches: the path for everything you did not predict
- Testing branch coverage: one test conversation per path, no path untested
- Refactoring topics: splitting one giant topic into three small clean ones

Projects built:
- Build 'Event Helper' for a real school or family event: RSVP path, question path, and organiser-escalation path, all condition-driven

Practice: Draw your Event Helper flow as a diagram, then have your mentor try to reach a dead end you did not design.
Assessment: Given a flow diagram with a logic bug, find and fix the bad branch in one session.

Class 13: Adaptive Cards and Rich Responses
Topics:
- Beyond plain text: adaptive cards for structured, tappable answers
- Card anatomy: title, facts, images, actions, and when a card beats a paragraph
- Designing cards for small screens: your agent will mostly be read on phones
- Buttons that continue the conversation: card actions feeding back into topics
- Consistency: a small card style guide so your agent looks designed, not assembled
- Accessibility basics: alt text and reading order, because agents are for everyone
- When NOT to use a card: the restraint that separates designers from decorators

Projects built:
- Give Homework Planner a card-based weekly view: each task a card with subject, due date and a 'mark done' action

Practice: Convert your three most-used answers into cards and A/B them with two real users against the text versions.
Assessment: Card critique: improve a deliberately ugly card (walls of text, no hierarchy) and justify each change.

Class 14: Generative Orchestration vs Classic
Topics:
- Two brains, one agent: classic orchestration (trigger phrases pick topics) vs generative orchestration (the model plans across topics, knowledge and tools)
- What generative orchestration unlocks: multi-intent requests, tool choice, and the autonomous triggers you will use in Phase 4
- What you trade: predictability, and how instructions rein the planner back in
- Watching the plan: reading how the agent decided which topic, knowledge source or tool to use
- Mixing modes wisely: designed topics for the critical paths, generative flexibility for the long tail
- Guardrails under orchestration: scope fences and refusals still rule, and you retest them now
- Phase 3 wrap: your conversation-design checklist, from trigger phrases to orchestration choice

Projects built:
- Switch Event Helper to generative orchestration, rerun your full test set, and document every behaviour change with a keep-or-fix verdict

Practice: Craft three multi-intent messages ('RSVP yes and what time and can my sister come') and tune until all three resolve cleanly.
Assessment: Phase 3 exam: design a five-topic agent on paper (topics, entities, branches, cards, orchestration mode) and defend the design.

PHASE 4: TOOLS & AUTONOMY

Make your agent act: connectors and Prompt tools, agent flows for multi-step work, a first look at Model Context Protocol, then event triggers and a fully autonomous agent with analytics to prove it works.

Class 15: Tools: Giving Your Agent Hands

Topics:

- The tool menu: Prompt, Agent flow, Custom connector, Model Context Protocol and REST API, and what each is for
- Connectors: Copilot Studio's library of more than 1,400 prebuilt connections to real services
- Your first tool: a Prompt tool that does one transformation perfectly (summarise, translate, rewrite)
- Tool descriptions matter: the agent chooses tools by reading their descriptions, so you write them carefully
- Fewer, better tools: the platform allows many tools per agent, professionals deliberately keep the list short
- Safety question of the day: what is this tool allowed to touch, and who said so
- Planning the tools your capstone actually needs (usually two, rarely five)

Projects built:

- Add a 'flashcard maker' Prompt tool to Revision Coach: paste messy notes, get clean question-answer pairs, every time

Practice: Write two versions of your tool's description and show how the wording changes when the agent decides to use it.

Assessment: Explain to your mentor, without notes, how an agent decides between answering directly, using knowledge, and calling a tool.

Class 16: Agent Flows: Multi-Step Work That Always Runs the Same

Topics:

- Agent flows: deterministic step-by-step automations your agent can call as a tool
- Flow anatomy: trigger, steps, conditions, and outputs handed back to the conversation
- When a flow beats the model: anything that must happen exactly the same way every time
- Building a notify flow: collect details in conversation, send a formatted email or Teams message
- Error paths in flows: what the user sees when a step fails, and why silence is never acceptable
- Flows vs topics: designed conversation vs designed action, and how they hand off
- Reading a flow run: inputs, outputs and the step where things went wrong

Projects built:

- Build 'Permission Slip': Event Helper collects details, an agent flow sends a tidy summary email to the organiser (a parent or teacher), and the agent confirms with the flow's result

Practice: Break your flow on purpose (bad input, missing field), observe the failure, then add the error path that makes it graceful.

Assessment: Given a task description, decide flow or topic or Prompt tool, and justify the choice in three sentences.

Class 17: Connecting to the Real World: Connectors, REST and MCP

Topics:

- Using a prebuilt connector as a tool: real services (To Do, Calendar, SharePoint) inside your conversation
- Authentication in plain words: why tools ask 'connect your account' and what is being granted
- REST APIs, demystified: request in, JSON out, and how an agent turns that into an answer
- Model Context Protocol (MCP): the open standard for plugging tool servers into agents, added from the same Add-a-tool menu
- Why MCP matters beyond Microsoft: the same protocol appears in Claude, IDEs and other agent platforms you already know
- Governance preview: connector access is policy-controlled in real companies, so 'can' and 'may' are different questions
- Choosing the responsible option: the least-powerful tool that does the job

Projects built:

- Wire one real connector tool into a practice agent (task list or calendar lookup) and demonstrate a conversation that reads and writes real data

Practice: Map one API you wish existed for your life (canteen menu, bus times) and write the tool description and three test utterances for it.

Assessment: Sketch the path of one tool call end to end: utterance, orchestration, tool choice, call, result, answer.

Class 18: Event Triggers: Agents That Wake Up by Themselves

Topics:

- The autonomy switch: event triggers let an agent act with no user in the chat at all
- Trigger types that matter: item created (SharePoint), file added (OneDrive), task completed (Planner), and Recurrence for schedules
- The trigger payload: the event's data arriving as input, and instructions deciding what to do with it
- Generative orchestration required: why autonomous behaviour needs the planning brain from Class 14
- The security fact professionals underline: triggers run with the maker's credentials, so you design as if everything it does is signed by you
- Designing the first autonomous job: small, observable, reversible

- Logging what your agent did while you were at school: the activity trail habit
Projects built:
- Build 'Drop Folder Librarian': when a file lands in a watched folder, the agent files a tidy summary card automatically, on a Recurrence backup schedule
Practice: Feed your autonomous agent five files while you are away from the keyboard and audit its five actions afterwards, scoring each.
Assessment: Explain maker-credential risk in your own words and name the two design rules you applied because of it.

Class 19: Your Autonomous Agent, Hardened
Topics:
- From demo to dependable: retries, idempotence in plain words (running twice must not double the damage)
- Human-in-the-loop: which autonomous actions should pause for approval, and how to design the pause
- Notification etiquette: an autonomous agent that spams is an autonomous agent that gets turned off
- Failure diaries: capturing what went wrong so Tuesday's bug is not repeated on Thursday
- Scope creep in autonomy: resisting the urge to let the agent 'also just' do one more thing
- Multi-agent preview: child agents and connected agents exist, and when one agent should become two
- Rehearsing the demo: showing autonomous behaviour live without praying
Projects built:
- Harden Drop Folder Librarian: add an approval pause for deletes, an error diary, and a weekly self-report message, then run it for three real days
Practice: Write the one-page 'operations note' for your agent: what it does, when, with whose permissions, and how to turn it off.
Assessment: Live drill: your mentor breaks one input; your agent must fail gracefully and your diary must show why.

Class 20: Analytics: Proving Your Agent Works
Topics:
- The analytics view: sessions, outcomes (resolved, escalated, abandoned), and what each outcome means
- Reading transcripts respectfully: real conversations are the best design feedback you will ever get
- Customer satisfaction in miniature: asking users to rate your agent and surviving the answers
- Finding the gap: the questions users asked that your agent could not handle, ranked
- Evaluations, previewed: professionals run test sets automatically against agents; you have been doing it by hand since Class 4
- The improvement loop: analytics, hypothesis, one change, retest, remeasure
- Phase 4 wrap: tools, autonomy and analytics as one system, ready for the capstone
Projects built:
- Analytics sprint: put one agent in front of five real users for a week, read every session, and ship two improvements the data demanded
Practice: Write your capstone's success metrics before building it: three numbers that will define 'it works'.
Assessment: Phase 4 exam: from a set of session transcripts, diagnose the top failure and propose the one-line fix, then prove it.

PHASE 5: PUBLISH & CAPSTONE

Publish agents to real channels, pass a safety and quality checklist, then design, build, test and present a capstone agent that does a real job for real people.

Class 21: Channels: Where Agents Live
Topics:
- The channel lineup: demo website, custom website, Microsoft Teams and Microsoft 365 Copilot, SharePoint, and even WhatsApp in business setups
- Publishing flow: from the studio to a shareable demo website in one class
- How the same agent feels different per channel: phone vs desktop vs inside Teams
- Access decisions: who can reach your agent, and why 'everyone' is rarely the right answer
- Versioning discipline: what publishing again replaces, and how not to break your live users
- The Agent Store idea: in companies, published agents go through an admin's approval, a preview of real-world governance
- Choosing your capstone's channel and writing its one-paragraph launch plan
Projects built:
- Publish Homework Planner to the demo website and run a supervised test with two real users on their own phones
Practice: Collect structured feedback from your two testers (what confused, what delighted) and file it against Class 23's build time.
Assessment: Explain what changes and what stays the same when one agent is published to two different channels.

Class 22: The Pre-Flight Checklist: Safety, Quality, Honesty
Topics:
- The publishing checklist professionals use: scope fences retested, refusals verified, sources cited, personal data audited

- Prompt injection for teens: how a malicious message tries to hijack instructions, and the defensive habits that blunt it
- Data minimisation: your agent stores the least it can and forgets what it should
- Transparency: users must know they are talking to an agent, and what it can and cannot do
- Credits and cost awareness: agent usage is metered in real deployments (Copilot Credits), and design choices change the bill
- Accessibility and kindness passes: language level, error tone, and the user having a bad day
- Signing off: the written go / no-go your mentor countersigns before capstone launch

Projects built:
- Run the full 20-point pre-flight checklist against your published agent, fix the failures, and produce the signed one-page audit

Practice: Attempt three prompt-injection attacks on your own agent, document what happened, and add one mitigation.

Assessment: Checklist mastery: audit a deliberately flawed agent spec and catch at least four of its five planted problems.

Class 23: Capstone Build Week

Topics:
- Freezing the spec: the capstone's job, users, sources, tools, trigger and channel on one page
- Building in the right order: knowledge first, topics second, tools third, trigger last
- Timeboxing with a mentor: what gets cut when reality bites, and why the core loop is protected
- The test set as safety net: your fixed questions rerun after every build milestone
- Polish that matters: greeting, name, description, card style, error tone
- Dress rehearsal: the full demo run, timed, with one planned failure recovery
- Presentation craft: showing the design decisions, not just the happy path

Projects built:
- Build the complete capstone agent: grounded knowledge, at least two designed topics, one tool or agent flow, one trigger if autonomous, published to your chosen channel

Practice: Run the dress rehearsal for a family member and cut or fix the two weakest moments of the demo.

Assessment: Milestone gate: the capstone passes its own test set and pre-flight checklist before demo day.

Class 24: Demo Day and What Comes Next

Topics:
- The live demo: your capstone, in front of a real audience, on a real channel, with citations showing
- Defending design decisions: why these sources, these topics, this tool, this trigger
- The retrospective: what you would build differently, the most honest slide in any deck
- Your portfolio: the capstone plus the practice agents, packaged so a school or interviewer can browse them
- The credential road: Microsoft's PL-900 Power Platform Fundamentals now has a Copilot Studio agents domain, and the Applied Skills lab 'Build an agent in Microsoft Copilot Studio' is the natural next rung
- Where this skill goes: Gartner projects that by 2029 at least half of knowledge workers will need to work with, govern or create AI agents
- Certificate, feedback, and the Living Syllabus promise: what changed in Copilot Studio while you were learning it

Projects built:
- Deliver the capstone demo and hand over the full packet: spec, source list, test log, audit page and a two-minute recorded walkthrough

Practice: Write your next agent's one-page spec unprompted, because you will not stop at one.

Assessment: Final evaluation: capstone demo, design defence, and the complete documentation packet, graded against the rubric from Class 20.

PROJECTS THE STUDENT BUILDS AND KEEPS

- Phase 1: an agent teardown, Study Buddy v1 from a plain-English description, a refusal gauntlet, a permanent 15-question test set, and a full map of how a question travels through the platform
- Phase 2: a website-grounded Study Buddy with citations, a 3-document Revision Coach with a proof test, a two-source Club Desk with conflict handling, and a published accuracy audit
- Phase 3: a Homework Planner with designed topics, entity-driven task capture, a condition-driven Event Helper, card-based weekly views, and a generative-orchestration migration with documented behaviour changes
- Phase 4: a flashcard-maker Prompt tool, a Permission Slip agent flow with graceful errors, a real connector tool reading and writing live data, the autonomous Drop Folder Librarian, its hardened successor with approval pauses, and an analytics sprint with shipped improvements
- Phase 5: a published agent tested by real users, a signed 20-point pre-flight audit, the complete capstone build, and a demo-day presentation with a full documentation packet
- Total: 24 hands-on projects, one per class, finishing with a published capstone agent

Total projects: 24 hands-on projects, one per class, finishing with a published capstone agent

SKILLS THE STUDENT WILL HAVE AT THE END

- Agent design: instructions, scope fences, refusals and tone control

- Knowledge grounding: websites, documents and SharePoint sources with citations
- Conversation design: topics, trigger phrases, entities, variables and condition logic
- Adaptive cards and mobile-first response design
- Generative orchestration vs classic orchestration, chosen deliberately
- Tools: Prompt tools, connectors, agent flows, and a working understanding of REST and Model Context Protocol
- Autonomous agents: event triggers, recurrence schedules, human-in-the-loop approvals
- Analytics and evaluation: outcomes, transcripts, test sets and the improvement loop
- Publishing: demo and custom websites, Teams, and the pre-flight checklist that gates a launch
- Responsible AI habits: grounding, transparency, data minimisation and injection awareness

HOW A TYPICAL WEEK IS SPLIT

Live classes: 2 private 1-on-1 classes per week, about 1 hour each, across 12 weeks
Hands on agent work: 1-1.5 hours building and testing in Copilot Studio between classes
Project time: 1 hour completing each class project, usually inside your own agents
Review and doubts: 20-40 minutes reviewing feedback and clearing doubts over WhatsApp before the next class
Homework: A task or problem set after every class, and a monthly mixed-review assignment that deliberately folds in earlier topics

SUPPORT INCLUDED

Dedicated mentor: The same mentor for all 24 classes, who knows exactly where your agents and your understanding stand
Whatsapp doubts: Doubt support between classes over WhatsApp
Practice environment: Help setting up your Copilot Studio practice environment in Class 1, including the account path for students under 18
Session recordings: Class recordings available for revision, so a missed detail is never lost

CERTIFICATION DETAIL

Completion: Certificate from Modern Age Coders, awarded on passing the final assessment. Fall short and there is focused revision and a free retest: the certificate certifies real learning, not attendance

WHERE THIS CAN LEAD

- A visible head start toward roles that now appear in real job listings: AI agent builder, automation specialist, Power Platform maker
- Microsoft's own credential ladder: PL-900 Power Platform Fundamentals (which now includes a Copilot Studio agents domain), then the Applied Skills lab 'Build an agent in Microsoft Copilot Studio'
- A published capstone agent and portfolio that make school projects, internship applications and university statements concrete
- The design-and-test discipline (grounding, refusals, evaluation) that transfers to every AI platform, not just Microsoft's
- A natural bridge into our Codex + Claude Code course when you are ready to build agents with real code

COMMON QUESTIONS ABOUT THIS COURSE

For anything about cost, use PART 4 and RULE 1. Do not quote two regions.

Q: Does my teenager need to know coding to build AI agents in Copilot Studio?
A: No. Microsoft Copilot Studio is a graphical, low-code studio: agents are built from instructions written in plain English, knowledge sources, and a visual conversation canvas. The skills that matter are clear thinking, good writing and honest testing, and the course teaches all three.

Q: Why is this course taught 1-on-1 only?
A: Because agent building is a design discipline. The mentor reviews your child's actual instructions, knowledge sources and conversation maps line by line every class, and rebuilds the projects around their real school, clubs and interests. That per-student review loop is what makes students genuinely good at this, and it cannot be done honestly in a group format.

Q: Does my teen need a special Microsoft account for Copilot Studio?
A: Copilot Studio uses a Microsoft work or school account rather than a personal email. Many students already have a school-provided Microsoft account that works. If not, we arrange access to a practice environment for the duration of the course, and for students under 18 a parent or guardian accepts Microsoft's terms. Your mentor handles the setup with you in the first class.

Q: Is Copilot Studio a real professional skill or just a learning tool?
A: It is the same product enterprises run: Microsoft's own materials state that 90% of the Fortune 500 use Copilot Studio, and Microsoft's cloud reported more than 230,000 organizations building with it as far back as April 2025.

Q: How current is the syllabus, given how fast AI tools change?

A: It is a Living Syllabus, re-verified against Microsoft's official documentation and What's New pages as features ship. Students on the current syllabus learn the present-day platform: generative orchestration, the current model lineup including GPT-5.5 Chat and Anthropic Claude models, Model Context Protocol tools, autonomous event triggers and agent analytics. When Copilot Studio changes, the course changes.

Q: What age is this course for, and does it suit complete beginners?
A: It is designed for ages 13-18 and assumes no prior experience with coding or AI tools beyond ordinary chatting. Classes 1-5 build everything from first principles. For students younger than 13 we recommend our kids' coding and AI-literacy courses first, since Microsoft's own AI tools set 13 as the general minimum age for its consumer Copilot.

Q: What does my child have at the end to show for it?
A: A published capstone agent demonstrated live to a real audience, a portfolio of 24 documented projects, a written accuracy audit and pre-flight safety checklist they produced themselves, a Modern Age Coders certificate earned by defending the capstone, and a mapped next step toward Microsoft's PL-900 credential if they want the official ladder.

Q: How am I assessed, and is the certificate just for showing up?
A: No. A task follows every class with feedback, monthly reviews deliberately mix new material with earlier topics so nothing is forgotten, and the course ends with a final project defended live, plus a written assessment. Passing earns the certificate; falling short earns focused revision and a free retest. We measure real learning, not attendance.

To enrol, message Shivam Sir on +91 9123366161 or send the parent this link: https://learn.modernagecoders.com/courses/ai-agents-with-microsoft-copilot-studio-course-for-teens
For a demo: the Priority Live Demo (guaranteed, today or tomorrow) is booked at https://learn.modernagecoders.com/priority-demo . The free demo is a waiting list with no fixed date.

==========
COURSE 9 OF 137: AI AND MACHINE LEARNING FOR TEENS: PYTHON TO REAL MODELS
==========

Course link: https://learn.modernagecoders.com/courses/ai-ml-masterclass-teens
Subject area: AI and Machine Learning
Designed for: Teens
Who can join: Beginner friendly, ages 13 to 18; school maths is enough to start
Course length: 10-12 months (40-48 weeks)
Time needed: 2 live classes/week + 3-4 hours practice
Certificate: Certificate from Modern Age Coders, awarded on passing the final exam

PRICE FOR THIS COURSE (quote only the one that applies to the person asking)
In India, per month: group Rs 1,499, mini batch Rs 2,999, one to one Rs 4,999
Outside India, per month: group $100, one to one $150
Classes: group and mini batch two live classes a week, eight a month; one to one in India one live class a week, four a month; one to one outside India two live classes a week, eight a month. Each class is one hour.

WHAT THIS COURSE IS

AI and machine learning course for teens aged 13-18: Python, real ML models, neural networks, computer vision, NLP and modern generative AI in 10-12 months.

In one line: Not another course about using AI. Ten months of building it: real models, trained and evaluated by a teenager who understands what is inside them.

ABOUT THE PROGRAMME

Most teens use AI daily; almost none understand it, and understanding is where all the opportunity lives. This live online course takes students aged 13 to 18 from zero, no coding assumed, to genuinely training, evaluating and shipping machine learning models: Python and the data stack first, then real machine learning with scikit-learn, neural networks built up from a single neuron, convolutional networks that see, language models that read, and the modern generative AI layer, understood from the inside and used through teen-legal tools with parent-involved accounts. Honesty shapes the syllabus. Fields like reinforcement learning, robotics and ML infrastructure are named and mapped, not squeezed in as fake weeks; the depth goes where a teen can actually build: vision projects with their own trained models, an NLP project on real text, a generative AI application with guardrails, and a final capstone defended at demo day. The maths is taught as needed, school algebra is enough to start, and every concept lands in code the same week it is explained. The pace is real: ten months at two live classes a week plus three to four hours of practice, with two more months in hand when needed. Homework after every class, monthly mixed reviews that reach back deliberately, phase exams, and a final exam that decides the certificate, with focused revision and a free retest. Real models, real evaluation, depth over dopamine.

WHAT MAKES THIS COURSE DIFFERENT

- Builders, not passengers: teens train, evaluate and ship their own models, they do not just

prompt someone else's
- Maths handled honestly: taught as needed from school algebra, never assumed, never hand-waved
- Evaluation is the moral core: overfitting, leakage and misleading accuracy are taught as hard as the models themselves
- Generative AI from the inside: how LLMs and diffusion actually work, plus building on them through teen-legal tools with parent-involved accounts
- An honest 10-month arc with 2 months of margin: the frontier fields are mapped truthfully as next steps, not faked as weeks
- Real assessment: weekly homework, monthly mixed reviews, and a final exam that decides the certificate, with focused revision and a free retest

THE LEARNING PATH, STEP BY STEP

Phase 1: Python and first models (Months 1-3): Python, NumPy and pandas, then real machine learning with scikit-learn
Phase 2: Core ML mastery (Months 4-6): regression to unsupervised learning, then neural networks and deep learning fundamentals
Phase 3: Machines that see and read (Months 7-8): CNNs and computer vision projects, NLP and the transformer idea
Phase 4: Modern AI and the capstone (Months 9-10): generative AI understood and used safely, ethics, an AI product build, and the final exam

WHAT A STUDENT NEEDS BEFORE STARTING

Coding experience: None. Python is taught from the first line
Maths background: School algebra is enough to start; every further piece of maths is taught exactly when a model needs it
Equipment: A normal laptop with a stable internet connection; free cloud notebooks carry the heavy training
Age: 13 to 18. Batches are grouped by age and pace
Time commitment: 2 live classes plus 3-4 hours of practice a week

WHO THIS COURSE IS FOR

Ai curious: Teens who use AI daily and have started asking the right question: how does this actually work?
Builders: Students who want trained models of their own, not just clever prompts
Future engineers: Teens aiming at computer science and AI tracks who want the real foundation early
Maths appliers: Students who like maths more when it does something, this is where it does the most
Complete beginners: No coding background required: the course starts at the very first line of Python

FULL CURRICULUM, WEEK BY WEEK

This is the complete teaching plan. Parents can ask about any week.

PHASE 1: PYTHON AND FIRST MODELS (MONTHS 1-3, WEEKS 1-12)

The data stack from zero, Python through pandas, then the moment it all changes: the first real machine learning model, trained and honestly evaluated.

Month 1: Python for AI (Weeks 1-4)
Introduction to AI & Python Setup
Topics:
- What is Artificial Intelligence? Real examples teens use daily
- AI vs ML vs Deep Learning explained with examples
- History of AI: From chess to ChatGPT
- Setting up Python environment (Anaconda, Jupyter)
- Google Colab for free GPU access
- Python basics: Variables, data types, operations
- Lists and dictionaries for data storage
- Functions and code organization
- Python libraries introduction: NumPy, Pandas preview
- Your first AI program: Rule-based chatbot
- How machines 'think': Algorithms vs intelligence
- AI in everyday life: Spotify, TikTok, YouTube recommendations
Projects built:
- Setup complete AI development environment
- Rule-based chatbot (like early Siri)
- Simple recommendation system using rules
- AI decision tree for game choices
Practice: Daily: Python exercises, explore AI applications
Python Data Structures & Control Flow
Topics:
- Advanced Python lists: Slicing, comprehensions
- Working with dictionaries for data mapping

```
      - Sets and tuples for data organization
      - If-else logic for AI decisions
      - Loops for processing data
      - Functions for reusable AI components
      - Object-oriented programming basics
      - Classes for AI models
      - File handling: Reading/writing data
      - JSON for AI configuration
      - Error handling in AI programs
      - Debugging AI code effectively
    Projects built:
      - Student grade predictor system
      - Text-based adventure game with AI NPCs
      - Data analyzer for social media stats
      - Simple expert system for diagnosis
    Practice: Build 10 Python programs with AI logic
    Assessment: Month 1 check: a Python data exercise live, plus a take-home mixing
    everything so far

Month 2: The Data Stack (Weeks 5-8)
  NumPy & Mathematical Foundations
    Topics:
      - NumPy arrays: The foundation of AI
      - Array operations and broadcasting
      - Mathematical operations on arrays
      - Statistics basics: Mean, median, mode, std deviation
      - Probability concepts for AI
      - Linear algebra basics: Vectors and matrices
      - Matrix operations: Addition, multiplication
      - Why math matters in AI (visual explanations)
      - Plotting with Matplotlib
      - Visualizing data patterns
      - Random numbers and simulations
      - Mathematical functions in NumPy
    Projects built:
      - Grade distribution analyzer
      - Dice probability simulator
      - Image manipulation with arrays
      - Statistical analysis dashboard
    Practice: Complete 20 NumPy exercises daily
  Pandas & Data Manipulation
    Topics:
      - DataFrames: Spreadsheets in Python
      - Reading data: CSV, Excel, JSON
      - Data selection and filtering
      - Handling missing data
      - Data cleaning techniques
      - Grouping and aggregation
      - Merging and joining datasets
      - Time series data basics
      - Data visualization with Pandas
      - Exploratory Data Analysis (EDA)
      - Feature engineering introduction
      - Preparing data for ML
    Projects built:
      - YouTube channel analytics tool
      - Sports statistics analyzer
      - Weather pattern explorer
      - Social media trends analyzer
    Practice: Analyze 5 real-world datasets
    Assessment: Month 2 check: clean and explore a messy real dataset, with quiz questions
    reaching back to month 1

Month 3: First Machine Learning (Weeks 9-12)
  Introduction to Machine Learning
    Topics:
      - What is Machine Learning? Learning from examples
      - Supervised vs Unsupervised vs Reinforcement Learning
      - Classification vs Regression problems
      - Training data, validation data, test data
      - Features and labels explained
      - Overfitting and underfitting (Goldilocks principle)
      - Model evaluation metrics: Accuracy, precision, recall
      - Confusion matrix understanding
      - Cross-validation concept
      - Bias-variance tradeoff simplified
      - Feature scaling and normalization
      - Introduction to Scikit-learn
    Projects built:
```

- Iris flower classifier (classic starter)
- Spam email detector
- Music genre classifier
- Friend group predictor

Practice: Train 10 different ML models

Classification Algorithms

Topics:

- K-Nearest Neighbors (KNN): Finding similar things
- Decision Trees: AI making choices
- Random Forests: Wisdom of crowds
- Naive Bayes: Probability-based predictions
- Logistic Regression for classification
- Support Vector Machines (SVM) basics
- Ensemble methods: Voting classifiers
- Multi-class classification
- Imbalanced data handling
- Feature importance analysis
- Model selection strategies
- Hyperparameter tuning basics

Projects built:

- Handwritten digit recognizer
- Emoji sentiment analyzer
- Game outcome predictor
- Fashion item classifier

Practice: Solve 15 classification challenges

Assessment: Phase 1 exam: train and evaluate a classifier live and explain its mistakes, plus a written mixed paper

---

PHASE 2: CORE MACHINE LEARNING (MONTHS 4-6, WEEKS 13-24)

The full classical toolkit, regression to clustering, then neural networks built from a single neuron to real deep learning, with data preparation as a discipline.

Month 4: Prediction and Patterns (Weeks 13-16)

Regression & Prediction

Topics:

- Linear Regression: Finding patterns in data
- Polynomial Regression: Curved relationships
- Multiple Linear Regression
- Ridge and Lasso Regression
- Regression evaluation metrics: MSE, RMSE, R^2
- Time series prediction basics
- Feature engineering for regression
- Dealing with outliers
- Residual analysis
- Gradient Descent visualization
- Learning rate importance
- Regression vs Classification: When to use what

Projects built:

- House price predictor
- Exam score predictor
- YouTube views predictor
- Weather temperature forecaster

Practice: Build 10 prediction models

Unsupervised Learning

Topics:

- Clustering: Finding groups in data
- K-Means clustering algorithm
- Hierarchical clustering
- DBSCAN for density-based clustering
- Dimensionality reduction: PCA basics
- t-SNE for visualization
- Anomaly detection methods
- Association rules (Market basket)
- Clustering evaluation metrics
- Choosing number of clusters
- Real-world clustering applications
- Visualization of high-dimensional data

Projects built:

- Customer segmentation tool
- Music playlist generator
- Anomaly detector for gaming
- Friend group discoverer

Practice: Apply clustering to 10 datasets

Assessment: Month 4 check: a regression-and-clustering task on fresh data, plus mixed review

Month 5: Neural Networks (Weeks 17-20)

```
  Advanced ML: Ensembles and Model Craft
    Topics:
      - Gradient Boosting Machines (GBM)
      - XGBoost: Competition winner
      - LightGBM for speed
      - CatBoost for categorical data
      - Stacking and blending models
      - Feature engineering mastery
      - Automated feature selection
      - Cross-validation strategies
      - Hyperparameter optimization: Grid, Random, Bayesian
      - Pipeline creation in Scikit-learn
      - Model interpretability: SHAP, LIME
      - Handling big data with ML
    Projects built:
      - Kaggle competition entry
      - Advanced recommendation system
      - Multi-model ensemble predictor
      - AutoML system builder
    Practice: Optimize 10 ML models for performance
  Introduction to Neural Networks
    Topics:
      - Biological inspiration: How brains work
      - Artificial neurons (Perceptrons)
      - Activation functions: ReLU, Sigmoid, Tanh
      - Forward propagation explained
      - Backpropagation intuition
      - Gradient descent deep dive
      - Building neural networks from scratch
      - Introduction to TensorFlow/Keras
      - Your first neural network
      - Training neural networks
      - Preventing overfitting: Dropout, regularization
      - Batch normalization basics
    Projects built:
      - Neural network from scratch (NumPy)
      - XOR problem solver
      - Simple pattern recognizer
      - Basic neural network visualizer
    Practice: Build 5 neural networks for different tasks
    Assessment: Month 5 check: build a small neural network by hand and explain each part,
    plus mixed review

Month 6: Deep Learning Fundamentals (Weeks 21-24)
  Deep Learning Fundamentals
    Topics:
      - What makes learning 'deep'?
      - Deep vs shallow networks
      - TensorFlow 2.0 and Keras API
      - Building deep neural networks
      - Optimizers: SGD, Adam, RMSprop
      - Learning rate scheduling
      - Early stopping and callbacks
      - Model checkpointing
      - Transfer learning concept
      - Pre-trained models introduction
      - GPU acceleration basics
      - Debugging neural networks
    Projects built:
      - MNIST digit classifier (deep version)
      - Fashion MNIST challenger
      - Simple image classifier
      - Sound pattern recognizer
    Practice: Train 10 deep learning models
  Data Preparation and Augmentation
    Topics:
      - Why data augmentation matters
      - Image augmentation techniques
      - Text augmentation methods
      - Audio data preprocessing
      - Synthetic data generation
      - Data balancing techniques
      - SMOTE for imbalanced data
      - Feature extraction from images
      - Text vectorization methods
      - Handling sequential data
      - Data pipeline optimization
      - TensorFlow Data API
    Projects built:
```

- Data augmentation toolkit
- Synthetic data generator
- Image preprocessing pipeline
- Text data preparation system

Practice: Create 5 augmented datasets

Assessment: Phase 2 exam: train a deep model with proper splits and augmentation, plus a written mixed paper over phases 1-2

PHASE 3: MACHINES THAT SEE AND READ (MONTHS 7-8, WEEKS 25-32)

The two great applied fields at teen-buildable depth: convolutional networks and computer vision projects, then NLP and the transformer idea that changed everything.

Month 7: Computer Vision (Weeks 25-28)

Convolutional Neural Networks (CNNs)

Topics:

- How computers see: Pixels to features
- Convolution operation explained visually
- Filters and feature maps
- Pooling layers: Max and average
- CNN architecture design
- Famous architectures: LeNet, AlexNet, VGG
- ResNet and skip connections
- Building CNNs in TensorFlow/Keras
- Image classification with CNNs
- Data augmentation for images
- Visualizing CNN layers
- Understanding what CNNs learn

Projects built:

- Custom image classifier (personal photos)
- Face emotion detector
- Hand gesture recognizer
- Pet breed identifier

Practice: Build 10 different CNN architectures

Advanced Computer Vision

Topics:

- Object detection: Finding things in images
- YOLO (You Only Look Once) basics
- Face detection and recognition
- Image segmentation techniques
- Style transfer: Making art with AI
- Image generation basics
- OpenCV for computer vision
- Real-time video processing
- Pose estimation
- Optical Character Recognition (OCR)
- Medical image analysis basics
- AR filters like Snapchat

Projects built:

- Object detection app
- Snapchat-style filter creator
- Document scanner with OCR
- Real-time pose detector for fitness

Practice: Create 8 computer vision applications

Assessment: Month 7 check: an image classifier trained on your own collected dataset, plus mixed review

Month 8: Language (Weeks 29-32)

Natural Language Processing Basics

Topics:

- How computers understand text
- Tokenization and text preprocessing
- Word embeddings: Word2Vec, GloVe
- Sentiment analysis techniques
- Named Entity Recognition (NER)
- Part-of-speech tagging
- Text classification methods
- Topic modeling with LDA
- Text summarization basics
- Machine translation introduction
- Chatbot frameworks
- NLTK and spaCy libraries

Projects built:

- Sentiment analyzer for reviews
- Fake news detector
- Chatbot for customer service
- Text summarizer for articles

Practice: Build 10 NLP applications

```
    Transformers and Modern NLP
      Topics:
        - Attention mechanism explained
        - Transformer architecture basics
        - BERT for understanding text
        - GPT models introduction
        - Fine-tuning pre-trained models
        - Hugging Face library basics
        - Zero-shot classification
        - Question answering systems
        - Text generation with GPT
        - Prompt engineering basics
        - Using APIs: OpenAI, Cohere
        - Responsible AI and bias
        - Why attention changed everything, drawn on one whiteboard
      Projects built:
        - Question-answering system
        - AI writing assistant
        - Language translator
        - Custom GPT for specific domain
      Practice: Fine-tune 5 transformer models
      Assessment: Phase 3 exam: a vision or NLP mini-project defended live, plus a cumulative
      written paper

------------------------------------------------------------
PHASE 4: MODERN AI AND THE CAPSTONE (MONTHS 9-10, WEEKS 33-40)
------------------------------------------------------------
Generative AI understood from the inside and used safely, ethics that actually bites, an AI
product built end to end, and the final exam at demo day.

  Month 9: The Generative Layer (Weeks 33-36)
    Generative AI from the Inside
      Topics:
        - Diffusion models deep dive
        - ControlNet for controlled generation
        - InstructPix2Pix
        - 3D generation: NeRF, 3D GANs
        - Video generation models
        - Audio generation: MusicLM, AudioLM
        - Code generation with AI
        - Generative agents and simulations
        - AI for procedural generation
        - Ethical implications of generative AI
        - Future of generative models
        - How diffusion models paint, concept-first with teen-legal tools like Firefly and Canva
        - Building on LLM APIs with accounts set up alongside a parent
        - Prompts as engineering: structure, iteration, evaluation
      Projects built:
        - Custom image generator
        - AI video creator
        - 3D scene generator
        - Code generation assistant
      Practice: Build 10 generative AI applications
    AI Ethics and Honest Evaluation
      Topics:
        - Bias in AI systems
        - Fairness metrics and evaluation
        - Explainable AI (XAI)
        - Privacy in machine learning
        - Differential privacy basics
        - AI safety considerations
        - Environmental impact of AI
        - AI regulations and compliance
        - Adversarial attacks and defenses
        - Deepfakes and detection
        - AI for social good
        - Future of AI careers
        - Explainability: knowing why a model said what it said
        - Deepfakes and detection: the literacy every teen needs
        - Capstone planning: choosing a project worth defending
      Projects built:
        - Bias detection tool
        - Model explainability dashboard
        - Fairness evaluation system
        - AI ethics case study analysis
      Practice: Evaluate 5 models for bias and fairness
      Assessment: Month 9 check: an ethics-and-evaluation case study argued in writing, plus
      mixed review
```

Month 10: Build, Ship, Defend (Weeks 37-40)
AI Product Week
Topics:
- From model to product: wrapping a trained model in a usable interface
- Streamlit or Gradio: demos people can actually touch
- Guardrails: handling wrong answers gracefully
- Cost and speed: why small models often win
- Writing the honest model card: what it does, where it fails
Projects built:
- Your best model shipped as a small usable app with a model card
Practice: Have three people use your app and log where it failed them
Final Capstone Build
Topics:
- Two focused weeks: data, model, evaluation, interface
- Instructor checkpoints and honest scope cuts
- Evaluation before excitement: the metric chosen and defended
- Daily progress with a training log
- Preparing the demo: the story of the build, failures included
Projects built:
- The capstone: a complete AI project, vision, language, tabular or generative, built and evaluated end to end
Practice: Daily training-log entries; a working demo at all times
Demo Day and What Comes Next
Topics:
- Presenting the capstone: live demo plus the hardest failure story
- An honest skills inventory: strong, shaky, next
- The truthful map of what comes next: reinforcement learning, MLOps and research, as real paths not fake weeks
- Where our college AI/ML and Codex/Claude Code courses continue the road
Projects built:
- Demo day presentation delivered to the batch and parents
Assessment: FINAL EXAM: a practical model-building task plus a written paper with questions mixed from every phase. Passing earns the certificate; a student who falls short gets a focused revision plan and a free retest

PROJECTS THE STUDENT BUILDS AND KEEPS

- Phase 1: Python data projects, honest exploratory analyses, and a first evaluated classifier
- Phase 2: regression and clustering studies, a hand-built neural network, and a properly augmented deep model
- Phase 3: an image classifier on a self-collected dataset and an NLP project on real text
- Phase 4: a generative AI application with guardrails, a shipped model demo, and the defended capstone

Total projects: 20+ trained models and AI builds, crowned by a defended capstone

SKILLS THE STUDENT WILL HAVE AT THE END

- Python for AI: the language plus NumPy and pandas fluency
- Classical ML: classification, regression, clustering and ensembles with scikit-learn
- Deep learning: neural networks from first principles through CNNs
- NLP: text processing through the transformer idea
- Generative AI: how it works inside, and building on it safely through teen-legal tools
- Evaluation: splits, metrics, overfitting and leakage, treated as the moral core
- Shipping: models wrapped in usable demos with honest model cards

HOW A TYPICAL WEEK IS SPLIT

Live classes: 2 live one-hour classes per week, coding along with the instructor
Homework: Homework after every class, and a mixed-review assignment at the end of every month so earlier skills stay sharp
Practice: 3-4 hours of model-building practice between classes
Review: Every submission reviewed with written feedback; recurring gaps reopened in class

SUPPORT INCLUDED

Doubt support: WhatsApp doubt support between classes, for the model that refuses to converge
Progress updates: Regular progress notes to parents: what was built, what comes next, and where encouragement helps

CERTIFICATION DETAIL

Completion: Certificate from Modern Age Coders, awarded on passing the final exam. Fall short and there is focused revision and a free retest: the certificate certifies knowledge, not attendance

WHERE THIS CAN LEAD

- Our college AI/ML masterclass: the same road at full depth, entered years ahead

  - Codex and Claude Code for Teens: building with AI coding agents on top of real understanding
  - Data science directions: the pandas and evaluation habits transfer directly
  - University AI tracks: this is precisely the foundation they assume
  - School science fairs and competitions, entered with genuinely trained models

COMMON QUESTIONS ABOUT THIS COURSE

  For anything about cost, use PART 4 and RULE 1. Do not quote two regions.

  Q: What AI projects will my teen actually build?
  A: Twenty-plus real builds across ten months: honest data analyses and a first evaluated classifier in phase 1, a hand-built neural network and properly trained deep models in phase 2, an image classifier trained on a dataset they collect themselves and an NLP project on real text in phase 3, and in phase 4 a generative AI application with guardrails plus the final capstone, a complete AI project shipped as a usable demo with a model card, defended at demo day.

  Q: How long does it take a teenager to learn AI and machine learning?
  A: To genuinely training and evaluating models: 10 months at 2 live classes a week plus 3 to 4 hours of practice, starting from zero coding. The course keeps 2 months of margin in hand for students who need more repetition, up to 12 months with no penalty. The first trained model happens in month 3; the understanding compounds from there.

  Q: How is my teen assessed? Is the certificate just for attending?
  A: No. Homework follows every class, each month ends with an assignment that deliberately mixes new material with earlier topics, every phase closes with an exam, and the course ends with a final exam: a practical model-building task plus written questions from the whole syllabus. Passing earns the certificate; falling short earns focused revision and a free retest. In a field this hyped, honest assessment is the product.

  Q: How much maths does my teen need beforehand?
  A: School algebra is enough to start. Teens consistently find the maths easier here than at school, because it finally does something visible.

  Q: Is this course about using AI tools like ChatGPT, or building AI?
  A: Building, with using in its proper place. The heart of the course is training and evaluating real models. The generative layer is then learned from the inside, how LLMs and diffusion models actually work, and built upon through APIs and teen-legal tools. A teen who only prompts is a passenger; this course produces drivers. For a tools-first path we run a separate AI Tools course.

  Q: What can my teen do after finishing?
  A: Enter our college-level AI/ML masterclass years ahead of schedule, take the Codex and Claude Code course to build with AI agents, carry the portfolio into school science fairs and university applications, or continue into data science. The frontier fields, reinforcement learning, robotics, ML infrastructure, are mapped honestly during the course as real next roads.

  Q: How do we try a class before enrolling?
  A: Book a free demo class with no commitment at learn.modernagecoders.com/contact or message us on WhatsApp at +91 91233 66161. Your teen will train a tiny model inside the demo itself; that moment usually decides things. (Agent note: the free demo is a waiting list with no fixed date. The Priority Live Demo is a guaranteed class today or tomorrow, booked at https://learn.modernagecoders.com/priority-demo . Offer both, as RULE 3 says.)

  Q: Are classes live with a teacher?
  A: Always: live 1-hour sessions with a real instructor in small groups, never pre-recorded videos. Machine learning is full of silent failure modes, a leaked dataset, a misread metric, and live eyes on a student's notebook is the only honest way to catch them early.

  To enrol, message Shivam Sir on +91 9123366161 or send the parent this link: https://learn.modernagecoders.com/courses/ai-ml-masterclass-teens
  For a demo: the Priority Live Demo (guaranteed, today or tomorrow) is booked at https://learn.modernagecoders.com/priority-demo . The free demo is a waiting list with no fixed date.

==
COURSE 10 OF 137: AI AND ML MASTERCLASS: PYTHON, DEEP LEARNING AND GENAI
==

Course link: https://learn.modernagecoders.com/courses/ai-ml-masterclass-complete-college
Subject area: AI and Machine Learning
Designed for: College students
Who can join: Complete beginner (18+); school maths refreshed, everything else built here
Course length: 12-14 months (48-56 weeks)
Time needed: 2 live classes/week + 5-6 hours practice
Certificate: Certificate from Modern Age Coders, awarded on passing the final exam

PRICE FOR THIS COURSE (quote only the one that applies to the person asking)

In India, per month: group Rs 1,499, mini batch Rs 2,999, one to one Rs 4,999
Outside India, per month: group $100, one to one $150
Classes: group and mini batch two live classes a week, eight a month; one to one in India one live class a week, four a month; one to one outside India two live classes a week, eight a month. Each class is one hour.

WHAT THIS COURSE IS

AI and machine learning masterclass: maths foundations, Python, scikit-learn, PyTorch deep learning, generative AI and deployment in 12-14 months, live online.

In one line: Twelve months, honestly spent: the mathematics, the models, the modern generative layer, and enough engineering to ship what you train.

ABOUT THE PROGRAMME

AI and machine learning is the deepest track we teach, and this masterclass respects that: twelve months from zero, no shortcuts and no skipped mathematics. The foundations phase builds linear algebra, calculus intuition, probability and statistics alongside Python and the data stack, because everything downstream stands on them. Classical machine learning follows with scikit-learn, classification, feature engineering, unsupervised learning, and evaluation taught as the discipline that separates practitioners from demo-makers. The deep learning phase goes through PyTorch, the framework research and industry actually share, into CNNs, computer vision and NLP up to transformers. The final phase is the modern layer: generative AI and LLM engineering, retrieval, fine-tuning concepts, honest evaluation of generated output, plus deployment fundamentals, serving a model, tracking experiments, monitoring drift, and a capstone shipped and defended. What this course refuses to do is fake the frontier: reinforcement learning, large-scale ML infrastructure and research careers are mapped honestly as next roads, not squeezed into hollow weeks. The reclaimed time goes into depth where it pays: evaluation, error analysis, and the engineering judgment interviews actually probe. The pace is real: twelve months at two live classes a week plus five to six hours of practice, with two more months in hand when needed. Problem sets after every class, monthly mixed reviews, phase exams, and a final exam that decides the certificate, with focused revision and a free retest. Real models, real evaluation, depth over dopamine.

WHAT MAKES THIS COURSE DIFFERENT

- Mathematics first, honestly: linear algebra, calculus and statistics built in-course, not waved at
- PyTorch as the spine of deep learning: the framework research and industry actually share
- Evaluation and error analysis treated as the core skill, because that is what interviews and real work probe
- A genuinely modern generative phase: LLM engineering, retrieval, fine-tuning concepts and honest output evaluation
- Deployment fundamentals included: serving, experiment tracking and monitoring, without pretending to be an infra course
- Real assessment: weekly problem sets, monthly mixed reviews, and a final exam that decides the certificate, with focused revision and a free retest

THE LEARNING PATH, STEP BY STEP

Phase 1: Foundations (Months 1-3): linear algebra, calculus, probability and statistics, with Python, NumPy, pandas and EDA
Phase 2: Classical ML (Months 4-6): scikit-learn end to end, feature engineering, unsupervised learning, ensembles and rigorous evaluation
Phase 3: Deep learning (Months 7-9): PyTorch, CNNs and computer vision, NLP through transformers
Phase 4: GenAI and shipping (Months 10-12): LLM engineering and retrieval, deployment and monitoring, ethics, interviews, and the defended capstone

WHAT A STUDENT NEEDS BEFORE STARTING

Coding experience: None required; Python is built within phase 1
Maths background: School mathematics; the course rebuilds everything it needs from there
Equipment: A normal laptop with a stable internet connection; free cloud GPUs carry the heavy training
Age: 18+; college students, graduates and working professionals
Time commitment: 2 live classes plus 5-6 hours of practice a week

WHO THIS COURSE IS FOR

Career switchers: Professionals moving toward ML roles who want the real foundation, mathematics included
College students: Students who want depth their electives gesture at, plus a deployed portfolio
Developers: Software engineers adding the ML and GenAI layer properly
Analysts: Data analysts stepping up from dashboards to models
Serious beginners: Anyone ready to trade twelve honest months for a real capability

FULL CURRICULUM, WEEK BY WEEK

This is the complete teaching plan. Parents can ask about any week.

PHASE 1: MATHEMATICS, PYTHON AND DATA (MONTHS 1-3, WEEKS 1-12)

The load-bearing floor: linear algebra, calculus intuition, probability and statistics, built alongside Python and real exploratory data work.

Month 1: The Mathematical Core I (Weeks 1-4)

Mathematics Prerequisites & Linear Algebra - Part 1

Topics:

- Why mathematics matters in AI/ML
- Basic arithmetic and algebra review
- Functions and graphs
- Introduction to vectors: geometric and algebraic view
- Vector operations: addition, scalar multiplication
- Dot product and geometric interpretation
- Vector norms (L1, L2, infinity norm)
- Matrices: definition and notation
- Matrix operations: addition, multiplication
- Matrix transpose and symmetric matrices
- Identity matrix and inverse matrices
- Matrix properties and rules
- Systems of linear equations
- Gaussian elimination
- Matrix rank and determinant (basics)

Projects built:

- Vector operations visualizer
- Matrix calculator implementation
- Linear equation solver
- Geometric transformations with matrices

Practice: Solve 50 linear algebra problems, implement from scratch in Python

Linear Algebra - Part 2 & Calculus Fundamentals

Topics:

- Eigenvalues and eigenvectors: concept and computation
- Eigendecomposition
- Singular Value Decomposition (SVD)
- Principal Component Analysis (PCA) mathematics
- Vector spaces and subspaces
- Linear transformations
- Introduction to calculus: limits
- Derivatives: definition and rules
- Power rule, product rule, quotient rule, chain rule
- Partial derivatives
- Gradient: vector of partial derivatives
- Gradient descent concept
- Second derivatives and Hessian matrix
- Taylor series expansion
- Optimization basics: finding minima and maxima

Projects built:

- PCA implementation from scratch
- Image compression using SVD
- Gradient descent visualizer
- Function optimizer using calculus

Practice: Solve 60 calculus problems, implement gradient descent variants

Assessment: Month 1 check: a linear algebra and calculus problem set, marked line by line

Month 2: Probability, Statistics and Python (Weeks 5-8)

Probability & Statistics - Part 1

Topics:

- Probability fundamentals: sample space, events
- Probability rules: addition, multiplication
- Conditional probability and Bayes' theorem
- Independent vs dependent events
- Random variables: discrete and continuous
- Probability distributions: uniform, Bernoulli, binomial
- Normal (Gaussian) distribution: properties and applications
- Poisson distribution
- Exponential distribution
- Probability density functions (PDF)
- Cumulative distribution functions (CDF)
- Expected value (mean) and variance
- Standard deviation and standard error
- Covariance and correlation
- Law of large numbers and Central Limit Theorem

Projects built:

- Probability calculator
- Distribution visualizer
- Bayes theorem applications
- Monte Carlo simulations
- Statistical analysis tool

Practice: Solve 70 probability and statistics problems

Statistics - Part 2 & Python for ML

Topics:

- Descriptive statistics: mean, median, mode
- Measures of spread: range, IQR, variance, std dev
- Hypothesis testing fundamentals
- Null and alternative hypotheses
- P-values and significance levels
- T-tests, Z-tests, Chi-square tests
- ANOVA (Analysis of Variance)
- Confidence intervals
- Statistical inference
- Python setup for ML: Anaconda, Jupyter
- NumPy for numerical computing
- Pandas for data manipulation
- Matplotlib and Seaborn for visualization
- Statistical computing with SciPy

Projects built:

- Hypothesis testing framework
- A/B testing simulator
- Statistical analysis dashboard
- Data exploration toolkit with Python
- Interactive visualization app

Practice: Statistical analysis of 10 real datasets

Assessment: Month 2 check: a statistics-in-Python exercise, plus mixed review of month 1

Month 3: The Data Stack (Weeks 9-12)

Advanced NumPy & Pandas

Topics:

- Advanced NumPy: broadcasting, vectorization
- NumPy for linear algebra
- NumPy random number generation
- Pandas DataFrames: advanced operations
- Data cleaning: handling missing values
- Data transformation: apply, map, applymap
- GroupBy operations and aggregations
- Merging, joining, and concatenating
- Time series data handling
- Categorical data handling
- Multi-index DataFrames
- Performance optimization in Pandas

Projects built:

- Complete data cleaning pipeline
- Time series analysis tool
- Data aggregation and reporting system
- Advanced data transformations
- Performance benchmarking study

Practice: Clean and analyze 15 messy datasets

Data Visualization & EDA

Topics:

- Principles of data visualization
- Matplotlib deep dive: customization
- Seaborn for statistical plots
- Plotly for interactive visualizations
- Distribution plots: histograms, KDE, box plots
- Relationship plots: scatter, line, regression
- Categorical plots: bar, count, violin
- Heatmaps and correlation matrices
- Pair plots and joint plots
- Exploratory Data Analysis (EDA) process
- Identifying patterns and anomalies
- Feature correlation analysis
- Handling outliers
- Data storytelling with visualizations
- SQL for data work: the one honest lesson every ML practitioner needs

Projects built:

- Complete EDA on Titanic dataset
- House prices EDA and insights
- Customer segmentation visualization
- COVID-19 data analysis and dashboard
- Interactive data exploration tool

Practice: Perform comprehensive EDA on 10 datasets

Assessment: Phase 1 exam: a full EDA on a fresh dataset with statistical claims

defended, plus a written mixed paper

PHASE 2: CLASSICAL MACHINE LEARNING (MONTHS 4-6, WEEKS 13-24)

The working core of applied ML: scikit-learn end to end, feature craft, unsupervised methods, ensembles, and evaluation as a discipline.

Month 4: First Models Done Right (Weeks 13-16)
Introduction to Machine Learning
Topics:
- What is Machine Learning? AI vs ML vs DL
- Types of ML: supervised, unsupervised, reinforcement
- ML workflow: problem definition to deployment
- Data preparation for ML
- Train-test split and validation set
- Cross-validation: k-fold, stratified k-fold
- Overfitting and underfitting
- Bias-variance tradeoff
- Evaluation metrics: accuracy, precision, recall, F1
- Confusion matrix
- ROC curve and AUC
- Scikit-learn library introduction
- Linear Regression: theory and mathematics
- Gradient descent for linear regression
- Cost function (MSE) and optimization
Projects built:
- House price prediction with linear regression
- Salary prediction model
- Sales forecasting
- Custom linear regression from scratch
- Gradient descent visualizer
Practice: Implement linear regression from scratch, solve 30 regression problems
Classification Algorithms - Part 1
Topics:
- Logistic Regression: binary classification
- Sigmoid function and probability interpretation
- Log loss (binary cross-entropy)
- Multi-class classification: one-vs-rest, softmax
- Decision Trees: splitting criteria (Gini, entropy)
- Information gain and entropy
- Tree pruning to prevent overfitting
- Random Forest: ensemble of trees
- Bagging and bootstrap aggregating
- Feature importance in Random Forest
- K-Nearest Neighbors (KNN): distance-based learning
- Choosing K and distance metrics
- Naive Bayes classifier: probabilistic approach
- Support Vector Machines (SVM): margin maximization
- Kernel trick for non-linear classification
Projects built:
- Email spam classifier (Naive Bayes)
- Iris flower classification (multi-class)
- Credit card fraud detection
- Customer churn prediction
- Disease prediction (Random Forest)
- Handwritten digit classification (KNN)
- Text classification with SVM
Practice: Build 15 classification models on different datasets
Assessment: Month 4 check: train, tune and defend a classifier on fresh data, plus mixed review

Month 5: Feature Craft and Structure (Weeks 17-20)
Feature Engineering & Preprocessing
Topics:
- Feature engineering importance
- Feature scaling: standardization vs normalization
- Min-Max scaling and Standard scaling
- Robust scaling for outliers
- Handling categorical features: one-hot encoding
- Label encoding and ordinal encoding
- Target encoding
- Feature creation: polynomial features
- Interaction features
- Binning and discretization
- Text features: Bag of Words, TF-IDF
- Feature selection: filter methods
- Wrapper methods: forward/backward selection
- Embedded methods: Lasso, Ridge

- Dimensionality reduction: PCA
Projects built:
- Feature engineering pipeline
- Automated feature selection tool
- Text feature extraction system
- Dimensionality reduction visualizer
- Complete preprocessing pipeline
Practice: Engineer features for 20 different datasets
Unsupervised Learning
Topics:
- Clustering: grouping similar data
- K-Means clustering: algorithm and initialization
- Elbow method for choosing K
- Hierarchical clustering: agglomerative and divisive
- Dendrograms
- DBSCAN: density-based clustering
- Gaussian Mixture Models (GMM)
- Anomaly detection techniques
- Dimensionality reduction: PCA (practical)
- t-SNE for visualization
- UMAP for dimensionality reduction
- Association rule mining: Apriori algorithm
- Market basket analysis
- Autoencoders for unsupervised learning (intro)
Projects built:
- Customer segmentation with K-Means
- Image compression with PCA
- Anomaly detection in transactions
- Document clustering
- Market basket analysis for retail
- High-dimensional data visualization
- Recommendation system basics
Practice: Cluster 15 different datasets, visualize with t-SNE/UMAP
Assessment: Month 5 check: a clustering-and-features task with honest interpretation,
plus mixed review

Month 6: Ensembles, Evaluation and the Phase Capstone (Weeks 21-24)
Model Evaluation & Validation
Topics:
- Evaluation metrics deep dive
- Classification metrics: precision, recall, F1, AUC-ROC
- Multi-class metrics: macro vs micro averaging
- Regression metrics: MAE, MSE, RMSE, R²
- Custom metrics creation
- Cross-validation strategies
- Stratified sampling
- Time series cross-validation
- Model interpretation: SHAP values
- LIME for local interpretability
- Feature importance analysis
- Partial dependence plots
- Model debugging and error analysis
- Bias and fairness in ML models
- A/B testing for ML models
- Ensemble methods: bagging, boosting and when they stop helping
Projects built:
- Model evaluation framework
- Model interpretation dashboard
- Bias detection tool
- A/B testing simulator
- Error analysis toolkit
Practice: Evaluate and interpret 20 different models
Phase 2 Capstone
Topics:
- Complete ML pipeline development
- Problem definition and data collection
- EDA and feature engineering
- Model selection and training
- Hyperparameter tuning
- Model evaluation and interpretation
- Documentation and presentation
Projects built:
- PHASE 2 CAPSTONE: End-to-End ML Project
- Option 1: Predict customer lifetime value (regression + classification)
- Option 2: Build complete recommender system
- Option 3: Time series forecasting for business metrics
- Requirements: Complete pipeline, feature engineering, ensemble methods, model interpretation,
detailed report
Assessment: Phase 2 exam: a complete classical-ML project defended, plus a cumulative

written paper over phases 1-2

PHASE 3: DEEP LEARNING WITH PYTORCH (MONTHS 7-9, WEEKS 25-36)

The modern engine room: PyTorch fluency, convolutional networks and real computer vision, NLP through the transformer.

Month 7: Into Deep Learning (Weeks 25-28)

Introduction to Deep Learning

Topics:

- Why deep learning?
- Neural networks basics: perceptron
- Activation functions: sigmoid, tanh, ReLU
- Forward propagation
- Backpropagation algorithm
- Gradient descent variants: SGD, momentum, Adam
- Loss functions for deep learning
- TensorFlow basics
- Keras Sequential API
- Building first neural network
- Training deep networks
- Regularization: dropout, L1, L2
- Batch normalization

Projects built:

- Neural network from scratch (NumPy)
- MNIST digit classification (MLP)
- Binary classification with NN
- Multi-class classification NN
- Regression with neural networks

Practice: Build 10 neural networks with Keras

PyTorch in Depth

Topics:

- PyTorch fundamentals
- Tensors and autograd
- Building models with nn.Module
- PyTorch data loading: Dataset, DataLoader
- Custom datasets creation
- Training loops in PyTorch
- GPU acceleration with PyTorch
- TorchVision for computer vision
- TorchText for NLP
- PyTorch Lightning for cleaner code
- Model checkpointing
- TensorBoard with PyTorch
- PyTorch vs TensorFlow comparison

Projects built:

- Image classifier in PyTorch
- Custom CNN architecture
- Transfer learning in PyTorch
- RNN/LSTM in PyTorch
- GAN in PyTorch
- PyTorch Lightning project
- Multi-GPU training

Practice: Reimplement 15 projects in PyTorch

Assessment: Month 7 check: build and train a network in raw PyTorch live, plus mixed review

Month 8: Computer Vision (Weeks 29-32)

Convolutional Neural Networks (CNN)

Topics:

- Limitations of fully connected networks for images
- Convolution operation: filters and feature maps
- Padding and stride
- Pooling layers: max pooling, average pooling
- CNN architecture components
- LeNet architecture
- AlexNet and ImageNet revolution
- VGGNet: deep and simple
- Inception/GoogLeNet: multi-scale features
- ResNet: residual connections and skip connections
- Transfer learning with pretrained models
- Fine-tuning strategies
- Data augmentation for images

Projects built:

- Image classification with CNN
- CIFAR-10 classification
- Transfer learning with ResNet
- Custom CNN architecture

- Dog vs Cat classifier
- Data augmentation pipeline
- Feature visualization in CNNs

Practice: Build 15 computer vision models

Advanced Computer Vision

Topics:

- Object detection: R-CNN, Fast R-CNN, Faster R-CNN
- YOLO (You Only Look Once): real-time detection
- SSD (Single Shot Detector)
- Semantic segmentation: FCN, U-Net
- Instance segmentation: Mask R-CNN
- Face recognition and verification
- Siamese networks
- Image generation introduction
- Style transfer with CNNs
- OpenCV for computer vision
- Image preprocessing techniques
- Handling class imbalance in CV
- Model optimization for edge devices

Projects built:

- Object detection system (YOLO)
- Face recognition application
- Image segmentation for medical images
- Style transfer implementation
- Real-time object detection
- Custom dataset object detector
- Siamese network for similarity

Practice: Complete 10 computer vision projects

Assessment: Month 8 check: a transfer-learning vision project with honest error analysis, plus mixed review

Month 9: Language and Transformers (Weeks 33-36)

Natural Language Processing (NLP) - Part 1

Topics:

- NLP pipeline and challenges
- Text preprocessing: tokenization, lowercasing
- Stop words removal and stemming/lemmatization
- Bag of Words (BoW) and TF-IDF review
- Word embeddings: Word2Vec (CBOW, Skip-gram)
- GloVe embeddings
- FastText embeddings
- Using pretrained embeddings
- Text classification with embeddings
- Named Entity Recognition (NER)
- Part-of-Speech (POS) tagging
- Dependency parsing basics
- spaCy for NLP
- Why attention replaced recurrence: the honest one-lesson history

Projects built:

- Sentiment classifier with embeddings
- Spam detection (email/SMS)
- Named Entity Recognition system
- Text summarization basics
- Question answering system (simple)
- Topic modeling with LDA
- Language detection

Practice: Complete 15 NLP tasks

Advanced NLP and the Transformer

Topics:

- Transformer architecture: self-attention
- Multi-head attention
- Positional encoding
- BERT: Bidirectional Encoder Representations
- GPT: Generative Pre-trained Transformer
- T5, RoBERTa, ALBERT
- Hugging Face Transformers library
- Fine-tuning BERT for classification
- Zero-shot and few-shot learning
- Prompt engineering basics
- Modern NLP pipeline
- Production NLP systems

Projects built:

- BERT fine-tuning for sentiment
- Question-answering with BERT
- Text classification with Transformers
- Named Entity Recognition with BERT
- Summarization with T5
- Text generation with GPT
- Multi-task NLP model

      Practice: Fine-tune 10 transformer models
      Assessment: Phase 3 exam: a vision or NLP project defended end to end, plus a
      cumulative written paper

PHASE 4: GENERATIVE AI, SHIPPING AND THE CAPSTONE (MONTHS 10-12, WEEKS 37-48)

The modern layer done properly: LLM engineering and retrieval, deployment and monitoring
fundamentals, responsible AI, interview craft, and the defended capstone.

  Month 10: Generative AI and LLM Engineering (Weeks 37-40)
    LLM Engineering
      Topics:
        - How large language models actually work: tokens, attention, training and alignment in honest
          depth
        - The frontier landscape read soberly: GPT-class, Claude-class and open-weight Llama-class
          models
        - Prompting as engineering: structure, iteration and evaluation harnesses
        - Retrieval-augmented generation: embeddings, vector search, and when plain search wins
        - Fine-tuning and adapters: what they change, what they cost, when they are wrong
        - Structured output and function calling: making models act reliably
        - Generative image models: how diffusion works and where it fits
        - Evaluating generated output without fooling yourself
        - Cost, latency and caching: the engineering triangle of GenAI
      Projects built:
        - A retrieval-augmented assistant over a real document set, with an evaluation harness
        - A structured-output pipeline that survives adversarial inputs
      Practice: Run 50 evaluated queries through your assistant and publish the score
      honestly
    Deployment and Experiment Tracking
      Topics:
        - ML model lifecycle
        - Model serialization: pickle, joblib
        - Flask for ML APIs
        - FastAPI for high-performance APIs
        - REST API design for ML
        - Input validation and preprocessing
        - Model serving basics
        - Docker for ML applications
        - Creating ML microservices
        - Model versioning strategies
        - A/B testing deployed models
        - Monitoring model performance
        - Experiment tracking: knowing which run produced which model
        - Serving a model behind an API, measured under load
      Projects built:
        - ML model API with Flask
        - FastAPI ML service
        - Dockerized ML application
        - Model versioning system
        - Simple ML deployment pipeline
      Practice: Deploy 10 ML models as APIs
      Assessment: Month 10 check: ship one model behind an API with tracked experiments, plus
      mixed review

  Month 11: Production Habits and Responsible AI (Weeks 41-44)
    MLOps Fundamentals, Honestly Scoped
      Topics:
        - What is MLOps? DevOps for ML
        - ML system architecture
        - ML pipeline orchestration
        - Kubeflow for ML workflows
        - Apache Airflow for ML pipelines
        - Feature stores: Feast, Tecton
        - Model registry: MLflow, DVC
        - Experiment tracking at scale
        - Metadata management
        - Data lineage and provenance
        - Continuous training (CT)
        - Automated retraining pipelines
        - Model governance
        - Monitoring and drift: knowing when your model quietly went stale
      Projects built:
        - Complete MLOps pipeline
        - Automated ML workflow with Airflow
        - Feature store implementation
        - Model registry setup
        - Continuous training system
        - End-to-end ML automation

Practice: Build 5 MLOps pipelines
Responsible AI and Explainability
Topics:
- Ethics in AI/ML
- Bias in machine learning
- Fairness metrics and definitions
- Detecting and mitigating bias
- Interpretable vs explainable AI
- LIME and SHAP for explanations
- Privacy in ML: differential privacy
- Federated learning for privacy
- Adversarial attacks on ML models
- Adversarial training for robustness
- Regulatory compliance: GDPR, AI Act
- Responsible AI frameworks
- Ethical considerations in deployment
- Explainability tools in practice: SHAP-style reasoning about model decisions
- Capstone planning: choosing a project worth defending
Projects built:
- Bias detection in models
- Fairness-aware classifier
- Model explanation dashboard
- Privacy-preserving ML experiment
- Adversarial examples generation
- Robust model training
- Ethical AI case studies
Practice: Audit models for bias and fairness
Assessment: Month 11 check: an ethics-and-monitoring case argued in writing, plus cumulative review

Month 12: Capstone, Interviews and the Final Exam (Weeks 45-48)
Capstone Build
Topics:
- Two focused weeks: data, model, evaluation, deployment
- Instructor checkpoints and honest scope cuts
- Error analysis before excitement: the metric chosen and defended
- The capstone served behind an API with tracked experiments
- A model card a skeptic could audit
Projects built:
- The capstone: a complete ML or GenAI system, trained, evaluated, deployed and documented
Practice: Daily training log; a working deployed build at all times
ML Interview Craft
Topics:
- ML interview preparation strategy
- Coding interviews for ML roles
- ML theory and concepts questions
- System design for ML systems
- Take-home assignments approach
- Portfolio projects presentation
- GitHub for ML engineers
- Networking in AI community
- Conferences and meetups
- Building personal brand
- Salary negotiation for ML roles
- Career paths in AI/ML
- Walking through your own capstone the way interviews actually probe it
Projects built:
- ML interview preparation guide
- Portfolio website with projects
- Technical blog writing
- GitHub profile optimization
- Mock interview practice
- System design case studies
Practice: Daily LeetCode, ML questions, system design
Demo Day and the Final Exam
Topics:
- Presenting the capstone: live system plus the hardest failure story
- A full-course spiral review before the exam
- The honest map of next roads: reinforcement learning, ML infrastructure, research
- Where our agents and Codex/Claude Code courses continue the modern layer
Projects built:
- Demo day presentation delivered to the batch
Assessment: FINAL EXAM: a practical modeling task plus a written paper with questions mixed from every phase. Passing earns the certificate; falling short earns a focused revision plan and a free retest

PROJECTS THE STUDENT BUILDS AND KEEPS

- Phase 1: mathematics problem sets that survive marking, and full EDAs with defended

statistical claims
- Phase 2: classical ML projects with feature craft, ensembles and rigorous evaluation
- Phase 3: PyTorch builds, a transfer-learning vision project and an NLP project through transformers
- Phase 4: a retrieval-augmented assistant with an evaluation harness, a deployed model, and the defended capstone

Total projects: 25+ trained and evaluated builds, crowned by a deployed, defended capstone

SKILLS THE STUDENT WILL HAVE AT THE END

- The mathematics: linear algebra, calculus intuition, probability and statistics, actually used
- Classical ML: scikit-learn end to end with feature engineering and honest evaluation
- Deep learning: PyTorch fluency, CNNs, transfer learning and NLP through transformers
- Generative AI: LLM engineering, retrieval, fine-tuning judgment and output evaluation
- Shipping: serving, experiment tracking, monitoring and model cards
- Judgment: error analysis, ethics and the interview-grade ability to defend every choice

HOW A TYPICAL WEEK IS SPLIT

Live classes: 2 live one-hour classes per week, worked problems and real notebooks
Homework: A problem set after every class, and a mixed-review assignment at the end of every month
Practice: 5-6 hours of model-building practice between classes
Review: Every set reviewed with written feedback; recurring gaps reopened in class

SUPPORT INCLUDED

Doubt support: WhatsApp doubt support between classes, for the loss curve that refuses to descend
Progress updates: Honest monthly progress reviews: what is solid, what is wobbly, and the plan for the wobble

CERTIFICATION DETAIL

Completion: Certificate from Modern Age Coders, awarded on passing the final exam. Fall short and there is focused revision and a free retest: the certificate certifies knowledge, not attendance

WHERE THIS CAN LEAD

- ML and data science roles: this is the portfolio and fluency those interviews test
- GenAI engineering: the LLM and retrieval work here is the fastest-growing demand
- Our AI agents courses: Copilot Studio and Codex/Claude Code continue the applied layer
- The honest frontier roads: reinforcement learning, ML infrastructure and research, entered from a real base
- Domain application: the strongest ML careers pair this skill with a field you already know

EARNING POTENTIAL (share only if asked, and never promise it)

Market context: The ranges below are general market salary bands for these roles in India and abroad, drawn from public industry data. They are shown for career context only and are not a promise or guarantee of income. Actual pay depends on your skills, experience, location, and the job market.
Early career roles: Rs 4-7 LPA (Junior Data Scientist/Analyst)
Growing roles: Rs 8-15 LPA (ML Engineer/Data Scientist); Rs 15-25 LPA (Senior ML Engineer)
Experienced roles: Rs 20-40 LPA (Senior ML/AI Engineer, Research Engineer); Rs 30-60 LPA (Lead ML Engineer)
Freelance consulting: Rs 3,000-10,000/hour based on expertise

COMMON QUESTIONS ABOUT THIS COURSE

For anything about cost, use PART 4 and RULE 1. Do not quote two regions.

Q: What does this AI and ML masterclass actually cover?
A: The full honest arc: the mathematics (linear algebra, calculus, probability, statistics) built alongside Python; classical machine learning with scikit-learn and evaluation as a discipline; deep learning in PyTorch through CNNs, computer vision and NLP to transformers; and the modern layer, LLM engineering with retrieval and fine-tuning judgment, deployment with experiment tracking and monitoring, responsible AI, and a capstone that is trained, evaluated, deployed and defended.

Q: How long does it take to learn AI and machine learning properly?
A: Twelve months at 2 live classes a week plus 5 to 6 hours of practice, starting from zero, and that is the honest floor when the mathematics is built rather than skipped. The course keeps two more months in hand for learners who need them. Bootcamps compress this by dropping exactly the parts, maths and evaluation, that interviews and real work then expose.

Q: How am I assessed? Is the certificate just for attending?
A: No. Problem sets follow every class with written feedback, monthly reviews deliberately mix new material with earlier topics, each phase ends with an exam, and the course ends with a final exam: a practical modeling task plus written questions from the entire syllabus. Passing earns the certificate; falling short earns focused revision and a free retest. In this field, honest assessment is the product.

Q: How much mathematics do I need before joining?
A: School mathematics. Phase 1 rebuilds linear algebra, calculus intuition, probability and statistics from there, in code and pictures alongside symbols, because every later phase stands on them. Learners who skipped maths for years consistently manage; the course assumes rust, not fluency.

Q: Does the course cover generative AI and LLMs seriously?
A: Yes, as engineering rather than magic: how transformers and diffusion actually work, prompting with evaluation harnesses, retrieval-augmented generation over real documents, fine-tuning judgment (what it changes, costs, and when it is wrong), structured output and function calling, and the cost-latency-quality triangle. The month ends with a retrieval assistant you built and scored honestly.

Q: Will I be able to deploy models, or just train them in notebooks?
A: Deploy. The final phase covers serving a model behind an API, experiment tracking, monitoring and drift, and the capstone is required to ship that way with a model card. Full-scale ML infrastructure is its own profession and is mapped honestly as a next road; what you leave with is the working end of it.

Q: Can I try a class before enrolling?
A: Yes, a free demo class with no commitment: book at learn.modernagecoders.com/contact or message us on WhatsApp at +91 91233 66161. You will train a small model inside the demo itself. (Agent note: the free demo is a waiting list with no fixed date. The Priority Live Demo is a guaranteed class today or tomorrow, booked at https://learn.modernagecoders.com/priority-demo . Offer both, as RULE 3 says.)

Q: Are classes live or recorded?
A: Live, always: small groups with a real instructor reading your actual notebooks, never pre-recorded videos. ML fails silently, leaked data, misread metrics, and live eyes on your work is the only honest way to catch it early.

To enrol, message Shivam Sir on +91 9123366161 or send the parent this link: https://learn.modernagecoders.com/courses/ai-ml-masterclass-complete-college
For a demo: the Priority Live Demo (guaranteed, today or tomorrow) is booked at https://learn.modernagecoders.com/priority-demo . The free demo is a waiting list with no fixed date.

==========

COURSE 11 OF 137: AI LITERACY FOR KIDS (AGES 8 TO 14): UNDERSTAND AI, DO NOT JUST USE IT

==========

Course link: https://learn.modernagecoders.com/courses/ai-literacy-for-kids-course
Subject area: AI Literacy for Kids
Designed for: Kids
Who can join: Ages 8 to 14; no prior coding required, everything is taught from scratch
Course length: 4 months (16 weeks), joinable any month
Time needed: 2 live classes/week + small weekly projects
Certificate: Certificate from Modern Age Coders, awarded on passing the final assessment

PRICE FOR THIS COURSE (quote only the one that applies to the person asking)
In India, per month: group Rs 1,499, mini batch Rs 2,999, one to one Rs 4,999
Outside India, per month: group $100, one to one $150
Classes: group and mini batch two live classes a week, eight a month; one to one in India one live class a week, four a month; one to one outside India two live classes a week, eight a month. Each class is one hour.

WHAT THIS COURSE IS

Live online AI literacy classes for ages 8 to 14. Children learn how AI actually works, how it learns from data, where it goes wrong, and how to judge it, with age-appropriate supervised tools.

In one line: Children who understand how AI works, where its answers come from, and when to doubt it, taught safely and at the right age.

ABOUT THE PROGRAMME

Most children already use AI daily, in recommendations, filters, voice assistants and homework help. Almost none of them understand what it is doing. That gap is the actual risk: not that children use AI, but that they trust it without knowing how it works, where its answers come from, or how confidently it can be wrong. This course closes that gap. Children learn what artificial intelligence actually is, how a machine learns from examples rather

than rules, why the data it learns from decides what it does, and why it can produce a confident answer that is simply false. They train simple models themselves, on data they collect, so machine learning stops being magic and becomes something they have done with their own hands. It is also built to be age-appropriate in a way most AI courses are not. Almost every mainstream AI tool sets a minimum age, commonly 13 and sometimes 18, in its own terms of service. We do not ask a nine-year-old to create an account on a service that does not permit it. Younger students work with tools designed for children and with teacher-run demonstrations, while older students in the range use more capable tools where age and parental permission allow. Nobody is left out, and no family is quietly pushed past a terms-of-service line.

WHAT MAKES THIS COURSE DIFFERENT

- Understanding first: children learn how AI works, not just which buttons to press
- Genuinely age-appropriate, because mainstream AI tools set minimum ages (commonly 13, sometimes 18) that most kids' AI courses quietly ignore
- Children train their own simple models on data they collect, so machine learning becomes concrete instead of magical
- Bias, hallucination and data quality taught in plain language, with examples children can see for themselves
- Aligned with the direction of school curricula, including computational thinking and AI now entering national syllabuses
- Live, small batches with a real teacher, never a recorded video or an app left to babysit

THE LEARNING PATH, STEP BY STEP

Phase 1: What AI is and is not, how machines learn from data, and training a first model by hand
Phase 2: Where AI goes wrong: bias, hallucination and data quality, plus judging AI output critically
Phase 3: Building simple AI-assisted projects and presenting them, with safety and honesty built in

WHAT A STUDENT NEEDS BEFORE STARTING

Title: What Your Child Needs to Start

WHO THIS COURSE IS FOR

Title: Who This Course Is For

FULL CURRICULUM, WEEK BY WEEK

This is the complete teaching plan. Parents can ask about any week.

PHASE 1: WHAT AI IS, AND HOW A MACHINE LEARNS

The foundations, taught with hands-on activities rather than definitions to memorise.

Month 1: Machines, Rules and Learning (Weeks 1-4)
What Is Artificial Intelligence, Really
Topics:
- What people mean by AI, and what computers were already doing before it
- The difference between following rules and learning from examples
- Spotting the AI you already use every day
- What computers are genuinely good at, and what humans are still better at
- Why AI does not think or understand the way a person does

Projects built:
- An AI spotting hunt: find five AI systems you used this week and explain what each one decides

Practice: Sort everyday examples into rule-following or learning-from-examples, and explain each choice

Teaching a Machine by Example
Topics:
- What training data is, in plain language
- How a machine finds patterns in examples
- Labels, and why a machine needs to be told what things are
- Why more and better examples usually mean better results
- The unplugged version, done with paper before any computer

Projects built:
- Train a classmate as if they were a machine: give only examples, no rules, then test them

Practice: Build a labelled example set for a simple classification task

Training Your First Real Model
Topics:
- Using a child-safe, teacher-supervised training tool
- Collecting your own examples for two or three categories
- Training the model and testing it live
- Watching accuracy change as the examples change

- Why the machine gets some things confidently wrong
Projects built:
- Train an image or sound classifier on your own examples and demonstrate it to the class
Practice: Improve your model by adding better examples and record what changed
Assessment: Show and explain your trained model: what it does, how you taught it, where it fails

Patterns, Data and Prediction
Topics:
- How patterns in data turn into predictions
- Simple ideas of features: what the machine actually looks at
- Why a machine can be confident and still wrong
- Prediction versus certainty, in language a child can hold
- Connecting this to maths patterns they already know
Projects built:
- Predict outcomes from a small dataset by hand, then compare with the model's prediction
Practice: Pattern and prediction puzzles using real, small datasets

---
PHASE 2: WHERE AI GOES WRONG, AND HOW TO JUDGE IT

The critical-thinking half, which is the part that actually protects a child.

Month 2: Bias, Hallucination and Judging Answers (Weeks 5-8)
Where the Data Comes From
Topics:
- Every AI learns from data somebody collected
- What gets left out of a dataset, and why that matters
- Seeing bias appear in a model you trained yourself
- Fair and unfair examples, explored with real cases suitable for the age
- Why the machine is not being unkind, it is repeating its examples
Projects built:
- Deliberately train a model on lopsided data, then show the class exactly how it fails
Practice: Audit a small dataset and list who or what is missing from it

When AI Makes Things Up
Topics:
- Why a text AI can produce a confident, fluent, completely false answer
- What it means that it predicts likely words rather than looking up facts
- Checking an AI answer against a real source
- Why AI is a starting point and not a final authority
- How to tell a class or teacher when you used AI, honestly
Projects built:
- Fact-check a set of teacher-provided AI answers and mark which are wrong and why
Practice: Source-checking drills: verify five claims against real references
Assessment: A short critical-thinking test on judging AI answers

Using AI Honestly for Schoolwork
Topics:
- The difference between AI helping you learn and AI doing it for you
- Asking AI for a hint or an explanation instead of the answer
- Explaining a solution in your own words as the real test of understanding
- Why copying an AI answer cheats only yourself
- Simple, honest rules a child can actually follow
Projects built:
- Take one homework-style problem, use AI only for hints, and explain the solution back unaided
Practice: Rewrite AI explanations in your own words and check them for errors

Staying Safe and Private
Topics:
- Why AI tools have minimum ages, and what a terms of service is
- What personal information should never be typed into any AI tool
- Why what you type may be stored or used
- Talking to a parent or teacher when something feels wrong
- Deepfakes and manipulated media, at an age-appropriate level
Projects built:
- Write a family AI agreement: what is allowed, what is not, and who to ask
Practice: Sort scenarios into safe, unsafe and ask-an-adult
Assessment: End-of-phase check on safety, privacy and honest use

---
PHASE 3: BUILDING SOMETHING REAL AND EXPLAINING IT

Children apply everything to a project of their own and learn to present it clearly.

Month 3: Simple AI Projects (Weeks 9-12)
Block Coding Meets AI
Topics:
- Connecting a trained model to a block-coded program
- Making the program react differently to each prediction
- Testing your project with inputs it has never seen
- Fixing it when it behaves oddly
- Planning before building

Projects built:
- Build a block-coded project that responds to your trained model's predictions
Practice: Debug three deliberately broken AI projects

Designing a Project That Helps Someone
Topics:
- Choosing a problem worth solving for a real person
- Deciding whether AI is even the right tool for it
- Sketching the idea before any building
- Planning what data you would need and whether you can get it fairly
- Setting a scope you can actually finish
Projects built:
- Write a one-page plan for your capstone: the person, the problem, the data, the plan
Practice: Give and receive feedback on each other's project plans

Building the Capstone
Topics:
- Building in small steps and testing each one
- Collecting balanced training data on purpose
- Handling the cases the model gets wrong
- Being honest in your project about its limits
- Getting it working end to end
Projects built:
- Build your working capstone project
Practice: Weekly build checkpoints with teacher review

Presenting and Explaining
Topics:
- Explaining what your project does and how you taught it
- Showing where it fails, honestly, which is the mark of real understanding
- Answering questions about your data
- Speaking clearly to an audience that is not technical
- Being proud of work you can actually explain
Projects built:
- Present your capstone to the class and to your parents
Practice: Rehearse the presentation and take questions
Assessment: Final capstone presentation, assessed on understanding rather than polish

HOW A TYPICAL WEEK IS SPLIT

Homework: A task or problem set after every class, and a monthly mixed-review assignment that deliberately folds in earlier topics

CERTIFICATION DETAIL

Completion: Certificate from Modern Age Coders, awarded on passing the final assessment. Fall short and there is focused revision and a free retest: the certificate certifies real learning, not attendance

WHERE THIS CAN LEAD

- A genuine head start for school computing and the AI topics entering national curricula
- A natural next step into Python and machine learning as a teenager
- Critical-thinking habits that apply well beyond technology
- Comfort with data and patterns that supports maths and science
- An informed, safe relationship with tools they will use lifelong

COMMON QUESTIONS ABOUT THIS COURSE

For anything about cost, use PART 4 and RULE 1. Do not quote two regions.

Q: Is my child old enough for AI tools?
A: This is exactly why the course is built the way it is. Most mainstream AI tools set a minimum age in their terms of service, commonly 13 and sometimes 18. We never ask a child to create an account on a service that does not permit their age. Younger students use tools designed for children and teacher-run demonstrations; older students use more capable tools where age and parental permission allow.

Q: Will my child just learn to use ChatGPT?
A: No, and that is the point. The course is about understanding: what AI is, how a machine learns from examples, why data quality decides the outcome, and why an AI can be confidently wrong. Children train their own simple models on data they collect. Using a chatbot well is a small part, taught honestly, and always as a starting point rather than an authority.

Q: Does my child need to know coding first?
A: No. Everything is taught from scratch. The early weeks are largely unplugged and hands-on, and where coding is used it is block-based and taught step by step. Children who already code will still be stretched, because the difficulty here is in the thinking, not the typing.

Q: How is this different from a normal coding class?
A: A coding class teaches your child to build software. This teaches your child to understand and judge systems that learn, which is a different skill. It pairs naturally with a coding

course but does not replace one.

Q: What ages are in each batch?
A: Batches are grouped by age band within the 8 to 14 range, so an eight-year-old is never placed with a fourteen-year-old. The concepts stay the same; the activities, tools and depth are matched to the band. We place your child after the free demo class. (Agent note: the free demo is a waiting list with no fixed date. The Priority Live Demo is a guaranteed class today or tomorrow, booked at https://learn.modernagecoders.com/priority-demo . Offer both, as RULE 3 says.)

Q: How is my child assessed, and is the certificate just for attending?
A: No. A task follows every class with feedback, monthly reviews deliberately mix new material with earlier topics so nothing is forgotten, and the course ends with a friendly final assessment of everything learned. Passing earns the certificate; falling short earns focused revision and a free retest. We measure real learning, not attendance.

To enrol, message Shivam Sir on +91 9123366161 or send the parent this link: https://learn.modernagecoders.com/courses/ai-literacy-for-kids-course
For a demo: the Priority Live Demo (guaranteed, today or tomorrow) is booked at https://learn.modernagecoders.com/priority-demo . The free demo is a waiting list with no fixed date.

==========

COURSE 12 OF 137: AI TOOLS COURSE FOR TEENS (13+): PROMPTING TO REAL PROJECTS

==========

Course link: https://learn.modernagecoders.com/courses/teens-ai-tools-mastery-course
Subject area: AI for Teens
Designed for: Teens
Who can join: Complete beginner, ages 13 to 18
Course length: 4-5 months (16-20 weeks)
Time needed: 2 live classes/week + 2-3 hours practice
Certificate: Certificate from Modern Age Coders, awarded on passing the final exam

PRICE FOR THIS COURSE (quote only the one that applies to the person asking)
In India, per month: group Rs 1,499, mini batch Rs 2,999, one to one Rs 4,999
Outside India, per month: group $100, one to one $150
Classes: group and mini batch two live classes a week, eight a month; one to one in India one live class a week, four a month; one to one outside India two live classes a week, eight a month. Each class is one hour.

WHAT THIS COURSE IS

AI tools course for teens aged 13-18: live online classes on ChatGPT prompting, safe AI art, study tools, coding assistants and a real AI capstone in 4-5 months.

In one line: Every teen already uses AI. This course turns using into understanding: prompting that actually works, tools that are actually allowed at their age, and a real project at the end.

ABOUT THE PROGRAMME

AI is already in every teenager's day, in search, homework, music and feeds, usually unexamined and often against the tools' own age rules. This live online course for ages 13 to 18 replaces that drift with skill: how AI actually works, prompting as a craft, AI art and media created with tools that genuinely permit teens, AI as a study partner used ethically, coding assistants, training small machine-learning models, and a capstone project that combines them. Age honesty is a feature of this course, not a footnote: every tool taught is selected for 13+ availability, accounts are set up together with a parent where consent is required, and the course explicitly teaches which popular tools teens should NOT be using yet and why. Ethics runs throughout: hallucinations and fact-checking from week 2, academic honesty in the study weeks, bias, privacy and deepfake awareness before graduation. The pace is honest: 4 months at two live classes a week plus two to three hours of practice, with a fifth month in hand for teens who want more time. Homework follows every class, each month ends with a mixed challenge that revisits earlier skills, and the course ends with a final exam, a capstone demo plus written questions, that decides the certificate, with a free retest after revision. Real skill, real judgment, depth over dopamine.

WHAT MAKES THIS COURSE DIFFERENT

- Age-clean by design: every tool taught genuinely permits teens, accounts are set up with parents, and the course teaches which famous tools are off-limits until 18 and why
- Prompting taught as a craft: structure, context, iteration and evaluation, not magic phrases
- Ethics is load-bearing: fact-checking, academic honesty, bias, privacy and deepfake awareness are core weeks, not disclaimers
- Beyond chatting: teens train their own small ML models and use AI coding assistants, the builder's side of AI
- An honest 4-month arc with a fifth month in hand: nobody is rushed, nobody coasts
- Real assessment: weekly homework, monthly mixed challenges, and a final exam that decides the certificate, with focused revision and a free retest

THE LEARNING PATH, STEP BY STEP

Month 1: AI foundations and prompting (Weeks 1-4): how AI works, ChatGPT done properly, and prompt engineering as a craft
Month 2: Creative AI (Weeks 5-8): AI art with teen-legal tools, image editing, and the copyright questions that come with them
Month 3: AI for school and media (Weeks 9-12): music and video tools, study assistants used ethically, research and writing
Month 4: The builder's month (Weeks 13-16): coding assistants, training your own models, ethics and safety, and the capstone exam

WHAT A STUDENT NEEDS BEFORE STARTING

Experience: None. Curiosity and a willingness to fact-check are the real prerequisites
Equipment: A computer or laptop with a stable internet connection; free tool tiers cover the whole course
Age: 13 to 18, firmly: the platforms' own age rules are part of the curriculum
Accounts: Set up together with a parent wherever consent is required
Time commitment: 2 live classes plus 2-3 hours of practice a week

WHO THIS COURSE IS FOR

Everyday users: Teens already using AI casually who should be using it skillfully and legally
Students: Class 8-12 students who want AI as an honest study advantage, not a shortcut that backfires
Creators: Teens making art, music and videos who want AI in their toolkit the right way
Future builders: Students curious about the builder side: coding assistants and training their own models
Careful parents: Families who want AI learned with age rules, ethics and supervision built in

FULL CURRICULUM, WEEK BY WEEK

This is the complete teaching plan. Parents can ask about any week.

MONTH 1: AI FOUNDATIONS AND PROMPT CRAFT

How AI actually works, ChatGPT used properly with a parent-approved account, and prompting practiced as a real skill.

Introduction to AI World
Topics:
- What is Artificial Intelligence? Simple explanation
- AI in everyday life: Siri, Alexa, YouTube recommendations
- How AI learns: Machine Learning basics for teens
- Types of AI: Narrow AI vs General AI
- AI history: From calculators to ChatGPT
- AI vocabulary: Model, training, dataset, algorithm
- AI myths vs reality
- How AI 'thinks' differently from humans
- AI limitations and capabilities
- Setting up safe AI accounts with parental guidance
- Creating AI learning journal
- Class rules for AI usage
Projects built:
- My First AI Conversation
- AI vs Human: Comparison chart
- Draw AI's journey timeline
- Play and analyze AI games
Practice: Spot five places AI helped you this week, like YouTube suggestions or a voice assistant, and mark which one felt the smartest.

ChatGPT Fundamentals
Topics:
- ChatGPT interface walkthrough
- Free vs paid versions understanding
- How to start conversations
- Basic prompt structure
- Being polite with AI (digital etiquette)
- Getting better responses
- When ChatGPT makes mistakes
- Fact-checking AI responses
- Using ChatGPT for homework help (ethically)
- ChatGPT for creative writing
- ChatGPT for explanations
- Saving and organizing chats
Projects built:
- Interview ChatGPT about its capabilities

- Create a story with ChatGPT
- Get homework help (with citations)
- Plan a birthday party with AI

Practice: With a parent nearby, ask ChatGPT three questions about your favorite animal and note which answer surprised you most.

Prompt Engineering Basics

Topics:
- What is a prompt?
- Anatomy of a good prompt
- Clear instructions importance
- Context and background information
- Specific vs vague prompts
- Using examples in prompts
- Role-playing prompts ('Act as a...')
- Step-by-step prompts
- Output format specification
- Temperature and creativity settings
- Iterative prompting (improving results)
- Prompt templates creation

Projects built:
- Create prompt template library
- Before/After prompt improvements
- Prompt engineering challenge
- Build custom AI assistant personality

Practice: Rewrite one vague prompt like 'draw a dog' into a detailed prompt with a place, a mood and a style, then compare the two answers.

Advanced ChatGPT Techniques

Topics:
- Multi-turn conversations
- Teaching ChatGPT your preferences
- Custom instructions setup
- Using ChatGPT for learning
- Language translation with AI
- Code explanation with ChatGPT
- Math problem solving
- ChatGPT for research projects
- Creating study guides
- Quiz and flashcard generation
- Web browsing with ChatGPT
- Custom GPTs and projects: building a tailored study helper

Projects built:
- Create personalized study assistant
- Build interactive quiz game
- Research project on favorite topic
- Multi-language story creation

Practice: Hold a five turn conversation where you teach the AI about your favorite hobby, then ask it to quiz you on it.

Assessment: Month 1 check: a live prompting challenge scored on a rubric, plus a take-home mixing everything from month 1

MONTH 2: CREATIVE AI, DONE LEGALLY

AI art and image editing with tools that genuinely permit teens, plus the copyright and ethics questions creative AI raises.

Introduction to AI Art

Topics:
- How AI creates images
- Understanding diffusion models (simple explanation)
- Text-to-image concept
- AI art history and evolution
- Famous AI artworks
- Copyright and AI art basics
- Ethical considerations in AI art
- Different styles AI can create
- Resolution and quality settings
- Image composition basics
- Color theory for AI art
- Planning AI art projects

Projects built:
- First AI artwork collection
- Illustrate a short story
- Create fantasy creatures
- Design dream bedroom with AI

Practice: Describe your dream bedroom in words, generate an image from the description and circle two details the AI got right.

Image Generation with Teen-Legal Tools
Topics:
- Image generator interface deep dive
- Crafting detailed image prompts
- Style modifiers: cartoon, realistic, abstract
- Artist styles (ethically)
- Lighting and mood descriptors
- Camera angles and perspectives
- Combining multiple concepts
- Inpainting and editing
- Variations and iterations
- Bing Image Creator advantages
- Batch generation techniques
- Saving and organizing AI art
Projects built:
- Create comic book pages
- Design game characters
- Reimagine famous paintings
- Build visual vocabulary guide
Practice: Generate the same scene in three styles, cartoon, realistic and abstract, and write down which prompt words worked best.

Adobe Firefly, Canva AI and Advanced Art
Topics:
- Adobe Firefly: generation built on licensed training data
- Canva Magic Media inside real design projects
- Microsoft Designer and Bing Image Creator workflows
- Style, mood and composition prompts that transfer across tools
- Consistent characters and series work
- Generative fill and expand: editing with AI
- Why several famous art tools are 18+ and what that means for now
- Building a small AI art portfolio with honest tool credits
Projects built:
- A themed 6-piece AI art series with consistent style
- A school event poster designed end to end in Canva with AI assists
Practice: One artwork a day across different tools, credited honestly

AI Photo Editing and Manipulation
Topics:
- AI-powered photo editing
- Background removal with AI
- Object removal and replacement
- AI upscaling and enhancement
- Face editing and avatars
- Style transfer techniques
- Creating AI filters
- Batch processing with AI
- Restoration of old photos
- AI color correction
- Creating photo compositions
- AI-assisted graphic design
Projects built:
- Restore and colorize old photos
- Create AI avatar collection
- Design poster with AI elements
- Before/after photo gallery
Practice: With permission, remove the background from a family photo using an AI editor and place the subject somewhere fun.
Assessment: Month 2 check: an art-and-editing challenge with a copyright question, plus mixed review from month 1

MONTH 3: AI FOR MEDIA AND SCHOOL

Music, audio and video tools at teen-appropriate levels, then the serious part: AI as a study partner used ethically.

AI Music and Audio
Topics:
- How AI composes music
- Music theory basics for AI
- Genres and styles in AI music
- Melody vs harmony generation
- Rhythm and beat creation
- AI instrument selection
- Mood and emotion in music
- Creating loops and samples
- Extending and editing AI music

    - Copyright in AI music
    - Using AI music in projects
    - Music prompt engineering
    - Text-to-speech and transcription tools for projects
    - Cleaning audio: noise removal with AI
    - Why voice cloning is age-restricted, and the ethics around it
  Projects built:
    - Create theme song for imaginary show
    - Compose study music playlist
    - Make birthday song variations
    - Video game soundtrack creation
  Practice: Generate two short tunes in different genres and tell someone at home which
  mood each one gives you.

AI Video and Animation
  Topics:
    - Text-to-video AI introduction
    - Video editing with AI assistance
    - Creating animations with AI
    - AI scene generation
    - Green screen with AI
    - Video upscaling and enhancement
    - Automatic subtitles and captions
    - Video summarization AI
    - Creating video thumbnails
    - AI video effects and filters
    - Lip-sync and dubbing AI
    - Short-form content creation
    - GIFs and short animations with teen-accessible tools
    - Animating a static image, responsibly and with consent
  Projects built:
    - Create AI news report
    - Animated explainer video
    - Music video with AI visuals
    - Educational video with AI presenter
  Practice: Storyboard a 15 second video in three drawn frames, then create one of the
  scenes with an AI video tool.

AI Study Assistants, Used Ethically
  Topics:
    - AI for different subjects
    - Math problem solvers
    - Science experiment simulators
    - History research assistants
    - Language learning with AI
    - AI essay helpers (ethical use)
    - Citation and bibliography tools
    - Concept explanation AI
    - Creating mind maps with AI
    - AI flashcard systems
    - Spaced repetition with AI
    - Exam preparation strategies
  Projects built:
    - Create personalized study plan
    - Build subject-specific AI tutor
    - Design quiz preparation system
    - Make visual study guides
  Practice: Use an AI study helper to practice five maths or spelling questions, and mark
  which ones you solved without any help.

AI Research and Writing Tools
  Topics:
    - Research methodology with AI
    - Finding reliable sources
    - AI for literature review
    - Summarizing long texts
    - Note-taking with AI
    - Outline generation
    - Paraphrasing tools
    - Grammar and style checking
    - Plagiarism detection
    - Creating bibliographies
    - Presentation creation with AI
    - Infographic generation
  Projects built:
    - Complete research project
    - Create academic presentation
    - Build knowledge database
    - Design infographic report

Practice: Ask AI to summarize a short article about space or animals, then check one fact from the summary in another source.
Assessment: Month 3 check: produce a short AI-assisted study artifact with sources verified, plus mixed review reaching back to month 1

MONTH 4: THE BUILDER'S MONTH AND THE FINAL EXAM

The step from user to builder: coding assistants, training your own models, the ethics that govern it all, and the capstone exam.

AI Coding Assistants
Topics:
- Introduction to AI pair programming
- How AI understands code
- Code completion basics
- Bug detection with AI
- Code explanation tools
- Converting ideas to code
- Learning programming with AI
- Different programming languages
- Debugging with AI help
- Code optimization suggestions
- Documentation generation
- Version control basics with AI

Projects built:
- Build first website with AI help
- Create simple Python game
- Make calculator app
- Design personal portfolio

Practice: Ask an AI assistant to explain a small piece of code in plain words, then change one thing and predict what happens.

Train Your Own Models
Topics:
- Training custom AI models
- Understanding datasets
- Classification vs regression
- Computer vision projects
- Natural language processing
- Predictive models basics
- Model evaluation metrics
- Overfitting and underfitting
- Feature engineering basics
- Deploying ML models
- ML ethics and bias
- Real-world ML applications
- Sharing a model demo with Gradio, the simple way

Projects built:
- Image classifier for recycling
- Sentiment analysis tool
- Gesture recognition system
- Predictive text generator

Practice: Train a Teachable Machine model to recognize two of your toys and test it five times with each toy.

AI Safety, Ethics and the Future
Topics:
- AI bias and fairness
- Privacy in AI age
- Deepfakes and detection
- Misinformation and AI
- Digital footprint awareness
- Cybersecurity basics
- AI regulation basics
- Intellectual property and AI
- Job displacement discussions
- Human-AI collaboration
- Future of work with AI
- Responsible AI use
- AI agents that act on your behalf: promise and risk
- Capstone planning: choosing a project worth defending

Projects built:
- Create AI ethics guidebook
- Design bias detection system
- Build fact-checking tool
- Develop digital safety plan

Practice: Play detective with a parent: compare one real photo and one AI image and list two clues that gave the AI image away.

Capstone, Demo Day and the Final Exam
Topics:
- Building the capstone: several AI tools, one real outcome
- Documentation: what was AI, what was you, said honestly
- Rehearsing the demo: showing judgment, not just output
- Presenting to the batch and parents
- A full-course mixed review before the exam
Projects built:
- The capstone: a study system, creative portfolio, small trained model or AI-assisted build, demonstrated live
Practice: Daily capstone progress with honest AI-use notes
Assessment: FINAL EXAM: capstone demo plus a written paper with questions mixed from the whole course, including tool-age judgment and ethics. Passing earns the certificate; falling short earns focused revision and a free retest

PROJECTS THE STUDENT BUILDS AND KEEPS

- Month 1: a prompt playbook, a custom study helper GPT, and a rubric-scored prompting challenge
- Month 2: a themed AI art series with honest crediting and a designed school poster
- Month 3: an AI-assisted audio or video piece and a verified research artifact
- Month 4: a self-trained ML model demo and the final capstone, defended live

Total projects: 15+ real AI-assisted projects plus a defended capstone

SKILLS THE STUDENT WILL HAVE AT THE END

- Prompt engineering: structure, context, iteration and honest evaluation
- Creative AI: image, audio and video work with teen-legal tools and proper credits
- Study skills: AI as tutor and research partner, inside academic honesty lines
- Builder basics: coding assistants and training small ML models
- Judgment: fact-checking, bias awareness, privacy habits and tool-age literacy

HOW A TYPICAL WEEK IS SPLIT

Live classes: 2 live one-hour classes per week, tools driven hands-on together
Homework: A practical AI task after every class, and a mixed challenge at the end of every month
Practice: 2-3 hours of guided practice between classes
Review: Every submission reviewed with feedback; judgment errors corrected kindly and early

SUPPORT INCLUDED

Doubt support: WhatsApp doubt support between classes
Progress updates: Regular notes to parents, including which tools were introduced and the consent settings that matter

CERTIFICATION DETAIL

Completion: Certificate from Modern Age Coders, awarded on passing the final exam, a capstone demo plus written paper. Fall short and there is focused revision and a free retest: the certificate certifies skill, not attendance

WHERE THIS CAN LEAD

- Codex and Claude Code for Teens: from using AI to building with AI coding agents
- AI and Machine Learning Masterclass: the mathematics and models behind the tools
- Python for Teens: the language that turns AI users into AI builders
- School advantage now: ethical AI study skills that compound every term
- The judgment layer: a teen who knows what to trust, cite and question

COMMON QUESTIONS ABOUT THIS COURSE

For anything about cost, use PART 4 and RULE 1. Do not quote two regions.

Q: What age is appropriate for this AI tools course?
A: Ages 13 to 18. That floor is deliberate: the major AI platforms themselves require 13+ with parental consent, and this course treats those rules as part of the curriculum. Younger children learn AI concepts hands-on in our kids coding course instead, using classroom-safe tools like Machine Learning for Kids and Teachable Machine.

Q: Is it safe for my teenager to use AI tools?
A: With the right setup and habits, yes, and building those habits is half this course. Accounts are created together with a parent wherever consent is required, no personal information goes into prompts, outputs are fact-checked as a reflex, and the course explicitly covers hallucinations, bias, privacy and deepfake awareness. Your teen also learns which popular tools are 18+ and why waiting matters.

Q: How long does the course take?
A: Four months at 2 live classes a week plus 2 to 3 hours of practice, with a fifth month in hand for teens who want more time on the builder skills, no rushing and no penalty. The course is paced so every week produces something real: a portfolio piece, a study system, a trained model, and it ends with a capstone exam.

Q: How is my teen assessed? Is the certificate just for attending?
A: No. Homework follows every class, each month ends with a mixed challenge that revisits earlier tools and adds ethics questions, and the course ends with a final exam: a capstone demo plus a written paper covering the whole syllabus, including tool-age judgment. Passing earns the certificate; falling short earns focused revision and a free retest. Real skill and real judgment, not attendance.

Q: Will my teenager learn actual skills or just play with AI toys?
A: Actual skills, in layers: prompt engineering practiced against rubrics, ethical research and study workflows, AI-assisted creative production with honest crediting, coding assistants, and training small machine-learning models of their own. The capstone requires combining tools into one defended project. Toys do not survive a viva.

Q: Which AI tools does the course use, and are they allowed for teens?
A: Only tools that genuinely permit ages 13+ (with parental consent where required): ChatGPT, Microsoft Copilot, Perplexity, Adobe Firefly, Canva AI, Bing Image Creator, GitHub Copilot, Teachable Machine and similar. Some well-known tools, several art generators and voice-cloning services among them, are 18+ by their own terms, and the course teaches exactly that instead of quietly ignoring it. Our public AI tools age guide lists every tool's floor.

Q: Will this help with school, or make cheating easier?
A: It is built to help honestly. The study weeks teach AI as a tutor and research partner: explaining concepts, generating practice questions, checking reasoning, always with verification and always inside school policy. Academic honesty is taught explicitly, including what crosses the line and why detection is the least of the reasons not to.

Q: What equipment does my teenager need?
A: A computer or laptop with a stable internet connection. The course runs on free tiers of every tool; where an account needs parental consent, it is set up together in the first weeks. No paid subscriptions are required for the syllabus.

Q: Is there a free trial class?
A: Yes, a free demo class with no commitment: book at learn.modernagecoders.com/contact or message us on WhatsApp at +91 91233 66161. Parents are welcome to sit in, and the age-and-safety setup is explained right there. (Agent note: the free demo is a waiting list with no fixed date. The Priority Live Demo is a guaranteed class today or tomorrow, booked at https://learn.modernagecoders.com/priority-demo . Offer both, as RULE 3 says.)

Q: Are classes live or recorded?
A: Live, always: small interactive groups with a real instructor, never pre-recorded videos. AI tools change monthly, and live teaching is the only format that keeps up honestly.

To enrol, message Shivam Sir on +91 9123366161 or send the parent this link: https://learn.modernagecoders.com/courses/teens-ai-tools-mastery-course
For a demo: the Priority Live Demo (guaranteed, today or tomorrow) is booked at https://learn.modernagecoders.com/priority-demo . The free demo is a waiting list with no fixed date.

==========

COURSE 13 OF 137: AI TOOLS MASTERY COURSE: CHATGPT, CLAUDE & AUTOMATION

==========

Course link: https://learn.modernagecoders.com/courses/ai-tools-mastery-complete-college
Subject area: AI & Automation
Designed for: College students
Who can join: Complete beginner (18+); college students, graduates and working professionals
Course length: 5-6 months (22-26 weeks)
Time needed: 2 live classes/week + 4-6 hours practice
Certificate: Certificate from Modern Age Coders, awarded on passing the final exam

PRICE FOR THIS COURSE (quote only the one that applies to the person asking)
In India, per month: group Rs 1,499, mini batch Rs 2,999, one to one Rs 4,999
Outside India, per month: group $100, one to one $150
Classes: group and mini batch two live classes a week, eight a month; one to one in India one live class a week, four a month; one to one outside India two live classes a week, eight a month. Each class is one hour.

WHAT THIS COURSE IS

AI tools course for adults and professionals: prompt engineering with ChatGPT and Claude, image and video AI, AI coding tools, then real automation and AI agents, in 5-6 months of live classes.

In one line: Fluency in the tools that now run knowledge work: prompting done properly, image and video AI, AI coding assistants, and real automation with agents.

ABOUT THE PROGRAMME

The AI tool landscape changed what a single professional can do in a day, but most people use a fraction of it and use that fraction badly. This live online course builds real fluency for adults and professionals: prompt engineering with ChatGPT and Claude that goes far past one-line questions, then the wider toolkit, image generation with Midjourney and Stable Diffusion, video and audio AI, AI research assistants and AI coding tools, then the payoff layer that separates power users from dabblers: workflow automation, connecting tools through their APIs, and building AI agents that carry out multi-step work. Because the tools change monthly, the course teaches durable judgment (how to evaluate, adopt and drop tools) alongside current specifics, and treats ethics, verification and responsible use as core skills, not a footnote. A finale month builds a real automation and sits the final exam. The pace is honest: about four months of teaching at two live classes a week plus practice, with margin in hand. Problem sets, monthly mixed reviews, phase exams, and a final exam that decides the certificate with a free retest.

WHAT MAKES THIS COURSE DIFFERENT

- Prompting taught to real depth, the skill most people fake
- The full modern toolkit: text, image, video, research and coding AI
- The power-user layer: automation, APIs and AI agents that do multi-step work
- Durable judgment for a fast-moving field: how to evaluate and adopt tools, not just the current list
- Verification and ethics as core skills: AI that helps, checked before it ships
- Real assessment: weekly problem sets, monthly mixed reviews, phase exams and a final exam with a free retest

THE LEARNING PATH, STEP BY STEP

Phase 1: Foundations (Weeks 1-6): prompt engineering with ChatGPT and Claude
Phase 2: The toolkit (Weeks 7-12): image, video, research and coding AI
Phase 3: Automation (Weeks 13-18): workflows, APIs and AI agents, used responsibly
Phase 4: The finale (Month 5): a real automation build and the final exam

WHAT A STUDENT NEEDS BEFORE STARTING

Coding experience: None. Everything is taught from the first line
Equipment: Any computer with a stable internet connection; every tool used is free
Age: 18+; college students, graduates and working professionals
Time commitment: 2 live classes plus 4-6 hours of practice a week

WHO THIS COURSE IS FOR

Professionals: Working professionals who want real leverage from AI, not surface tricks
College students: Students who want to enter the workforce genuinely AI-fluent
Creators and marketers: Creators and marketers who need text, image and video AI at depth
Founders: Founders and freelancers automating the work of a larger team
Career switchers: Newcomers who want a fast, current, practical AI skill

FULL CURRICULUM, WEEK BY WEEK

This is the complete teaching plan. Parents can ask about any week.

PHASE 1: AI FOUNDATIONS AND PROMPT ENGINEERING (WEEKS 1-6)

Master ChatGPT, prompt engineering, AI writing tools, and conversational AI applications.

ChatGPT & Prompt Engineering Excellence (Weeks 1-6)
Introduction to AI Tools & ChatGPT Basics
Topics:
- AI revolution: understanding generative AI
- Overview of AI tools landscape (2026)
- What is ChatGPT? How its models differ, and how to pick one
- ChatGPT account setup and interface
- ChatGPT Plus vs Free tier comparison
- Basic prompting: asking questions effectively
- Understanding AI responses and limitations
- Chat history management and organization
- Mobile app usage and tips
- ChatGPT plugins introduction
- Custom instructions setup
- Conversation starters and templates
- Ethics and responsible AI tool usage
- AI detection and originality
- Data privacy and security with AI tools

  Projects built:
    - Personal AI assistant setup
    - Custom instruction templates
    - Daily productivity workflow with ChatGPT
    - Meeting notes summarizer
    - Email response generator
  Practice: Use ChatGPT daily for 20 different tasks
Advanced Prompt Engineering
  Topics:
    - What is prompt engineering?
    - Anatomy of effective prompts
    - Zero-shot, one-shot, few-shot prompting
    - Chain-of-thought prompting
    - Role-based prompting techniques
    - Context setting and framing
    - Prompt templates and frameworks
    - RISEN framework: Role, Instructions, Steps, End goal, Narrowing
    - RTF framework: Role, Task, Format
    - Iterative prompt refinement
    - Handling AI hallucinations
    - Temperature and parameter understanding
    - Multi-turn conversations strategies
    - Prompt libraries and repositories
    - A/B testing prompts for best results
  Projects built:
    - Prompt template library (50+ templates)
    - Industry-specific prompt collections
    - Complex task automation prompts
    - Creative writing prompt system
    - Business analysis prompts
  Practice: Create and test 100+ prompts across categories
ChatGPT for Content Creation & Writing
  Topics:
    - Content ideation with ChatGPT
    - Blog post writing workflow
    - Article outlines and structure
    - SEO-optimized content creation
    - Social media content generation
    - Email marketing campaigns
    - Copywriting: sales pages, ads, landing pages
    - Storytelling and creative writing
    - Technical writing and documentation
    - Resume and cover letter creation
    - Editing and proofreading with AI
    - Tone and style adjustments
    - Multi-language content creation
    - Content repurposing strategies
    - Plagiarism checking and originality
  Projects built:
    - Complete blog writing system
    - Social media content calendar (30 days)
    - Email sequence (welcome, nurture, sales)
    - E-book outline and chapters
    - Product descriptions generator
    - LinkedIn posts automation
    - YouTube script templates
  Practice: Create 50+ pieces of content in different formats
ChatGPT for Business & Productivity
  Topics:
    - Business strategy and planning
    - Market research with ChatGPT
    - Competitive analysis workflows
    - SWOT analysis generation
    - Business plan creation
    - Financial projections and modeling prompts
    - Data analysis and insights
    - Code generation basics (no coding knowledge needed)
    - Excel formulas and spreadsheet help
    - Presentation content and structure
    - Meeting preparation and agendas
    - Decision-making frameworks
    - Problem-solving with AI
    - Learning and education use cases
    - Personal development and coaching
  Projects built:
    - Business plan generator
    - Market research report automation
    - Competitor analysis system
    - Excel/Sheets automation prompts

- Presentation creation workflow
- Personal learning curriculum
- Daily productivity dashboard

Practice: Apply ChatGPT to 30 business scenarios

Assessment: Phase 1 exam: a practical build defended live, plus a written paper mixing this phase with everything before it

---

PHASE 2: VISUAL, CREATIVE AND DEVELOPER AI TOOLS (WEEKS 7-12)

Master Claude, Gemini, Midjourney, Stable Diffusion, and all major AI tools for images, video, and audio.

Visual AI & Alternative LLMs (Weeks 7-10)

Claude AI & Google Gemini

Topics:

- Claude AI: features and strengths
- Claude vs ChatGPT comparison
- Claude's long context window usage
- Document analysis with Claude
- Claude for coding and technical tasks
- Claude Projects feature
- Google Gemini introduction
- Gemini Advanced features
- Gemini vs GPT-4 comparison
- Multi-modal capabilities of Gemini
- Google Workspace integration
- How Gemini replaced Bard, and what changed
- Choosing the right AI for the task
- Using multiple AIs together
- AI tool comparison matrix

Projects built:

- Document summarization system (Claude)
- Long-form content analysis
- Code review automation
- Research paper summarizer
- Multi-AI workflow (ChatGPT + Claude + Gemini)
- AI tool selector guide

Practice: Complete 20 tasks with each AI, compare results

Midjourney and Image Generation

Topics:

- Introduction to AI image generation
- Midjourney setup: Discord integration
- Midjourney versions: V5, V6, Niji
- Basic prompting for images
- Understanding parameters: aspect ratio, quality, stylize
- Image weights and multi-prompts
- Style references and character consistency
- Remix mode and variations
- Upscaling and image enhancement
- Negative prompts for better control
- Seed for reproducibility
- Chaos and weirdness parameters
- Photography styles and techniques
- Artistic styles replication
- Brand and marketing visuals

Projects built:

- Product photography collection
- Brand visual identity
- Social media graphics library
- Character design series
- Marketing campaign visuals
- Book cover designs
- Website hero images

Practice: Generate 200+ images, build prompt library

Stable Diffusion & Other Image AI Tools

Topics:

- Stable Diffusion introduction
- Local installation vs cloud platforms
- Automatic1111 WebUI
- Stable Diffusion prompting differences
- LoRA models and fine-tuning
- ControlNet for precise control
- Inpainting and outpainting
- Adobe Firefly for commercial use
- Leonardo.ai for game assets
- Playground AI features
- Image upscaling tools: Topaz, Magnific
- Background removal: Remove.bg, Clipdrop

- AI photo editing: Photoshop AI, Luminar
- Comparing all image AI tools

Projects built:

- Stable Diffusion custom model
- ControlNet workflow setup
- Image editing pipeline
- Multi-tool image creation workflow
- Background replacement system
- Product photography enhancement
- AI image editing service

Practice: Master 5+ image AI tools, create comparison guide

Video & Audio AI Tools

Topics:

- AI video generation: Runway ML, Pika
- Text-to-video creation
- Image-to-video animation
- Video editing with AI: Descript, Opus Clip
- AI avatars: Synthesia, HeyGen
- Video enhancement and upscaling
- AI voice generation: ElevenLabs, Murf
- Voice cloning ethics and usage
- Text-to-speech for videos
- Music generation: Suno, Udio
- Audio enhancement tools
- Podcast editing with AI
- Subtitle generation and translation
- Video summarization tools
- Social media video optimization

Projects built:

- AI-generated video ads
- Explainer video with AI avatar
- Podcast intro/outro creation
- Social media video series
- Product demo video
- Multi-language video content
- Complete video production workflow

Practice: Create 15 videos using various AI tools

Research, Coding and Creative AI Tools (Weeks 11-12)

AI Research & Knowledge Tools

Topics:

- Perplexity AI for research
- Research paper summaries: Semantic Scholar, Consensus
- Literature review automation
- You.com for AI-powered search
- Bing AI (Copilot) features
- AI fact-checking tools
- Citation and reference management
- Knowledge base creation with AI
- Note-taking with AI: Notion AI, Mem
- Obsidian with AI plugins
- Roam Research AI integration
- Personal knowledge management
- Learning and study tools
- AI tutors and educational platforms
- Research workflow optimization

Projects built:

- Research automation system
- Literature review generator
- AI-powered knowledge base
- Personal learning system
- Fact-checking workflow
- Study guide generator
- Research paper writing assistant

Practice: Build comprehensive research toolkit

AI Coding & Development Tools

Topics:

- GitHub Copilot for coding
- Cursor AI editor
- Replit AI for full-stack development
- V0.dev by Vercel for UI generation
- ChatGPT for code generation
- Code debugging with AI
- Code review automation
- Documentation generation
- No-code platforms: Bubble, Webflow
- AI-powered app builders: FlutterFlow
- Database schema generation
- API creation with AI

- Testing and QA with AI
- Code refactoring tools
- Building apps without coding knowledge

Projects built:
- Landing page with V0.dev
- Full web app with Replit AI
- Mobile app with FlutterFlow
- Chrome extension with AI
- Automation script generation
- API wrapper creation
- Complete SaaS MVP without coding

Practice: Build 10 applications using AI coding tools

Assessment: Phase 2 exam: a practical build defended live, plus a written paper mixing this phase with everything before it

---

PHASE 3: AI AUTOMATION AND PROFESSIONAL APPLICATIONS (WEEKS 13-18)

Turn tool fluency into leverage: workflow automation, connecting tools through their APIs, and building AI agents for multi-step work, used responsibly with verification built in.

Automation, Agents and Business Applications (Weeks 13-16)

AI Workflow Automation

Topics:
- Introduction to AI automation
- Zapier with AI: ChatGPT integration
- Make (Integromat) for complex workflows
- n8n for advanced automation
- Connecting multiple AI tools
- Trigger-action automation
- Multi-step workflows
- Conditional logic in automation
- Error handling and fallbacks
- Data transformation between tools
- API connections basics
- Webhook usage for real-time automation
- Scheduled automation
- Database integration (Airtable, Google Sheets)
- Testing and debugging workflows

Projects built:
- Content publishing automation
- Lead generation and nurturing workflow
- Social media automation system
- Email response automation
- Data extraction and analysis pipeline
- Customer onboarding automation
- Report generation workflow

Practice: Build 20 automation workflows

AI Agents & Advanced Automation

Topics:
- What are AI agents?
- AutoGPT and autonomous agents
- BabyAGI for task automation
- LangChain for AI applications
- Agent frameworks overview
- Custom GPTs creation
- GPT Actions and integrations
- Assistants API usage
- Function calling in AI
- Agent memory and context
- Multi-agent systems
- Agent orchestration
- Agentic workflows design
- Limitations and considerations
- Future of AI agents

Projects built:
- Custom GPT for specific task
- Personal AI assistant (multi-functional)
- Research agent system
- Customer service agent
- Data analysis agent
- Content creation agent
- Business intelligence agent

Practice: Create 10 specialized AI agents

AI Integration & API Usage

Topics:
- Understanding APIs basics
- Anthropic Claude API
- Google Gemini API

- Stability AI API
- API key management
- Rate limits and cost optimization
- Building apps with AI APIs (no-code tools)
- Glide for AI-powered apps
- Softr for AI integrations
- API connectors in various platforms
- Custom chatbots with APIs
- Embedding AI in websites
- WhatsApp/Telegram bot creation
- AI-powered Chrome extensions

Projects built:
- Custom chatbot on website
- WhatsApp AI assistant
- Telegram bot with AI
- Chrome extension with ChatGPT
- Mobile app with AI features (Glide)
- Internal tool with AI (Softr)
- AI-powered form builder

Practice: Build 8 AI-integrated applications

AI Tools for Business and Professional Work

Topics:
- Freelancing with AI tools
- AI services to offer clients
- Pricing AI-powered services
- Building AI tool SaaS products
- Affiliate marketing with AI content
- AI-generated digital products
- Selling prompts and templates
- AI consulting services
- Agency model with AI
- White-label AI solutions
- Course creation with AI
- AI automation services
- Building and selling AI agents
- Subscription-based AI services

Projects built:
- Freelance service package design
- AI SaaS product MVP
- Prompt marketplace listings
- Digital product creation
- Agency service offerings
- Online course with AI help

Practice: Launch 3 revenue streams with AI tools

Staying Current and Responsible Use (Weeks 17-18)

Staying Current with AI Tools

Topics:
- AI tool discovery strategies
- Following AI news and updates
- There's An AI For That (directory)
- AI tool review and evaluation
- Beta testing new AI tools
- Community engagement: Twitter, Reddit, Discord
- AI newsletters and resources
- Testing frameworks for new tools
- Building personal AI tool stack
- Documentation and knowledge management
- Sharing findings and building authority
- Predicting AI tool trends
- Adapting to rapid changes
- Continuous learning strategies
- Building learning systems

Projects built:
- AI tool evaluation framework
- Personal AI tools dashboard
- Weekly AI tools newsletter
- AI tools comparison database
- Trend analysis report
- Learning and update system

Practice: Review 50+ new AI tools, create evaluation system

Ethics, Safety & Responsible AI Use

Topics:
- AI ethics principles
- Bias in AI tools
- Transparency and disclosure
- AI content labeling
- Misinformation and deepfakes
- Copyright and AI-generated content

- Privacy considerations
- Data security with AI tools
- Terms of service understanding
- Commercial use rights
- AI watermarking and detection
- Responsible automation
- Job displacement considerations
- Environmental impact of AI
- Building ethical AI practices

Projects built:
- Ethical AI usage policy
- Client education materials
- Disclosure templates
- Rights and licensing guide
- AI ethics checklist
- Best practices document

Practice: Develop comprehensive ethical framework

Assessment: Phase 3 exam: a practical build defended live, plus a written paper mixing this phase with everything before it

---

PHASE 4: THE FINALE (MONTH 5, WEEKS 19-23)

The capstone month: spec, build, ship and defend, then the final exam that decides the certificate.

Month 5: Capstone and the Final Exam (Weeks 19-23)

Capstone Spec and Setup

Topics:
- Choosing the capstone: a real end-to-end AI automation: a content pipeline, a research assistant or a multi-step agent workflow for actual work
- A one-page spec: scope, milestones, stack
- Repository and skeleton ready on day one
- Instructor sign-off before the build begins

Projects built:
- Approved capstone spec plus the running skeleton

Practice: Pitch the spec to the batch and absorb one hard question

Capstone Build

Topics:
- Two focused weeks in vertical slices
- Instructor checkpoints and honest scope cuts
- Using the whole course: prompting depth, the right tools for each step, and automation wiring through APIs or agents
- Daily commits and an always-working build

Projects built:
- The capstone, feature-complete with version control

Practice: A working build at the end of every session

Ship and Polish

Topics:
- The finishing pass: edge cases, errors, documentation
- Working and verified: an automation that runs, with human checks where they matter
- A README worth reading and a demo worth watching
- A full-course spiral review before the exam

Projects built:
- The capstone shipped, documented and rehearsed

Practice: Two mock demos, each tighter than the last

Demo Day and the Final Exam

Topics:
- Presenting the capstone: live demo plus the hardest bug story
- The honest map of next roads: deeper automation with code, AI-assisted development, or applied AI in your own field
- Where our other courses continue the journey

Projects built:
- Demo day presentation delivered to the batch

Assessment: FINAL EXAM: a practical build plus a written paper with questions mixed from every phase. Passing earns the certificate; falling short earns a focused revision plan and a free retest

PROJECTS THE STUDENT BUILDS AND KEEPS

- Phase 1: a prompt library and real ChatGPT and Claude workflows
- Phase 2: image, video and coding-AI deliverables
- Phase 3: automations and a working AI agent
- Phase 4: the end-to-end automation capstone

Total projects: 15+ real deliverables, crowned by an end-to-end automation build

SKILLS THE STUDENT WILL HAVE AT THE END

- Prompt engineering with ChatGPT and Claude, to real depth
- Visual and media AI: Midjourney, Stable Diffusion, video and audio tools
- AI research and coding assistants, used well
- Automation: workflows, API connections and AI agents
- Judgment and ethics: evaluating tools, verifying output, using AI responsibly

HOW A TYPICAL WEEK IS SPLIT

Live classes: 2 live one-hour classes per week, coding along with the instructor
Homework: A problem set after every class, and a mixed-review assignment at the end of every month
Practice: 4-6 hours of building between classes
Review: Every submission reviewed with written feedback; recurring gaps reopened in class

SUPPORT INCLUDED

Doubt support: WhatsApp doubt support between classes
Progress updates: Honest monthly progress reviews: what is solid, what is wobbly, and the plan for the wobble

CERTIFICATION DETAIL

Completion: Certificate from Modern Age Coders, awarded on passing the final exam. Fall short and there is focused revision and a free retest: the certificate certifies knowledge, not attendance

WHERE THIS CAN LEAD

- Applied AI in your own field: the toolkit plus your domain
- Our Python automation course to build automations in code
- AI-assisted development: our agentic and coding-tool courses
- Deeper model work: our AI/ML course for what is under the tools

COMMON QUESTIONS ABOUT THIS COURSE

For anything about cost, use PART 4 and RULE 1. Do not quote two regions.

Q: What does this AI tools course cover?
A: Prompt engineering with ChatGPT and Claude first, then the wider toolkit, image generation with Midjourney and Stable Diffusion, video and audio AI, AI research assistants and AI coding tools, then the automation layer, workflow automation, connecting tools through APIs, and building AI agents for multi-step work, with tool-evaluation judgment, verification and responsible-use ethics throughout. A finale month builds a real automation and sits the final exam.

Q: How long does this AI tools course take?
A: About four months of teaching at 2 live classes a week plus practice, with margin in hand for a 5 to 6 month total. Three phases cover prompting, the wider toolkit, and automation with agents; the finale month builds a real automation and sits the final exam.

Q: How am I assessed? Is the certificate just for attending?
A: No. Problem sets follow every class with written feedback, monthly reviews deliberately mix new material with earlier topics, each phase ends with a cumulative exam, and the course ends with a final exam: a practical build plus written questions from the whole syllabus. Passing earns the certificate; falling short earns focused revision and a free retest.

Q: The tools change every month, so will this course be out of date?
A: The specific tools will keep changing; the skills will not. Prompting well, evaluating a new tool quickly, wiring automations and verifying AI output are durable, and this course teaches those alongside current specifics. You leave able to pick up the next new tool in an afternoon, which is the real skill.

Q: Do I need to be technical to take this course?
A: No. Most of the course needs no coding: prompting, image and video AI, research tools and no-code automation are all accessible. The automation phase touches simple API use, taught gently, and you can go as deep or as light there as your goals need. It is built for professionals of every background, not just developers.

Q: Is this course suitable for teenagers?
A: This is our adult (18+) AI tools course, because several tools it uses, including the general-purpose image and chat models, set their own terms and age limits at 18. Younger learners have a dedicated teens AI tools course built entirely around teen-appropriate, age-compliant tools, which is the honest place for them to start.

Q: Can I try a class before enrolling?
A: Yes, a free demo class with no commitment: book at learn.modernagecoders.com/contact or message us on WhatsApp at +91 91233 66161. (Agent note: the free demo is a waiting list with no fixed date. The Priority Live Demo is a guaranteed class today or tomorrow, booked at https://learn.modernagecoders.com/priority-demo . Offer both, as RULE 3 says.)

  Q: Are classes live or recorded?
  A: Live, always: small groups with a real instructor reading your actual code, never
  pre-recorded videos.

  To enrol, message Shivam Sir on +91 9123366161 or send the parent this link: https://learn.modernagecoders.com/courses/ai-tools-mastery-complete-college
  For a demo: the Priority Live Demo (guaranteed, today or tomorrow) is booked at
  https://learn.modernagecoders.com/priority-demo . The free demo is a waiting list with no fixed date.

==========
COURSE 14 OF 137: ALGEBRA FOUNDATIONS: PRE-ALGEBRA & ALGEBRA 1, LIVE ONLINE
==========

Course link: https://learn.modernagecoders.com/courses/algebra-foundations-masterclass
Subject area: School Mathematics
Designed for: Middle school
Who can join: Grades 7-9, or any student whose algebra base needs a real rebuild
Course length: 12 months (52 weeks)
Time needed: 2 live one-hour classes per week + short practice sets
Certificate: Certificate from Modern Age Coders, awarded on passing the final assessment

PRICE FOR THIS COURSE (quote only the one that applies to the person asking)
  In India, per month: group Rs 1,499, mini batch Rs 2,999, one to one Rs 4,999
  Outside India, per month: group $100, one to one $150
  Classes: group and mini batch two live classes a week, eight a month; one to one in India one
  live class a week, four a month; one to one outside India two live classes a week, eight a
  month. Each class is one hour.

WHAT THIS COURSE IS

  Live online Pre-Algebra and Algebra 1: repair fractions and negatives, then master linear
  equations, functions and quadratics. 8 one-hour classes a month.

  In one line: Algebra is a language. We teach your child to speak it, not memorize it.

ABOUT THE PROGRAMME

  A 12-month live program covering Pre-Algebra and the whole of Algebra 1, the single most
  consequential stretch in school mathematics. Every later course (Geometry, Algebra 2, SAT,
  calculus) silently assumes this material, and most struggling high-schoolers trace their
  trouble to exactly here. We teach algebra as a language with meaning: negatives and fractions
  rebuilt first, letters introduced as numbers-in-waiting, equations read as sentences, and
  functions met as machines. Students solve and explain aloud in every class; procedures are
  drilled only after the idea underneath holds.

WHAT MAKES THIS COURSE DIFFERENT

  - The arithmetic base, fractions, negatives, order of operations, is repaired first, because
    algebra built on sand always collapses in year two
  - Letters taught as meaning, not ritual: students can say what x is doing in every line they
    write
  - Word problems as the main course, not the scary extras at the chapter's end
  - Equation-table-graph fluency: every linear situation seen three ways
  - The explain-back method: what survives explaining is what is actually learned
  - One dedicated mentor who tracks exactly where understanding thins
  - A genuine on-ramp to Algebra 2, SAT prep and beyond, this course is the runway
  - One full interactive hour per class, twice a week

THE LEARNING PATH, STEP BY STEP

  Phase 1: Pre-Algebra: the number system mastered, integers, fractions, decimals, ratios and
  the first variables
  Phase 2: The heart of Algebra 1: equations, inequalities, linear functions and systems, seen
  as equation, table and graph
  Phase 3: Exponents, polynomials and quadratics, plus the word-problem and graph craft that
  makes it all usable

WHAT A STUDENT NEEDS BEFORE STARTING

  Education: Typically grades 7-9; older students rebuilding a weak base are equally welcome
  Math background: Basic whole-number arithmetic, everything else is taught or repaired inside
    the course
  Equipment: Computer with stable internet, notebook and pencil
  Time commitment: 2 live hours plus 1-2 practice hours weekly
  English: Course taught in English
  Motivation: Willingness to explain thinking aloud, the method depends on it

WHO THIS COURSE IS FOR

First timers: Grade 7-9 students meeting algebra for the first time who deserve to meet it properly
Strugglers: Students drowning in school algebra whose real gap is usually fractions or negatives
Rebuilders: Older students whose Algebra 2, SAT or IGCSE trouble traces back to this exact material
Homeschoolers: Families who want a structured, live-taught algebra year with a real teacher
Advancers: Strong grade 6-7 students ready to start the algebra road early

FULL CURRICULUM, WEEK BY WEEK

This is the complete teaching plan. Parents can ask about any week.

PHASE 1: PRE-ALGEBRA, THE NUMBER SYSTEM MASTERED (WEEKS 1-16)

Almost every algebra struggle is an arithmetic gap wearing a disguise. This phase rebuilds integers, fractions, decimals and ratios to genuine fluency, then introduces variables so gently they feel obvious.

Weeks 1-4: Diagnostic + Integers and the Number Line

Topics:

- Full diagnostic: where the number base actually stands
- The number line as home: integers, opposites and absolute value
- Adding and subtracting negatives with meaning (temperature, money, elevation)
- Multiplying and dividing negatives, why the rules are what they are
- Order of operations as grammar, not a mnemonic chant
- Mental arithmetic habits started: every class opens with fluency work

Projects built:

- Personal gap map for the year ahead
- Integer war-stories set: temperature, bank balance and elevation problems

Practice: Do a short daily integer practice set this week, using the number line whenever unsure, and write one real money or temperature story for a negative number calculation.

Weeks 5-10: Fractions and Decimals, Properly This Time

Topics:

- Fractions as numbers with places on the line, not pizza slices
- Equivalence and comparison through reasoning, not rules
- All four operations with fractions, each from a picture first
- Decimals, place value and fraction-decimal-percent conversion fluency
- Estimation as a checking habit: does this answer make sense?
- Exponents introduced as repeated multiplication with meaning

Projects built:

- Fraction operation gallery: one worked picture per operation, made by the student
- Real-recipe scaling project: fractions doing real work

Practice: Complete a mixed fractions and decimals problem set, drawing a quick picture for any operation you cannot yet explain in words.

Weeks 11-16: Ratios, Percents and the First Variables

Topics:

- Ratio and rate reasoning: the choose-the-easy-comparison skill
- Proportions solved by sense first, cross-multiplication second
- Percent problems in every costume: change, discount, tax, reverse
- Variables introduced as numbers-in-waiting; expressions as phrases
- Evaluating and simplifying expressions; like terms with meaning
- The distributive property as area, a picture that never lies

Projects built:

- Best-buy investigation: unit-price reasoning on real products
- Phase mastery check: solve, explain and extend, per topic

Practice: Solve ten percent problems taken from real life, discounts, tax and score changes, estimating each answer before computing to check your number sense.

PHASE 2: EQUATIONS, FUNCTIONS AND SYSTEMS (WEEKS 17-36)

The heart of Algebra 1. Equations are read as sentences and solved with balance reasoning; linear functions are met as equation, table and graph telling one story; systems make two stories intersect. This is the phase that decides the next five years of math.

Weeks 17-22: Equations and Inequalities as Sentences

Topics:

- One-step and two-step equations from balance reasoning
- Multi-step equations: variables on both sides, distribution, fractions
- Translating words into equations, the skill that unlocks word problems
- Literal equations: isolating any variable in a formula
- Inequalities: what flips the sign and why
- Checking solutions as a habit, not an afterthought

Projects built:
- Equation-sentence dictionary: twenty phrasings, twenty equations
- Real-world setups: phone plans, savings goals, break-even problems

Practice: Work a set of multi step equations showing the balance move at every line, then translate three word problems into equations without solving them.

Weeks 23-29: Linear Functions Three Ways

Topics:
- Coordinate plane fluency and graph-reading discipline
- Slope as rate of change, from stories before formulas
- Slope-intercept, point-slope and standard form, translated freely
- Graphing lines by meaning; intercepts as starting values
- Function notation and the function-as-machine idea
- Linear modeling: real data fitted, interpreted and questioned

Projects built:
- Equation-table-graph triptych for three real situations
- Data modeling mini-project: fit a line, defend the interpretation

Practice: Graph the same line from slope intercept, point slope and standard form to confirm they agree, and describe one real situation the line could model.

Weeks 30-36: Systems of Equations and Inequalities

Topics:
- Systems by graphing: the intersection as the answer to a question
- Substitution and elimination, chosen by structure not habit
- How many solutions? Parallel, crossing and identical lines as ideas
- Systems word problems: mixtures, comparisons, break-even
- Linear inequalities and systems of them, with shaded-region reasoning
- Phase checkpoint: mixed problem set at grade-level exam standard

Projects built:
- Business break-even case solved all three ways
- Phase mastery check: solve, explain and extend, per topic

Practice: Solve six systems choosing the method by structure, at least two each by graphing, substitution and elimination, and check every answer in both equations.

PHASE 3: EXPONENTS, POLYNOMIALS AND QUADRATICS (WEEKS 37-52)

The bridge into Algebra 2: exponent rules from meaning, polynomial arithmetic without fear, factoring as detective work and quadratics met as functions with real stories. The course closes with the word-problem and graph craft that turns knowledge into marks.

Weeks 37-42: Exponents and Polynomials

Topics:
- Exponent rules derived, not memorized, including zero and negatives
- Scientific notation with real scale (atoms to galaxies)
- Polynomials as expressions with structure: naming, adding, subtracting
- Multiplying polynomials: the area model that makes FOIL obvious
- Special products recognized as patterns: squares and difference of squares
- Fluency drills at pace, now that meaning holds

Projects built:
- Powers-of-ten scale tour: notation doing real scientific work
- Area-model gallery for polynomial multiplication

Practice: Complete an exponent rules drill, deriving any rule you forget instead of guessing, plus five polynomial multiplications using the area model.

Weeks 43-48: Factoring and Quadratic Equations

Topics:
- Factoring as un-multiplying: GCF, trinomials, special patterns
- The zero-product property, why factoring solves equations
- Square roots and solving by square-rooting
- The quadratic formula, derived once so it is never mysterious
- Choosing a method by structure: factor, root, or formula
- The discriminant previewed: how many solutions and why

Projects built:
- Factoring pattern-book, built by the student
- Quadratic equation gauntlet: mixed methods under light timing

Practice: Factor a 15 expression mixed set, then solve five quadratic equations choosing factoring, square roots or the formula and noting why each time.

Weeks 49-52: Quadratic Functions + the Capstone

Topics:
- Quadratic functions and parabola anatomy: vertex, axis, intercepts
- Projectile and area stories: the vertex as the answer to a real question
- Graphing quadratics from every form
- Course capstone review: the year's ideas connected into one map
- Algebra 2 preview: what comes next and why this base carries it
- Final mastery check across all three phases

Projects built:
- Capstone: one real quadratic situation modeled, graphed and presented

- Personal algebra handbook, the year's ideas in the student's own words
Practice: Graph two parabolas from different forms, labeling vertex, axis and intercepts, and start your capstone map connecting the year's big ideas.

PROJECTS THE STUDENT BUILDS AND KEEPS

- Personal gap map and year-long error log
- Fraction operation gallery and factoring pattern-book, made by the student
- Equation-table-graph triptychs for real situations
- Business break-even case solved three ways
- Capstone quadratic modeling project + personal algebra handbook

Total projects: 10+ student-made artifacts across the year

SKILLS THE STUDENT WILL HAVE AT THE END

- Integer, fraction and decimal fluency
- Ratio, proportion and percent reasoning
- Equation solving with balance reasoning
- Linear functions as equation, table and graph
- Systems of equations and inequalities
- Exponent rules and polynomial arithmetic
- Factoring and quadratic equations
- Word-problem translation craft

HOW A TYPICAL WEEK IS SPLIT

Live classes: 2 one-hour live classes with your mentor
Practice: Short, purposeful sets, never busywork stacks
Fluency: Mental-math warm-up in every class
Total per week: About 3-4 focused hours
Homework: A problem set after every class, and a monthly mixed-review assignment that deliberately folds in earlier topics

SUPPORT INCLUDED

Live sessions: 8 live one-hour classes every month, 2 per week
Mentorship: One dedicated mentor across the whole year
Recordings: Every class recorded for revision
Progress tracking: Phase mastery checks shared with parents
Flexibility: Slots move around school exams and family plans

CERTIFICATION DETAIL

Completion: Certificate from Modern Age Coders, awarded on passing the final assessment. Fall short and there is focused revision and a free retest: the certificate certifies mastery, not attendance

WHERE THIS CAN LEAD

- Ready for Algebra 2, Geometry and the high-school mathematics track
- The base that SAT and ACT math prep assumes
- Eligible for competition mathematics and honors placements
- Continue with the High School Mathematics Mastery Program with the same mentor

COMMON QUESTIONS ABOUT THIS COURSE

For anything about cost, use PART 4 and RULE 1. Do not quote two regions.

Q: Who is this course for?
A: Three groups: students in grades 7-9 meeting algebra for the first time and wanting it taught properly; older students whose Algebra 2 or SAT struggles trace back to a weak Algebra 1 base; and homeschool families who want a structured, live-taught algebra year. The diagnostic in the free demo places every student accurately. (Agent note: the free demo is a waiting list with no fixed date. The Priority Live Demo is a guaranteed class today or tomorrow, booked at https://learn.modernagecoders.com/priority-demo . Offer both, as RULE 3 says.)

Q: My child is already failing algebra at school. Is this remedial or advanced?
A: It is neither and both, it is understanding-first. We start where your child actually is (the diagnostic finds it), repair the arithmetic underneath if needed, and build to full Algebra 1 ownership. Struggling students stop sinking; comfortable students go deeper than school does.

Q: Why does the course spend weeks on fractions and negatives?
A: Because they are the gap behind most algebra failures. A student who cannot operate on fractions confidently will lose points in every algebra topic forever. We fix the foundation first, it is slower in week one and dramatically faster by month six.

Q: How is this different from school algebra?
A: Class sizes and method. School must march thirty students through a syllabus; we teach 1-on-1 or in tight small groups, with your child solving and explaining aloud for a full hour. Every idea is built from meaning, balance reasoning, area models, function machines, so it survives past the test.

Q: Will this align with my child's school curriculum?
A: Yes. The course covers the standard Pre-Algebra and Algebra 1 territory (US Common Core, and the equivalent stretch in Indian, British and IB middle-school systems), and the mentor sequences topics to reinforce what school is doing rather than clash with it.

Q: How long until we see grade improvement?
A: Homework and test comfort usually move within 4-6 weeks; deep, durable improvement, the kind that persists into Algebra 2, builds over the year. Monthly billing means you watch evidence and re-decide every four weeks.

Q: How am I assessed, and is the certificate just for showing up?
A: No. A problem set follows every class with written feedback, monthly reviews deliberately mix new material with earlier topics so nothing is forgotten, and the course ends with a final exam covering the whole course. Passing earns the certificate; falling short earns focused revision and a free retest. We measure real understanding, not attendance.

Q: Can we try it before paying?
A: Yes. Every student starts with a free live demo class that doubles as the diagnostic, a real lesson plus an honest read on where the gaps actually are, with no card details required.

To enrol, message Shivam Sir on +91 9123366161 or send the parent this link: https://learn.modernagecoders.com/courses/algebra-foundations-masterclass
For a demo: the Priority Live Demo (guaranteed, today or tomorrow) is booked at https://learn.modernagecoders.com/priority-demo . The free demo is a waiting list with no fixed date.

==========
COURSE 15 OF 137: ALGORITHMIC TRADING COURSE: STRATEGY, QUANT & ML
==========

Course link: https://learn.modernagecoders.com/courses/algorithmic-trading-masterclass-complete
Subject area: Data Science
Designed for: College students
Who can join: Complete beginner (18+); college students, graduates and working professionals
Course length: 10-12 months (44-52 weeks)
Time needed: 2 live classes/week + 4-6 hours practice
Certificate: Certificate from Modern Age Coders, awarded on passing the final exam

PRICE FOR THIS COURSE (quote only the one that applies to the person asking)
In India, per month: group Rs 1,499, mini batch Rs 2,999, one to one Rs 4,999
Outside India, per month: group $100, one to one $150
Classes: group and mini batch two live classes a week, eight a month; one to one in India one live class a week, four a month; one to one outside India two live classes a week, eight a month. Each class is one hour.

WHAT THIS COURSE IS

Algorithmic trading course for adults and professionals: Python for markets, strategy design and backtesting, risk management, then machine learning for trading, taught as engineering, not get-rich promises, in 10-12 months.

In one line: The quant skill set, taught as engineering: Python for markets, strategies you can backtest honestly, risk management first, then machine learning, no profit promises, real capability.

ABOUT THE PROGRAMME

Algorithmic trading is a serious quantitative discipline, and this course treats it as one, not as a get-rich pitch. It builds the strategy-and-research half of the field in order: Python for financial data, technical and statistical analysis, then strategy design and honest backtesting (including the traps, lookahead bias, overfitting, survivorship, that make bad strategies look brilliant), then risk management and position sizing taught before anything goes near live markets, and finally machine learning for trading, used with the scepticism the domain demands. Throughout, the message is consistent and repeated: markets carry real risk of loss, backtests do not predict the future, and this is education, not financial advice. A finale month builds a fully backtested strategy system and sits the final exam. The pace is honest: ten teaching months at two live classes a week plus four to six hours of practice, with two more in hand. Problem sets, monthly mixed reviews, phase exams, and a final exam that decides the certificate with a free retest.

WHAT MAKES THIS COURSE DIFFERENT

- Taught as engineering and research, not as a money-making scheme

- Backtesting honesty is a core theme: the biases that fake good results are named and defeated
- Risk management before live markets, not as an afterthought
- Machine learning applied with domain scepticism, not hype
- Honest about risk on every page: education, not financial advice, no profit claims
- Real assessment: weekly problem sets, monthly mixed reviews, phase exams and a final exam with a free retest

THE LEARNING PATH, STEP BY STEP

Phase 1: Foundations (Months 1-3): markets, Python for finance, technical and statistical analysis
Phase 2: Strategy and backtesting (Months 4-6): strategy design, honest backtesting, risk management
Phase 3: Machine learning for trading (Months 7-9): ML models, sentiment, alternative data, execution
Phase 4: The finale (Month 10): a fully backtested strategy system and the final exam

WHAT A STUDENT NEEDS BEFORE STARTING

Coding experience: None. Everything is taught from the first line
Equipment: Any computer with a stable internet connection; every tool used is free
Age: 18+; college students, graduates and working professionals
Time commitment: 2 live classes plus 4-6 hours of practice a week

WHO THIS COURSE IS FOR

Developers: Programmers who want the quantitative-finance skill set
College students: Students targeting quant analyst and quant developer roles
Finance professionals: Finance people who want to add real coding and research skill
Data minded: Data and stats enthusiasts drawn to markets as a hard problem
Disciplined learners: Adults who want the real discipline, not a trading-signals subscription

FULL CURRICULUM, WEEK BY WEEK

This is the complete teaching plan. Parents can ask about any week.

PHASE 1: FINANCIAL MARKETS & TRADING FOUNDATIONS (MONTHS 1-3, WEEKS 1-13)

Build solid understanding of financial markets, instruments, Python programming, and data analysis for trading.

Months 1-2: Markets, Instruments & Python Basics (Weeks 1-8)
Introduction to Financial Markets
Topics:
- Financial markets overview: stocks, forex, crypto, commodities
- Stock market basics: exchanges, indices, sectors
- Understanding stocks: equity, shares, market cap
- How stock prices move: supply and demand
- Market participants: retail, institutional, market makers
- Trading sessions: pre-market, regular, after-hours
- Order types: market, limit, stop-loss, stop-limit
- Bid-ask spread and liquidity
- Long vs short positions
- Margin trading and leverage
- Trading costs: brokerage, taxes, slippage
- Forex market: currency pairs, pips, lots
- Cryptocurrency markets: Bitcoin, altcoins, exchanges
- Market microstructure basics
- Regulatory environment and compliance
Projects built:
- Market research on different instruments
- Paper trading practice (manual)
- Order type experiments
- Market analysis report
- Trading journal setup
Practice: Paper trade 20 manual trades, document everything
Python Programming for Trading - Part 1
Topics:
- Why Python for algorithmic trading?
- Python installation and setup (Anaconda)
- Jupyter notebooks for trading analysis
- Variables and data types
- Lists, tuples, dictionaries for market data
- Control flow: if-else for trading conditions
- Loops for iterating through historical data
- Functions for trading logic
- NumPy for numerical operations
- Arrays for price data manipulation

- Pandas for financial data analysis
- DataFrames for OHLCV data
- Reading CSV files (historical data)
- DateTime handling for trading timestamps
- Basic data cleaning

Projects built:
- Load and explore stock price data
- Calculate basic statistics (mean, std, returns)
- Price data manipulation exercises
- Simple moving average calculator
- Trading signal generator (basic)

Practice: Solve 50 Python problems focused on financial data

Financial Data Analysis with Python

Topics:
- Data sources: Yahoo Finance, Alpha Vantage, Quandl
- yfinance library for stock data
- pandas_datareader for multiple sources
- OHLCV data: Open, High, Low, Close, Volume
- Data cleaning and preprocessing
- Handling missing data in time series
- Resampling: converting timeframes
- Forward-fill and back-fill methods
- Calculating returns: simple and log returns
- Cumulative returns calculation
- Volatility calculation and analysis
- Correlation analysis between assets
- Data visualization with Matplotlib
- Candlestick charts with mplfinance
- Creating trading dashboards

Projects built:
- Multi-asset data downloader
- Returns and volatility analyzer
- Correlation matrix for portfolio
- Interactive price charts
- Market data dashboard
- Historical performance analyzer

Practice: Analyze 50+ stocks, create comprehensive reports

Technical Analysis Foundations

Topics:
- Technical analysis principles
- Support and resistance levels
- Trend analysis: uptrend, downtrend, sideways
- Trendlines and channels
- Chart patterns: head and shoulders, triangles, flags
- Candlestick patterns: doji, hammer, engulfing
- Moving averages: SMA, EMA, WMA
- Moving average crossovers
- Bollinger Bands: calculation and interpretation
- Relative Strength Index (RSI)
- MACD: Moving Average Convergence Divergence
- Stochastic Oscillator
- Volume analysis and indicators
- Average True Range (ATR) for volatility
- Implementing indicators in Python

Projects built:
- Technical indicator library in Python
- SMA/EMA crossover strategy
- RSI-based trading signals
- Bollinger Bands strategy
- Multi-indicator dashboard
- Pattern recognition tool (basic)
- Technical analysis automation

Practice: Implement 20+ technical indicators from scratch

Month 3: Advanced Python & Market Analysis (Weeks 9-13)

Object-Oriented Programming for Trading Systems

Topics:
- OOP concepts for trading applications
- Creating trading strategy classes
- Portfolio class design
- Order management system (OMS) structure
- Risk management class
- Data handler class for market data
- Event-driven architecture for trading
- Inheritance for strategy variations
- Encapsulation for strategy logic
- Design patterns for trading systems
- Backtesting framework architecture
- Modular code organization

```
        - Configuration management
        - Logging for trading systems
        - Error handling in live trading
      Projects built:
        - Trading strategy base class
        - Portfolio manager class
        - Order execution simulator
        - Risk calculator class
        - Complete OOP trading framework
        - Modular backtesting engine
      Practice: Refactor all previous code using OOP
    Statistical Analysis for Trading
      Topics:
        - Descriptive statistics for returns
        - Normal distribution and fat tails
        - Hypothesis testing for strategies
        - P-values and statistical significance
        - Correlation and causation
        - Cointegration for pairs trading
        - Stationarity and unit root tests
        - Autocorrelation in time series
        - Monte Carlo simulations
        - Bootstrap methods for trading
        - Sharpe ratio calculation and interpretation
        - Sortino ratio and downside deviation
        - Maximum drawdown analysis
        - Value at Risk (VaR)
        - Risk-adjusted performance metrics
      Projects built:
        - Statistical analysis toolkit
        - Returns distribution analyzer
        - Strategy performance metrics calculator
        - Monte Carlo simulator for trading
        - Risk metrics dashboard
        - Hypothesis testing framework
      Practice: Statistical analysis of 30 trading strategies
    Fundamental Analysis & Market Data APIs
      Topics:
        - Fundamental analysis basics
        - Financial statements: P&L, balance sheet, cash flow
        - Key ratios: P/E, P/B, ROE, debt-to-equity
        - Earnings and revenue analysis
        - Economic indicators impact on markets
        - News sentiment analysis
        - Alternative data sources
        - Broker APIs: Interactive Brokers, Zerodha, Alpaca
        - Real-time data streaming
        - WebSocket connections for live data
        - REST APIs for historical data
        - Rate limiting and data management
        - Building data pipelines
        - Database setup for storing market data
        - Time-series databases (InfluxDB, TimescaleDB)
      Projects built:
        - Fundamental data scraper
        - Real-time data streamer
        - Market data database setup
        - Multi-source data aggregator
        - News sentiment analyzer
        - PHASE 1 MINI CAPSTONE: Complete Market Analysis Platform
      Assessment: Phase 1 exam: a practical build defended live, plus a written paper mixing
      this phase with everything before it

------------------------------------------------------------
PHASE 2: TRADING STRATEGIES & BACKTESTING (MONTHS 4-6, WEEKS 14-26)
------------------------------------------------------------
Master strategy development, backtesting frameworks, optimization, and strategy evaluation.

  Months 4-5: Strategy Development & Backtesting (Weeks 14-22)
    Backtesting Framework Development
      Topics:
        - What is backtesting? Importance and limitations
        - Backtesting bias: look-ahead, survivorship, overfitting
        - Event-driven backtesting architecture
        - Vectorized vs event-driven backtesting
        - Building custom backtesting engine
        - Backtrader library introduction
        - Backtrader strategies and indicators
        - Position sizing in backtests
```

    - Commission and slippage modeling
    - Realistic execution simulation
    - Walk-forward analysis
    - Out-of-sample testing
    - Multiple timeframe backtesting
    - Parameter optimization in backtests
    - Backtesting best practices
  Projects built:
    - Custom backtesting engine from scratch
    - Backtrader strategy implementation
    - Slippage and commission simulator
    - Walk-forward testing framework
    - Multi-timeframe backtester
    - Optimization engine
  Practice: Backtest 20 strategies with different approaches
Momentum & Trend Following Strategies
  Topics:
    - Momentum trading principles
    - Relative Strength Momentum
    - Moving average crossover strategies
    - Dual moving average system
    - Triple moving average system
    - MACD crossover strategy
    - Trend following concepts
    - Donchian Channel breakout
    - ATR-based trailing stops
    - Turtle trading system
    - Channel breakout strategies
    - Parabolic SAR strategy
    - Supertrend indicator strategy
    - Combining multiple trend indicators
    - Exit strategies for trend trades
  Projects built:
    - Moving average crossover bot
    - MACD strategy implementation
    - Turtle trading system
    - Donchian breakout strategy
    - Multi-indicator trend follower
    - Momentum portfolio strategy
    - Optimized trend following system
  Practice: Develop and backtest 15 momentum/trend strategies
Mean Reversion & Statistical Arbitrage
  Topics:
    - Mean reversion theory
    - Bollinger Bands mean reversion
    - RSI oversold/overbought strategy
    - Stochastic mean reversion
    - Z-score based strategies
    - Pairs trading fundamentals
    - Cointegration testing for pairs
    - Pairs selection methodology
    - Spread calculation and trading
    - Statistical arbitrage concepts
    - Market neutral strategies
    - Long-short equity strategies
    - Ornstein-Uhlenbeck process
    - Half-life of mean reversion
    - Kalman filter for pairs trading
  Projects built:
    - Bollinger Bands reversion strategy
    - RSI mean reversion bot
    - Pairs trading system
    - Cointegration scanner
    - Statistical arbitrage strategy
    - Market neutral portfolio
    - Kalman filter pairs trader
  Practice: Build 12 mean reversion strategies
Breakout & Volatility Strategies
  Topics:
    - Breakout trading concepts
    - Support/resistance breakouts
    - High/low breakout strategies
    - Opening range breakout (ORB)
    - Volatility breakout strategy
    - ATR-based position sizing
    - Volatility expansion trading
    - Volatility contraction setups
    - Squeeze indicator strategies
    - News-based breakout trading

- Volume-confirmed breakouts
- False breakout filtering
- Consolidation pattern breakouts
- Multiple timeframe confirmation
- Breakout strategy optimization

Projects built:
- Support/resistance breakout bot
- Opening range breakout strategy
- Volatility breakout system
- Squeeze strategy implementation
- Volume breakout trader
- Multi-timeframe breakout system
- False breakout filter

Practice: Develop 10 breakout trading strategies

Options Trading Strategies (Basics)

Topics:
- Options basics: calls, puts, strikes, expiry
- Option Greeks: Delta, Gamma, Theta, Vega
- Option pricing: Black-Scholes model
- Implied volatility and IV rank
- Covered call strategy
- Cash-secured put strategy
- Bull call spread and bear put spread
- Iron Condor strategy
- Straddle and strangle
- Option selling strategies
- Delta-neutral strategies
- Volatility trading with options
- Options data analysis in Python
- Option chain analysis
- Backtesting options strategies

Projects built:
- Options calculator (Greeks, pricing)
- IV rank analyzer
- Covered call screener
- Iron Condor backtester
- Options strategy simulator
- Volatility trading system

Practice: Implement 8 options strategies

Month 6: Advanced Strategies & Optimization (Weeks 23-26)

Strategy Optimization & Parameter Tuning

Topics:
- Optimization objectives and pitfalls
- Overfitting vs robust optimization
- Grid search optimization
- Random search methods
- Genetic algorithms for optimization
- Particle swarm optimization
- Bayesian optimization
- Walk-forward optimization
- Sensitivity analysis
- Parameter stability testing
- Monte Carlo optimization
- Multi-objective optimization
- Sharpe ratio optimization
- Drawdown-constrained optimization
- Transaction cost considerations

Projects built:
- Grid search optimizer
- Genetic algorithm optimizer
- Walk-forward optimization framework
- Parameter sensitivity analyzer
- Multi-objective optimizer
- Robust optimization system
- Strategy parameter dashboard

Practice: Optimize 20 strategies, compare methods

Risk Management & Position Sizing

Topics:
- Risk management principles
- Position sizing methods: fixed, percentage, volatility-based
- Kelly Criterion for position sizing
- Risk per trade calculation
- Stop-loss placement strategies
- Trailing stop techniques
- ATR-based stops
- Time-based exits
- Profit target strategies
- Risk-reward ratio analysis

- Portfolio heat and risk limits
- Correlation-based position sizing
- Leverage management
- Drawdown control
- Circuit breakers and kill switches

Projects built:
- Position sizing calculator
- Kelly Criterion implementation
- Stop-loss optimizer
- Risk management system
- Portfolio heat monitor
- Drawdown controller
- Kill switch implementation

Practice: Add risk management to all strategies

Multi-Asset & Portfolio Strategies

Topics:
- Portfolio construction principles
- Modern Portfolio Theory (MPT)
- Efficient frontier calculation
- Mean-variance optimization
- Risk parity strategies
- Equal weight vs optimal weight
- Tactical asset allocation
- Strategic asset allocation
- Rebalancing strategies
- Correlation-based diversification
- Sector rotation strategies
- Multi-strategy portfolio
- Strategy allocation optimization
- Portfolio backtesting
- Portfolio performance attribution

Projects built:
- Portfolio optimizer (Markowitz)
- Risk parity portfolio
- Sector rotation system
- Multi-strategy portfolio manager
- Rebalancing algorithm
- Portfolio backtester
- Asset allocation dashboard

Practice: Build 10 portfolio-level strategies

Cryptocurrency Trading Strategies

Topics:
- Crypto market characteristics
- Round-the-clock trading considerations
- Crypto exchanges: Binance, Coinbase, Kraken
- Crypto data sources and APIs
- Bitcoin and altcoin strategies
- Crypto volatility strategies
- Arbitrage: exchange arbitrage, triangular arbitrage
- DeFi and DEX trading
- Crypto market making basics
- Sentiment analysis for crypto
- On-chain data analysis
- Crypto-specific indicators
- High volatility management
- Crypto tax considerations
- Security and wallet management

Projects built:
- Crypto data collector
- Bitcoin trend following bot
- Crypto arbitrage scanner
- Altcoin momentum strategy
- Crypto mean reversion system
- Exchange arbitrage bot
- Crypto portfolio rebalancer

Practice: Develop 12 crypto trading strategies

Assessment: Phase 2 exam: a practical build defended live, plus a written paper mixing this phase with everything before it

---

PHASE 3: MACHINE LEARNING & ADVANCED QUANT (MONTHS 7-9, WEEKS 27-39)

Master machine learning for trading, advanced quantitative strategies, and high-frequency concepts.

Months 7-8: Machine Learning for Trading (Weeks 27-35)

ML Fundamentals for Trading

Topics:
- Machine learning in trading overview

    - Supervised vs unsupervised learning
    - Feature engineering for trading
    - Price-based features
    - Technical indicator features
    - Sentiment features
    - Fundamental features
    - Alternative data features
    - Label creation: classification vs regression
    - Triple-barrier method for labeling
    - Train-test split for time series
    - Cross-validation for trading models
    - Overfitting in trading ML
    - Model evaluation metrics for trading
    - Scikit-learn for trading models
  Projects built:
    - Feature engineering pipeline
    - Label creation system
    - ML data preparation framework
    - Cross-validation for time series
    - Trading-specific feature library
    - Model evaluation toolkit
  Practice: Create 100+ features for trading
Classification Models for Trading
  Topics:
    - Price direction prediction
    - Logistic regression for trading signals
    - Decision trees for market regimes
    - Random Forest for trading
    - Feature importance analysis
    - Gradient Boosting (XGBoost, LightGBM)
    - Support Vector Machines for classification
    - Ensemble methods for trading
    - Model stacking and blending
    - Probability calibration
    - Threshold optimization for signals
    - Handling imbalanced data
    - SMOTE for trading datasets
    - Model interpretation for trading
    - Backtesting ML strategies
  Projects built:
    - Price direction classifier
    - Random Forest trading strategy
    - XGBoost market predictor
    - Ensemble trading model
    - Market regime classifier
    - ML signal generator
    - Complete ML trading strategy
  Practice: Build 15 ML classification strategies
Deep Learning for Trading
  Topics:
    - Neural networks for trading
    - LSTM for time series prediction
    - GRU networks for trading
    - Sequence-to-sequence models
    - Attention mechanism for trading
    - Transformer models for finance
    - CNN for technical pattern recognition
    - Autoencoders for feature extraction
    - Reinforcement learning for trading (Q-learning)
    - Deep Q-Networks (DQN) for trading
    - Policy gradient methods
    - TensorFlow and Keras for trading
    - PyTorch for trading models
    - GPU acceleration for training
    - Model deployment considerations
  Projects built:
    - LSTM price predictor
    - CNN pattern recognition strategy
    - Autoencoder for anomaly detection
    - Reinforcement learning trader
    - DQN trading agent
    - Transformer-based predictor
    - Deep learning ensemble system
  Practice: Implement 10 deep learning trading models
NLP & Sentiment Analysis for Trading
  Topics:
    - Natural language processing in trading
    - News sentiment analysis
    - Twitter sentiment for stocks/crypto

- Financial news scraping
- Text preprocessing for finance
- Sentiment scoring methods
- VADER for financial sentiment
- FinBERT for financial text
- Topic modeling for market themes
- Event extraction from news
- Earnings call analysis
- Social media signal extraction
- Alternative text data sources
- Real-time sentiment streaming
- Combining sentiment with price action

Projects built:

- News sentiment analyzer
- Twitter sentiment tracker
- Earnings call sentiment extractor
- Reddit sentiment for stocks/crypto
- Real-time sentiment dashboard
- Sentiment-based trading strategy
- Multi-source sentiment aggregator

Practice: Build 8 sentiment-based strategies

Alternative Data & Quantitative Research

Topics:

- Alternative data in trading
- Satellite imagery analysis
- Web scraping for trading signals
- Credit card transaction data
- Supply chain data
- Weather data for commodities
- Social media activity metrics
- App download data
- Google Trends for trading
- Data vendor integration
- Alpha generation from alt data
- Factor models and factor investing
- Fama-French factors
- Custom factor creation
- Quantitative research process

Projects built:

- Web scraping trading signals
- Google Trends strategy
- Alternative data aggregator
- Factor model implementation
- Multi-factor strategy
- Quantitative research report
- Alpha generation framework

Practice: Research and test 10 alternative data sources

Month 9: Advanced Trading Concepts (Weeks 36-39)

High-Frequency Trading (HFT) Concepts

Topics:

- High-frequency trading overview
- Market microstructure for HFT
- Order book dynamics
- Limit order book analysis
- Market making strategies
- Bid-ask spread capture
- Statistical arbitrage at high frequency
- Latency arbitrage concepts
- Co-location and infrastructure
- Low-latency programming
- FPGA and hardware acceleration
- Tick data processing
- Order flow analysis
- Liquidity provision strategies
- HFT regulations and compliance

Projects built:

- Order book visualizer
- Limit order book simulator
- Simple market making bot
- Order flow analyzer
- Tick data processor
- Microstructure research tools
- HFT backtesting framework

Practice: Analyze order book data, simulate HFT strategies

Advanced Options & Derivatives

Topics:

- Advanced option strategies
- Volatility trading deep dive

```
        - VIX trading strategies
        - Volatility arbitrage
        - Skew trading strategies
        - Calendar spread strategies
        - Diagonal spreads
        - Ratio spreads
        - Butterfly and Condor variations
        - Delta hedging automation
        - Gamma scalping
        - Options market making
        - Exotic options basics
        - Futures and futures spreads
        - Commodity spread trading
      Projects built:
        - Volatility trading system
        - VIX trading strategy
        - Calendar spread optimizer
        - Delta hedging bot
        - Gamma scalping system
        - Options portfolio manager
        - Futures spread trader
      Practice: Implement 12 advanced derivatives strategies
    Execution Algorithms & Transaction Cost Analysis
      Topics:
        - Execution algorithms overview
        - VWAP (Volume-Weighted Average Price) algorithm
        - TWAP (Time-Weighted Average Price) algorithm
        - Implementation shortfall
        - Adaptive execution algorithms
        - Iceberg orders and order slicing
        - Smart order routing
        - Transaction cost analysis (TCA)
        - Slippage measurement and modeling
        - Market impact models
        - Broker execution quality analysis
        - Fill rate optimization
        - Execution latency measurement
        - Pre-trade and post-trade analysis
        - Best execution requirements
      Projects built:
        - VWAP execution algorithm
        - TWAP execution bot
        - Order slicing algorithm
        - Transaction cost analyzer
        - Slippage tracker
        - Execution quality dashboard
        - Smart order router (basic)
      Practice: Implement and analyze 8 execution strategies
    Quantitative Portfolio Management
      Topics:
        - Advanced portfolio construction
        - Black-Litterman model
        - Factor-based portfolio construction
        - Multi-factor models
        - Smart beta strategies
        - Long-short portfolio construction
        - 130/30 strategies
        - Market-neutral portfolio management
        - Portfolio rebalancing optimization
        - Transaction cost in rebalancing
        - Portfolio risk decomposition
        - Tracking error minimization
        - Active vs passive management
        - Hedge fund strategies
        - Performance attribution analysis
      Projects built:
        - Black-Litterman portfolio optimizer
        - Multi-factor portfolio constructor
        - Long-short portfolio manager
        - Smart beta strategy
        - Rebalancing optimizer with costs
        - Portfolio analytics dashboard
        - Performance attribution system
      Practice: Build 10 portfolio management systems
      Assessment: Phase 3 exam: a practical build defended live, plus a written paper mixing
      this phase with everything before it

------------------------------------------------------------
PHASE 4: THE FINALE (MONTH 10, WEEKS 40-44)
```

The capstone month: spec, build, ship and defend, then the final exam that decides the certificate.

- Month 10: Capstone and the Final Exam (Weeks 40-44)
  - Capstone Spec and Setup
    - Topics:
      - Choosing the capstone: a complete, honestly backtested strategy system: research, signals, risk sizing and a defensible evaluation
      - A one-page spec: scope, milestones, stack
      - Repository and skeleton ready on day one
      - Instructor sign-off before the build begins
    - Projects built:
      - Approved capstone spec plus the running skeleton
    - Practice: Pitch the spec to the batch and absorb one hard question
  - Capstone Build
    - Topics:
      - Two focused weeks in vertical slices
      - Instructor checkpoints and honest scope cuts
      - Using the whole course: Python for markets, strategy design, bias-free backtesting, risk management and ML where it earns its place
      - Daily commits and an always-working build
    - Projects built:
      - The capstone, feature-complete with version control
    - Practice: A working build at the end of every session
  - Ship and Polish
    - Topics:
      - The finishing pass: edge cases, errors, documentation
      - Backtested without self-deception: results that survive out-of-sample and honest cost assumptions
      - A README worth reading and a demo worth watching
      - A full-course spiral review before the exam
    - Projects built:
      - The capstone shipped, documented and rehearsed
    - Practice: Two mock demos, each tighter than the last
  - Demo Day and the Final Exam
    - Topics:
      - Presenting the capstone: live demo plus the hardest bug story
      - The honest map of next roads: quant analyst, quant developer or fintech data roles; trading your own capital is a personal decision, not a placement
      - Where our other courses continue the journey
    - Projects built:
      - Demo day presentation delivered to the batch
    - Assessment: FINAL EXAM: a practical build plus a written paper with questions mixed from every phase. Passing earns the certificate; falling short earns a focused revision plan and a free retest

PROJECTS THE STUDENT BUILDS AND KEEPS

- Phase 1: financial-data analysis tools and technical indicators in Python
- Phase 2: backtested strategies with risk sizing and honest evaluation
- Phase 3: ML-driven signals and execution-aware research
- Phase 4: the fully backtested strategy-system capstone

Total projects: 15+ research and backtesting projects, crowned by a full strategy system

SKILLS THE STUDENT WILL HAVE AT THE END

- Python for financial data: cleaning, analysis and indicators
- Strategy design across momentum, mean-reversion and volatility
- Backtesting without self-deception: defeating lookahead, overfitting and survivorship bias
- Risk management and position sizing as first principles
- Machine learning for trading, applied with domain scepticism

HOW A TYPICAL WEEK IS SPLIT

Live classes: 2 live one-hour classes per week, coding along with the instructor
Homework: A problem set after every class, and a mixed-review assignment at the end of every month
Practice: 4-6 hours of building between classes
Review: Every submission reviewed with written feedback; recurring gaps reopened in class

SUPPORT INCLUDED

Doubt support: WhatsApp doubt support between classes
Progress updates: Honest monthly progress reviews: what is solid, what is wobbly, and the plan for the wobble

CERTIFICATION DETAIL

  Completion: Certificate from Modern Age Coders, awarded on passing the final exam. Fall short
    and there is focused revision and a free retest: the certificate certifies knowledge, not
    attendance

WHERE THIS CAN LEAD

  - Quant analyst and quant developer roles in funds, banks and fintech
  - Our trading automation course for the systems and execution half
  - Data science and ML roles: the research skills transfer directly
  - Trading your own capital is a personal financial decision, made with full awareness of the
    risk

COMMON QUESTIONS ABOUT THIS COURSE

  For anything about cost, use PART 4 and RULE 1. Do not quote two regions.

  Q: What does this algorithmic trading course cover?
  A: The research-and-strategy half of quant trading, taught as engineering: Python for
  financial data, technical and statistical analysis, strategy design across momentum,
  mean-reversion and volatility, honest backtesting that defeats lookahead, overfitting and
  survivorship bias, risk management and position sizing, then machine learning for trading
  with sentiment and alternative data. A finale month builds a fully backtested strategy system
  and sits the final exam. It is education, not financial advice.

  Q: How long does it take to learn algorithmic trading properly?
  A: Ten months of teaching at 2 live classes a week plus 4 to 6 hours of practice, with two
  more months in hand for learners who need them. The three teaching phases build the skill and
  its real-world application; the finale month ships a capstone and sits the final exam.

  Q: How am I assessed? Is the certificate just for attending?
  A: No. Problem sets follow every class with written feedback, monthly reviews deliberately
  mix new material with earlier topics, each phase ends with a cumulative exam, and the course
  ends with a final exam: a practical build plus written questions from the whole syllabus.
  Passing earns the certificate; falling short earns focused revision and a free retest.

  Q: Is this financial advice? Will I make guaranteed profits?
  A: No, and be wary of anyone who says otherwise. This is an engineering and quantitative
  course: it teaches you to research, build, backtest and automate trading systems, not what to
  buy or a way to get rich. Markets carry real risk of loss, backtest results do not guarantee
  future returns, and we make no profit claims of any kind. What you gain is genuine, in-demand
  skill; what you do with real money afterwards is your own decision and your own risk.

  Q: How is this different from your trading automation course?
  A: This course is the research-and-strategy half: what to trade, why, and how to know whether
  a strategy is real, statistics, backtesting honesty and machine learning. The trading
  automation course is the systems half: how to build reliable, production-grade bots that
  execute through broker APIs with monitoring and safeguards. Many serious learners take both;
  this one makes you the researcher, that one makes you the systems engineer.

  Q: Do I need finance or trading experience to start?
  A: No. Markets and the maths you need are taught from the ground up inside the course. What
  helps most is comfort with logical thinking and a willingness to be sceptical of your own
  results, which is the single most important habit in quantitative trading.

  Q: Can I try a class before enrolling?
  A: Yes, a free demo class with no commitment: book at learn.modernagecoders.com/contact or
  message us on WhatsApp at +91 91233 66161. (Agent note: the free demo is a waiting list with
  no fixed date. The Priority Live Demo is a guaranteed class today or tomorrow, booked at
  https://learn.modernagecoders.com/priority-demo . Offer both, as RULE 3 says.)

  Q: Are classes live or recorded?
  A: Live, always: small groups with a real instructor reading your actual code, never
  pre-recorded videos.

  To enrol, message Shivam Sir on +91 9123366161 or send the parent this link:
https://learn.modernagecoders.com/courses/algorithmic-trading-masterclass-complete
  For a demo: the Priority Live Demo (guaranteed, today or tomorrow) is booked at
  https://learn.modernagecoders.com/priority-demo . The free demo is a waiting list with no fixed date.

==
COURSE 16 OF 137: ALPHA GIRLS: SYSTEMS AT SCALE FOR SENIOR WOMEN ENGINEERS
==

Course link: https://learn.modernagecoders.com/courses/alpha-girls-elite-tech-mastery
Subject area: Women in Tech
Designed for: Girls only batches
Who can join: Experienced women engineers (roughly 4+ years or Queen Coders graduates)

Course length: 9-11 months (36-44 weeks)
Time needed: 2 live classes/week + 4-6 hours practice
Certificate: Certificate from Modern Age Coders, awarded on passing the final exam

PRICE FOR THIS COURSE (quote only the one that applies to the person asking)
  In India, per month: group Rs 1,499, mini batch Rs 2,999, one to one Rs 4,999
  Outside India, per month: group $100, one to one $150
  Classes: group and mini batch two live classes a week, eight a month; one to one in India one live class a week, four a month; one to one outside India two live classes a week, eight a month. Each class is one hour.

WHAT THIS COURSE IS

  Senior engineering course for women: system design at scale, reliability, platforms, ML systems and technical strategy in 9-11 months, live online.

  In one line: The deepest technical road: systems at scale, reliability as a discipline, and the strategy skills of engineers whole companies listen to.

ABOUT THE PROGRAMME

  Some engineers choose depth as the career: the people rooms go quiet for when architecture is on the table. Alpha Girls is that road, built for experienced women engineers: system design at genuine scale, data platforms, reliability engineering with SLOs and honest incident practice, platform thinking, ML systems in production, security and compliance leadership, and the technical strategy craft, roadmaps, build-versus-buy, architecture reviews, that turns depth into organizational influence. The course runs on artifacts: every month produces designs, reviews and documents of the kind staff and principal engineers are actually judged on, and it ends with the capstone, a complete system redesign proposal defended before a hard panel. No fantasy titles and no throne metaphors: scale is an engineering property here, not a personality. Nine months at two live classes a week plus four to six hours of practice, with two more in hand. Monthly mixed reviews, phase exams, and a final defense that decides the certificate with a free retest. Depth, chosen deliberately.

WHAT MAKES THIS COURSE DIFFERENT

  - Scale as engineering, not vocabulary: capacity math, failure domains and cost curves done honestly
  - Reliability as a discipline: SLOs, incident command and postmortems practiced, not described
  - ML systems in production: the operational reality behind the model
  - Strategy as craft: roadmaps, reviews and build-vs-buy argued with artifacts
  - A senior peer room of women, rare and deliberately built
  - Real assessment: artifact reviews monthly and a final panel defense that decides the certificate, with a free retest

THE LEARNING PATH, STEP BY STEP

  Phase 1: Systems at scale (Months 1-3): design method, data at scale, cloud architecture, reliability and performance economics
  Phase 2: Platforms and production ML (Months 4-6): platform engineering, ML systems, security leadership, and an architecture review cycle
  Phase 3: Technical strategy (Months 7-8): roadmaps, build-vs-buy, leading through migrations and incidents
  Phase 4: The finale (Month 9): the redesign capstone and the panel defense

WHAT A STUDENT NEEDS BEFORE STARTING

  Experience: Substantial engineering experience, roughly 4+ years or Queen Coders graduation; a short portfolio conversation places every applicant honestly
  Equipment: A computer with a stable internet connection
  Audience: Senior women engineers choosing depth as the career
  Time commitment: 2 live classes plus 4-6 hours of practice a week

WHO THIS COURSE IS FOR

  Depth choosers: Engineers who want the senior IC road, staff and principal, walked deliberately
  Scale facers: Women whose systems have started failing in interesting ways
  Strategy builders: Engineers whose ideas are right but underfunded, who need the influence craft
  Returning seniors: Experienced engineers returning to depth after management or a break
  Rare room seekers: Senior women who have never had a senior-women peer room, and want one

FULL CURRICULUM, WEEK BY WEEK

  This is the complete teaching plan. Parents can ask about any week.

  PHASE 1: SYSTEMS AT SCALE (MONTHS 1-3, WEEKS 1-12)

The core discipline: design method under load, data at scale, cloud architecture, reliability
and the economics of performance.

  Month 1: Design Method Under Load (Weeks 1-4)
    System Design at Scale: The Method
      Topics:
        - Facebook/Google/Amazon architecture deep dive
        - Multi-datacenter global infrastructure
        - Edge computing at planetary scale
        - Real-time systems with <10ms latency
        - Handling 1M+ requests per second
        - Database systems for exabyte-scale data
        - Network architecture for global systems
        - Distributed consensus at scale (Raft, Paxos)
        - Chaos engineering for critical systems
        - Zero-downtime deployment strategies
      Projects built:
        - Design Twitter-scale messaging system
        - Build Netflix-level video streaming architecture
        - Create Uber's global dispatch system
        - Implement Google-scale search infrastructure
      Practice: Daily: Architect systems handling 100M+ users
    Cloud Architecture, Judged
      Topics:
        - Multi-cloud architecture for Fortune 500
        - Hybrid cloud with on-premise integration
        - Kubernetes at massive scale (10K+ nodes)
        - Service mesh for 1000+ microservices
        - Global traffic management (Anycast, GeoDNS)
        - Multi-region active-active architectures
        - Disaster recovery for critical infrastructure
        - Cloud cost optimization saving millions
        - Compliance across 50+ countries
        - Enterprise security architecture
        - Zero-trust implementation at scale
      Projects built:
        - Migrate Fortune 500 to cloud (real project)
        - Build multi-cloud platform for enterprise
        - Design $10M+ cost optimization strategy
        - Implement global compliance framework
      Assessment: Month 1 check: a capacity-math design exercise defended, plus mixed review

  Month 2: Data and Reliability (Weeks 5-8)
    Data Platforms and Pipelines
      Topics:
        - Storage engines by workload: the honest decision table
        - Partitioning, replication and the consistency you actually need
        - Batch and streaming pipelines: when each earns its complexity
        - Schema evolution without weekend outages
        - Data quality as an engineering property
        - Cost curves: where data spend actually goes
      Projects built:
        - A data platform design for a stated workload, with the decision table shown
      Practice: One storage decision re-argued from a real system you know
    Reliability Engineering
      Topics:
        - SLIs, SLOs and error budgets that change behavior
        - Failure domains: drawing the blast radius before it draws itself
        - Incident command: roles, comms and the clock
        - Postmortems that are blameless and still honest
        - Degradation by design: what fails first, on purpose
        - On-call humanely: sustainable operational load
      Projects built:
        - An SLO set plus incident runbook for a chosen service
      Practice: Run one tabletop incident with your batch
      Assessment: Month 2 check: a reliability review presented, plus mixed review

  Month 3: Performance Economics and ML Systems (Weeks 9-12)
    Performance at Scale
      Topics:
        - Profiling before opinions: where time actually goes
        - Caching layers and their invalidation debts
        - Queueing theory enough to argue with
        - Latency budgets end to end
        - Cost as a performance metric: the bill is telemetry
        - Load testing that predicts instead of reassures
      Projects built:
        - A performance investigation with before/after measurements

      Practice: Profile one real system and write the honest findings
    ML Systems in Production
      Topics:
        - Training models on petabyte datasets
        - Distributed training across 1000+ GPUs
        - Real-time ML inference <5ms latency
        - A/B testing ML models at scale
        - Feature stores for enterprise ML
        - ML pipelines processing TB/hour
        - Computer vision for millions of images/day
        - NLP systems for 100+ languages
        - Recommendation systems like YouTube/TikTok
        - Fraud detection processing $1B+ transactions
        - AutoML platforms for enterprise
      Projects built:
        - Build TikTok-scale recommendation system
        - Create enterprise fraud detection saving $100M
        - Implement real-time translation for 50 languages
        - Design autonomous vehicle ML pipeline
      Practice: Deploy ML models serving 1B+ requests/day
      Assessment: Phase 1 exam: a scale design defended under hard questioning, plus a
      written mixed paper

PHASE 2: PLATFORMS AND PRODUCTION JUDGMENT (MONTHS 4-6, WEEKS 13-24)

Platform engineering, security and compliance leadership, and the architecture review cycle
practiced as craft.

  Month 4: Platform Engineering (Weeks 13-16)
    Platforms and Developer Experience
      Topics:
        - What a platform is: paved roads, not police
        - Golden paths: making the right way the easy way
        - Internal APIs and the contracts that keep teams decoupled
        - Migration mechanics: how platforms actually get adopted
        - Measuring developer experience without theater
        - When NOT to build a platform
      Projects built:
        - A platform proposal for a real pain, with adoption plan
      Practice: Interview two engineers about their worst golden-path gap
    Security and Compliance Leadership
      Topics:
        - Threat modeling as a design habit
        - The security review that teams do not dread
        - Secrets, identity and the boundaries that matter
        - Compliance translated: what auditors need vs what teams fear
        - Incident response for security events
        - Building security culture without becoming the villain
      Projects built:
        - A threat model and security review for a chosen system
      Practice: Run one lightweight security review with your batch
      Assessment: Month 4 check: platform or security artifact reviewed, plus mixed review

  Month 5: The Architecture Review Cycle (Weeks 17-20)
    Architecture Reviews and ADRs
      Topics:
        - Decision records that future engineers thank you for
        - Running reviews that surface risk without crushing authors
        - The reviewer's question toolkit
        - Disagree-and-commit done honestly
        - Review anti-patterns: rubber stamps and ambushes
        - A review culture one engineer can start
      Projects built:
        - Two ADRs written and two peer designs reviewed in cycle
      Practice: One review given and one received weekly
    Build, Buy or Wait
      Topics:
        - Total cost of ownership beyond the invoice
        - Vendor judgment: lock-in, escape hatches and leverage
        - Open source as a strategic dependency
        - The wait option: when deferring is the strong move
        - Writing the recommendation executives can act on
        - Sunk costs and the courage to reverse
      Projects built:
        - A build-vs-buy recommendation with the TCO math shown
      Practice: Re-argue one past build-vs-buy from your own history
      Assessment: Month 5 check: recommendation defended, plus mixed review

```
  Month 6: The Mid-Course Defense (Weeks 21-24)
    Integration: An AI-Era System at Scale
      Topics:
        - Designing a system where ML and scale pressures meet
        - Evaluation, guardrails and rollback for model-driven features
        - Data flywheels and their governance
        - Cost control when inference is in the hot path
      Projects built:
        - An AI-era system design integrating the phase's judgment
      Practice: Panel-style questioning practice in pairs
    Phase 2 Defense
      Topics:
        - Assembling the mid-course portfolio: designs, reviews, recommendations
        - Defense practice: hard questions, honest answers
        - A cumulative review of phases 1-2
      Projects built:
        - The mid-course portfolio, defended in panel
      Assessment: Phase 2 exam: portfolio defense plus a cumulative written paper

---------------------------------------------------------------
PHASE 3: TECHNICAL STRATEGY (MONTHS 7-8, WEEKS 25-32)
---------------------------------------------------------------
Turning depth into direction: roadmaps, migrations, incident leadership and the influence
craft of principal engineers.

  Month 7: Direction (Weeks 25-28)
    Technical Strategy and Roadmaps
      Topics:
        - Strategy as diagnosis, policy and coherent action
        - Roadmaps that survive contact with quarters
        - Sequencing: the order that de-risks everything after it
        - Saying no with alternatives attached
        - Writing strategy short enough to be read
        - Getting non-engineers to fund engineering work
      Projects built:
        - A one-page technical strategy for a real system's next year
      Practice: Present the strategy to a non-engineer and revise from their questions
    Leading Migrations
      Topics:
        - Migrations as the true test of senior engineering
        - Strangler patterns and reversible steps
        - The long middle: keeping momentum after novelty dies
        - Data migrations without lost weekends
        - Deprecation with dignity: turning things off kindly
        - Migration comms: the updates that keep trust
      Projects built:
        - A migration plan for a real legacy pressure, reversible steps shown
      Practice: Postmortem one migration you lived through, honestly
      Assessment: Month 7 check: strategy or migration artifact defended, plus mixed review

  Month 8: Influence (Weeks 29-32)
    Incident Leadership and Hard Weeks
      Topics:
        - Commanding incidents when the org is watching
        - Communication under pressure: cadence and candor
        - The recovery week: postmortem to prevention
        - Leading tired teams without spending trust
        - Escalation judgment: when to wake whom
      Projects built:
        - A full incident-command simulation, led
      Practice: One tabletop incident led end to end
    Mentoring, Sponsorship and the Room
      Topics:
        - Mentoring versus sponsorship: the door versus the push through it
        - Growing engineers without cloning yourself
        - Technical writing that scales your judgment
        - Speaking: the internal talk that changes direction
        - Being the senior woman in the room, on your own terms
      Projects built:
        - One mentee plan and one internal talk delivered to the batch
      Practice: Mentor one junior from our other courses for the month
      Assessment: Phase 3 exam: influence portfolio reviewed, plus cumulative written paper

---------------------------------------------------------------
PHASE 4: THE FINALE (MONTH 9, WEEKS 33-36)
---------------------------------------------------------------
The redesign capstone: one real system taken from pressure to proposal to panel.

  Month 9: The Redesign and the Panel (Weeks 33-36)
```

Capstone Build: The Redesign Proposal
Topics:
- Choosing the system: real pressure, real stakes
- Current-state honesty: what is actually there
- Target architecture with capacity and cost math
- Reliability, security and migration woven in
- The proposal document, executive summary first
Projects built:
- THE CAPSTONE: a complete system redesign proposal
Practice: Daily dossier progress; sections panel-reviewed as written
Red Team Week
Topics:
- Your proposal, attacked by your peers
- Finding the weakest argument before the panel does
- Revision under pressure
- Final rehearsal
Projects built:
- The proposal, hardened by red-team review
Practice: Attack two peer proposals with rigor and kindness
The Final Defense
Topics:
- The panel defense: proposal presented, hard questions taken
- A full-course spiral review
- The road on: principal work, and the community that stays
Projects built:
- The panel defense, delivered
Assessment: FINAL EXAM: the capstone defense plus a written paper mixed from every phase. Passing earns the certificate; falling short earns focused revision and a free retest

PROJECTS THE STUDENT BUILDS AND KEEPS

- Phase 1: capacity-math designs, a data platform design, SLOs and runbooks, a performance investigation
- Phase 2: a platform proposal, a threat model, ADR cycles and a build-vs-buy recommendation
- Phase 3: a one-page strategy, a migration plan, an incident simulation and a delivered talk
- Phase 4: the redesign proposal, red-teamed and defended before a panel

Total projects: A staff-level artifact portfolio, crowned by the defended redesign proposal

SKILLS THE STUDENT WILL HAVE AT THE END

- System design at scale with honest capacity and cost math
- Reliability as a practiced discipline: SLOs, incidents, postmortems
- Platform, security and ML-in-production judgment
- Technical strategy: direction argued so it gets funded
- Influence: reviews, mentoring, writing and speaking that scale judgment

HOW A TYPICAL WEEK IS SPLIT

Live classes: 2 live one-hour classes per week
Homework: Homework after every class, and a mixed-review assignment at the end of every month
Practice: 4-6 hours of practice between classes
Review: Every submission reviewed with written feedback; recurring gaps reopened in class

SUPPORT INCLUDED

Doubt support: WhatsApp doubt support between classes
Progress updates: Monthly artifact reviews with named focus areas

CERTIFICATION DETAIL

Completion: Certificate from Modern Age Coders, awarded on passing the final exam. Fall short and there is focused revision and a free retest: the certificate certifies knowledge, not attendance

WHERE THIS CAN LEAD

- Staff and principal engineering: the artifacts here are those interviews
- Architecture and platform leadership roles
- Reliability and infrastructure specialization
- Mentoring the ladder: Queen and Princess batches benefit from Alpha graduates
- The peer room itself: senior women engineers who stay in each other's corner

COMMON QUESTIONS ABOUT THIS COURSE

For anything about cost, use PART 4 and RULE 1. Do not quote two regions.

Q: What is Alpha Girls, and who is it for?

A: The deepest technical course in our women-in-tech ladder: systems at scale, reliability engineering, platforms, ML in production and technical strategy, for experienced women engineers (roughly 4+ years or Queen Coders graduates).

Q: How is this different from Queen Coders?
A: Queen builds the step from good developer to trusted engineer: advanced engineering, AI fluency and first technical leadership. Alpha assumes that step and goes deeper into the senior IC road: scale, reliability, platforms and strategy, the work of staff and principal engineers. Many students take them in sequence with working years between.

Q: Is this a management course?
A: No: it is the senior individual-contributor road, walked deliberately. Leadership here means technical direction, reviews, mentoring and incident command, influence without the org chart. The management fork is examined honestly in Queen Coders; Alpha is for women who choose depth.

Q: How is progress assessed? Is the certificate just for attending?
A: No. Homework follows every class, each month ends with an assignment that deliberately mixes new questions with earlier topics, every phase closes with a cumulative exam, and the course ends with a final exam. Passing earns the certificate; falling short earns focused revision and a free retest.

Q: What does the final defense involve?
A: A complete redesign proposal for a real system under real pressure: current-state honesty, target architecture with capacity and cost math, reliability and migration woven in, red-teamed by peers in week 35 and then defended before a panel that asks the questions real review boards ask. Passing it, plus the written paper, earns the certificate.

Q: Is there a free trial class?
A: Yes, a free demo class with no commitment: book at learn.modernagecoders.com/contact or message us on WhatsApp at +91 91233 66161. (Agent note: the free demo is a waiting list with no fixed date. The Priority Live Demo is a guaranteed class today or tomorrow, booked at https://learn.modernagecoders.com/priority-demo . Offer both, as RULE 3 says.)

Q: Are classes live or recorded?
A: Live, always: small groups with a real instructor, never pre-recorded videos.

To enrol, message Shivam Sir on +91 9123366161 or send the parent this link: https://learn.modernagecoders.com/courses/alpha-girls-elite-tech-mastery
For a demo: the Priority Live Demo (guaranteed, today or tomorrow) is booked at https://learn.modernagecoders.com/priority-demo . The free demo is a waiting list with no fixed date.

==========

COURSE 17 OF 137: AP CALCULUS AB & BC EXAM PREP, LIVE ONLINE, SCORE 5 GOAL

==========

Course link: https://learn.modernagecoders.com/courses/ap-calculus-exam-prep
Subject area: Test Prep Mathematics
Designed for: High school
Who can join: AP Calculus AB and BC students, grades 11-12
Course length: 10 months (40 weeks)
Time needed: 2 live one-hour classes per week + weekly problem sets
Certificate: Certificate from Modern Age Coders, awarded on passing the final assessment

PRICE FOR THIS COURSE (quote only the one that applies to the person asking)
In India, per month: group Rs 1,499, mini batch Rs 2,999, one to one Rs 4,999
Outside India, per month: group $100, one to one $150
Classes: group and mini batch two live classes a week, eight a month; one to one in India one live class a week, four a month; one to one outside India two live classes a week, eight a month. Each class is one hour.

WHAT THIS COURSE IS

Live online AP Calculus AB and BC prep: limits, derivatives and integrals taught as ideas, every FRQ against real rubrics, plus full mock exam cycles.

In one line: Three ideas, taught like ideas, then trained against the real rubrics.

ABOUT THE PROGRAMME

A 10-month live program that runs alongside your student's AP Calculus course and aims squarely at the exam. All of calculus is three ideas, the limit, the derivative, the integral, and students who own them as ideas find the AP exam fair. We teach ideas first, repair the precalculus debt that quietly causes most 'calculus errors', then convert understanding into score: every free-response question type drilled against actual College Board rubrics, multiple-choice pacing, calculator-section strategy, and full mock cycles timed like the real exam. AB and BC students are taught to their exact course.

WHAT MAKES THIS COURSE DIFFERENT

- Ideas before technique: the derivative discovered through shrinking intervals, the FTC earned as a punchline, so unfamiliar exam framings do not break the student
- Precalculus repaired inline: weak composition and trig are fixed inside calculus problems, where the repair sticks
- FRQ craft against real rubrics: how points are actually awarded, including justification language graders look for
- AB and BC tracks: series, parametrics and polar taught properly for BC students
- Calculator and no-calculator sections trained as different skills
- Full mock cycles with documented score progression, peaking in exam week
- One dedicated mentor across the whole year, one full interactive hour per class
- Honest guidance: a diagnostic first, evidence-based targets, never invented score promises

THE LEARNING PATH, STEP BY STEP

Phase 1: Limits and derivatives as ideas, with precalculus repaired inline and the rule toolkit built to speed
Phase 2: Derivative applications, integrals, the Fundamental Theorem and differential equations, the AB core completed
Phase 3: BC extensions (series, parametrics, polar), then exam craft: FRQ rubrics, MCQ pacing, calculator strategy and full mock cycles

WHAT A STUDENT NEEDS BEFORE STARTING

Education: Enrolled in (or about to start) AP Calculus AB or BC, typically grades 11-12
Math background: Precalculus completed at any comfort level, the diagnostic finds the real base and we repair inline
Equipment: Computer with stable internet; an approved graphing calculator for the calculator sections
Time commitment: 2 live hours plus 2-3 practice hours weekly
English: Course taught in English
Motivation: The May exam date does the motivating; we supply the method

WHO THIS COURSE IS FOR

Ab students: AP Calculus AB students who want the ideas owned and the exam trained, not just survived
Bc students: BC students who need series, parametrics and polar taught properly, plus the pace to finish strong
Struggling mid year: Students whose first-semester grade says the memorize-and-hope approach is failing
Score maximizers: Strong students hunting a 5 through FRQ craft and error elimination
Self studiers: Disciplined students taking the exam without an AP class at school

FULL CURRICULUM, WEEK BY WEEK

This is the complete teaching plan. Parents can ask about any week.

PHASE 1: LIMITS AND DERIVATIVES AS IDEAS (WEEKS 1-14)

The diagnostic finds the real starting point, including the precalculus debt, then the two foundational ideas are built properly: the limit as approach, the derivative as instantaneous rate, and the rule toolkit drilled to exam speed only after the ideas hold.

Weeks 1-3: Diagnostic + Limits as Approach
Topics:
- Full diagnostic: calculus-so-far plus the precalculus underneath (composition, trig, algebra fluency)
- Limits graphically, numerically and analytically, one idea, three faces
- One-sided limits, infinite limits and limits at infinity
- Continuity as a definition that finally makes sense
- The Intermediate Value Theorem as an exam justification pattern
- Precalculus repair begins: the personal gap list, attacked weekly

Projects built:
- Personal error log and gap map for the whole year
- Limit-evaluation toolkit sheet, built not copied

Practice: Complete a limits problem set spanning graphical, numerical and analytic forms, writing full sentence IVT justifications for two of them.

Weeks 4-8: The Derivative, Discovered Then Drilled
Topics:
- The derivative discovered via shrinking-interval tables, limit and derivative met as one idea
- Derivative as slope, as rate, and as the exam's favorite interpretation question
- Differentiability vs continuity, and where functions fail to have derivatives
- The rule toolkit: power, product, quotient rules built from meaning
- The chain rule as composition unwrapping, the make-or-break skill
- Trig, exponential and logarithmic derivatives to fluency

    Projects built:
      - Shrinking-interval investigation: one data table to both core ideas
      - Timed derivative gauntlet at exam pace, reviewed for error patterns
    Practice: Run a 20 minute derivative drill most evenings covering power, product,
    quotient and chain rules, and log any rule that misfires under speed.

  Weeks 9-14: Implicit, Inverse and the First Applications
    Topics:
      - Implicit differentiation as the chain rule in disguise
      - Derivatives of inverse functions, including inverse trig
      - Related rates from pictures: setup discipline that survives exam pressure
      - Local linearity and tangent-line approximation
      - L'Hospital's Rule, used where it is actually allowed
      - First FRQ exposure: rate and interpretation questions against the rubric
    Projects built:
      - Related-rates case set: five classic setups from picture to answer
      - Phase checkpoint: timed AB-style mixed section with full review
    Practice: Solve six related rates problems, starting each with a labeled picture, plus a
    short implicit differentiation set with every step written out.

PHASE 2: ANALYSIS, INTEGRALS AND THE FTC (WEEKS 15-28)

Curve analysis makes the derivative a reasoning tool, then the integral arrives as
accumulation and the Fundamental Theorem connects the two halves of the course. By the end of
this phase the entire AB syllabus is owned.

  Weeks 15-19: Curve Analysis and Optimization
    Topics:
      - First and second derivative analysis: increasing, concavity, extrema, inflection
      - The Mean Value Theorem and its exam justification language
      - Curve sketching from f' and f'', the classic FRQ family
      - Optimization from word problems: model first, calculus second
      - Motion on a line: position, velocity, acceleration, speed
      - Justification writing: the exact phrases rubrics award points for
    Projects built:
      - Full f-f'-f'' graph-relationship FRQ solved and self-graded on the rubric
      - Optimization mini-case portfolio: fence, box, cost, distance
    Practice: Complete two past style curve analysis FRQs using exact MVT and extrema
    justification language, then self grade against the rubric.

  Weeks 20-24: The Integral as Accumulation + the FTC
    Topics:
      - Riemann sums by hand and in tables, the accumulation idea made concrete
      - The definite integral as net change; units and interpretation questions
      - The Fundamental Theorem of Calculus, arrived at as a discovery
      - Antiderivatives and the substitution method as the chain rule reversed
      - Functions defined by integrals, the FRQ type students fear most, defanged
      - Average value and the accumulation FRQ family
    Projects built:
      - Riemann-to-FTC investigation: watching sums converge
      - Accumulation FRQ set against real rubrics
    Practice: Work a Riemann sum table set by hand, then a substitution drill, and explain
    the Fundamental Theorem in your own words at the top of the page.

  Weeks 25-28: Applications of Integrals + Differential Equations
    Topics:
      - Area between curves, set up from sketches
      - Volumes: discs, washers and known cross-sections
      - Separable differential equations and exponential models
      - Slope fields: reading, matching and sketching
      - Motion problems revisited with integrals
      - AB syllabus checkpoint: full timed section, error log updated
    Projects built:
      - Volume gallery: one solid each way, from sketch to setup to answer
      - AB mock exam number one with documented score
    Practice: Set up and solve three area and volume problems, drawing each region first,
    plus one separable differential equation with a slope field sketch.

PHASE 3: BC TOPICS + EXAM CRAFT AND MOCK CYCLES (WEEKS 29-40)

BC students complete series, parametrics and polar; AB students go straight to craft. Then
the program becomes an exam machine: FRQ rubric mastery, MCQ pacing, calculator strategy and
full mock cycles that peak in the first week of May.

  Weeks 29-33: BC Extensions (BC track) / Deep Review (AB track)
    Topics:
      - Integration by parts and partial fractions (BC)

- Improper integrals and L'Hospital revisited (BC)
- Sequences and series: convergence tests as a decision tree (BC)
- Taylor and Maclaurin polynomials; Lagrange error bound (BC)
- Parametric and polar: derivatives, speed, arc length and area (BC)
- AB track in parallel: full-syllabus spaced review by error-log priority

Projects built:
- Series convergence decision-tree card, built by the student
- Parametric motion mini-case (BC) / AB mixed mock section (AB)

Practice: Apply the convergence decision tree to ten mixed series (or work the AB deep review set), noting which test you chose and why for each.

Weeks 34-37: FRQ Rubric Mastery and Calculator Strategy

Topics:
- The six FRQ archetypes and their rubric patterns, drilled one by one
- Justification language: what earns the point and what graders ignore
- Calculator-active strategy: what to store, graph and compute
- No-calculator section speed: exact values and clean algebra under time
- MCQ pacing plans built from personal timing data
- Partial-credit engineering: banking points on problems you cannot finish

Projects built:
- Self-graded FRQ portfolio: one of each archetype against real rubrics
- Personal pacing plan for all four exam sections

Practice: Grade two of your own completed FRQs point by point against the released rubric and rewrite any justification that would not earn credit.

Weeks 38-40: Full Mock Cycles and Peak Week

Topics:
- Full-length mocks under exact AP timing, AB or BC as registered
- Question-by-question review: reasoning, rubric, and the named fix
- Error-log closure and final target calibration
- Peak-week plan: light practice, rest, logistics and warm-up routine
- Exam-day rituals: the reset after a hard FRQ, time checkpoints per section

Projects built:
- Two full mock cycles with documented score progression
- Written exam-day plan, rehearsed before the real morning

Practice: Sit one full length timed mock this week and close your error log so every recurring mistake has a written, named fix.

PROJECTS THE STUDENT BUILDS AND KEEPS

- Year-long error log and precalculus gap map
- Self-graded FRQ portfolio covering every archetype against real rubrics
- Series convergence decision tree and personal formula sheets (BC)
- Two full mock cycles with documented score progression
- Written exam-day plan rehearsed before May

Total projects: 5+ exam artifacts including full mock cycles

SKILLS THE STUDENT WILL HAVE AT THE END

- Limits, continuity and the derivative as ideas
- The full derivative toolkit at exam speed
- Curve analysis, optimization and motion
- Integrals, the FTC and accumulation reasoning
- Differential equations and slope fields
- Series, parametrics and polar (BC)
- FRQ rubric craft and justification writing
- MCQ pacing and calculator-section strategy

HOW A TYPICAL WEEK IS SPLIT

Live classes: 2 one-hour live classes with your mentor
Problem sets: One curated set per week, reviewed in class
Timed work: Timed sections increasing in frequency toward May
Total per week: About 4-5 focused hours
Homework: A problem set after every class, and a monthly mixed-review assignment that deliberately folds in earlier topics

SUPPORT INCLUDED

Live sessions: 8 live one-hour classes every month, 2 per week
Mentorship: One dedicated mentor across the whole year
Recordings: Every class recorded for revision
Progress tracking: Error log + mock progression shared with parents
Flexibility: Intensity adjusts around school exams and mock weeks

CERTIFICATION DETAIL

Completion: Certificate from Modern Age Coders, awarded on passing the final assessment. Fall

short and there is focused revision and a free retest: the certificate certifies mastery, not attendance

WHERE THIS CAN LEAD

- A 4-5 on AP Calculus, with the college-credit positioning that follows
- Engineering, CS and quantitative-major readiness built on real understanding
- A lighter, calmer first-year college math experience
- Ready for the College Mathematics Masterclass or competition mathematics

COMMON QUESTIONS ABOUT THIS COURSE

For anything about cost, use PART 4 and RULE 1. Do not quote two regions.

Q: Does this course cover AB or BC?
A: Both, taught to your student's actual registration. The AB core is the shared spine; BC students additionally get series, parametrics, polar and the extra integration techniques in Phase 3 while AB students run deep review and extra mock cycles. The mentor aligns with your school's pacing so classwork and prep reinforce each other.

Q: My student is strong in class but bombs timed practice. Can you fix that?
A: Usually, yes, that profile is craft, not content. Timed collapse comes from slow routes, missing rubric awareness and pacing panic, all of which are trained skills. The FRQ rubric work plus personal pacing plans built from real timing data is exactly the fix.

Q: Most of my student's lost points are algebra slips, not calculus. Does prep help?
A: This is the most common pattern on AP exams, and it is very fixable. We track exactly where points die; when it is precalculus debt, simplification, composition, trig values, we repair those habits inside calculus problems, where the fix actually sticks.

Q: When should AP Calculus prep start?
A: The full 10-month arc starts alongside the school year and peaks in May. Joining mid-year works too, the mentor compresses toward your student's gap list and the mock cycles. The honest note: series (for BC) and FRQ craft reward runway, so earlier is calmer.

Q: What score can we expect?
A: We will not invent one. What you get instead: a real diagnostic, a plan aimed at the highest-value gaps, and a documented mock progression so the trend is visible long before May. Most committed students who complete the mock cycles walk in targeting 4-5 with evidence behind the target.

Q: How is this different from the school's AP class?
A: It is 1-on-1 or a tight small group, so your student's specific errors get the airtime a class of thirty cannot give. School covers the syllabus; we make sure your student owns the ideas, and then train the exam itself, rubrics, pacing, calculator strategy, which most classrooms have no time for.

Q: How am I assessed, and is the certificate just for showing up?
A: No. A problem set follows every class with written feedback, monthly reviews deliberately mix new material with earlier topics so nothing is forgotten, and the course ends with a full mock AP-style paper as the final assessment. Passing earns the certificate; falling short earns focused revision and a free retest. We measure real understanding, not attendance.

Q: Can we try it before paying?
A: Yes. Every student starts with a free live demo class that doubles as the diagnostic, a real lesson plus an honest read on the starting point, with no card details required.

To enrol, message Shivam Sir on +91 9123366161 or send the parent this link: https://learn.modernagecoders.com/courses/ap-calculus-exam-prep
For a demo: the Priority Live Demo (guaranteed, today or tomorrow) is booked at https://learn.modernagecoders.com/priority-demo . The free demo is a waiting list with no fixed date.

==========

COURSE 18 OF 137: AP COMPUTER SCIENCE A: JAVA PROGRAMMING AND FULL EXAM PREP

==========

Course link: https://learn.modernagecoders.com/courses/ap-computer-science-a-java-exam-prep-course
Subject area: Advanced Placement Computer Science
Designed for: Teens
Who can join: High school students preparing for AP Computer Science A; taught from Java basics, no prior coding required
Course length: 6 months (24 weeks)
Time needed: 2 live classes/week + 4-5 hours practice
Certificate: Certificate from Modern Age Coders, awarded on passing the final assessment

PRICE FOR THIS COURSE (quote only the one that applies to the person asking)
In India, per month: group Rs 1,499, mini batch Rs 2,999, one to one Rs 4,999
Outside India, per month: group $100, one to one $150
Classes: group and mini batch two live classes a week, eight a month; one to one in India one

live class a week, four a month; one to one outside India two live classes a week, eight a month. Each class is one hour.

WHAT THIS COURSE IS

Live online AP Computer Science A prep taught to the 2025-26 redesign: Java from scratch, all four units, free-response mastery and full digital mock exams.

In one line: A real Java programming course that happens to end in a top exam score, taught to the 2025-26 redesign that most courses have not caught up to yet.

ABOUT THE PROGRAMME

AP Computer Science A is a real first course in programming, taught in Java, and this course treats it that way: you leave able to write Java, not just to pass a test. It is also built for the exam as it exists now, not as it existed last year. The College Board redesigned AP CS A for 2025-26, collapsing the old ten units into four, moving the whole exam onto the digital Bluebook platform, and changing what is tested. Inheritance, polymorphism, interfaces and writing recursive methods were removed. Reading text files with Scanner, working with data sets, and tracing recursive calls were added. A course still teaching the ten-unit format with an inheritance unit is preparing students for an exam that no longer exists. The six-month structure follows the four redesigned units in order. Months 1 and 2 build Java from nothing and cover Unit 1, using objects and methods. Months 3 and 4 cover selection and iteration, then class creation, which is exactly what the class-design free-response question asks for. Months 5 and 6 cover data collections, arrays, ArrayList, 2D arrays, file reading and data sets, then turn fully to exam craft: all four free-response question types drilled against the real rubric, multiple-choice strategy for the forty-two-question digital section, and full timed mock exams under Bluebook-style conditions. Every class is live and small, and every concept is practised by writing code, because that is the only way this subject is ever actually learned.

WHAT MAKES THIS COURSE DIFFERENT

- Taught to the 2025-26 redesign: four units, the fully digital Bluebook exam, and the current content, so no time is wasted on inheritance, polymorphism or writing recursion, all of which were removed
- The added topics are covered properly: reading text files with Scanner, working with data sets, and tracing recursive calls, which many older courses and books still omit
- A real Java course, not a cram sheet: students finish able to read and write Java, which is the point of a first programming course
- Free-response mastery against the actual rubric: all four question types, drilled until earning points is a habit, with partial credit understood
- Digital-exam readiness: multiple-choice pacing for the forty-two-question section and full mock exams run under Bluebook-style conditions, so test day holds no surprises
- Live, small batches where you write code during class and get it reviewed, not lecture videos you watch alone

THE LEARNING PATH, STEP BY STEP

Phase 1: Java from scratch and Unit 1: primitive types, expressions, Strings, the Math class, and using objects and methods correctly
Phase 2: Units 2 and 3: boolean logic, conditionals and loops, then writing your own classes with constructors, methods and encapsulation
Phase 3: Unit 4 and exam mastery: arrays, ArrayList, 2D arrays, files and data sets, then all four free-response types and full timed digital mock exams

WHAT A STUDENT NEEDS BEFORE STARTING

Maths level: Comfortable school algebra: variables, expressions and basic logic. No advanced maths is required for AP Computer Science A
Programming: None required. The course teaches Java from the first line, so a complete beginner can start here; prior block-based or Python experience helps but is not assumed
Equipment: A computer that can run Java and a modern browser, since the real exam and our mock exams use a digital testing environment. We help with the full setup in week 1
Audience: High school students preparing for AP Computer Science A, typically in the years leading up to the exam, whether taking it at school or self-studying

WHO THIS COURSE IS FOR

Ap students: Students taking AP Computer Science A at school who want a structured, current course and real code review alongside their class
Self studiers: Students whose school does not offer AP CS A and who are preparing for the exam independently
Score focused: Students aiming for a strong score who want free-response drilling against the real rubric and full timed mock exams
Cs bound: Students headed for a computer science or engineering degree who want a genuine first programming course, not just exam tricks
International students: International students sitting AP for university applications who need the exam taught to its current, digital, 2025-26 format

FULL CURRICULUM, WEEK BY WEEK

This is the complete teaching plan. Parents can ask about any week.

PHASE 1: JAVA FOUNDATIONS AND USING OBJECTS (UNIT 1, MONTHS 1-2, WEEKS 1-8)

Java built from nothing, then Unit 1 of the redesigned course: using objects and methods, the largest single source of early marks and the base everything else stands on.

Month 1: Java From the Ground Up (Weeks 1-4)

Setup, the Java Program, and Output

Topics:

- Installing Java and a clean editor setup, plus a first look at the Bluebook exam environment
- The anatomy of a Java program: class, main method, statements and semicolons
- Printing with System.out.print and println, and reading output carefully
- Comments, whitespace and why readable code earns marks in free response
- The compile-and-run cycle and reading your first error messages without fear
- The AP Java Quick Reference: what it gives you on the exam and how to use it

Projects built:

- First program: a short Java program that prints a formatted pattern, run and explained line by line

Practice: 10 short output-tracing exercises: predict what a snippet prints, then run it and reconcile any difference

Primitive Types, Variables, and Expressions

Topics:

- The primitive types AP tests: int, double and boolean
- Declaration, initialisation and assignment
- Arithmetic operators, and the two that trip everyone: integer division and modulus
- Operator precedence and using parentheses to mean what you intend
- Casting between int and double, and where rounding silently happens
- Compound assignment and increment operators read correctly

Projects built:

- Calculator methods: small programs computing averages, remainders and unit conversions, each predicting integer versus double results first

Practice: 16 expression-evaluation problems, half of them designed around the integer-division and modulus traps

Using Objects and the String Class

Topics:

- Objects versus primitives, and the reference model that explains so many exam questions
- Creating objects and calling methods on them
- String concatenation and building output
- The tested String methods: length, substring, indexOf, equals and compareTo
- Why equals and == are different for objects, a guaranteed exam theme
- Reading a method's header to know what it needs and what it returns

Projects built:

- String toolkit: methods that extract initials, reverse words and search text, using only the AP-tested String methods

Practice: 14 String problems worked against the Quick Reference, each solution using only methods the exam actually provides

The Math Class and Method Basics

Topics:

- The Math methods AP tests: abs, pow, sqrt and random
- Turning Math.random into an integer in a target range, a classic exam skill
- Calling methods: arguments, parameters and return values
- void methods versus value-returning methods
- Method signatures and matching a call to a header
- Tracing a program that hands values between several methods

Projects built:

- Dice and ranges: a program that generates random values in given ranges and verifies the distribution by counting

Practice: 12 mixed problems on Math and method calls, plus 4 random-range questions built the way the exam builds them

Assessment: Month 1 checkpoint: a timed set on types, expressions, Strings and methods, marked on accuracy and correct tracing

Month 2: Unit 1 Depth, Using Objects and Methods (Weeks 5-8)

Wrapper Classes and Number Handling

Topics:

- Integer and Double wrapper classes and why they exist
- Autoboxing and unboxing seen in code you will meet later with ArrayList
- Parsing numbers and Integer.MAX_VALUE and MIN_VALUE
- Double precision surprises and why you never test doubles with ==
- Choosing int versus double deliberately, not by habit
- Reading questions that hide a type mismatch

Projects built:

- Number-handling drill: a program that safely parses, compares and formats numeric input, with the precision traps annotated

Practice: 12 problems on wrapper classes, parsing and precision, each with a one-line note on the type decision made

String Manipulation Deep Dive

Topics:

- Building, searching and comparing Strings at exam difficulty
- Common String algorithms: counting characters, extracting parts, reversing
- The off-by-one errors that live in substring and indexOf
- Traversing a String by index, a bridge to loops in Unit 2
- Comparing Strings correctly with equals and compareTo
- Writing a helper method that returns a processed String

Projects built:

- Text processor: methods that clean, search and transform text, each tested on tricky edge cases like empty and single-character strings

Practice: 14 String-algorithm problems, every solution checked against an empty-string and one-character edge case

Designing and Calling Methods

Topics:

- Decomposing a problem into small, named methods
- Helper methods and why they make free-response answers cleaner
- Method overloading, recognised and read correctly
- Tracing a chain of method calls and their return values
- Parameter passing in Java: what a method can and cannot change about what you pass it
- Reading a specification and turning it into method headers

Projects built:

- Method decomposition: one larger task solved twice, once as a single long method and once split into helpers, then compared for clarity

Practice: 12 method-tracing problems plus 4 parameter-passing questions built around the value-semantics trap

Unit 1 Mastery and the Digital Multiple Choice

Topics:

- Pulling Unit 1 together: objects, methods, Strings and the Math class
- The multiple-choice section as it is now: forty-two questions, choices A to D, ninety minutes
- Roughly two minutes a question, and how that changes pacing
- Reading code-snippet questions quickly and accurately
- Eliminating wrong answers on tracing questions
- A personal error log started here and grown all course

Projects built:

- First timed multiple-choice block on Unit 1 content, reviewed question by question with each miss tagged by cause

Practice: A timed Unit 1 multiple-choice set at exam pace, followed by a written review of every wrong and every guessed answer

Assessment: Unit 1 assessment: a timed multiple-choice section on using objects and methods, scored with the error log updated

---

PHASE 2: SELECTION, ITERATION AND CLASS CREATION (UNITS 2 AND 3, MONTHS 3-4, WEEKS 9-16)

The logic and loops that drive every program, then writing your own classes, which is exactly what the class-design free-response question demands.

Month 3: Selection and Iteration (Unit 2) (Weeks 9-12)

Boolean Expressions and if Statements

Topics:

- Boolean values and relational operators
- if, if-else and if-else-if chains
- Nested conditionals and reading them without getting lost
- Common logic errors and how the exam sets them
- Writing conditions that match a worded specification exactly
- Deciding between an if-else-if chain and separate ifs, and why it matters

Projects built:

- Decision engine: a grading or categorising program driven entirely by conditionals, tested against every boundary value

Practice: 14 conditional problems, each one required to be traced for at least three different inputs

Compound Conditions and De Morgan's Laws

Topics:

- The logical operators and, or and not
- Short-circuit evaluation and when the second condition is never checked
- De Morgan's laws and rewriting a condition as its equivalent
- Simplifying tangled boolean expressions
- Boolean-returning methods, a frequent exam and free-response pattern
- Truth-table thinking for questions that look harder than they are

Projects built:

- Condition simplifier: a set of gnarly boolean expressions rewritten in simplest equivalent form and verified by truth table

Practice: 12 compound-condition problems including 4 De Morgan rewrites checked both ways

While and For Loops

Topics:

- The while loop and its three moving parts
- The for loop as a compact while, and converting between them
- Counters, accumulators and running totals
- Sentinel-controlled loops
- Off-by-one errors and infinite loops, diagnosed on purpose
- Counting exactly how many times a loop body runs, a guaranteed multiple-choice type

Projects built:
- Loop patterns: programs that sum, count, find and build using loops, each with the iteration count predicted before running

Practice: 16 loop problems, half asking for the exact number of executions rather than the final value

Nested Loops and String Traversal

Topics:
- Nested loops and how the inner loop multiplies the work
- Traversing a String character by character with a loop
- Building patterns and tables with nested iteration
- Analysing nested-loop statement execution counts
- Combining loops with the conditionals from earlier weeks
- Recognising when a loop is the wrong tool

Projects built:
- Pattern generator: nested-loop programs that draw shapes and process text grids, with execution counts worked out by hand

Practice: 12 nested-loop and String-traversal problems, execution counts required on the nested ones

Assessment: Unit 2 assessment: a timed section on conditionals and loops, including statement-execution-count questions

Month 4: Class Creation (Unit 3) (Weeks 13-16)

Anatomy of a Class

Topics:
- Instance variables and the state an object holds
- Constructors and initialising an object correctly
- Default values and the null reference
- Creating objects with new and calling their methods
- The this reference and when you need it
- Reading a class specification the way a free-response question presents it

Projects built:
- First class from scratch: a small class with fields and a constructor, instantiated and exercised from a tester program

Practice: 10 problems building constructors and instance variables from a written specification

Methods, Encapsulation, and Access

Topics:
- Accessor and mutator methods done cleanly
- private versus public and why encapsulation is tested
- Returning and updating an object's state safely
- Writing methods that use the object's own instance variables
- Method contracts: honouring exactly what a specification promises
- Common class-design mistakes that cost free-response points

Projects built:
- Encapsulated class: a class with private fields and a full set of methods, with a test proving the state can only change through methods

Practice: 12 problems adding correct accessor, mutator and behaviour methods to given classes

Static, Scope, and Designing to a Specification

Topics:
- static variables and methods, and how they differ from instance members
- Local versus instance scope, a frequent source of exam confusion
- Designing a whole class from a table of required behaviour
- Choosing fields, constructors and methods that satisfy every listed case
- Testing your own class against the specification before trusting it
- How this maps directly onto free-response Question 2, class design

Projects built:
- Spec-to-class: a complete class built from a behaviour table alone, then checked case by case against that table

Practice: 10 class-design problems worked from specification to tested class, scope errors flagged as they appear

Unit 3 Mastery and the Class-Design Free Response

Topics:
- Writing a full class to specification under time
- The Class Design free-response question and its rubric
- Reading the specification table for exactly the points on offer
- Where partial credit lives in a class-design answer
- Self-checking an answer against the rubric before moving on
- Handwriting and clarity habits that protect marks on a digital exam

Projects built:
- Full class-design response written to a released-style prompt, then scored against the rubric point by point

Practice: Two timed class-design responses, each self-scored on the rubric with the

      lost points named
      Assessment: Unit 3 assessment: a timed section plus one class-design free response,
      scored on the official rubric

PHASE 3: DATA COLLECTIONS AND EXAM MASTERY (UNIT 4 AND FULL MOCKS, MONTHS 5-6, WEEKS 17-24)

Arrays, ArrayList, 2D arrays, files and data sets, then a full turn to exam craft: every
free-response type drilled and complete timed digital mock exams.

  Month 5: Data Collections (Unit 4) (Weeks 17-20)
    One-Dimensional Arrays
      Topics:
        - Declaring, creating and initialising arrays
        - Indexing, length and the out-of-bounds error
        - Traversing an array with a standard for loop
        - The enhanced for loop and when it can and cannot be used
        - Array algorithms: minimum, maximum, sum, count and average
        - The array traps the exam reuses, including modifying while traversing
      Projects built:
        - Array analyser: methods that scan an array for statistics and matches, each tested on empty
          and single-element arrays
      Practice: 14 array problems spanning both loop styles, edge cases required on every
      algorithm
    ArrayList
      Topics:
        - ArrayList versus arrays, and why the exam tests both
        - The tested methods: add, get, set, remove and size
        - Autoboxing in an ArrayList of Integer
        - Traversing and searching an ArrayList
        - The removal-during-iteration bug and the two correct fixes
        - ArrayList algorithms that mirror free-response Question 3, data analysis
      Projects built:
        - Data-analysis methods: an ArrayList processed to filter, count and summarise, written the way
          the free response asks
      Practice: 14 ArrayList problems, including two built specifically around the
      remove-while-iterating trap
    Two-Dimensional Arrays
      Topics:
        - Declaring and initialising 2D arrays
        - Row-major order and what it means for traversal
        - Nested loops over a grid, rows then columns
        - 2D array algorithms: row sums, column sums, searching and counting
        - Common indexing mistakes on the second dimension
        - How this maps onto free-response Question 4, the 2D array question
      Projects built:
        - Grid processor: methods that analyse a 2D array by row, column and whole grid, each traced on
          a small sample grid first
      Practice: 12 two-dimensional array problems, a hand trace required before coding each
      solution
    Files, Data Sets, and Recursion Tracing
      Topics:
        - Reading text files with Scanner, a topic added in the 2025-26 redesign
        - Working with data sets: loading, storing and processing real rows of data
        - Tracing recursive calls, which the current exam tests; you trace recursion, you do not write
          it
        - Why inheritance, polymorphism and writing recursion are not on the redesigned exam, so we do
          not spend time on them
        - Combining files, arrays and ArrayList into one small data program
        - A clear map of exactly what Unit 4 does and does not require
      Projects built:
        - Mini data project: read a small text data set with Scanner, store it, and answer questions
          about it with array or ArrayList methods
      Practice: 10 problems mixing file reading and data processing, plus 6 recursion-tracing
      questions that ask only for the traced result
      Assessment: Unit 4 assessment: a timed section on arrays, ArrayList, 2D arrays, file
      reading and recursion tracing

  Month 6: Free-Response Mastery and Full Mock Exams (Weeks 21-24)
    Free Response 1 and 2: Methods, Control Structures and Class Design
      Topics:
        - Question 1, methods and control structures: writing two methods, or a constructor and a
          method, to spec
        - Handling the String-method part cleanly in Question 1
        - Question 2, class design, revisited under exam time
        - Reading a rubric to see exactly where points are awarded
        - The commonest point-losing mistakes on these two questions
        - Writing code clean enough to be scored quickly and correctly
      Projects built:

- Two timed responses, one Question-1 style and one Question-2 style, each scored against the official rubric

Practice: Timed free-response practice on Questions 1 and 2, every attempt self-scored with the lost points named

Free Response 3 and 4: ArrayList Data Analysis and 2D Arrays

Topics:

- Question 3, data analysis with an ArrayList, from spec to working method
- Question 4, the 2D array question, traversed and manipulated correctly
- The data-manipulation patterns these two questions reward
- Partial-credit strategy: securing points even when the full method is hard
- Time budgeting across all four free-response questions
- Checking a method against the given examples before you commit

Projects built:

- Two timed responses, one Question-3 style and one Question-4 style, scored against the rubric and compared to week 21

Practice: Timed free-response practice on Questions 3 and 4, with a written note on where partial credit was won or missed

Multiple-Choice Strategy and Full Mock Exam One

Topics:

- Pacing the forty-two-question digital multiple-choice section
- Fast, accurate code tracing under time
- Elimination and educated guessing when a trace stalls
- A first complete timed mock: multiple choice and free response together
- Running the mock under Bluebook-style digital conditions
- Scoring the mock and converting toward the 1 to 5 scale

Projects built:

- Full mock exam one, scored, with a written breakdown of multiple-choice versus free-response performance

Practice: The full timed mock plus a complete review, every missed multiple-choice question re-traced correctly

Full Mock Exam Two and Test-Ready Review

Topics:

- A second complete timed mock under exam conditions
- Comparing the two mocks for direction of travel
- Closing the last content gaps the mocks exposed
- The test-day digital routine: the Bluebook app, the Quick Reference, timing
- A realistic, evidence-based target score from your mock results
- Where to go next: college programming, data structures, or a first real project

Projects built:

- Full mock exam two, scored and reviewed, ending in a one-page test-day plan built from your own results

Practice: The second full mock plus targeted repair of any remaining weak topic

Assessment: Final assessment: a complete timed mock exam, a progress summary from week 1 to now, and certificate review

PROJECTS THE STUDENT BUILDS AND KEEPS

- A String toolkit built from only the AP-tested String methods
- An encapsulated class designed from a behaviour specification
- An array analyser tested on every edge case
- An ArrayList data-analysis method in the free-response style
- A 2D array grid processor
- A mini data project that reads a text data set with Scanner
- Eight scored free-response answers across all four question types
- Two full timed mock exams under digital conditions

Total projects: Dozens of small Java programs plus eight scored free responses and two complete timed mock exams, all mapped to the 2025-26 exam

SKILLS THE STUDENT WILL HAVE AT THE END

- Reading and writing real Java, not just recognising it
- Using objects and methods, the largest scored area of the redesigned exam
- Conditionals, loops and nested iteration with correct execution-count reasoning
- Designing and writing classes to a specification, the class-design free response
- Arrays, ArrayList, 2D arrays, file reading and recursion tracing under the new Unit 4
- Free-response point-earning and digital multiple-choice pacing on full timed mocks

HOW A TYPICAL WEEK IS SPLIT

Live classes: 2 live one-hour classes per week, writing and tracing Java code live rather than watching solutions scroll by

Practice: 4-5 hours weekly of coding problems, tracing exercises and, later, timed free-response and mock sections

Review: Homework and free responses reviewed with written feedback, scored against the official rubric so you see exactly where points are won and lost

Homework: A task or problem set after every class, and a monthly mixed-review assignment that deliberately folds in earlier topics

SUPPORT INCLUDED

  Doubt support: WhatsApp doubt support between classes, with worked solutions for the problems that stall you
  Progress updates: Monthly progress notes tracking unit assessments and, in the final months, mock-exam scores against your target
  Career guidance: Honest guidance on what an AP score does and does not do for college admissions and credit, and what to study next in computer science

CERTIFICATION DETAIL

  Completion: Certificate from Modern Age Coders, awarded on passing the final assessment. Fall short and there is focused revision and a free retest: the certificate certifies real learning, not attendance

WHERE THIS CAN LEAD

  - A strong footing for the AP Computer Science A exam and, through it, university applications
  - Readiness for a college introductory programming course, often the exact content AP CS A mirrors
  - A genuine first step toward a computer science, software engineering or data degree
  - The Java and problem-solving base for our more advanced coding courses, including data structures and algorithms
  - Programming and free-response habits that transfer to later coursework and technical interviews

COMMON QUESTIONS ABOUT THIS COURSE

  For anything about cost, use PART 4 and RULE 1. Do not quote two regions.

  Q: Is this course taught to the new 2025-26 AP CS A exam?
  A: Yes, and this is the single most important thing to check in any AP CS A course right now. The College Board redesigned the course for 2025-26: the old ten units became four, the exam moved fully onto the digital Bluebook platform, and the content changed. Inheritance, polymorphism, interfaces and writing recursive methods were removed. Reading text files with Scanner, working with data sets, and tracing recursive calls were added. We teach the four-unit course and the digital exam as they are now. A course or textbook still built around a separate inheritance unit is preparing you for an exam that no longer exists.

  Q: Do I need to know Java or any programming before I start?
  A: No. The course starts at the very first line of Java and builds up, so a complete beginner is exactly who it is designed for. If you have done some block coding or a little Python, that background helps you move faster, but nothing is assumed. What the course does need is the practice hours: programming is learned by writing code, and the four to five hours a week of practice are where the real progress happens, not only in class.

  Q: What is the exam format now?
  A: The redesigned exam has two sections of equal length. Section 1 is multiple choice: forty-two questions with answer choices A to D, ninety minutes, and it is worth fifty-five percent of the score. Section 2 is free response: four questions, ninety minutes, worth forty-five percent. The four free-response questions are methods and control structures, class design, data analysis with an ArrayList, and a 2D array question. The whole exam is taken digitally in the Bluebook app, with the Java Quick Reference available on screen. We run full mock exams under these conditions so test day feels familiar.

  Q: Will this course get me a 5, or college credit?
  A: No honest course can promise a specific score. AP exams are graded 1 to 5, and your result depends on your starting point, the hours you put in and your performance on the day. What we can promise is honest: live teaching to the current exam, small batches, real doubt support, free-response drilling against the official rubric, and full timed mock exams, plus a clear, evidence-based read on a realistic target for you. Whether a given score earns college credit is decided by each university, not by us or by the College Board, so we will point you to check the specific policy of the colleges you care about.

  Q: What happened to inheritance and recursion?
  A: They changed in the redesign, and knowing this saves you real time. Inheritance, polymorphism, the extends and super keywords, interfaces, and writing recursive methods were all removed from the required content. Recursion is still on the exam, but only tracing: you follow recursive calls and state the result, you are not asked to write a recursive method. We teach recursion tracing properly, and we deliberately do not spend weeks on the removed topics, which is time we give back to the areas the exam actually tests, especially Unit 4 data collections, the largest scored unit.

  Q: Can I manage this alongside school and other subjects?
  A: Yes, it is built for a school student's week: two live one-hour classes plus four to five hours of practice you can place where they fit, with evening and weekend class slots. The pace is steady rather than crushing, and WhatsApp doubt support means a problem that stalls you on a school night does not have to wait for the next class. Students who miss a session can usually attend the same class with another batch where scheduling allows, so a busy exam

week does not leave a gap.

Q: How is the free response practised and marked?
A: The way it is actually scored. From month 4 onward you write timed free-response answers to released-style prompts, and each one is marked against the official College Board rubric, point by point, so you see exactly where marks are earned and lost. By the final month you will have written and reviewed several answers across all four question types. This rubric-first habit is what separates students who understand Java from students who reliably score on the free-response section, and the two are not the same thing.

Q: How am I assessed, and is the certificate just for showing up?
A: No. A task follows every class with feedback, monthly reviews deliberately mix new material with earlier topics so nothing is forgotten, and the course ends with a full mock paper as the final assessment. Passing earns the certificate; falling short earns focused revision and a free retest. We measure real learning, not attendance.

Q: Is this course affiliated with the College Board?
A: No. Modern Age Coders is an independent education provider and is not affiliated with, authorised by, or endorsed by the College Board. AP and Advanced Placement are registered trademarks of the College Board, used here only to describe the exam this course prepares students for. For official course and exam information, students should always refer to the College Board and AP Central directly.

==========

COURSE 19 OF 137: AP COMPUTER SCIENCE PRINCIPLES: CREATE TASK AND EXAM PREP

==========

Course link: https://learn.modernagecoders.com/courses/ap-computer-science-principles-exam-prep-course
Subject area: Advanced Placement Computer Science
Designed for: Teens
Who can join: High school students preparing for AP Computer Science Principles; beginner-friendly, no prior coding required
Course length: 6 months (24 weeks)
Time needed: 2 live classes/week + 3-4 hours practice
Certificate: Certificate from Modern Age Coders, awarded on passing the final assessment

PRICE FOR THIS COURSE (quote only the one that applies to the person asking)
In India, per month: group Rs 1,499, mini batch Rs 2,999, one to one Rs 4,999
Outside India, per month: group $100, one to one $150
Classes: group and mini batch two live classes a week, eight a month; one to one in India one live class a week, four a month; one to one outside India two live classes a week, eight a month. Each class is one hour.

WHAT THIS COURSE IS

Live online AP Computer Science Principles course: programming fundamentals, data, algorithms, the Create performance task, and full digital exam prep for CSP.

In one line: A broad, honest introduction to computing, built for the exam and the Create task exactly as they exist right now.

ABOUT THE PROGRAMME

AP Computer Science Principles is deliberately the wide-angle course: instead of teaching one language deeply the way AP Computer Science A teaches Java, CSP is organised around five Big Ideas, Creative Development, Data, Algorithms and Programming, Computer Systems and Networks, and Impact of Computing, and it is language-flexible by design. Students may build in a block-based or a text-based language, and this course teaches with a beginner-friendly, text-based language while also teaching fluent reading of the College Board's own pseudocode, since exam questions are written in that pseudocode regardless of what a student builds with. What matters on the exam is the concept underneath, a loop, a list, a procedure with parameters, not which keyword a particular language happens to use for it. The course is also built for the assessment as it currently works, which changed in 2024 in a way many older courses have not caught up to. Students still spend at least nine hours of guided development time building an individually developed program with a list, a procedure that takes parameters, and an algorithm that manages complexity with selection or iteration, the Create Performance Task, and they still submit their code as a Personalized Project Reference PDF through the AP Digital Portfolio near the end of April. What changed is that this submission is no longer scored on its own by AP readers. Instead, on the end-of-course exam in May, students answer two written-response questions about their own program using that same Personalized Project Reference as their permitted reference material. Section I, seventy multiple-choice questions in one hundred twenty minutes, is worth seventy percent of the score. Section II, the two written responses about the student's own code, is worth thirty percent. The six-month structure follows this directly: Months 1 and 2 build Creative Development and core programming; Months 3 and 4 cover Data and deeper Algorithms and

Programming while the Create Task is planned, built, and finished; Months 5 and 6 cover Computer Systems and Networks and Impact of Computing, then turn fully to full-length multiple-choice practice and drilling the two written responses against the student's own finished project, ending in complete timed mock exams under digital conditions.

WHAT MAKES THIS COURSE DIFFERENT

- Taught to the exam as it is scored now: the 2024 change to the Create Performance Task, no longer a separately scored artifact but the reference material for two written-response questions on the exam itself, is built into the course from month one
- Genuinely language-flexible teaching: concepts are taught to transfer, and students also learn to read the College Board's own pseudocode fluently, since that is the language most multiple-choice questions are actually written in
- A real, individually developed Create Task, built over guided sessions across month 4 with instructor feedback, not assembled the week before the deadline
- All five Big Ideas covered in proportion to how the exam actually weights them, so time is not lost over-teaching one area and under-teaching another
- Written-response practice done the way the exam requires it: against the student's own finished program and their own Personalized Project Reference, not a generic prompt
- Live, small batches where every class involves writing or reading real code, not lecture slides watched alone

THE LEARNING PATH, STEP BY STEP

Phase 1: Creative Development and programming foundations: variables, lists, selection, iteration, and procedures, built alongside the habits of incremental development, testing, and choosing a Create Task idea
Phase 2: Data and deeper Algorithms and Programming, while the Create Performance Task itself is planned, built across guided sessions, tested, and finished with its Personalized Project Reference
Phase 3: Computer Systems and Networks and Impact of Computing, then full seventy-question multiple-choice practice, written-response drilling against your own code, and complete timed digital mock exams

WHAT A STUDENT NEEDS BEFORE STARTING

Maths level: Comfortable school-level arithmetic and logical reasoning. No calculus or advanced maths is required for AP Computer Science Principles
Programming: None required. The course is beginner-friendly and builds programming concepts from the first class; CSP is intentionally language-flexible, and no prior experience is assumed
Equipment: A computer that can run our teaching language and a modern browser, since the real exam and our mock exams use a digital testing environment. We help with the full setup in week 1
Audience: High school students preparing for AP Computer Science Principles, typically as their first AP computer science course, whether taking it at school or self-studying

WHO THIS COURSE IS FOR

Ap students: Students taking AP Computer Science Principles at school who want a structured, current course and real code review alongside their class
Self studiers: Students whose school does not offer AP CSP and who are preparing for the exam independently
First ap course: Students choosing CSP as their first AP computer science course, since it is broader and more forgiving of a standing start than AP Computer Science A
Curious beginners: Students who are not yet sure programming is for them and want an honest, low-pressure introduction to what computing actually involves
International students: International students sitting AP for university applications who need the exam taught to its current, digital, two-part format

FULL CURRICULUM, WEEK BY WEEK

This is the complete teaching plan. Parents can ask about any week.

PHASE 1: CREATIVE DEVELOPMENT AND PROGRAMMING FOUNDATIONS (BIG IDEA 1 AND CORE OF BIG IDEA 3, MONTHS 1-2, WEEKS 1-8)

Computational thinking, the core programming building blocks CSP tests, and the habits of incremental development, ending with a planned and approved Create Task idea.

Month 1: Computational Thinking and Programming Building Blocks (Weeks 1-4)
Course Map, Computational Thinking, and What CSP Actually Tests
Topics:
- What AP Computer Science Principles covers: the five Big Ideas, Creative Development, Data, Algorithms and Programming, Computer Systems and Networks, and Impact of Computing, and how this course maps to them
- How CSP differs from AP Computer Science A: a broad, language-flexible course about computing itself, not a single-language programming course
- The two-part assessment at a glance: a seventy-question multiple-choice exam and a

written-response section built around a program you build yourself
- Computational thinking as a habit: decomposition, abstraction, and pattern recognition, not just vocabulary to memorise
- A first look at the language and environment we build in, and why the concept matters more than the exact keyword a language uses for it
- Setting up your development environment and a running course notebook, where every future Create Task idea starts getting written down

Projects built:
- First program: a short interactive program that takes input and produces output, run and explained line by line

Practice: 10 short exercises identifying which Big Idea a given exam-style question is testing, plus a first working program written and run

Variables, Data Abstraction, and Expressions

Topics:
- Variables as named, reusable storage, and why naming them clearly is a skill the exam rewards directly
- Data types CSP cares about: numbers, text, and Boolean values, and how the College Board's own pseudocode represents each
- Assignment versus comparison, and expressions that combine arithmetic and logic correctly
- Data abstraction: hiding detail behind a clear name so a program stays readable as it grows
- Lists as CSP's core data structure: creating a list and accessing an item by its index
- Reading and predicting the output of short CSP-style pseudocode blocks, the single most common multiple-choice question shape

Projects built:
- Variable tracker: a short program that stores, updates, and reports several related values, traced by hand before it is run

Practice: 14 pseudocode-tracing problems written to the CSP Exam Reference Sheet conventions, each paired with equivalent code in our teaching language

Lists and Iteration

Topics:
- Traversing a list with a loop, the single most tested list pattern on the exam
- FOR EACH style iteration versus counting loops, and reading both forms in CSP pseudocode
- Building a list up over time: appending, inserting, and removing items
- Searching a list: finding a matching value and correctly handling the case where none exists
- Common list bugs: off-by-one errors and changing a list while iterating over it
- Using a list to model something real, such as scores, names, or sensor readings

Projects built:
- List toolkit: procedures that sum, count, filter, and find the maximum of a list, tested on an empty list and a single-item list

Practice: 12 list and iteration problems, half written in CSP pseudocode and translated, half written directly in code

Selection, Boolean Logic, and Procedures

Topics:
- Boolean expressions and the relational operators the exam tests
- IF, IF-ELSE, and nested selection, read in both CSP pseudocode and our teaching language
- AND, OR, and NOT, and reasoning carefully through compound conditions
- Defining a procedure with parameters and a return value
- Why breaking a program into procedures is itself a Creative Development skill, not just tidy style
- Combining selection, iteration, and procedures into one small, working program

Projects built:
- Decision-making procedure: a small program that classifies input using nested conditionals, tested against every boundary case

Practice: 16 problems mixing selection and procedure tracing, pitched at the same difficulty as the exam's code-reading questions

Assessment: Month 1 checkpoint: a timed set covering variables, lists, selection, and procedures, scored the way Section I multiple choice is scored

Month 2: Algorithms, Procedural Abstraction, and Planning the Create Task (Weeks 5-8)

Algorithms: Combining Sequencing, Selection, and Iteration

Topics:
- What an algorithm means in CSP's terms: a precise sequence of steps that solves a problem or a whole class of problems
- Combining sequencing, selection, and iteration together to express a real algorithm
- Simulating an algorithm by hand on paper before trusting it in code
- Search: a first look at how a program finds something inside a list
- Sort: the idea of putting data in order, without needing to memorise every sorting method by name
- Recognising an algorithm's purpose from CSP-style pseudocode alone, a guaranteed multiple-choice skill

Projects built:
- Algorithm workbook: a search and a sort implemented from a plain-language description, each hand-traced on a small list first

Practice: 12 algorithm-tracing problems in CSP pseudocode, each requiring a predicted output before running the equivalent code

Procedural Abstraction and Parameters

Topics:
- Procedural abstraction: naming a block of steps so it can be reused without re-reading it every time

- Parameters as a procedure's inputs, and return values as its output
- Building a program from smaller, individually tested procedures instead of one long block
- Libraries and built-in procedures: using code you did not write, correctly and with understanding
- How the CSP Exam Reference Sheet documents procedures, and reading a procedure header quickly
- Documenting what a procedure does so a reader does not have to trace it line by line to understand it

Projects built:
- Procedure library: a small set of reusable procedures for a chosen task, called from one main program and tested independently

Practice: 10 problems designing a procedure header from a plain-language specification, plus 4 tracing problems on procedure calls

The Development Process: Incremental Building, Testing, and Collaboration

Topics:
- Incremental and iterative development: build a little, test a little, the exact process Creative Development questions test
- Identifying and fixing errors, and the real difference between a syntax error and a logic error
- Testing with a range of inputs, including edge cases that break naive solutions
- Collaboration in program development, and describing working with others honestly the way CSP expects
- Program documentation: comments that explain why a choice was made, not only what a line does
- Keeping a running development log, the exact habit month 4 relies on for the Create Task

Projects built:
- Debug and repair: a deliberately broken program fixed step by step, with every bug and its fix logged in writing

Practice: 8 debugging exercises with planted logic errors, plus a short written reflection on the development process used

Choosing and Planning Your Create Task Idea

Topics:
- What the Create Performance Task actually requires: an individually developed program with at least one list, a procedure that takes parameters, and an algorithm using selection or iteration to manage complexity
- Choosing an idea you can build and explain in your own words, not one that looks impressive but that you cannot honestly walk through
- Scoping a project to roughly nine hours of hands-on development time, the College Board's own minimum
- Sketching the program's purpose, inputs, and outputs before writing a line of code
- Planning exactly where the required list, procedure, and algorithm will live in your design
- Instructor sign-off on your Create Task idea before month 3's Data content and month 4's build sessions begin

Projects built:
- Approved Create Task proposal: a one-page plan naming your program's purpose, its list, its procedure with parameters, and its core algorithm

Practice: A written self-check against the official Create Task requirements, item by item, before the idea is approved

Assessment: Unit assessment: a timed multiple-choice set on Creative Development and the core programming content, reviewed question by question

---

PHASE 2: DATA, DEEPER ALGORITHMS, AND BUILDING THE CREATE TASK (BIG IDEAS 2 AND 3, MONTHS 3-4, WEEKS 9-16)

How computers represent and use data, then a return to algorithms with more complex data, while the Create Performance Task itself is planned, built across guided sessions, and finished.

Month 3: Data and Information (Weeks 9-12)

Binary and How Computers Represent Data

Topics:
- Binary numbers: converting between binary and decimal by hand
- Why computers store everything, numbers, text, images, and sound, as binary underneath
- Bits, bytes, and the sizes CSP expects a student to reason about
- Representing text with character encodings, and images as grids of coloured bits
- Analog versus digital data, and what is gained and lost when something is digitised
- Reading CSP multiple-choice questions that test binary conversion directly

Projects built:
- Binary explorer: a program that converts numbers between binary and decimal and explains each step of the conversion

Practice: 14 binary conversion problems plus 6 conceptual questions on the digital representation of text, image, and sound

Data Compression

Topics:
- Lossless compression: preserving every bit of the original data on the way back out
- Lossy compression: trading some detail for a much smaller file
- Where each type is actually used, and why source code and financial data are never compressed lossily
- A simple compression scheme worked by hand to see the size trade-off directly
- Metadata: what it is and why it travels with compressed and uncompressed data alike
- Compression questions the way CSP tends to ask them: scenario-based, not formula-based

Projects built:
- Compression demo: a small program that compresses a repetitive data set with a simple scheme and reports the size saved

Practice: 10 scenario questions on choosing lossless versus lossy compression for a stated real-world use

Extracting Information from Data

Topics:
- Why data alone is not information, and the extraction step that sits between the two
- Filtering, sorting, and searching a large data set for a specific answer
- Combining two data sets to surface a relationship that neither shows on its own
- Using tools to explore a data set too large to read by hand
- Visualising data honestly, echoing the same cautions taught in our data-focused courses
- Drawing a defensible conclusion from a data set, and stating plainly what that conclusion cannot claim

Projects built:
- Data-set investigation: a provided data set explored with filtering and grouping to answer three written questions with cited evidence

Practice: 8 data-extraction problems on real-style tables, each answer required to cite which rows or columns support it

Using Data to Solve Problems and Simulations

Topics:
- Simulations as simplified models of a real or imagined process
- What a simulation can tell you, and what it cannot, since it is only ever a model
- Building a simple simulation and running it many times to see a pattern emerge
- Bias in data, and bias in the people who select or interpret it
- How Data-focused questions typically read on the exam: a short scenario, then a reasoning question
- Pulling the month together: binary, compression, extraction, and simulation as one connected story about data

Projects built:
- Simple simulation: a small program that models a repeated random process, for example a game of chance, and reports results across many runs

Practice: A timed set of Data-focused multiple-choice questions, reviewed with the reasoning written out for every miss

Assessment: Unit assessment: a timed multiple-choice section on data representation, compression, extraction, and simulation

Month 4: Robust Programs and Building the Create Task (Weeks 13-16)

Two-Dimensional Lists and Algorithmic Thinking

Topics:
- Lists of lists: representing a grid or a table of data
- Traversing a two-dimensional list with nested iteration
- Choosing a data structure that fits the problem, not just the one you already know best
- A first, intuitive look at algorithm efficiency: why some approaches slow down badly as the data grows
- Undecidable problems: an honest look at problems no algorithm can solve correctly for every possible input
- Reading exam questions that compare two different algorithms solving the same problem

Projects built:
- Grid processor: a program that stores and analyses a small two-dimensional data set, for example a seating chart or a simple game board

Practice: 10 two-dimensional list problems plus 4 short-answer questions comparing the efficiency of two approaches to the same task

Simulations, Abstraction, and Managing Complexity

Topics:
- Abstraction as the tool that lets a program grow without becoming unreadable
- Managing complexity with procedures, parameters, and well-named variables used together
- Building a slightly larger simulation than week 12's, with more moving parts
- Deciding what detail a simulation can safely leave out without breaking its usefulness
- Refactoring a working but messy program into a cleaner one without changing what it does
- Applying these same habits directly to your own Create Task program, starting this week

Projects built:
- Create Task build session one: the first working version of your program's core algorithm and required list, reviewed live with the instructor

Practice: A self-review of your in-progress Create Task code against the list, procedure, and algorithm requirements

Building the Create Task: Robust Programs and Instructor Feedback

Topics:
- Writing a procedure with parameters that genuinely does the work your program needs, not one added only to meet a checklist
- Testing your Create Task program against both typical and edge-case inputs
- Handling unexpected input without the program crashing, a real mark of a robust program
- Explaining your own code out loud in class, the exact skill the exam later asks for in writing
- Incorporating instructor feedback into a second, improved working version
- Keeping your development log current: what changed, why it changed, and what you tested afterward

Projects built:
- Create Task build session two: a tested, working version of your full program, incorporating

the feedback from session one
      Practice: A written walkthrough of your program explaining what your list, procedure, and algorithm each do and why you built them that way
    Completing the Create Task and the Personalized Project Reference
      Topics:
        - Finalising your Create Task program: last fixes, clear comments, and a clean final run
        - Producing your Personalized Project Reference, the PDF of your own code you are permitted to use on exam day
        - What changed in 2024: the Create Task is no longer submitted as a separately scored artifact; instead your Personalized Project Reference becomes the material you use on the exam itself to answer two written-response questions about your own program
        - Submitting through the AP Digital Portfolio, and the real deadline this falls near, around the end of April on a typical school-year calendar
        - A first practice attempt at explaining your program in writing, the same task the exam itself will ask for
        - Why building a program you can actually explain matters more than building one that merely runs without errors
      Projects built:
        - Completed Create Task: a finished, tested program with its Personalized Project Reference PDF prepared exactly as exam day requires
      Practice: Two practice written responses about your own program, self-checked against the kind of reasoning the real prompts reward
      Assessment: Create Task checkpoint: instructor review of the finished program, its documentation, and a first written explanation of your own code

---
PHASE 3: COMPUTER SYSTEMS, IMPACT OF COMPUTING, AND EXAM MASTERY (BIG IDEAS 4 AND 5 AND FULL PRACTICE, MONTHS 5-6, WEEKS 17-24)

How the internet and larger computing systems actually work, an honest look at computing's effects on real people, then a full turn to exam craft built around your own finished Create Task.

  Month 5: Computer Systems and Networks (Weeks 17-20)
    How the Internet Works
      Topics:
        - The internet as a network of networks, not a single thing that lives anywhere
        - IP addresses and how a message finds its way to the right destination
        - Packets: breaking a message into pieces that can travel by different paths
        - Protocols as the agreed rules that let different systems talk to each other reliably
        - Bandwidth and latency, and why a fast connection is not the same thing as a low-delay one
        - Reading a CSP question about internet infrastructure for the exact concept being tested
      Projects built:
        - Packet-trace exercise: a written walkthrough of how a message would be broken into packets, routed, and reassembled between two points
      Practice: 10 conceptual questions on IP addressing, packets, and protocols, each answered in one or two precise sentences
    Fault Tolerance and Parallel Computing
      Topics:
        - Redundancy: why the internet keeps working even when a piece of it fails
        - Fault tolerance as a deliberate design goal, not an accident of good luck
        - Sequential versus parallel computing, and where each is genuinely the right choice
        - Distributed computing: splitting one large problem across many machines
        - Speedup, and why doubling the number of machines rarely halves the time exactly
        - Scenario questions that ask you to identify a fault-tolerant or a parallel design
      Projects built:
        - Parallel-versus-sequential demo: a small program run two ways, timed and compared, with the result explained in writing
      Practice: 8 scenario questions distinguishing genuinely fault-tolerant designs from a single point of failure
    Cybersecurity Fundamentals
      Topics:
        - What makes a system a worthwhile target: the value of the data it holds, not just its size
        - Common attacks explained plainly: phishing, malware, and denial-of-service, at the level CSP tests
        - Symmetric encryption: one shared key, and where that approach breaks down
        - Public-key encryption: how two sides can agree on a secret without ever meeting first
        - Authentication: passwords, multi-factor methods, and why each adds a genuine barrier
        - Practical safe-computing habits worth keeping regardless of the exam
      Projects built:
        - Encryption walkthrough: a simple substitution-style cipher implemented and then explained alongside why real systems need something far stronger
      Practice: 10 cybersecurity scenario questions, each requiring the specific vulnerability or protection to be named
    Computer Systems Review and Practice
      Topics:
        - Pulling the month together: the internet, fault tolerance, parallel computing, and cybersecurity as one connected system
        - Common traps in this area: mixing up a protocol with a specific piece of hardware
        - Practising the reading-passage multiple-choice questions, five of the seventy on the real

exam
- Timing strategy for the systems and networks questions specifically
- Building a personal glossary of systems terms from the errors made this month
- A short look ahead at Impact of Computing, which closes out the exam's content

Projects built:
- Systems glossary: a personal reference of every systems term missed this month, defined in your own words

Practice: A timed multiple-choice set on computer systems and networks content only, reviewed with every miss traced to its specific concept

Assessment: Unit assessment: a timed multiple-choice section on computer systems and networks, including reading-passage-style questions

Month 6: Impact of Computing and Full Exam Mastery (Weeks 21-24)

Beneficial and Harmful Effects of Computing

Topics:
- Computing innovations as double-edged: the same tool serving different purposes for different people
- The digital divide: unequal access to computing, and what that actually costs the people on the wrong side of it
- Bias in algorithms: where it enters, from the data going in to the decisions coming out
- Case studies of real computing innovations, weighed honestly for who benefits and who is put at risk
- Safe computing practices: privacy settings, a personal data footprint, and informed consent
- Writing a balanced answer that names both a genuine benefit and a genuine risk, the exact shape these questions want

Projects built:
- Impact case study: one real computing innovation analysed in writing for its benefits, its risks, and who is affected by each

Practice: 6 short-answer questions each requiring one genuine benefit and one genuine harm for a given computing innovation

Intellectual Property, Open Source, and Full Multiple-Choice Practice

Topics:
- Intellectual property: copyright, and why code can be protected the same way other creative work is
- Open source and Creative Commons licensing, and how each differs from default copyright
- Crowdsourcing and collaborative projects as a computing-enabled way of working
- Legal and ethical questions CSP expects you to reason through, not just define
- Starting full-length, seventy-question multiple-choice practice sets under timed conditions
- Building the error log that will drive the final two weeks of review

Projects built:
- First full multiple-choice practice set: seventy questions in one hundred twenty minutes, scored and logged by Big Idea

Practice: The full timed multiple-choice set plus a written review of every question missed, grouped by which Big Idea it tested

Written-Response Drilling with the Personalized Project Reference

Topics:
- The written-response section in full: two required questions about your own program, answered using your Personalized Project Reference
- What each written-response question actually asks for, and how it is scored
- Practising with your own finished Create Task code, exactly as the real exam requires
- Multiple-choice pacing refined: fifty-seven single-select, eight multiple-select choose-two, and five reading-passage questions in the mix
- Strategies for the multiple-select questions specifically, since a partial answer does not earn partial credit there
- A second full multiple-choice practice set, timed, with pacing tracked question by question

Projects built:
- Two scored written responses about your own Create Task program, written exactly as the real exam requires and reviewed against the reasoning the rubric rewards

Practice: The second full timed multiple-choice set, plus two written-response drafts scored and revised

Full Mock Exam and Test-Ready Review

Topics:
- A complete timed mock exam: seventy multiple-choice questions plus both written-response questions, run under digital conditions
- Reviewing the mock section by section, multiple choice against written response
- Closing the last content gaps the mock exposed
- The test-day routine: the Personalized Project Reference on hand, digital exam navigation, and timing across both sections
- An honest, evidence-based look at where you stand across all five Big Ideas
- Where to go next: AP Computer Science A, a first real coding course, or building further on the Create Task itself

Projects built:
- Full mock exam, scored across both sections, ending in a one-page test-day plan built from your own results

Practice: The complete mock exam plus targeted repair of the single weakest Big Idea it revealed

Assessment: Final assessment: a complete timed mock exam covering both the multiple-choice and written-response sections, plus a progress summary from week 1 to now

PROJECTS THE STUDENT BUILDS AND KEEPS

- A list toolkit of procedures tested on an empty list and a single-item list
- An algorithm workbook implementing a search and a sort from plain-language descriptions
- A binary explorer that converts and explains number representations
- A data-set investigation answering written questions with cited evidence
- A finished, tested Create Performance Task program with its own required list, procedure, and algorithm
- A Personalized Project Reference prepared exactly as exam day requires
- An impact case study weighing a real computing innovation's benefits and risks
- A complete timed mock exam covering multiple choice and both written responses

Total projects: Dozens of small programs plus a completed Create Performance Task, an impact case study, two scored written responses, and a full timed mock exam, all mapped to the current CSP exam

SKILLS THE STUDENT WILL HAVE AT THE END

- Reading and writing real code built around variables, lists, selection, iteration, and procedures
- Designing, building, testing, and explaining an individually developed program, the exact demand of the Create Performance Task
- Reasoning about data: binary representation, compression, and drawing defensible conclusions from a data set
- Understanding how the internet, fault tolerance, and parallel computing actually work, at the depth the exam tests
- Weighing the beneficial and harmful effects of a computing innovation in writing, including bias and the digital divide
- Multiple-choice pacing and written-response habits drilled on full timed mock exams

HOW A TYPICAL WEEK IS SPLIT

Live classes: 2 live one-hour classes per week, building and discussing real programs rather than watching slides
Practice: 3-4 hours weekly of coding exercises and pseudocode tracing, plus dedicated Create Task build time from month 4 onward
Review: Homework, the Create Task, and written responses reviewed with written feedback, scored the way the real exam scores each section
Homework: A task or problem set after every class, and a monthly mixed-review assignment that deliberately folds in earlier topics

SUPPORT INCLUDED

Doubt support: WhatsApp doubt support between classes, with worked explanations for the problems that stall you
Progress updates: Monthly progress notes tracking unit assessments, Create Task milestones and, in the final month, mock-exam scores
Career guidance: Honest guidance on what an AP score does and does not do for college admissions and credit, and what to study next in computer science

CERTIFICATION DETAIL

Completion: Certificate from Modern Age Coders, awarded on passing the final assessment. Fall short and there is focused revision and a free retest: the certificate certifies real learning, not attendance

WHERE THIS CAN LEAD

- A strong footing for the AP Computer Science Principles exam and, through it, university applications
- A natural next step into AP Computer Science A, our Java-based course, for students who want to go deeper into a single language
- A genuine first exposure to computing broad enough to inform a computer science, data, or engineering degree choice
- The programming and problem-solving base for our other coding courses, including Python and web development
- A completed, explainable programming project and an honest sense of what computing work actually involves, useful well beyond the exam itself

COMMON QUESTIONS ABOUT THIS COURSE

For anything about cost, use PART 4 and RULE 1. Do not quote two regions.

Q: How is AP Computer Science Principles different from AP Computer Science A?
A: CSP is the broad, conceptual course. It covers five Big Ideas, Creative Development, Data, Algorithms and Programming, Computer Systems and Networks, and Impact of Computing, and it is language-flexible, so students may work in a block-based or a text-based language. AP Computer Science A, by contrast, is a single-language course taught entirely in Java, with no data, internet, or impact content. Many students take CSP first, since it needs no prior

coding background and gives an honest sense of whether programming and computing are worth going deeper into with AP Computer Science A afterward.

Q: Do I need any coding experience before I start?
A: No. The course is built to be beginner-friendly from the first class, and CSP itself is designed for students with no programming background. We teach the concepts, variables, lists, procedures, selection, and iteration, from scratch, alongside the College Board's own pseudocode conventions used in most exam questions. Some prior exposure to any language, block-based or text-based, helps you move faster, but nothing is assumed.

Q: What is the Create Performance Task, and how is it assessed now?
A: You submit your code as a Personalized Project Reference PDF through the AP Digital Portfolio, with a deadline that falls near the end of April on a typical school-year calendar. What changed starting with the 2024-25 exam is how this is scored: the Create Task is no longer graded as a standalone submitted artifact by AP readers. Instead, on the end-of-course exam itself, you answer two written-response questions about your own program, using your Personalized Project Reference as permitted reference material. This written-response section is Section II of the exam and is worth thirty percent of your score. We build and finish your Create Task across guided sessions in month 4, then drill exactly this written-response format against your own finished code in month 6.

Q: What programming language will I use?
A: CSP is intentionally language-flexible: the College Board allows both block-based and text-based languages for the Create Task, and does not test any one language's exact syntax on the multiple-choice exam. We teach with a beginner-friendly, text-based language for building real programs, including your Create Task, and we also teach fluent reading of the College Board's own pseudocode, since that is the notation most multiple-choice questions are actually written in.

Q: What is the exam format?
A: The exam has two sections, taken digitally. Section I is multiple choice: seventy questions in one hundred twenty minutes, worth seventy percent of the score. Section II is the written-response section: two questions about your own Create Task program, answered using your Personalized Project Reference, worth thirty percent of the score. We run full timed practice on both sections, including complete mock exams under digital conditions.

Q: Will this course get me a 5, or college credit?
A: No honest course can promise a specific score. AP exams are graded 1 to 5, and your result depends on your starting point, the hours you put into practice, and your performance on the day. What we can promise is honest: live teaching to the current two-part exam, a real, individually developed Create Task built with instructor feedback, full multiple-choice and written-response practice, and complete timed mock exams, plus a clear, evidence-based read on a realistic target for you. Whether a given score earns college credit is decided by each university individually, not by us or by the College Board, so check the specific policy of the colleges you care about.

Q: Can I manage this alongside school and other subjects?
A: Yes, it is built for a school student's week: two live one-hour classes plus three to four hours of practice you can place where it fits, with evening and weekend class slots. The pace stays steady rather than crushing, and WhatsApp doubt support means a problem that stalls you on a school night does not have to wait for the next class. Students who miss a session can usually attend the same class with another batch where scheduling allows, so a busy exam week does not leave a real gap.

Q: Is this course affiliated with the College Board?
A: No. Modern Age Coders is an independent education provider and is not affiliated with, authorised by, or endorsed by the College Board. AP and Advanced Placement are registered trademarks of the College Board, used here only to describe the exam this course prepares students for. For official course and exam information, students should always refer to the College Board and AP Central directly.

To enrol, message Shivam Sir on +91 9123366161 or send the parent this link: https://learn.modernagecoders.com/courses/ap-computer-science-principles-exam-prep-course

==========

COURSE 20 OF 137: AP PRECALCULUS: UNITS 1 TO 3 AND FULL EXAM PREP

==========

Course link: https://learn.modernagecoders.com/courses/ap-precalculus-exam-prep-course
Subject area: Advanced Placement Mathematics
Designed for: High school
Who can join: High school students preparing for AP Precalculus; a solid Algebra 2 background is assumed
Course length: 6 months (24 weeks)
Time needed: 2 live classes/week + 4-5 hours practice
Certificate: Certificate from Modern Age Coders, awarded on passing the final assessment

PRICE FOR THIS COURSE (quote only the one that applies to the person asking)

In India, per month: group Rs 1,499, mini batch Rs 2,999, one to one Rs 4,999
Outside India, per month: group $100, one to one $150
Classes: group and mini batch two live classes a week, eight a month; one to one in India one live class a week, four a month; one to one outside India two live classes a week, eight a month. Each class is one hour.

WHAT THIS COURSE IS

Live online AP Precalculus exam prep covering Units 1-3: functions, exponentials, trig and polar. Small batches, real teachers, full timed mock exams.

In one line: A function-fluency course that happens to end in an AP exam, concentrated exactly where the exam is scored: Units 1 to 3.

ABOUT THE PROGRAMME

AP Precalculus is the newest AP mathematics course, and it is tested in a specific, slightly unusual way that changes how it should be prepared for. The classroom course covers four units, but the exam assesses only Units 1, 2 and 3. Unit 4, functions involving parameters, vectors and matrices, is taught across a full school year but does not appear on the exam at all. A prep course that spends real weeks drilling Unit 4 for exam purposes is spending time a student does not get back. This course concentrates its exam preparation exactly where the College Board tests: polynomial and rational functions, exponential and logarithmic functions, and trigonometric and polar functions. The six-month structure follows the three tested units in order, with the later weeks given fully to exam craft once each unit's content is covered. Months 1 and 2 build Unit 1: rates of change, polynomial behaviour and zeros, rational functions with their asymptotes and holes, transformations, and choosing the right model for a data set. Months 3 and 4 build Unit 2: arithmetic and geometric sequences, exponential functions and modelling, function composition and inverses, and logarithms through to equation solving. Month 5 builds Unit 3: the unit circle, sinusoidal functions and modelling, tangent and the reciprocal trig functions, inverse trig, and polar coordinates and functions. Month 6 turns fully to exam mastery: the calculator versus no-calculator skill that decides pacing on both sections, free-response method drilled against real question types, and two full timed mock exams run under the hybrid digital format, multiple choice answered in the Bluebook app and free response handwritten in paper booklets. A short, clearly labelled preview of Unit 4 closes the final week for students continuing on to calculus, with the honest note attached that it is not assessed on this exam. Every class is live and small, and the exam's calculator boundary, no calculator in Multiple Choice Part A, calculator required in Part B, calculator required again in Free Response Part A, then no calculator in Part B, is treated as a skill in its own right and drilled on both sides from week one, not left to the final month.

WHAT MAKES THIS COURSE DIFFERENT

- Exam prep concentrated exactly where the College Board tests: Units 1, 2 and 3. Unit 4, functions involving parameters, vectors and matrices, is taught in the full course but is not assessed on the exam, and this course does not spend exam-prep weeks pretending otherwise
- The calculator and no-calculator boundary is taught as its own skill from week one: Multiple Choice Part A with no calculator and Part B with one, Free Response Part A with a calculator and Part B without, drilled deliberately on both sides of the line
- A real function-fluency course, not a formula-memorisation cram sheet: transformations, end behaviour, equivalent representations and modelling are practised until they are habits, because that fluency is exactly what AP Calculus assumes on day one
- Free-response method drilled against real question types: modelling justification, equation solving and graph reading, with partial credit understood the way the rubric actually awards it
- Hybrid digital exam readiness: multiple-choice pacing for the Bluebook app and genuine handwriting practice for the paper free-response booklets, so the test-day format itself holds no surprises
- Live, small batches where problems are worked and reasoning is checked in class, not lecture videos watched alone

THE LEARNING PATH, STEP BY STEP

Phase 1: Unit 1: rates of change, polynomial functions and zeros, rational functions and asymptotes, transformations, and choosing the right function model
Phase 2: Unit 2: arithmetic and geometric sequences, exponential functions and modelling, function composition and inverses, logarithms and equation solving
Phase 3: Unit 3 and exam mastery: the unit circle, sinusoidal and trigonometric functions, polar coordinates and functions, then the calculator/no-calculator skill, free-response method, and full timed hybrid-digital mock exams

WHAT A STUDENT NEEDS BEFORE STARTING

Maths level: A solid Algebra 2 background: comfort with function notation, factoring, exponents and basic graphing. This course does not re-teach Algebra 2 from scratch, though real gaps are patched as they surface
Programming: None required and none used. This is a pure mathematics course; no coding

background is assumed or needed, even though Modern Age Coders also teaches programming
Equipment: A graphing calculator of the kind allowed on the AP exam, for Multiple Choice Part B and Free Response Part A, plus a notebook for the no-calculator hand-work, and a device with stable internet for live classes. Since the real exam and our mock exams use the Bluebook digital platform, we help with the setup in week 1
Audience: High school students preparing for AP Precalculus, typically in the year before AP Calculus, whether taking the course at school or preparing independently

WHO THIS COURSE IS FOR

Ap students: Students taking AP Precalculus at school who want a structured, exam-focused course and real problem-solving alongside their class
Self studiers: Students whose school does not offer AP Precalculus and who are preparing for the exam independently
Score focused: Students aiming for a strong score who want free-response drilling against a real rubric and full timed mock exams under hybrid-digital conditions
Calculus bound: Students headed for AP Calculus AB or BC who want genuine function fluency, not just exam tricks, since that fluency is exactly what calculus assumes
International students: International students sitting AP exams for university applications who need Units 1 to 3 taught to the current hybrid digital format

FULL CURRICULUM, WEEK BY WEEK

This is the complete teaching plan. Parents can ask about any week.

PHASE 1: POLYNOMIAL AND RATIONAL FUNCTIONS (UNIT 1, MONTHS 1-2, WEEKS 1-8)

Rates of change, polynomial behaviour and zeros, rational functions with their asymptotes and holes, transformations, and model selection: the function-behaviour toolkit every later unit builds on.

Month 1: Rates of Change and Polynomial Behaviour (Weeks 1-4)
Functions, Change, and Rates of Change
Topics:
- Function notation, domain and range refreshed from Algebra 2, plus a first look at the Bluebook digital exam environment
- Change in tandem: reading how one quantity's change drives another's from a table of values
- Average rate of change as the slope of a secant line over a stated interval
- Comparing rates of change across different intervals to describe where a function is increasing or decreasing
- Using a second layer of differences to notice when a rate of change is itself changing, an early signal of concavity
- Reading the same function's behaviour from a table, a graph and an equation, and checking that the three agree

Projects built:
- Rate-of-change notebook: a function studied three ways, table, graph and average rate of change over five different intervals, with each answer interpreted in a sentence

Practice: 16 rate-of-change problems worked from tables and graphs, half requiring the interval to be chosen from a written description
Polynomial Functions: Zeros and Local Behaviour
Topics:
- Polynomial vocabulary: degree, leading coefficient and standard form, read at a glance
- Zeros of a polynomial function and what multiplicity does to the graph at each one
- Distinguishing a zero where the graph crosses the axis from one where it only touches
- Local maxima and minima, and intervals of increase and decrease read from a polynomial's graph
- Complex zeros and the fact that non-real zeros of a real polynomial always come in conjugate pairs
- Sketching a polynomial from its zeros, their multiplicities and its degree, before ever plotting a point

Projects built:
- Zero-to-graph drill: eight polynomials sketched from a list of zeros and multiplicities alone, then checked point by point

Practice: 14 problems finding zeros, multiplicities and local behaviour, each sketch attempted before any calculator is used
End Behaviour and Rational Functions
Topics:
- End behaviour of a polynomial function read directly from its degree and leading coefficient
- Rational functions introduced as one polynomial divided by another, and why their behaviour differs from a polynomial's
- Horizontal asymptotes of a rational function from comparing numerator and denominator degree
- Slant asymptotes, which appear when the numerator's degree is exactly one more than the denominator's
- Zeros of a rational function found from the numerator, and why the denominator is never asked for a zero
- Describing end behaviour the way the exam expects it written, not just sketched

Projects built:
- Asymptote hunt: twelve rational functions sorted into horizontal-asymptote, slant-asymptote

or neither, then verified by long division where needed
Practice: 16 end-behaviour and asymptote problems across polynomials and rational functions, degree comparison written before any graphing

Vertical Asymptotes, Holes, and Equivalent Forms
Topics:
- Vertical asymptotes of a rational function from the zeros of the denominator
- Holes: what happens when a factor cancels between numerator and denominator, and why that point still does not exist
- Telling an asymptote from a hole by algebra, not by guessing from a rough sketch
- Equivalent representations of a polynomial or rational expression, factored versus standard form, and what each reveals faster
- Rewriting a rational expression to expose its asymptotes, holes and end behaviour in a single step
- Choosing the representation that answers a given question fastest, a real time-saver under the no-calculator clock

Projects built:
- Rewrite-and-reveal set: ten rational functions rewritten from standard to factored form specifically to expose a hidden hole or asymptote

Practice: 18 mixed Unit 1 problems on asymptotes, holes and equivalent forms, worked at no-calculator pace
Assessment: Month 1 checkpoint: a timed, no-calculator paper on rates of change, polynomial behaviour and rational functions, marked for reasoning as well as answers

Month 2: Transformations, Modelling, and Unit 1 Mastery (Weeks 5-8)

Transformations of Functions
Topics:
- Parent function shapes reviewed: linear, quadratic, cubic, square root and reciprocal
- Vertical and horizontal translations applied to a parent function's equation and graph
- Vertical and horizontal stretches and compressions, and how they interact with translations
- Reflections, and combining several transformations correctly in one rule
- Reading a transformed equation straight into a sketch without plotting points first
- Recovering the transformation from a before-and-after pair of graphs, a favourite exam question style

Projects built:
- Transformation matching set: ten transformed graphs matched to their equations, then the reverse, equation to sketch, for the same ten

Practice: 20 transformation problems split evenly between equation-to-graph and graph-to-equation

Choosing a Function Model
Topics:
- Deciding whether a data table is better modelled as linear, polynomial or rational, from its pattern of change
- Using constant, changing or ratio-based differences to identify the right model family
- Stating the assumptions a chosen model makes, and saying honestly where it might not hold
- Fitting a model to a short data table and justifying the choice of model in writing
- The justify-your-model free-response style, where the reasoning earns as many points as the equation
- Common model-selection traps: data that looks exponential over a short interval but is not

Projects built:
- Model justification write-up: two data tables modelled and the choice of model defended in four written sentences each

Practice: 10 model-selection problems, a written justification required for every answer, not just an equation

Algebraic Fluency with Polynomial and Rational Expressions
Topics:
- Factoring polynomial and rational expressions at exam speed, not textbook speed
- Polynomial long division and how a leftover remainder connects to a slant asymptote
- Combining rational expressions and simplifying without silently losing a domain restriction
- Solving polynomial and rational equations cleanly, checking every solution against the original domain
- Sign analysis on a number line for solving rational inequalities
- The domain-restriction mistakes that quietly cost marks on an otherwise correct answer

Projects built:
- Domain-safe solving set: eight rational equations and inequalities solved with every excluded value stated before the algebra begins

Practice: 18 equation and inequality problems, domain restrictions written first on every single one

Unit 1 Mastery and the Multiple-Choice Format
Topics:
- Pulling Unit 1 together: rates of change, polynomial behaviour, rational functions and equivalent forms
- The multiple-choice section as it is now: 40 questions, 2 hours, worth 62.5 percent of the score
- Part A: 28 questions in 80 minutes with no calculator, fluency without a crutch
- Part B: 12 questions in 40 minutes with a graphing calculator required
- Recognising on sight which Unit 1 questions reward hand analysis and which are faster on a calculator
- A personal error log started here, tagged by unit and by calculator or no-calculator part, and grown for the rest of the course

Projects built:
- First timed multiple-choice block on Unit 1, split into a no-calculator half and a calculator half, reviewed question by question

Practice: A timed Unit 1 multiple-choice set at exam pace, both parts, followed by a written review of every miss

Assessment: Unit 1 assessment: a timed multiple-choice section on polynomial and rational functions, run in two parts, calculator and no-calculator, with the error log updated

---

PHASE 2: EXPONENTIAL AND LOGARITHMIC FUNCTIONS (UNIT 2, MONTHS 3-4, WEEKS 9-16)

Sequences as the discrete root of exponential change, exponential functions and modelling, composition and inverses, then logarithms through to equation solving, closing with a first look at free response.

Month 3: Sequences, Exponential Functions, and Modelling (Weeks 9-12)

Sequences and the Roots of Exponential Growth

Topics:
- Arithmetic sequences as discrete linear change, and the common difference that defines one
- Geometric sequences as discrete exponential change, and the common ratio that defines one
- Telling an arithmetic pattern from a geometric one directly from a table, before writing any formula
- Moving from a geometric sequence to a continuous exponential function
- The general exponential function form and what its starting value and base each control
- Growth versus decay, read straight from whether the base is greater than or less than one

Projects built:
- Sequence-to-function bridge: four geometric sequences extended into continuous exponential models, with the jump from discrete to continuous explained in writing

Practice: 16 sequence problems, half arithmetic and half geometric, each one converted into a formula from a table alone

Exponential Functions: Behaviour and Manipulation

Topics:
- Domain, range and end behaviour of an exponential function
- Percent change and how it connects directly to the growth or decay factor in the equation
- Rewriting an exponential expression with a different base without changing what it represents
- Transformations of exponential functions, applied the same way as any other parent function
- Why an exponential function's average rate of change scales rather than stays constant across equal-length intervals
- Spotting an exponential pattern in a table from that scaling behaviour, before any equation is written

Projects built:
- Percent-change translator: eight real-world growth and decay descriptions rewritten as exponential equations, base and starting value identified from the words alone

Practice: 18 exponential-function problems mixing percent change, rewriting bases and reading behaviour from tables

Exponential Modelling and Competing Models

Topics:
- Setting up an exponential model from a context: identifying the starting value and the rate
- Interpreting the parameters of a fitted exponential model back in the words of the original problem
- Competing function model validation: choosing between linear, polynomial and exponential from how a data set actually changes
- Checking a proposed model against the given data points before trusting it further
- The build-a-model and justify-your-choice free-response style, and what earns the reasoning point
- Recognising when a model is being used outside a domain where it still makes sense

Projects built:
- Model face-off: one data set modelled two competing ways, exponential and polynomial, with a written case for which one actually fits

Practice: 12 modelling problems, each requiring both a model and a two-to-three sentence justification

Function Composition and Inverses

Topics:
- Composing two functions and evaluating the result from a table, a graph, or an equation
- Interpreting what a composition means in a real-world context, not just computing it
- Inverse functions: what it actually means for one function to undo another
- Finding an inverse algebraically and confirming it graphically as a reflection over y = x
- The domain restriction a function needs before a true inverse exists
- Why exponential and logarithmic functions are built as a natural inverse pair, setting up the second half of this unit

Projects built:
- Inverse verification set: six functions inverted algebraically, then checked both by composing and graphically, by reflecting

Practice: 14 composition and inverse problems, each inverse checked by composing it back with the original

Assessment: Month 3 checkpoint: a timed paper on sequences, exponential functions and modelling, composition and inverses

Month 4: Logarithms and Equation Solving (Weeks 13-16)
Logarithms as Inverses of Exponential Functions
Topics:
- Defining the logarithm as the inverse of an exponential function, not as an isolated new rule
- Converting fluently between exponential form and logarithmic form in both directions
- The common logarithm and the natural logarithm, and when each one is the natural choice
- Domain and range of a logarithmic function, and why the domain excludes zero and negative numbers
- Graphing a logarithmic function directly from its exponential parent by reflecting over y = x
- Vertical asymptotes of logarithmic graphs, and why they sit exactly where the exponential's horizontal asymptote was

Projects built:
- Exponential-log translation set: twelve equations converted between exponential and logarithmic form, evaluated by hand where the values are friendly

Practice: 16 problems converting between forms and sketching logarithmic graphs from their exponential parents

Logarithmic Properties and Manipulation
Topics:
- The product, quotient and power properties of logarithms, and where each one comes from
- Expanding a single logarithmic expression into several, and condensing several back into one
- The change-of-base formula and exactly when a calculator needs it
- The property-application mistakes the exam sets on purpose, misapplying a rule that only works one way
- Using log properties to simplify an expression before solving, which is almost always faster than solving first
- Transformations of logarithmic functions, applied the same way as exponential ones

Projects built:
- Expand-and-condense drill: ten logarithmic expressions expanded fully, then condensed back, each check confirming the two forms are equal

Practice: 18 logarithm-property problems, half expanding and half condensing, plus 4 change-of-base calculator problems

Solving Exponential and Logarithmic Equations
Topics:
- Solving exponential equations by matching bases when possible
- Solving exponential equations by taking a logarithm of both sides when bases will not match
- Solving logarithmic equations and checking every solution against the original domain for extraneous answers
- Exponential and logarithmic inequalities, solved and expressed in interval form
- Semi-log plots: why data that looks exponential on a normal grid becomes a straight line on a semi-log scale
- Reading a semi-log plot to recover the original exponential model's parameters

Projects built:
- Extraneous-solution audit: eight logarithmic equations solved, with every solution checked back in the original equation and any extraneous root explained

Practice: 20 equation and inequality problems across exponential and logarithmic functions, extraneous-solution checks required throughout

Unit 2 Mastery and a First Look at Free Response
Topics:
- Pulling Unit 2 together: sequences, exponential functions, composition, inverses and logarithms
- A first full look at the free-response section: 4 questions, 1 hour, worth 37.5 percent of the score
- Part A of free response: 2 questions, 30 minutes, graphing calculator required
- Part B of free response: 2 questions, 30 minutes, no calculator allowed
- The style of exponential and logarithmic modelling question that tends to appear in free response
- Writing a modelling justification in full sentences, since the reasoning point is scored separately from the equation

Projects built:
- First free-response attempt: one Unit 2 style modelling question answered under time and self-scored against a sample rubric

Practice: A timed Unit 2 multiple-choice set at exam pace plus one full free-response attempt, reviewed for both content and communication

Assessment: Unit 2 assessment: a timed section on exponential and logarithmic functions, run in calculator and no-calculator parts, with the error log updated

---

PHASE 3: TRIGONOMETRIC AND POLAR FUNCTIONS, AND FULL EXAM MASTERY (UNIT 3 AND MOCKS, MONTHS 5-6, WEEKS 17-24)

The unit circle, sinusoidal and trigonometric functions, and polar coordinates and functions, followed by a full turn to exam craft: the calculator/no-calculator skill, free-response method, and complete timed hybrid-digital mock exams.

Month 5: Trigonometric and Polar Functions (Weeks 17-20)
The Unit Circle and Periodic Behaviour
Topics:
- The unit circle built from angle, radius one, and the coordinates it defines as cosine and sine
- Radians as the natural unit for angle measure, and fluent conversion between radians and

degrees
- Special angles and the exact sine and cosine values worth having memorised, not looked up
- Periodicity: why sine and cosine repeat, and what a period of two-pi actually means
- Sine and cosine graphed directly from the unit circle, point by point at first, then from pattern
- Amplitude, period and midline read from a sinusoidal graph or straight from its equation

Projects built:
- Unit-circle-to-graph build: the sine and cosine graphs constructed point by point from the unit circle, then compared to the pattern-based shortcut

Practice: 20 unit-circle and radian-conversion problems, exact values required wherever the angle is a special one

Sinusoidal Functions and Modelling

Topics:
- The general sinusoidal function form and what amplitude, period, midline and phase shift each control
- Phase shift and exactly how it moves a sine or cosine graph left or right
- Building a sinusoidal model from a context description: extracting amplitude, period, midline and phase from words
- Sinusoidal context and data modelling questions in the free-response style
- Reading a sinusoidal model's parameters back out of a real-world description, the reverse skill
- Checking a fitted sinusoidal model against given data points before trusting it

Projects built:
- Sinusoidal modelling write-up: two real-world periodic scenarios, tides and temperature style, modelled with a full equation and parameters explained in words

Practice: 14 sinusoidal modelling problems, amplitude, period, midline and phase identified separately before the equation is assembled

Tangent, Reciprocal Trig, and Inverse Trig

Topics:
- The tangent function: its period, its vertical asymptotes and how its graph differs from sine and cosine
- Secant, cosecant and cotangent as reciprocal functions, graphed from their sine and cosine parents
- Inverse trigonometric functions and the restricted domains that make them true functions
- Using an inverse trig function to solve for an angle in a real context
- Solving trigonometric equations over a stated interval, finding every solution, not just one
- Trigonometric inequalities and expressing the solution as an interval

Projects built:
- Solve-and-verify set: ten trigonometric equations solved over a stated interval, every solution checked back on the unit circle

Practice: 18 problems across tangent, reciprocal trig functions and inverse trig, solution intervals stated before solving begins

Equivalent Trig Forms and Polar Functions

Topics:
- Trig identities as equivalent representations: the Pythagorean identity and the reciprocal identities
- Rewriting a trigonometric expression into an equivalent form that reveals its behaviour faster
- Polar coordinates: converting a point between polar and rectangular form in both directions
- Polar functions and their graphs: circles, roses and limacons recognised at a glance from their equation
- Reading symmetry and key features, maximum distance, zeros, directly from a polar graph
- How a polar function's periodic behaviour connects back to everything studied in this unit

Projects built:
- Polar gallery: six polar functions graphed and identified by family, circle, rose or limacon, with symmetry and key points labelled

Practice: 16 problems mixing trig identity rewriting and polar coordinate conversion, plus 4 polar-graph identification questions

Assessment: Unit 3 assessment: a timed section on trigonometric and polar functions, run in calculator and no-calculator parts

Month 6: Free-Response Mastery and Full Mock Exams (Weeks 21-24)

The Calculator/No-Calculator Split and Multiple-Choice Strategy

Topics:
- Mapping all four exam parts precisely: MC Part A, 28 questions, 80 minutes, no calculator; MC Part B, 12 questions, 40 minutes, calculator required; FRQ Part A, 2 questions, 30 minutes, calculator; FRQ Part B, 2 questions, 30 minutes, no calculator
- Building genuine no-calculator fluency: exact values, factoring and algebraic manipulation done by hand at speed
- Calculator strategy for Part B: what a graphing calculator is actually good for, and what it cannot substitute for
- Pacing each part on its own terms, roughly two minutes a question in Part A and just over three in Part B
- Recognising at a glance which part of the exam a released question is drawn from, and adjusting method accordingly
- A first timed multiple-choice block mixing both parts, reviewed question by question with each miss tagged by cause

Projects built:
- Timed mixed multiple-choice block, Part A followed immediately by Part B, reviewed with every

miss tagged calculator, no-calculator, concept or pacing
Practice: A timed multiple-choice set at full exam pace across both parts, followed by a written review of every wrong and every guessed answer

Free-Response Method Across Units 1 to 3
Topics:
- The free-response rubric mindset: where partial credit lives and how to secure it even on a question you cannot fully finish
- Justification writing: what actually earns the communication point on a modelling question, in plain, specific sentences
- A Unit 1 style free-response task: justifying a polynomial or rational model against given data
- A Unit 2 style free-response task: building an exponential or logarithmic model and solving an equation from it
- A Unit 3 style free-response task: building a sinusoidal model from a context description
- Self-scoring a free-response answer against a sample rubric, and naming exactly which point was lost and why

Projects built:
- Three timed free-response responses, one from each tested unit, each self-scored against a sample rubric with lost points named

Practice: Timed free-response practice across all three units, every attempt scored for both the answer and the justification

Full Mock Exam One
Topics:
- Running a complete timed mock in the real order: Multiple Choice Part A, Part B, then Free Response Part A, Part B
- Working under hybrid-digital conditions: multiple choice answered in a Bluebook-style flow, free response handwritten on paper
- Scoring the mock and converting the raw result toward the 1 to 5 scale
- Reviewing errors sorted by unit, Units 1, 2 and 3, to see where the real gaps sit
- Reviewing errors sorted by part, so a calculator-dependent weakness is not confused with a content gap
- Naming the single biggest gap the mock revealed and building one week's plan to close it

Projects built:
- Full mock exam one, scored and reviewed, with a written breakdown of performance by unit and by calculator or no-calculator part

Practice: The full timed mock plus a complete review, every missed multiple-choice question re-worked correctly by hand

Full Mock Exam Two, Test-Ready Review, and a Unit 4 Preview
Topics:
- A second complete timed mock, run fully under exam conditions from Multiple Choice Part A through Free Response Part B
- Comparing the two mocks directly to see real direction of travel, not just a single score
- The test-day routine: the Bluebook app for multiple choice, the paper booklet for free response, and timing across all four parts
- A realistic, evidence-based target score built from both mocks, not a guess
- An optional, clearly labelled preview of Unit 4, functions involving parameters, vectors and matrices, for students continuing on to calculus; this content is not tested on the AP Precalculus exam and is covered only as a bridge forward
- Where to go next: AP Calculus AB or BC, or a next mathematics course, chosen honestly from where this course leaves you

Projects built:
- Full mock exam two, scored and reviewed, ending in a one-page test-day plan built from both mocks' results

Practice: The second full mock plus targeted repair of any remaining weak topic from either mock

Assessment: Final assessment: a complete timed mock exam covering Units 1 through 3, a progress summary from week 1 to now, and certificate review

PROJECTS THE STUDENT BUILDS AND KEEPS

- A rate-of-change notebook studying one function across table, graph and equation
- A zero-to-graph and asymptote-hunt portfolio across polynomial and rational functions
- A model-justification write-up defending a chosen function model in writing
- A sequence-to-function bridge connecting discrete geometric sequences to continuous exponential models
- An inverse-verification set checking every inverse both algebraically and graphically
- A sinusoidal modelling write-up built from real-world periodic scenarios
- A polar gallery of graphed and identified polar function families
- Three scored free-response answers across all three tested units, plus two full timed mock exams under hybrid-digital conditions

Total projects: Dozens of worked problem sets plus three scored free responses and two complete timed mock exams, all mapped to Units 1 through 3

SKILLS THE STUDENT WILL HAVE AT THE END

- Function fluency: rates of change, transformations, end behaviour and equivalent representations
- Polynomial and rational function analysis, including zeros, asymptotes and holes

- Exponential and logarithmic reasoning, from sequences through to equation solving
- Trigonometric and polar function analysis, from the unit circle through to polar graphs
- Model selection and modelling justification, written the way the free-response rubric rewards
- Calculator and no-calculator fluency on both sides of the exam's part boundary, drilled on full timed mocks

HOW A TYPICAL WEEK IS SPLIT

Live classes: 2 live one-hour classes per week, working and checking problems live rather than watching solutions scroll by
Practice: 4-5 hours weekly of problem sets and, in the final month, timed free-response and full mock sections
Review: Homework and free responses reviewed with written feedback, scored against a sample rubric so you see exactly where reasoning is won and lost
Homework: A task or problem set after every class, and a monthly mixed-review assignment that deliberately folds in earlier topics

SUPPORT INCLUDED

Doubt support: WhatsApp doubt support between classes, with worked solutions for the problems that stall you
Progress updates: Monthly progress notes tracking unit assessments and, in the final month, mock-exam scores against your target
Career guidance: Honest guidance on what an AP score does and does not do for college admissions and credit, and what mathematics course to take next

CERTIFICATION DETAIL

Completion: Certificate from Modern Age Coders, awarded on passing the final assessment. Fall short and there is focused revision and a free retest: the certificate certifies real learning, not attendance

WHERE THIS CAN LEAD

- A strong footing for the AP Precalculus exam, Units 1 through 3, and through it, university applications
- The function fluency, transformations, modelling and equivalent representations, that AP Calculus AB and BC assume from the first week
- A genuine next step toward AP Calculus or a first university mathematics course
- Modelling and justification habits that transfer to statistics, physics and other quantitative coursework
- The problem-solving base for our AP Calculus and college-level mathematics courses

COMMON QUESTIONS ABOUT THIS COURSE

For anything about cost, use PART 4 and RULE 1. Do not quote two regions.

Q: Is Unit 4 tested on the AP Precalculus exam?
A: No, and this is the single most useful thing to know before you plan your prep time. AP Precalculus is taught as four units, but the exam only assesses Units 1, 2 and 3: polynomial and rational functions, exponential and logarithmic functions, and trigonometric and polar functions. This course concentrates its exam preparation on Units 1 through 3, exactly where the scoring happens, and covers Unit 4 only as a short, clearly labelled preview in the final week for students continuing on to calculus.

Q: What is the calculator versus no-calculator split on this exam?
A: Both sections are split into a calculator part and a no-calculator part, and knowing the boundary cold is a real exam skill. Section I, Multiple Choice, has Part A with 28 questions in 80 minutes and no calculator allowed, then Part B with 12 questions in 40 minutes where a graphing calculator is required. Section II, Free Response, has Part A with 2 questions in 30 minutes where a graphing calculator is required, then Part B with 2 questions in 30 minutes and no calculator. We drill both sides of that line from week one, not just in the final month.

Q: What do I need to know before starting this course?
A: A solid Algebra 2 background: comfort with function notation, factoring, exponents and basic graphing. The course does not re-teach Algebra 2 from the beginning, though real gaps are patched as they show up rather than ignored. No programming or coding background is needed or used; this is a pure mathematics course.

Q: How does AP Precalculus actually prepare me for AP Calculus?
A: Honestly, and mostly through fluency rather than new tricks. AP Calculus assumes you can read a function's behaviour, transformations, end behaviour, zeros, asymptotes, without hesitating, and that you are comfortable moving between exponential, logarithmic and trigonometric forms. That is exactly what Units 1 through 3 build. Students who finish this course fluent in function behaviour spend their first weeks of calculus learning calculus, not relearning precalculus under a new name.

Q: What is the AP Precalculus exam format?

A: Two sections. Section I, Multiple Choice, is 40 questions in 2 hours and is worth 62.5 percent of the score, split into a 28-question no-calculator Part A and a 12-question calculator-required Part B. Section II, Free Response, is 4 questions in 1 hour and is worth 37.5 percent of the score, split into a 2-question calculator-required Part A and a 2-question no-calculator Part B.

Q: What is the hybrid digital exam format?
A: The multiple-choice section is taken digitally in the College Board's Bluebook app, the same platform used for the digital SAT and several other AP exams. The free-response section, though, is answered by hand: you view the questions in Bluebook but write your actual answers in a paper booklet. We run our mock exams under exactly this split, digital multiple choice and handwritten free response, so the format itself is familiar by test day.

Q: Will this course get me a 5, or college credit?
A: No honest course can promise a specific score. AP exams are graded 1 to 5, and your result depends on your starting point, the hours you put in and your performance on the day. What we can promise is honest: live teaching concentrated on the tested units, small batches, real doubt support, free-response drilling against a real rubric, and full timed mock exams under hybrid-digital conditions, plus a clear, evidence-based read on a realistic target for you. Whether a given score earns college credit, and for what, is decided by each university, and AP Precalculus credit policies vary more than AP Calculus policies do, so we point students to check the specific policy of the colleges they care about.

Q: How am I assessed, and is the certificate just for showing up?
A: No. A task follows every class with feedback, monthly reviews deliberately mix new material with earlier topics so nothing is forgotten, and the course ends with a full mock paper as the final assessment. Passing earns the certificate; falling short earns focused revision and a free retest. We measure real learning, not attendance.

Q: Is this course affiliated with the College Board?
A: No. Modern Age Coders is an independent education provider and is not affiliated with, authorised by, or endorsed by the College Board. AP and Advanced Placement are trademarks of the College Board, used here only to describe the exam this course prepares students for. For official course and exam information, students should always refer to the College Board and AP Central directly.

==========

COURSE 21 OF 137: AP STATISTICS: EXAM PREP WITH THE INVESTIGATIVE TASK

==========

Course link: https://learn.modernagecoders.com/courses/ap-statistics-maths-exam-prep-course
Subject area: Advanced Placement Mathematics
Designed for: High school
Who can join: High school students preparing for AP Statistics; taught from the ground up, comfort with school algebra assumed
Course length: 6 months (24 weeks)
Time needed: 2 live classes/week + 4-5 hours practice
Certificate: Certificate from Modern Age Coders, awarded on passing the final assessment

PRICE FOR THIS COURSE (quote only the one that applies to the person asking)
In India, per month: group Rs 1,499, mini batch Rs 2,999, one to one Rs 4,999
Outside India, per month: group $100, one to one $150
Classes: group and mini batch two live classes a week, eight a month; one to one in India one live class a week, four a month; one to one outside India two live classes a week, eight a month. Each class is one hour.

WHAT THIS COURSE IS

Live online AP Statistics exam prep: all nine AP units, the Investigative Task, free-response rubric mastery and full digital mock exams for a real score.

In one line: A statistics course built around one exam: nine AP units, the Investigative Task, and the free-response rubric that decides most of the score.

ABOUT THE PROGRAMME

AP Statistics is not the same subject as a general college statistics course, even though the two share a name. It is organised around nine specific units, tested on one specific exam, in one specific format, and this course is built around exactly that exam as it exists now, not around statistics in general. The exam runs in two equal halves: Section I is 40 multiple-choice questions in 90 minutes, worth half the score, and Section II is 6 free-response questions in 90 minutes, worth the other half. Of those six, the first five are short-answer questions, budgeted at roughly 12 minutes each, and the sixth is the Investigative Task, a single longer question worth about 30 of those 90 minutes that asks you

to apply and extend what you know to a scenario the exam has not shown you before. The exam is also hybrid: multiple-choice questions and the free-response prompts are viewed in the College Board's Bluebook digital testing app, but every free-response answer is handwritten in a paper booklet that is collected and scored separately. A graphing calculator, such as a TI-84, is expected and permitted for the whole exam, and this course teaches its use from week one. The six-month structure follows the nine AP units in the order the exam tests them. Months 1 and 2 cover Units 1 through 3: exploring one-variable data with the normal model, exploring two-variable data with correlation and least-squares regression, and collecting data through sampling and experimental design. Months 3 and 4 cover Units 4 and 5: probability, random variables, the binomial and geometric distributions, then sampling distributions and the Central Limit Theorem that every later inference procedure depends on. Months 5 and 6 cover Units 6 through 9, formal inference for proportions, means, chi-square settings and regression slopes, then turn fully to exam craft: the Investigative Task practiced as its own skill, every free-response question type drilled against the real rubric, and two full timed mock exams run under the exam's actual hybrid-digital conditions. Because the rubric rewards communication as much as computation, every answer in this course, from week one onward, is written to justify a conclusion with evidence, interpret it correctly in context, and state the conditions it depends on, since a right number with no justification earns limited credit on the real exam.

WHAT MAKES THIS COURSE DIFFERENT

- Organised around the nine official AP Statistics units in the order the exam actually tests them, not a general statistics syllabus with an AP label attached
- The Investigative Task, free-response Question 6, practiced as its own skill from month 6 onward, since it is scored differently from the other five questions and most courses barely touch it
- Free-response answers drilled against the communication standard the rubric truly rewards: justifying a conclusion with evidence, interpreting it correctly, and stating the conditions it depends on
- Graphing calculator fluency built in from week 1, since the real exam expects confident use of a calculator such as a TI-84 throughout both sections
- Full readiness for the hybrid-digital format: multiple-choice and free-response prompts viewed in the Bluebook app, but free-response answers handwritten in paper booklets, practiced under those exact conditions
- Live, small batches where you work real data and real free responses during class and get them reviewed, not lecture videos watched alone

THE LEARNING PATH, STEP BY STEP

Phase 1: Exploring data and collecting it: one-variable distributions and the normal model, two-variable scatterplots and least-squares regression, then sampling methods, experiments and bias (Units 1-3)
Phase 2: Randomness and its rules: probability, random variables, binomial and geometric distributions, then sampling distributions and the Central Limit Theorem (Units 4-5)
Phase 3: Formal inference and the exam itself: confidence intervals and significance tests for proportions, means, chi-square settings and slopes (Units 6-9), Investigative Task mastery, and full timed mock exams under real hybrid-digital conditions

WHAT A STUDENT NEEDS BEFORE STARTING

Maths level: Comfortable school algebra: working with formulas, fractions, percentages and graphs. No calculus is required anywhere in AP Statistics
Programming: None required. All work is done with a graphing calculator and by hand; no coding or spreadsheet skills are needed for this course
Equipment: A graphing calculator such as a TI-84 or an equivalent approved model, used and permitted throughout the real exam, plus a device with a stable internet connection for live classes. We help with calculator setup in week 1
Audience: High school students preparing for AP Statistics, typically in the years leading up to the exam, whether taking it at school or self-studying

WHO THIS COURSE IS FOR

Ap students: Students taking AP Statistics at school who want a structured, unit-by-unit course and real feedback on their free responses alongside their class
Self studiers: Students whose school does not offer AP Statistics and who are preparing for the exam independently
Score focused: Students aiming for a strong score who want free-response drilling against the real rubric, Investigative Task practice, and full timed mock exams
Math and science bound: Students headed for a data-heavy college major, from psychology to engineering, who want genuine statistical reasoning, not just exam tricks
International students: International students sitting AP Statistics for university applications who need the exam taught to its current hybrid-digital format

FULL CURRICULUM, WEEK BY WEEK

This is the complete teaching plan. Parents can ask about any week.

PHASE 1: EXPLORING DATA AND COLLECTING DATA (UNITS 1-3, MONTHS 1-2, WEEKS 1-8)

The data-analysis half of the course: describing one-variable and two-variable data honestly,
then how data is collected in the first place. The graphing calculator and the free-response
communication standard are introduced here and used every week from this point on.

  Month 1: Exploring One-Variable Data (Unit 1) (Weeks 1-4)
    Displaying and Describing Distributions
      Topics:
        - Individuals, variables, and the shape of the AP Statistics course: nine units, two exam sections, and the exam that ends it
        - Categorical versus quantitative data, and the type of graph each one calls for
        - Dotplots, stemplots and histograms: reading shape, not just drawing it
        - Describing a distribution in words: shape, outliers, center and spread, the sentence the exam always wants
        - Setting up the graphing calculator: entering lists, running 1-Var Stats, and building a first histogram on screen
        - The AP Statistics communication standard: why a correct number with no justification earns limited credit
      Projects built:
        - First distribution report: a real one-variable data set displayed, described in full shape-outliers-center-spread sentences, and checked on the calculator
      Practice: 12 distribution-description problems, each answer required to name shape, outliers, center and spread in one paragraph, not a list of numbers
    Measuring Center and Spread
      Topics:
        - Mean and median, and which one a skewed distribution or an outlier pulls away from the other
        - Range, interquartile range, and the 1.5 times IQR rule for flagging outliers
        - Variance and standard deviation built up from deviations, not dropped as a formula
        - The five-number summary, and building a boxplot from it by hand and by calculator
        - Choosing mean and standard deviation versus median and IQR to summarise a distribution, and defending the choice
        - Comparing two distributions side by side on boxplots, a guaranteed exam question type
      Projects built:
        - Center-and-spread comparison: two real groups compared on boxplots with a full written comparison of shape, center, spread and outliers
      Practice: 14 problems computing and choosing summary measures, half requiring a written comparison between two groups
    The Normal Distribution
      Topics:
        - The normal curve, its parameters, and the 68-95-99.7 rule
        - Standardising a value into a z-score and reading what it says about relative position
        - Finding areas under the normal curve on the calculator with normalcdf
        - The inverse problem: finding a value from a given percentile with invNorm
        - Assessing normality with a normal probability plot, read for curvature rather than computed
        - Normal calculations written up in context, the way the exam scores them, not just the final number
      Projects built:
        - Normal model check: a real quantitative data set tested against the 68-95-99.7 rule, with normalcdf and invNorm used to answer three context questions
      Practice: 14 normal distribution problems, each opened with a labelled sketch of the curve and the shaded region before any calculator work
    Unit 1 Mastery and the Free-Response Standard
      Topics:
        - Pulling Unit 1 together: distributions, summary statistics and the normal model in one paper
        - Reading a Unit 1 free-response prompt the way the rubric is written, points named as sentences rather than numbers
        - The exam's two sections at a glance: 40 multiple-choice questions in 90 minutes worth 50 percent of the score, and 6 free-response questions in 90 minutes worth the other 50 percent
        - Multiple-choice pacing for a Unit 1 style set: roughly two minutes a question
        - Common Unit 1 mistakes: describing shape from a boxplot alone, and confusing standard deviation with interquartile range
        - Starting a personal error log, kept and grown for the rest of the course
      Projects built:
        - First scored free response: a Unit 1 style question written under time and self-scored against a rubric, with every lost point named
      Practice: A timed Unit 1 multiple-choice set at exam pace, followed by one full free-response question reviewed line by line against its rubric
      Assessment: Unit 1 assessment: a timed paper on one-variable data covering multiple-choice and one free response, marked on both the number and the justification

  Month 2: Two-Variable Data and Collecting Data (Units 2-3) (Weeks 5-8)
    Exploring Two-Variable Data: Scatterplots and Correlation
      Topics:
        - Explanatory and response variables, and setting up a scatterplot correctly
        - Describing a scatterplot: direction, form, strength and outliers, the two-variable version of shape-outliers-center-spread
        - The correlation coefficient r: what it measures and where its usefulness stops
        - Correlation is not causation, with a plausible confounding variable named every time

- Computing r on the calculator from two lists
- Why a strong r does not automatically mean a good model, previewing residuals

Projects built:
- Relationship study: a real two-variable data set plotted, described in full, and its correlation computed and interpreted in context

Practice: 12 scatterplot and correlation problems, every claim of a relationship backed by a described scatterplot, not just an r value

Least-Squares Regression

Topics:
- The least-squares regression line and exactly what quantity it minimises
- Finding the equation on the calculator with LinRegTTest, and reading slope and intercept in context
- The coefficient of determination, r-squared, and what percentage of variation it explains
- Residuals and the residual plot: the honesty check the exam consistently asks for
- Predicting within the range of the data versus extrapolating beyond it
- Influential points and outliers in a regression setting

Projects built:
- Prediction model: a regression line fit to real data, its residual plot checked for pattern, and two predictions made with their limits stated

Practice: 12 regression problems with slope and intercept interpreted in the units of the problem every time, plus 4 residual-plot readings

Collecting Data: Sampling

Topics:
- Population versus sample, and why that distinction drives all of Unit 3
- Simple random samples, stratified samples, cluster samples and systematic samples
- Convenience sampling and voluntary response, and why both are biased by design
- Sources of bias: undercoverage, nonresponse, and response bias from question wording
- How a sampling method is described and evaluated on the free-response section
- Designing a sampling plan for a given population and research question

Projects built:
- Sampling critique: a real published survey evaluated for its sampling method, with specific bias risks named in writing

Practice: 10 sampling-design problems, each requiring the method to be named and one bias risk identified

Collecting Data: Experiments and Unit 2-3 Mastery

Topics:
- Observational studies versus experiments, and what only a well-designed experiment can show
- Experimental design vocabulary: treatments, experimental units, and the placebo effect
- The principles of good experimental design: control, randomisation, and replication
- Blocking and why it is used, contrasted with a completely randomised design
- Confounding variables in an experiment versus in an observational study
- Units 2 and 3 pulled together, with a timed multiple-choice set mixing both

Projects built:
- Experiment design: a full experimental design written for a given research question, naming treatments, randomisation and control

Practice: 10 experimental-design problems plus a timed Unit 2-3 multiple-choice set reviewed question by question

Assessment: Unit 2-3 assessment: a timed paper on two-variable data and data collection, including one regression free response and one design free response

---

PHASE 2: PROBABILITY AND SAMPLING DISTRIBUTIONS (UNITS 4-5, MONTHS 3-4, WEEKS 9-16)

The mechanics of randomness that make inference possible: probability rules, random variables, the named distributions, then sampling distributions and the Central Limit Theorem that the entire second half of the course depends on.

Month 3: Probability, Random Variables and Probability Distributions (Unit 4) (Weeks 9-12)

Probability Rules

Topics:
- Randomness, probability as long-run relative frequency, and simulating it on the calculator
- Sample spaces, events, and the basic probability rules
- The addition rule for mutually exclusive and overlapping events
- Conditional probability, and what being told the condition changes about the sample space
- Independence: the definition, and testing for it using a two-way table
- The multiplication rule for independent and dependent events

Projects built:
- Two-way table study: a real two-way table used to compute conditional probabilities and formally test two events for independence

Practice: 14 probability problems from single events through conditional probability, independence checked by calculation, not by eye

Random Variables

Topics:
- Discrete random variables and their probability distributions
- Mean, or expected value, of a discrete random variable, and what it means for a variable that only takes whole values
- Standard deviation of a discrete random variable
- Combining random variables: rules for the mean and variance of sums and differences
- Independence between two random variables, and why it matters before combining variances

- Random variables in context: insurance, games, and simple business scenarios
  Projects built:
  - Combined-variable analysis: two random variables combined by sum or difference, with mean and standard deviation of the result found and interpreted
  Practice: 12 random variable problems including 4 combination questions checked for the independence condition first
Binomial and Geometric Distributions
  Topics:
  - The binomial setting: the four conditions checked in words before any formula is used
  - Binomial probability, mean and standard deviation, by hand and with binompdf and binomcdf
  - The geometric setting: waiting for the first success
  - Geometric probability, mean and standard deviation, with geometpdf and geometcdf
  - Choosing between a binomial and a geometric model from the story in the question
  - The 10 percent condition: when sampling without replacement behaves close enough to independent
  Projects built:
  - Model choice project: three real scenarios each modelled correctly as binomial or geometric, with the setting's conditions checked in writing
  Practice: 14 binomial and geometric problems, the first written step always naming and checking the setting's conditions
Unit 4 Mastery and Probability Free Response
  Topics:
  - Pulling Unit 4 together: probability rules, random variables, binomial and geometric models
  - Reading a probability free-response question for exactly what it asks: a probability, a mean, or a standard deviation
  - Common Unit 4 mistakes: using a binomial model when trials are not independent, and misreading at least versus more than
  - Calculator fluency check: normalcdf, invNorm, binompdf, binomcdf, geometpdf and geometcdf used correctly and quickly
  - A timed Unit 4 multiple-choice set at exam pace
  - Error log review: Unit 4 mistakes classified and drilled
  Projects built:
  - Timed probability free response written under exam conditions and self-scored against a rubric
  Practice: A timed Unit 4 multiple-choice set plus one full free-response question reviewed against its rubric
  Assessment: Unit 4 assessment: a timed paper on probability, random variables and probability distributions, including one free response

Month 4: Sampling Distributions (Unit 5) (Weeks 13-16)
Sampling Variability and the Sampling Distribution of a Proportion
  Topics:
  - Parameter versus statistic, and why every sample gives a slightly different answer
  - The idea of a sampling distribution: the distribution of a statistic over repeated samples
  - Simulating a sampling distribution on the calculator to watch shape, center and spread build up
  - The sampling distribution of a sample proportion: its mean, its standard deviation, and when it is approximately normal
  - The conditions for that normal approximation: random, 10 percent, and large counts
  - Unbiased estimators, and why the sample proportion is one for the population proportion
  Projects built:
  - Simulation build: a sampling distribution for a proportion simulated by hand or calculator, with shape, center and spread reported from the simulation
  Practice: 10 sampling-distribution problems for proportions, each requiring the three conditions checked before any normal calculation
The Sampling Distribution of a Sample Mean and the Central Limit Theorem
  Topics:
  - The sampling distribution of a sample mean: its mean and its standard deviation
  - The Central Limit Theorem stated precisely: what a large sample size buys you even from a skewed population
  - Watching the Central Limit Theorem happen: simulating sample means from a skewed population as sample size grows
  - When the population itself is already normal, and why a large sample size is not needed then
  - The 10 percent condition applied to sample means
  - Common misreadings of the theorem, including confusing the population's shape with the sampling distribution's shape
  Projects built:
  - Central Limit Theorem simulation: sample means drawn repeatedly from a skewed population, with the resulting shape compared at small and large sample sizes
  Practice: 10 sampling-distribution problems for means, plus the simulation repeated on a second population shape
Sampling Distributions for Differences and Exam-Style Reasoning
  Topics:
  - The sampling distribution of a difference in two proportions
  - The sampling distribution of a difference in two sample means
  - Conditions for each, including independence between the two samples
  - Reading a scenario to decide which sampling distribution applies: one sample or two, proportion or mean
  - Connecting Unit 5 forward to Units 6 and 7: every confidence interval and test still to come

rests on one of these distributions
- Free-response practice describing a sampling distribution in full: shape, center, spread and the conditions that justify each

Projects built:
- Distribution identification drill: ten scenarios each matched to the correct sampling distribution, with mean, standard deviation and conditions stated

Practice: 12 mixed sampling-distribution problems where the question never announces which distribution to use

Unit 5 Mastery and the Bridge to Inference

Topics:
- Pulling Unit 5 together: sampling variability and every sampling distribution covered so far
- A worked preview of how a confidence interval is really a sampling distribution centered on a statistic
- A worked preview of how a significance test asks whether a statistic is surprising given an assumed sampling distribution
- A timed multiple-choice set at exam pace covering Units 4 and 5 together
- Error log review: probability and sampling-distribution mistakes classified and drilled
- Calculator fluency check across every function used so far in the course

Projects built:
- Timed Unit 5 free response written under exam conditions and self-scored against a rubric

Practice: A timed Units 4-5 multiple-choice set plus one full free-response question reviewed against its rubric

Assessment: Unit 5 assessment: a timed paper on sampling distributions, including one free response connecting a distribution to its conditions

---

PHASE 3: INFERENCE AND EXAM MASTERY (UNITS 6-9 AND FULL MOCKS, MONTHS 5-6, WEEKS 17-24)

Formal inference for every setting the exam tests, then a full turn to exam craft: the Investigative Task drilled as its own skill, every free-response type reviewed against the real rubric, and two complete timed mock exams under hybrid-digital conditions.

Month 5: Inference for Proportions and Means (Units 6-7) (Weeks 17-20)

Confidence Intervals for a Proportion

Topics:
- The logic of a confidence interval: an interval built to have a stated chance of capturing the true parameter
- The conditions for inference on one proportion: random, 10 percent, and large counts
- Constructing a one-sample z-interval for a proportion, by hand and with the calculator
- Margin of error, and the three things that change it
- What 95 percent confidence actually means, and the misreadings the exam is built to catch
- Confidence intervals for a difference in two proportions

Projects built:
- Interval report: a confidence interval for a real proportion built from data, with the correct interpretation written out in full context

Practice: 12 proportion-interval problems, every interval followed by a correctly worded, in-context interpretation sentence

Significance Tests for a Proportion

Topics:
- Stating null and alternative hypotheses correctly for a one-proportion test
- The test statistic, the p-value, and what a p-value actually measures
- Checking the same three conditions before trusting a test
- One-sample and two-sample z-tests for proportions, by hand and with the calculator
- Type I and Type II errors, and significance level as the Type I error rate you choose
- Writing a full test conclusion in context: state, plan, do, conclude, the four-step structure the rubric rewards

Projects built:
- Claim test: a real claim about a proportion tested against data, written up in the full state-plan-do-conclude structure

Practice: 12 proportion-test problems, every conclusion written in context and linked back to the p-value

Confidence Intervals for a Mean

Topics:
- Why a t-distribution, not a normal distribution, is used for inference on a mean
- Degrees of freedom in plain language, and how the t-distribution compares to normal as they grow
- The conditions for inference on one mean: random, 10 percent, and normal or large sample
- Constructing a one-sample t-interval for a mean, by hand and with the calculator
- Confidence intervals for a difference in two means, paired and unpaired designs told apart
- Recognising a paired design, a frequent trap on the exam

Projects built:
- Interval report: a confidence interval for a real mean built from data, with the paired-versus-unpaired decision justified in writing

Practice: 12 mean-interval problems including two paired designs hidden among unpaired ones

Significance Tests for a Mean and Unit 6-7 Mastery

Topics:
- One-sample and two-sample t-tests for means, hypotheses stated and conditions checked every time

- Paired t-tests, and why they are really a one-sample test performed on the differences
- Effect size, and why a significant result is not automatically an important one
- Pulling Units 6 and 7 together: proportions and means, intervals and tests, side by side
- A timed multiple-choice set at exam pace covering both units
- Error log review: inference mistakes classified, especially condition-checking and interpretation wording

Projects built:
- Timed inference free response written under exam conditions and self-scored against a rubric

Practice: A timed Units 6-7 multiple-choice set plus one full free-response question reviewed against its rubric

Assessment: Unit 6-7 assessment: a timed paper on inference for proportions and means, including one free response scored on conditions and conclusion wording

Month 6: Chi-Square, Slopes, the Investigative Task, and Full Mock Exams (Units 8-9) (Weeks 21-24)

Inference for Categorical Data: Chi-Square

Topics:
- The chi-square goodness-of-fit test: does one categorical variable match a claimed distribution
- The chi-square test for independence: are two categorical variables related, within one sample
- The chi-square test for homogeneity: do several populations share the same distribution, and how it differs from independence
- Expected counts, the conditions for a valid chi-square test, and computing the test statistic
- Running each chi-square test on the calculator and reading its output correctly
- Writing a full chi-square conclusion in the state-plan-do-conclude structure

Projects built:
- Independence study: a real two-way table tested for independence, with expected counts shown and a full written conclusion

Practice: 12 chi-square problems split across the three test types, the correct type identified from the scenario before any calculation

Inference for the Slope of a Regression Line

Topics:
- The population regression model, and what the true value of the slope represents
- Conditions for inference on a slope, read from a residual plot and a normal probability plot of residuals
- The t-test for the slope: hypotheses, test statistic, and reading calculator regression output
- The confidence interval for the slope, constructed from the same output
- Connecting Unit 9 back to Unit 2: the regression skills from month 2, now formally tested
- Interpreting a slope-test conclusion in the context of the original two variables

Projects built:
- Slope inference project: a real two-variable data set tested for a nonzero slope, with conditions checked from residual and normal plots

Practice: 10 slope-inference problems, conditions checked from a described or sketched residual plot every time

The Investigative Task

Topics:
- What free-response Question 6, the Investigative Task, actually asks: applying and extending the course's skills to a scenario that will not look familiar
- Why the Investigative Task is scored differently from Questions 1 through 5, and what that means for pacing, roughly 30 of the 90 free-response minutes
- Reading an unfamiliar prompt calmly: identifying which unit's tools actually apply underneath the new dressing
- Extending a known method one step further than it was originally taught, the specific skill the task tests
- Working through released Investigative Task style prompts, one full task per session
- Building a personal checklist for the task: state assumptions, justify every step, and answer the question actually asked

Projects built:
- Two full Investigative Task style responses written under time and self-scored against a released-style rubric, with the extension step highlighted

Practice: Two more Investigative Task style prompts worked untimed first for understanding, then timed, with every assumption stated in writing

Full Mock Exams and Test-Ready Review

Topics:
- A first complete timed mock exam: all 40 multiple-choice questions and all 6 free-response questions, including the Investigative Task
- Running the mock under real hybrid-digital conditions: multiple-choice and free-response prompts viewed digitally, free-response answers handwritten on paper
- Scoring the mock against official-style rubrics and converting toward the 1 to 5 scale
- A second complete timed mock, then closing whatever gaps the first one exposed
- Test-day logistics: the Bluebook app, the graphing calculator, the paper answer booklets, and timing across both sections
- A one-page, evidence-based test-day plan built from your own two mock scores

Projects built:
- Two full mock exams, scored, with a written comparison of the two and a final one-page test-day plan

Practice: Both full timed mocks plus a complete review, every missed multiple-choice question re-worked and every free response re-scored

Assessment: Final assessment: a complete timed mock exam under hybrid-digital conditions, a progress summary from week 1 to now, and certificate review

PROJECTS THE STUDENT BUILDS AND KEEPS

- A full shape-outliers-center-spread distribution report on a real one-variable data set
- A least-squares regression model with residuals checked and predictions limited to the data range
- A sampling-method critique of a real published survey
- A full experimental design written for a real research question
- A simulated sampling distribution built and reported by you
- A confidence interval and significance test written in the full state-plan-do-conclude structure
- A chi-square independence study with a complete written conclusion
- Two Investigative Task style responses and two full timed mock exams under hybrid-digital conditions

Total projects: A portfolio of unit projects across all nine AP units plus multiple scored free responses, two Investigative Task responses and two complete timed mock exams

SKILLS THE STUDENT WILL HAVE AT THE END

- Describing and comparing distributions with full statistical language, not just numbers
- Scatterplots, correlation and least-squares regression, checked with residual plots
- Sound data collection: sampling methods, bias, and experimental design
- Probability, random variables, and the binomial and geometric distributions
- Sampling distributions and the Central Limit Theorem that inference depends on
- Confidence intervals and significance tests for proportions, means, chi-square settings and slopes, plus Investigative Task reasoning

HOW A TYPICAL WEEK IS SPLIT

Live classes: 2 live one-hour classes per week, working problems and free responses live rather than watching solutions scroll by
Practice: 4-5 hours weekly of problem sets, calculator drills and, from month 5 onward, timed free-response and mock sections
Review: Homework and free responses reviewed with written feedback, scored against AP-style rubrics so you see exactly where points are earned and lost
Homework: A task or problem set after every class, and a monthly mixed-review assignment that deliberately folds in earlier topics

SUPPORT INCLUDED

Doubt support: WhatsApp doubt support between classes, with worked solutions for the problems that stall you
Progress updates: Monthly progress notes tracking unit assessments and, in the final months, mock-exam scores against your target
Career guidance: Honest guidance on what an AP score does and does not do for college admissions and credit, and what to study next after AP Statistics

CERTIFICATION DETAIL

Completion: Certificate from Modern Age Coders, awarded on passing the final assessment. Fall short and there is focused revision and a free retest: the certificate certifies real learning, not attendance

WHERE THIS CAN LEAD

- A strong footing for the AP Statistics exam and, through it, university applications
- Readiness for a college introductory statistics course, which AP Statistics closely mirrors in both content and reasoning
- A genuine base of statistical reasoning for any data-heavy major: psychology, economics, biology, business or engineering
- Free-response and justification habits, stating assumptions and interpreting evidence, that transfer directly into college coursework
- A natural next step into our Statistics and Probability course for students who want the subject's college-level and professional applications beyond the AP exam

COMMON QUESTIONS ABOUT THIS COURSE

For anything about cost, use PART 4 and RULE 1. Do not quote two regions.

Q: How is this different from a general statistics course, and from your other Statistics and Probability course?
A: It is a different subject taught for a different purpose. Our Statistics and Probability course is a general college-level and professional course, spreadsheet-first, with no exam and no fixed unit order, ending in a capstone analysis of a dataset you choose. This AP Statistics course is exam-specific: it is organised around the nine official AP units in the order the College Board tests them, it drills the free-response section against the actual AP

rubric, it dedicates real time to the Investigative Task, it teaches graphing-calculator methods the AP exam expects, and it is built for high school students working toward an AP score of 1 to 5. If your goal is the AP exam, take this course. If your goal is statistics for a data-heavy career with no exam involved, our Statistics and Probability course is the better fit, and graduates of this course who want that broader, professional-facing material are welcome there afterward.

Q: Do I need a graphing calculator, and which one?
A: Yes. A graphing calculator is expected and permitted throughout the entire AP Statistics exam, and we use one in class from week 1 onward, both for computation and because the exam expects you to read and quote calculator output correctly. A TI-84 or TI-84 Plus is the most common model and the one our examples default to, but any calculator on the College Board's approved list works, and we help you get comfortable with whichever model you already own during the first week rather than requiring a specific purchase.

Q: What is the Investigative Task?
A: It is free-response Question 6, and it is different from the other five free-response questions. Where Questions 1 through 5 test one unit's skills in a fairly direct way, the Investigative Task hands you a scenario you have not seen before and asks you to apply and extend the statistical reasoning you already have to fit it, sometimes stretching a method slightly beyond how it was originally taught. It is budgeted at roughly 30 of the 90 free-response minutes, making it worth real, focused preparation rather than being left as an afterthought, which is why we give it a dedicated week, week 23, plus additional timed practice in the mock phase.

Q: What is the exam format, and why does justification matter so much?
A: Section I is 40 multiple-choice questions in 90 minutes, worth 50 percent of the score. Section II is 6 free-response questions in 90 minutes, worth the other 50 percent: 5 short-answer questions budgeted at roughly 12 minutes each, plus the Investigative Task at around 30 minutes. The free-response rubric is built around communication, not just a final number: you are scored on justifying a conclusion with evidence from the data, interpreting a result correctly in context, and stating the conditions or assumptions a procedure depends on. A correct number with a missing or wrong justification consistently loses points, which is why every free response in this course, from week 1, is written to that standard rather than left as bare arithmetic.

Q: What is the hybrid digital format of the exam?
A: The multiple-choice section and the free-response prompts are both delivered digitally through the College Board's Bluebook application. However, your free-response answers themselves are handwritten in a paper answer booklet, which is collected separately and scored by hand. This mixed format catches students who have only ever practiced on paper or only ever practiced on screen, so our mock exams in weeks 23 and 24 are run under the same conditions: prompts read digitally, answers written out by hand, so test day is not the first time you have worked this way.

Q: How much maths do I need coming in?
A: Comfortable school algebra: rearranging a formula, working with fractions and percentages, and reading a graph. There is no calculus anywhere in AP Statistics, which surprises some students expecting a more advanced maths course. Where a result would traditionally require calculus to fully derive, the course demonstrates it through simulation and the graphing calculator instead, which is also how the AP exam itself expects the material to be handled.

Q: Will this get me a 5, or college credit?
A: No honest course can promise a specific score. AP exams are graded 1 to 5, and your result depends on your starting point, the hours you put in, and your performance on the day itself. What we can promise is honest: live teaching to the current nine-unit exam, small batches, real doubt support, free-response drilling against the official rubric, dedicated Investigative Task practice, and two full timed mock exams, plus a clear, evidence-based read on a realistic target score for you. Whether a given score earns college credit is decided by each university individually, not by us or by the College Board, so check the specific policy of the colleges you are applying to.

Q: How am I assessed, and is the certificate just for showing up?
A: No. A task follows every class with feedback, monthly reviews deliberately mix new material with earlier topics so nothing is forgotten, and the course ends with a full mock paper as the final assessment. Passing earns the certificate; falling short earns focused revision and a free retest. We measure real learning, not attendance.

Q: Is this course affiliated with the College Board?
A: No. Modern Age Coders is an independent education provider and is not affiliated with, authorised by, or endorsed by the College Board. AP and Advanced Placement are trademarks of the College Board, used here only to describe the exam this course prepares students for. For official course descriptions, syllabus updates and exam information, students should always refer to the College Board and AP Central directly.

==
COURSE 22 OF 137: APP DEVELOPMENT COURSE: FLUTTER, IOS & ANDROID
==

Course link: https://learn.modernagecoders.com/courses/complete-app-development-masterclass-college
Subject area: App Development
Designed for: College students
Who can join: Complete beginner (18+); college students, graduates and working professionals
Course length: 10-12 months (44-52 weeks)
Time needed: 2 live classes/week + 4-6 hours practice
Certificate: Certificate from Modern Age Coders, awarded on passing the final exam

PRICE FOR THIS COURSE (quote only the one that applies to the person asking)
  In India, per month: group Rs 1,499, mini batch Rs 2,999, one to one Rs 4,999
  Outside India, per month: group $100, one to one $150
  Classes: group and mini batch two live classes a week, eight a month; one to one in India one
  live class a week, four a month; one to one outside India two live classes a week, eight a
  month. Each class is one hour.

WHAT THIS COURSE IS

  App development course for college students and professionals: Flutter as the production
  stack, Firebase and backends, then native literacy in Swift and Kotlin, in 10-12 months.

  In one line: The whole app landscape in one honest arc: Flutter as your production stack, real backends, then working literacy in native iOS and Android.

ABOUT THE PROGRAMME

  App development hiring wants a specific shape of developer: deep in one cross-platform stack
  that ships products fast, and literate enough in native iOS and Android to go deeper when a
  product demands it. This live online masterclass builds exactly that shape: Flutter and Dart
  as the production road, UI, state management, navigation done properly, then the product
  layer, storage, REST APIs, Firebase, app backends with Node, testing, plus honest survey
  weeks of React Native and PWAs so the alternatives are understood rather than feared. Then
  the native literacy phase: a real month in Swift with SwiftUI, a real month in Kotlin with
  Jetpack Compose. A finale month ships a capstone app and sits the final exam. The pace is
  honest: ten teaching months at two live classes a week plus four to six hours of practice,
  with two more in hand. Problem sets, monthly mixed reviews, phase exams, and a final exam
  that decides the certificate with a free retest.

WHAT MAKES THIS COURSE DIFFERENT

  - One production stack, not a four-framework blur: Flutter carries the building; native months
    add literacy
  - The product layer included: storage, APIs, Firebase and app backends, where real apps live
  - Native literacy on both platforms: Swift with SwiftUI, Kotlin with Compose, taught for
    judgment
  - Alternatives surveyed honestly: React Native and PWAs explained, so stack choices are
    informed
  - An honest 10-month arc with 2 months in hand
  - Real assessment: weekly problem sets, monthly mixed reviews, phase exams and a final exam
    with a free retest

THE LEARNING PATH, STEP BY STEP

  Phase 1: Foundations (Months 1-3): programming, app design and Flutter fundamentals
  Phase 2: The product layer (Months 4-6): storage, APIs, Firebase, backends and testing
  Phase 3: Native literacy (Months 7-9): a real month each in Swift/SwiftUI and Kotlin/Compose
  Phase 4: The finale (Month 10): the capstone app and the final exam

WHAT A STUDENT NEEDS BEFORE STARTING

  Coding experience: None. Everything is taught from the first line
  Equipment: Any reasonably recent computer; Flutter, Android tooling and every tool used are
    free. The iOS month is structured so learners without a Mac follow fully (details in the FAQ)
  Age: 18+; college students, graduates and working professionals
  Time commitment: 2 live classes plus 4-6 hours of practice a week

WHO THIS COURSE IS FOR

  College students: Students who want the complete app-developer profile, not one framework
  Career switchers: Professionals entering mobile with the market-shaped skill set
  Product builders: Founders and makers who need apps shipped and stacks chosen wisely
  Generalists: Developers who want to understand the whole mobile landscape properly
  Freshers: Graduates who want portfolio apps plus the judgment interviews probe

FULL CURRICULUM, WEEK BY WEEK

This is the complete teaching plan. Parents can ask about any week.

PHASE 1: FOUNDATIONS & FIRST APPS (MONTHS 1-3, WEEKS 1-13)

Build programming foundations, master UI/UX design principles, and create your first mobile applications.

Months 1-2: Programming Basics & App Fundamentals (Weeks 1-8)

Introduction to App Development & Setup

Topics:

- Mobile app ecosystem overview
- iOS vs Android vs Cross-platform
- Types of apps: native, hybrid, web apps
- App development career paths
- Development environment setup
- Installing necessary tools and IDEs
- Understanding app architecture
- Mobile operating systems basics
- App lifecycle and states
- Screen sizes and resolutions
- Touch interactions and gestures
- Mobile-first design thinking
- Your first app ideas brainstorming
- App development process overview
- Version control with Git basics

Projects built:

- Environment setup checklist
- Simple 'Hello World' app
- App idea documentation
- Wireframe sketches (paper)
- Git repository creation

Practice: Research 20 successful apps, analyze their features

Programming Fundamentals (Dart/JavaScript)

Topics:

- Why Dart and JavaScript for apps?
- Variables and data types
- Operators: arithmetic, comparison, logical
- Strings and string manipulation
- Numbers and math operations
- Booleans and conditions
- If-else statements
- Switch statements
- Loops: for, while, do-while
- Lists/Arrays basics
- Maps/Objects basics
- Functions: declaration and calling
- Parameters and return values
- Arrow functions (JavaScript) / Fat arrow (Dart)
- Basic debugging techniques

Projects built:

- Calculator logic
- Temperature converter
- Todo list logic (console)
- Quiz game logic
- BMI calculator logic
- Simple games (number guessing)

Practice: Solve 100 basic programming problems

UI/UX Design for App Developers

Topics:

- UI vs UX: understanding the difference
- Mobile UI design principles
- Material Design (Android) guidelines
- Human Interface Guidelines (iOS)
- Color theory for apps
- Typography in mobile apps
- Icons and iconography
- Spacing and layout grids
- Visual hierarchy
- Navigation patterns: tabs, drawers, bottom navigation
- Common UI components: buttons, cards, lists
- Touch targets and accessibility
- Figma for app design (basics)
- Creating wireframes and mockups
- Prototyping interactive designs

Projects built:

- Design system in Figma

- App UI mockups (5 different apps)
- Icon set creation
- User flow diagrams
- Interactive prototype
- Style guide document

Practice: Design UI for 10 different app types

Introduction to Flutter Development

Topics:

- What is Flutter? Why Flutter?
- Flutter installation and setup
- Dart language review for Flutter
- Flutter architecture and widgets
- Stateless vs Stateful widgets
- Widget tree concept
- Common widgets: Text, Container, Row, Column
- Scaffold and AppBar
- Buttons: ElevatedButton, TextButton, IconButton
- Images and assets
- ListView and ListTile
- GridView for grid layouts
- Stack for layered layouts
- Padding and margin
- Hot reload and hot restart

Projects built:

- Hello Flutter app
- Personal card app
- BMI calculator app (UI + logic)
- Dice rolling app
- Quote of the day app
- Simple calculator app

Practice: Build 10 simple Flutter apps

Month 3: Intermediate Flutter & State Management (Weeks 9-13)

Advanced Flutter Widgets & Layouts

Topics:

- Custom widgets creation
- Widget composition
- Form widgets: TextField, Form, TextFormField
- Input validation
- DropdownButton and menus
- Date and time pickers
- Sliders and switches
- Checkbox and radio buttons
- Dialogs and bottom sheets
- SnackBar and notifications
- TabBar and TabBarView
- PageView for swiping
- Card and material design
- Themes and theming
- Dark mode implementation

Projects built:

- Todo app with add/delete
- Expense tracker app
- Form-based registration app
- Settings page with preferences
- Multi-page app with tabs
- Dark mode enabled app

Practice: Create 15 different UI screens

State Management in Flutter

Topics:

- Understanding state in Flutter
- setState and local state
- InheritedWidget basics
- Provider package introduction
- ChangeNotifier and ChangeNotifierProvider
- Consumer and Selector widgets
- Multiple providers
- Riverpod introduction (modern alternative)
- BLoC pattern basics
- GetX state management
- Choosing the right state management
- Global state vs local state
- State persistence basics
- Debugging state issues
- Best practices for state management

Projects built:

- Counter app with Provider
- Shopping cart with state management
- Todo app with Provider

- Theme switcher with Provider
- Multi-screen state sharing
- Complete app with Riverpod

Practice: Refactor 10 apps with proper state management

Navigation & Routing

Topics:

- Navigation basics in Flutter
- Navigator.push and pop
- Named routes
- Passing data between screens
- Returning data from screens
- Navigation with arguments
- Bottom navigation bar implementation
- Drawer navigation
- Tab navigation
- Deep linking basics
- GoRouter package
- Navigation 2.0 introduction
- Nested navigation
- Route guards and authentication flow
- Transition animations

Projects built:

- Multi-screen app with navigation
- Bottom nav app (3+ screens)
- Drawer menu app
- Login flow with navigation
- PHASE 1 MINI CAPSTONE: Complete Multi-screen App
- E.g., Recipe app, News app, or Portfolio app

Assessment: Phase 1 exam: a practical build defended live, plus a written paper mixing this phase with everything before it

---

PHASE 2: CROSS-PLATFORM DEVELOPMENT & BACKEND INTEGRATION (MONTHS 4-6, WEEKS 14-26)

Master cross-platform development, backend integration, APIs, databases, and real-world app features.

Months 4-5: Backend Integration & Data Persistence (Weeks 14-21)

Local Data Storage

Topics:

- Data persistence importance
- SharedPreferences for simple data
- Key-value storage patterns
- SQLite database basics
- sqflite package in Flutter
- CRUD operations with SQLite
- Database schema design
- Migrations and versioning
- Hive (NoSQL) database
- Sembast for Flutter
- Choosing the right storage solution
- Data encryption basics
- Secure storage for sensitive data
- File storage and management
- Cache management

Projects built:

- Notes app with SQLite
- Todo app with local database
- Expense tracker with Hive
- User preferences with SharedPreferences
- Offline-first app
- Encrypted data storage app

Practice: Build 10 apps with different storage methods

REST APIs & HTTP Networking

Topics:

- Understanding REST APIs
- HTTP methods: GET, POST, PUT, DELETE
- API endpoints and routes
- HTTP package in Flutter
- Dio package for advanced networking
- Making GET requests
- Making POST requests with body
- Headers and authentication tokens
- Query parameters
- JSON parsing in Dart
- Serialization and deserialization
- Error handling in API calls
- Loading states and UX
- Retry logic and timeout

- API rate limiting handling
  Projects built:
- Weather app with API
- News app (NewsAPI integration)
- Movie database app (TMDB API)
- Currency converter with live rates
- Quote app with API
- GitHub profile viewer
- Restaurant finder (Google Places API)
  Practice: Integrate 15 different public APIs
Firebase Integration
  Topics:
- Firebase introduction and setup
- Firebase project creation
- Firebase Authentication: email/password
- Google Sign-In integration
- Phone authentication
- Social logins: Facebook, Apple
- Firestore database (NoSQL)
- Firestore CRUD operations
- Real-time listeners
- Firestore queries and filtering
- Cloud Storage for files
- Image upload and retrieval
- Firebase Cloud Messaging (FCM)
- Push notifications implementation
- Firebase Analytics basics
  Projects built:
- User authentication app
- Chat application with Firestore
- Social media app (basic)
- File sharing app
- Real-time todo app
- Push notification app
- Complete Firebase-backed app
  Practice: Build 10 Firebase-integrated apps
Advanced App Features
  Topics:
- Camera and photo library access
- image_picker package
- Taking photos and videos
- Location services and GPS
- Google Maps integration
- Displaying maps and markers
- Geolocation and tracking
- QR code scanning and generation
- Biometric authentication (fingerprint, face)
- In-app browser (WebView)
- Audio playback and recording
- Video playback
- Sensors: accelerometer, gyroscope
- Background tasks
- App shortcuts and widgets (home screen)
  Projects built:
- Instagram-like photo app
- Location tracking app
- Maps-based app (find nearby)
- QR code scanner app
- Music player app
- Fitness tracker (basic)
- AR basics with camera
  Practice: Implement 15 advanced features across apps
Animations & Advanced UI
  Topics:
- Implicit animations in Flutter
- AnimatedContainer, AnimatedOpacity
- TweenAnimationBuilder
- Explicit animations with AnimationController
- Animation curves
- Hero animations
- Page transitions
- Custom animations
- Lottie animations integration
- Rive animations (interactive)
- Shimmer effects for loading
- Custom painters for graphics
- Gesture detectors and interactions
- Draggable widgets
- Performance optimization for animations

```
    Projects built:
      - Onboarding screens with animations
      - Animated app intro
      - Loading animations collection
      - Interactive animation app
      - Animated charts and graphs
      - Game with animations (simple)
      - Beautiful UI app with micro-interactions
    Practice: Add animations to 10 previous apps

Month 6: Alternative Stacks: React Native, PWAs & App Backends (Weeks 22-26)
  React Native Introduction
    Topics:
      - What is React Native?
      - React Native vs Flutter comparison
      - React Native setup and CLI
      - JSX syntax
      - Components in React Native
      - Functional vs Class components
      - React Hooks: useState, useEffect
      - Props and state
      - Styling in React Native
      - Flexbox layouts
      - Common components: View, Text, Image, ScrollView
      - FlatList and SectionList
      - TextInput and forms
      - TouchableOpacity and buttons
      - Navigation with React Navigation
    Projects built:
      - Hello React Native app
      - Todo app in React Native
      - Weather app with API
      - Navigation app (multi-screen)
      - Form handling app
      - List-based app (contacts, recipes)
    Practice: Build 10 React Native apps
  Progressive Web Apps (PWA)
    Topics:
      - What are Progressive Web Apps?
      - PWA vs native apps
      - Service workers
      - Offline functionality
      - App manifest
      - Add to home screen
      - Push notifications in PWA
      - Responsive design for PWA
      - PWA frameworks: React, Vue, Angular
      - Flutter for web (PWA)
      - Testing PWA on mobile
      - PWA deployment
      - App-like experience on web
      - Performance optimization
      - PWA best practices
    Projects built:
      - Simple PWA with offline support
      - Todo PWA
      - News PWA with caching
      - Flutter web app as PWA
      - E-commerce PWA (basic)
      - Social media PWA
    Practice: Convert 5 apps to PWAs
  Backend Development for Apps (Node.js/Express)
    Topics:
      - Why build your own backend?
      - Node.js and Express basics
      - RESTful API design for mobile
      - Database integration: MongoDB/PostgreSQL
      - User authentication (JWT)
      - CRUD API endpoints
      - File upload handling
      - Input validation and sanitization
      - Error handling in APIs
      - API security best practices
      - Environment variables
      - CORS configuration
      - Rate limiting
      - API documentation
      - Deployment basics (Render, Railway)
    Projects built:
```

- Simple REST API for todo app
- User authentication API
- Blog API with CRUD
- Image upload API
- Social media backend (basic)
- E-commerce backend API
- Complete backend for Flutter app

Practice: Build backends for 8 different apps

Testing & Quality Assurance

Topics:

- Importance of testing in apps
- Unit testing in Flutter
- Widget testing
- Integration testing
- Test-driven development (TDD) basics
- Mocking and stubbing
- Testing API calls
- Testing state management
- UI testing with Flutter
- Automated testing
- Testing in React Native
- Debugging techniques
- Performance testing
- Beta testing preparation
- User acceptance testing

Projects built:

- Test suite for calculator app
- Widget tests for UI components
- Integration tests for complete app
- TDD for new feature
- Automated testing pipeline
- Bug tracking and fixing

Practice: Write tests for all major apps

Phase 2 Capstone Project

Topics:

- Full-stack app development
- Custom backend API
- Advanced features integration
- State management
- Testing coverage
- Performance optimization

Projects built:

- PHASE 2 CAPSTONE: Complete Social Media App
- Features: Auth, posts, comments, likes, user profiles, image upload, real-time updates, push notifications
- Alternative: E-commerce app with cart, checkout, orders
- Alternative: Fitness/Health tracking app with charts
- Alternative: Chat application with Firebase
- Requirements: Backend integration, 10+ screens, polished UI, tested

Assessment: Phase 2 exam: a practical build defended live, plus a written paper mixing this phase with everything before it

---

PHASE 3: NATIVE DEVELOPMENT & ADVANCED TOPICS (MONTHS 7-9, WEEKS 27-39)

Master native iOS and Android development, advanced app features, and platform-specific capabilities.

Months 7-8: iOS Development with Swift (Weeks 27-34)

Swift Programming & iOS Basics

Topics:

- Introduction to iOS development
- Xcode installation and setup
- Swift programming language basics
- Variables, constants, and types
- Optionals and optional binding
- Collections: Arrays, Dictionaries, Sets
- Control flow in Swift
- Functions and closures
- Object-oriented programming in Swift
- Classes and structures
- Protocols and extensions
- iOS app architecture
- Storyboards vs SwiftUI
- View controllers lifecycle
- Interface Builder basics

Projects built:

- Swift programming exercises
- Hello iOS app

    - Calculator app in Swift
    - Simple UI app with storyboards
    - Multi-screen app with segues
  Practice: Solve 50 Swift programming problems
UIKit Development
  Topics:
    - UIKit framework overview
    - UIViewController and view lifecycle
    - UIView and subviews
    - Auto Layout and constraints
    - Stack views for layouts
    - UITableView and UITableViewCell
    - UICollectionView
    - Navigation Controller
    - Tab Bar Controller
    - UIAlertController and dialogs
    - UITextField and forms
    - UIImageView and image handling
    - Gesture recognizers
    - Delegates and protocols
    - Programmatic UI vs Storyboards
  Projects built:
    - Todo app with UITableView
    - Photo gallery with UICollectionView
    - Multi-screen app with navigation
    - Tab-based app
    - Form-based app with validation
    - Custom table view cells
  Practice: Build 12 UIKit apps
SwiftUI (Modern iOS Development)
  Topics:
    - SwiftUI introduction
    - Declarative UI paradigm
    - Views and modifiers
    - State and @State property wrapper
    - @Binding for two-way binding
    - @ObservedObject and @StateObject
    - @EnvironmentObject for global state
    - Lists and ForEach
    - Navigation in SwiftUI
    - NavigationView and NavigationLink
    - TabView for tabs
    - Sheets and fullscreen covers
    - Alerts and action sheets
    - Animations in SwiftUI
    - Combine framework basics
  Projects built:
    - SwiftUI todo app
    - Weather app with SwiftUI
    - MVVM architecture app
    - List-detail navigation app
    - Form app with SwiftUI
    - Animated UI app
    - Complete SwiftUI application
  Practice: Build 15 SwiftUI apps
iOS Data & Networking
  Topics:
    - UserDefaults for simple storage
    - Core Data for local database
    - Core Data entities and relationships
    - Fetch requests and predicates
    - URLSession for networking
    - Codable protocol for JSON
    - REST API integration in iOS
    - Async/await in Swift
    - Combine for reactive programming
    - Error handling in networking
    - Image caching
    - CloudKit basics
    - iCloud synchronization
    - Keychain for secure storage
    - File management in iOS
  Projects built:
    - Notes app with Core Data
    - API-based news app
    - Weather app with networking
    - Image downloading and caching
    - Secure password manager
    - Cloud-synced todo app

- Complete data-driven app
Practice: Build 10 data-intensive iOS apps
iOS Advanced Features
Topics:
- Camera and photo library
- Core Location and MapKit
- Push notifications (local and remote)
- Background tasks
- App extensions (Today, Share, Keyboard)
- SiriKit integration
- HealthKit basics
- ARKit for augmented reality
- Core ML for machine learning
- App clips
- Widgets (WidgetKit)
- In-app purchases (StoreKit)
- Biometric authentication (Face ID, Touch ID)
- Universal links and deep linking
- Accessibility in iOS apps
Projects built:
- Camera app with filters
- Location-based app with maps
- Push notification app
- Widget for iOS 14+
- AR experience app (basic)
- Health tracking app
- App with in-app purchases
Practice: Implement 10 advanced iOS features

Month 9: Android Development with Kotlin (Weeks 35-39)
Kotlin Programming & Android Basics
Topics:
- Introduction to Android development
- Android Studio setup
- Kotlin programming basics
- Variables: val vs var
- Data types and type inference
- Null safety in Kotlin
- Collections in Kotlin
- Control flow: if, when, loops
- Functions and lambdas
- Object-oriented Kotlin
- Classes, objects, and data classes
- Android project structure
- Activities and their lifecycle
- Fragments basics
- AndroidManifest.xml
Projects built:
- Kotlin programming exercises
- Hello Android app
- Simple calculator app
- Activity lifecycle app
- Multi-activity app with intents
Practice: Solve 50 Kotlin programming problems
Android UI Development
Topics:
- XML layouts in Android
- LinearLayout, RelativeLayout, ConstraintLayout
- RecyclerView and adapters
- ViewHolder pattern
- ListView (legacy)
- Material Design components
- CardView and material cards
- Bottom navigation
- Navigation drawer
- Floating action button
- Snackbar and Toast
- Dialogs and AlertDialog
- Menus and toolbars
- Styles and themes
- Vector drawables and icons
Projects built:
- RecyclerView list app
- Material Design app
- Bottom navigation app
- Drawer navigation app
- Custom adapter app
- Theming and styling app
Practice: Build 12 Android UI apps

```
    Jetpack Compose (Modern Android UI)
      Topics:
        - Jetpack Compose introduction
        - Composable functions
        - State management in Compose
        - remember and mutableStateOf
        - Layouts: Column, Row, Box
        - LazyColumn and LazyRow
        - Modifiers in Compose
        - Material Design 3 in Compose
        - Navigation in Compose
        - ViewModel with Compose
        - Side effects and LaunchedEffect
        - Theming in Compose
        - Animations in Compose
        - Compose vs XML comparison
        - Interoperability with XML
      Projects built:
        - Compose todo app
        - MVVM app with Compose
        - Navigation app in Compose
        - Animated Compose app
        - Material 3 design app
        - Complete Compose application
      Practice: Build 15 Jetpack Compose apps
    Android Data & Architecture
      Topics:
        - SharedPreferences in Android
        - Room database (SQLite ORM)
        - Room entities, DAOs, and database
        - LiveData for observable data
        - ViewModel for UI state
        - Repository pattern
        - MVVM architecture
        - Retrofit for networking
        - Gson/Moshi for JSON parsing
        - Coroutines for async operations
        - Flow for reactive streams
        - Dependency injection with Hilt/Dagger
        - WorkManager for background tasks
        - DataStore (modern preferences)
        - Architecture components
      Projects built:
        - Notes app with Room
        - MVVM todo app
        - API-based app with Retrofit
        - Repository pattern implementation
        - Coroutines and Flow app
        - Dependency injection app
        - Background task app
      Practice: Build 10 architecture-compliant apps
    Android Advanced & Phase 3 Capstone
      Topics:
        - Camera and photos in Android
        - Location services and Google Maps
        - Firebase Cloud Messaging
        - Push notifications in Android
        - Services: foreground, background
        - Broadcast receivers
        - Content providers
        - Permissions in Android
        - Biometric authentication
        - In-app billing
        - Android Jetpack libraries
        - Accessibility in Android
        - App widgets
        - Deep linking
      Projects built:
        - PHASE 3 CAPSTONE: Native iOS + Android App
        - Build same app for both iOS (Swift/SwiftUI) and Android (Kotlin/Compose)
        - Option 1: Fitness tracking app
        - Option 2: E-commerce app
        - Option 3: Social media app
        - Requirements: Native code, platform-specific features, polished UI, backend integrated
      Assessment: Phase 3 exam: a practical build defended live, plus a written paper mixing
      this phase with everything before it

------------------------------------------------------------
PHASE 4: THE FINALE (MONTH 10, WEEKS 40-44)
```

The capstone month: spec, build, ship and defend, then the final exam that decides the certificate.

Month 10: Capstone and the Final Exam (Weeks 40-44)
Capstone Spec and Setup
Topics:
- Choosing the capstone: a complete Flutter app with Firebase and a real backend, or a cross-platform product with one native companion feature
- A one-page spec: scope, milestones, stack
- Repository and skeleton ready on day one
- Instructor sign-off before the build begins
Projects built:
- Approved capstone spec plus the running skeleton
Practice: Pitch the spec to the batch and absorb one hard question
Capstone Build
Topics:
- Two focused weeks in vertical slices
- Instructor checkpoints and honest scope cuts
- Using the whole course: Flutter depth, the product layer, and the platform judgment from the native months
- Daily commits and an always-working build
Projects built:
- The capstone, feature-complete with version control
Practice: A working build at the end of every session
Ship and Polish
Topics:
- The finishing pass: edge cases, errors, documentation
- Store-discipline pass: release builds, signing and checklists understood on both platforms
- A README worth reading and a demo worth watching
- A full-course spiral review before the exam
Projects built:
- The capstone shipped, documented and rehearsed
Practice: Two mock demos, each tighter than the last
Demo Day and the Final Exam
Topics:
- Presenting the capstone: live demo plus the hardest bug story
- The honest map of next roads: mobile development roles, or single-stack depth in Flutter, Swift or Kotlin
- Where our other courses continue the journey
Projects built:
- Demo day presentation delivered to the batch
Assessment: FINAL EXAM: a practical build plus a written paper with questions mixed from every phase. Passing earns the certificate; falling short earns a focused revision plan and a free retest

PROJECTS THE STUDENT BUILDS AND KEEPS

- Phase 1: first Flutter apps with real layouts and state
- Phase 2: apps with storage, APIs, Firebase and their own backends
- Phase 3: native mini-apps in SwiftUI and Jetpack Compose
- Phase 4: the capstone app, shipped and defended

Total projects: 20+ real builds across Flutter and both native platforms, crowned by a shipped capstone

SKILLS THE STUDENT WILL HAVE AT THE END

- Flutter and Dart at production depth: UI, state and navigation
- The product layer: local storage, REST APIs, Firebase, app backends
- Native literacy: Swift with SwiftUI, Kotlin with Jetpack Compose
- Stack judgment: cross-platform versus native versus PWA, decided like an engineer
- Quality habits: testing, release discipline and store requirements

HOW A TYPICAL WEEK IS SPLIT

Live classes: 2 live one-hour classes per week, coding along with the instructor
Homework: A problem set after every class, and a mixed-review assignment at the end of every month
Practice: 4-6 hours of building between classes
Review: Every submission reviewed with written feedback; recurring gaps reopened in class

SUPPORT INCLUDED

Doubt support: WhatsApp doubt support between classes
Progress updates: Honest monthly progress reviews: what is solid, what is wobbly, and the plan for the wobble

CERTIFICATION DETAIL

  Completion: Certificate from Modern Age Coders, awarded on passing the final exam. Fall short
    and there is focused revision and a free retest: the certificate certifies knowledge, not
    attendance

WHERE THIS CAN LEAD

  - Mobile development roles: the cross-platform-plus-literacy profile is exactly the ask
  - Single-stack depth: our dedicated Flutter, Swift and Kotlin courses continue each road
  - Product building: ship both stores with informed architecture choices
  - Backend depth for the server half of app products

COMMON QUESTIONS ABOUT THIS COURSE

  For anything about cost, use PART 4 and RULE 1. Do not quote two regions.

  Q: What does this app development course cover?
  A: Flutter and Dart as the production stack: UI, state management and navigation properly,
  then the product layer, local storage, REST APIs, Firebase, app backends with Node, testing,
  plus honest survey weeks of React Native and PWAs. A finale month ships a capstone app and
  sits the final exam.

  Q: How long does it take to learn app development properly?
  A: Ten months of teaching at 2 live classes a week plus 4 to 6 hours of practice, with two
  more months in hand for learners who need them. The three teaching phases build the skill and
  its real-world application; the finale month ships a capstone and sits the final exam.

  Q: How am I assessed? Is the certificate just for attending?
  A: No. Problem sets follow every class with written feedback, monthly reviews deliberately
  mix new material with earlier topics, each phase ends with a cumulative exam, and the course
  ends with a final exam: a practical build plus written questions from the whole syllabus.
  Passing earns the certificate; falling short earns focused revision and a free retest.

  Q: Why Flutter first, and then native months?
  A: Because that is the shape hiring actually wants: deep in one cross-platform stack that
  ships products fast, plus enough native fluency to read platform documentation, use platform
  channels and know when a feature demands going native. Four frameworks at equal depth in one
  course would be a tour, not a skill; one deep stack plus two literacy months is a profile.

  Q: Do I need a Mac?
  A: Not to take the course. Flutter, Android and the backend work run on any computer, and
  that is where your hands-on depth lives. The Swift month is the one place Apple's rules bite:
  full iOS building needs a Mac, so learners without one follow the instructor's live Xcode
  session and practice Swift itself in browser playgrounds, while learners with a Mac run
  everything locally. We say this upfront rather than let it surprise you in month seven.

  Q: Can I try a class before enrolling?
  A: Yes, a free demo class with no commitment: book at learn.modernagecoders.com/contact or
  message us on WhatsApp at +91 91233 66161. (Agent note: the free demo is a waiting list with
  no fixed date. The Priority Live Demo is a guaranteed class today or tomorrow, booked at
  https://learn.modernagecoders.com/priority-demo . Offer both, as RULE 3 says.)

  Q: Are classes live or recorded?
  A: Live, always: small groups with a real instructor reading your actual code, never
  pre-recorded videos.

  To enrol, message Shivam Sir on +91 9123366161 or send the parent this link: https://learn.modernagecoders.com/courses/complete-app-development-masterclass-college
  For a demo: the Priority Live Demo (guaranteed, today or tomorrow) is booked at
  https://learn.modernagecoders.com/priority-demo . The free demo is a waiting list with no fixed date.

==
COURSE 23 OF 137: APP DEVELOPMENT FOR TEENS: BUILD REAL APPS WITH REACT NATIVE
==

Course link: https://learn.modernagecoders.com/courses/complete-app-development-masterclass-for-teens
Subject area: App Development
Designed for: Teens
Who can join: Absolute beginner, ages 13 to 18
Course length: 10-12 months (40-48 weeks)
Time needed: 2 live classes/week + 3-4 hours practice
Certificate: Certificate from Modern Age Coders, awarded on passing the final exam

PRICE FOR THIS COURSE (quote only the one that applies to the person asking)
  In India, per month: group Rs 1,499, mini batch Rs 2,999, one to one Rs 4,999
  Outside India, per month: group $100, one to one $150
  Classes: group and mini batch two live classes a week, eight a month; one to one in India one
  live class a week, four a month; one to one outside India two live classes a week, eight a
  month. Each class is one hour.

WHAT THIS COURSE IS

App development course for teens aged 13-18: JavaScript, React and React Native with Expo, Firebase, AI features and a launched capstone app in 10-12 months.

In one line: The phone in their pocket becomes the thing they build for: real apps, installed on real devices, shipped with one honest stack in ten months.

ABOUT THE PROGRAMME

Every teenager lives inside apps; very few know they could build one this year. This live online course takes students aged 13 to 18 from zero to a real, installable, launched mobile app, using the path the modern industry actually recommends for one-person teams: JavaScript learned properly, React for interface thinking, then React Native with Expo, one codebase that runs on both Android and iOS, with Firebase as the backend and AI features where they genuinely help. The stack choice is the honest part. Courses that tour four frameworks, Kotlin, Swift, React Native and Flutter, produce teens fluent in none of them. This course masters one: React Native powers apps at Meta, Microsoft, Shopify and thousands of startups, works fully on a Windows laptop, and lets a teen carry their JavaScript skills from web to phone. Flutter gets an honest taste week, and native Android and iOS get a clear map, what they are, when they matter, and where our Kotlin and Swift courses continue. The pace is real: ten months at two live classes a week plus three to four hours of practice, with two more months in hand when needed. Apps go onto real phones from month 3, the capstone is user-tested and distributed properly, and store publishing is explained exactly as it works for minors: developer accounts are parent-managed, and we walk families through it. Homework after every class, monthly mixed reviews, phase exams, and a final exam that decides the certificate with a free retest. Real apps, real users, depth over dopamine.

WHAT MAKES THIS COURSE DIFFERENT

- One stack mastered, honestly chosen: JavaScript, React and React Native with Expo, the one-person-team path the industry actually uses
- Runs on any laptop: no Mac required for the course; iOS specifics and Apple's rules are explained honestly
- Apps on real phones from month 3: Expo puts student work on their own device almost immediately
- Store truth for minors: developer accounts are parent-managed and we walk families through exactly how distribution works
- AI features built in properly: server-side calls, streaming and guardrails inside the student's own app
- Real assessment: weekly homework, mixed-review assignments every month, and a final exam that decides the certificate, with focused revision and a free retest

THE LEARNING PATH, STEP BY STEP

Phase 1: Foundations to first app (Months 1-3): JavaScript, UI/UX, React, Firebase, then React Native and an app on your own phone
Phase 2: App craft (Months 4-6): data, device features, polish, analytics, store readiness, AI features and a polished second app
Phase 3: The wider craft (Months 7-8): the native map, notifications, team Git workflow, and the capstone designed and built
Phase 4: Launch (Months 9-10): hardening, distribution, real users, iteration, portfolio, and the final exam at demo day

WHAT A STUDENT NEEDS BEFORE STARTING

Coding experience: None. JavaScript is taught from the first variable
Computer skills: Comfortable typing and managing files and folders
Equipment: Any computer with a stable internet connection, Windows is fully sufficient, plus an Android or iOS phone for testing their own apps
Age: 13 to 18. Batches are grouped by age and pace so the room always fits
Time commitment: 2 live classes plus 3-4 hours of practice a week

WHO THIS COURSE IS FOR

App dreamers: Teens who look at the apps they use daily and think: I could make one of those, and are right
Complete beginners: Students starting from zero who want one honest path instead of a four-framework tour
Makers: Teens who want their work living on real phones, theirs and their friends', not in a folder
Future engineers: Students eyeing computer science who want a shipped product behind their applications
Practical families: Parents who want the store-and-accounts reality for minors explained straight

FULL CURRICULUM, WEEK BY WEEK

This is the complete teaching plan. Parents can ask about any week.

PHASE 1: FOUNDATIONS TO FIRST APP (MONTHS 1-3, WEEKS 1-12)

JavaScript learned properly, interface thinking with React, and the jump to React Native: by the end of this phase an app the student built runs on their own phone.

Month 1: How Apps Are Built (Weeks 1-4)

The App World, Honestly Mapped

Topics:

- How apps changed the world: From Snake to TikTok
- Native vs Cross-platform vs Web apps explained
- iOS vs Android: The eternal rivalry
- Famous teen app developers who became millionaires
- Setting up your development environment
- Installing VS Code, Android Studio, Xcode preview
- Introduction to Terminal/Command Line
- Git and GitHub: Your code's backup and portfolio
- Creating developer accounts (Google, Apple developer preview)
- Your first HTML/CSS/JavaScript app
- How the App Store and Google Play work

Projects built:

- Research and present your favorite app's history
- Set up complete development environment
- Create your first web-based calculator app
- Design your dream app concept (mockup)

Practice: Daily: Analyze 3 apps you use - what makes them addictive?

JavaScript Essentials

Topics:

- JavaScript: The language that powers everything
- Variables: Storing user data and game scores
- Data types: Numbers, strings, booleans with app examples
- Arrays: Managing Instagram posts, Spotify playlists
- Objects: Describing user profiles, game characters
- Functions: Reusable code for app features
- Conditionals: Making apps smart with if/else
- Loops: Processing TikTok feeds, game levels
- DOM manipulation: Making apps interactive
- Event handling: Responding to taps and swipes
- Local storage: Saving app data offline
- JSON: The data format apps love

Projects built:

- To-do list app with local storage
- Quiz game with score tracking
- Weather app using API
- Instagram-style photo filter app (basic)

Practice: Complete 50 JavaScript challenges on CodeWars

UI and UX Fundamentals

Topics:

- What makes apps beautiful and addictive?
- Design thinking process: Empathize, Define, Ideate
- User research: Understanding your target users (teens!)
- Color psychology: Why Instagram is purple-pink
- Typography: Choosing fonts that don't suck
- Mobile UI patterns: Bottom nav, cards, modals
- Figma basics: Professional design tool
- Creating wireframes and mockups
- Prototyping: Making designs clickable
- Design systems: Consistency across your app
- Accessibility: Designing for everyone
- Dark mode: Because we all love it

Projects built:

- Redesign a popular app for better UX
- Create complete UI kit in Figma
- Design your social media app mockup
- Build clickable prototype

Practice: Daily UI challenge - create one UI element per day

Modern JavaScript

Topics:

- Modern JavaScript features apps need
- Arrow functions: Cleaner, cooler syntax
- Destructuring: Extracting data elegantly
- Spread operator: Copying and merging data
- Template literals: Dynamic content creation
- Promises: Handling async operations
- Async/await: Making async code readable
- Fetch API: Getting data from servers
- Modules: Organizing code like a pro

```
      - Classes: Object-oriented programming
      - Error handling: When things go wrong
      - Regular expressions: Pattern matching magic
    Projects built:
      - Movie database app with TMDB API
      - Real-time chat app (web version)
      - Music player with Spotify Web API
      - Meme generator with API integration
    Practice: Refactor old projects with modern JavaScript
    Assessment: Month 1 check: a small interactive build live, plus a take-home assignment
    mixing everything from month 1

Month 2: React and the Backend Taste (Weeks 5-8)
  React Fundamentals
    Topics:
      - Why React? Facebook, Instagram, Netflix use it
      - Vite: Starting projects quickly
      - JSX: HTML in JavaScript (weird but awesome)
      - Components: Building blocks of apps
      - Props: Passing data between components
      - State: Making components remember things
      - Hooks: useState, useEffect explained simply
      - Event handling in React
      - Conditional rendering: Showing/hiding content
      - Lists and keys: Rendering feeds and grids
      - React DevTools: Debugging like a detective
      - Component lifecycle: Birth to death of components
    Projects built:
      - Instagram clone (feed, stories, posts)
      - Real-time scoreboard app
      - Recipe app with search and filters
      - Portfolio website in React
    Practice: Build 20 React components for different use cases
  State and Navigation Thinking
    Topics:
      - Managing complex state: When useState isn't enough
      - useContext: Sharing data across components
      - useReducer: Redux-like state management
      - Custom hooks: Creating your own superpowers
      - React Router: Multi-page apps
      - Navigation patterns: Tabs, drawers, stacks
      - Protected routes: Login-only pages
      - URL parameters: Dynamic pages
      - Local storage with React
      - Form handling and validation
      - Optimizing performance: React.memo, useMemo
      - Code splitting: Faster app loading
    Projects built:
      - Multi-page social media app
      - E-commerce app with cart
      - Blog platform with authentication
      - Task management app like Notion
    Practice: Add routing and state management to previous projects
  Progressive Web Apps: Ship Before the Stores
    Topics:
      - What are PWAs? Apps without app stores
      - Service workers: Offline functionality
      - Web app manifest: Installing on home screen
      - Push notifications for web apps
      - Caching strategies: Offline-first approach
      - Background sync: Uploading when online
      - PWA best practices
      - Testing PWAs on mobile devices
      - PWA vs native apps: Pros and cons
      - Converting React apps to PWAs
      - PWA deployment and hosting
      - Analytics and monitoring for PWAs
    Projects built:
      - Convert React app to PWA
      - Offline-first news app
      - PWA game that works offline
      - Push notification system
    Practice: Make all web apps installable as PWAs
  Firebase: A Backend Without a Server
    Topics:
      - Why apps need backends: Where data lives
      - Firebase: Google's backend for apps
      - Authentication: Sign up, login, social auth
      - Firestore: Real-time NoSQL database
```

```
      - Cloud Storage: Storing images and videos
      - Cloud Functions: Server code without servers
      - Real-time features: Live chat, notifications
      - Security rules: Protecting user data
      - Firebase Analytics: Understanding users
      - Firebase Hosting: Deploying apps
      - Cost optimization: Avoiding surprise bills
      - Firebase alternatives: Supabase, Appwrite
    Projects built:
      - Chat app with Firebase
      - Instagram-like app with storage
      - Collaborative todo app
      - Social authentication system
    Practice: Add Firebase to 3 existing projects
    Assessment: Month 2 check: a small React feature built live, with quiz questions
    reaching back to month 1

Month 3: React Native, and an App on Your Phone (Weeks 9-12)
  React Native with Expo
    Topics:
      - React Native: Write once, run everywhere
      - How Facebook built React Native
      - Setting up development environment
      - Expo vs React Native CLI
      - Core components: View, Text, Image, ScrollView
      - Styling with Flexbox
      - Platform-specific code
      - React Navigation: Routing for mobile
      - Bottom tabs, stack, and drawer navigation
      - Handling user input
      - Lists with FlatList and SectionList
      - Pull to refresh and infinite scroll
      - Expo Go: your code running on your own phone in minutes
    Projects built:
      - Instagram clone in React Native
      - Todo app with navigation
      - Weather app with location
      - News feed with API
    Practice: Convert React web apps to React Native
  Core Components and Native Feel
    Topics:
      - Native modules: Accessing device features
      - Camera and image picker
      - Geolocation and maps
      - Push notifications setup
      - AsyncStorage for persistence
      - SQLite integration
      - Animations with Animated API
      - Gesture handler
      - Lottie animations
      - React Native Firebase
      - Authentication flows
      - Performance optimization
    Projects built:
      - Snapchat-like camera app
      - Uber clone with maps
      - Chat app with Firebase
      - Fitness tracker with sensors
    Practice: Add native features to all React Native apps
  Styling and UI Libraries
    Topics:
      - Native Base components
      - React Native Elements
      - React Native Paper (Material Design)
      - Custom component libraries
      - Themed components
      - Responsive design for tablets
      - Safe area handling
      - Keyboard avoiding views
      - Modal and overlay patterns
      - Splash screens and app icons
      - Building custom UI components
      - Micro-interactions and feedback
    Projects built:
      - E-commerce app with beautiful UI
      - Social media app with themes
      - Music player interface
      - Dating app UI
    Practice: Create reusable component library
```

```
    Phase Capstone: First Real App
      Topics:
        - Scoping a first app worth finishing: one screenful of value
        - Navigation, state and styling brought together
        - Testing on your own device like a user, not a builder
        - Sharing the app with family through Expo
        - The finish-line checklist: icons, name, empty states
        - A cumulative review of the whole phase
      Projects built:
        - PHASE CAPSTONE: a complete small app, a habit tracker, quiz app or club companion, running on
          the student's own phone and shared with family
      Practice: Collect feedback from three real users and fix the most confusing thing
      Assessment: Phase 1 exam: app walkthrough plus a written mixed paper over months 1-3

------------------------------------------------------------
PHASE 2: APP CRAFT (MONTHS 4-6, WEEKS 13-24)
------------------------------------------------------------
What separates demos from products: data that persists, device features, polish, analytics,
store readiness, accessibility and AI features, ending in a polished second app.

  Month 4: Data and Device Powers (Weeks 13-16)
    State Management and Testing
      Topics:
        - Redux in React Native
        - Redux Toolkit setup
        - Context API for state
        - MobX state management
        - Zustand for simplicity
        - Redux Persist for offline
        - Testing React Native apps
        - Jest and React Native Testing Library
        - Detox for E2E testing
        - Debugging with Flipper
        - Performance profiling
        - Crash reporting with Sentry
      Projects built:
        - Complex app with Redux
        - Offline-first app
        - Test suite for existing app
        - Performance optimization project
      Practice: Add state management to all apps
    Data That Survives: Storage and Offline
      Topics:
        - AsyncStorage: small data that persists
        - SQLite on the device: real local databases
        - Syncing local data with Firebase
        - Offline-first thinking: apps that work in a lift
        - Loading, empty and error states as a discipline
        - Migrations: changing your data shape without losing users
        - Backups and the data users would cry to lose
      Projects built:
        - A notes or collection app that works fully offline and syncs when back
      Practice: Airplane-mode test your app and fix what breaks
    Camera, Location and Notifications
      Topics:
        - Permissions: asking honestly and handling refusal
        - Camera and image picker flows
        - Location: maps and geofencing basics
        - Local notifications that help instead of nag
        - Sensors: what the device knows
        - Privacy by design: collecting the minimum
        - Feature flags: shipping carefully
      Projects built:
        - A photo-journal or treasure-hunt app using camera and location
      Practice: Add one device feature to your phase 1 capstone
    Builds and Sharing
      Topics:
        - Building for production
        - Code signing for iOS
        - Android APK and AAB
        - Over-the-air updates with CodePush
        - CI/CD for React Native
        - Fastlane automation
        - App Store deployment
        - Play Store deployment
        - Beta testing with TestFlight/Play Console
        - Analytics integration
        - Crash analytics
        - Performance monitoring
```

```
    Projects built:
      - Deploy React Native app to both stores
      - Set up CI/CD pipeline
      - Implement OTA updates
      - Create deployment automation
    Practice: Deploy all React Native apps
    Assessment: Month 4 check: an offline-capable mini feature built live, plus a mixed
    quiz over earlier months

Month 5: The Product Layer (Weeks 17-20)
  Firebase in Depth: Auth and Firestore
    Topics:
      - Firebase deep dive
      - Supabase: Open source Firebase
      - AWS Amplify for mobile
      - Appwrite backend
      - Hasura GraphQL
      - Strapi headless CMS
      - Authentication services
      - Real-time synchronization
      - Offline-first architecture
      - Data syncing strategies
      - Cost optimization
      - Scaling considerations
    Projects built:
      - Multi-user collaboration app
      - Offline-first note app
      - Real-time gaming backend
      - Social platform with BaaS
    Practice: Compare different BaaS providers
  Animations and Gestures
    Topics:
      - Why motion matters: feedback, hierarchy, delight
      - Layout animations and transitions
      - Reanimated basics: 60fps as a habit
      - Gestures: swipe, drag and pull-to-refresh
      - Micro-interactions that make apps feel expensive
      - Restraint: when animation is noise
      - Performance: keeping motion smooth on cheap phones
    Projects built:
      - A polish pass: your best app re-animated tastefully
    Practice: Recreate two animations from apps you admire
  Analytics and Performance, Honestly
    Topics:
      - Google Analytics for apps
      - Firebase Analytics setup
      - Custom event tracking
      - User behavior analysis
      - Funnel optimization
      - A/B testing in apps
      - Performance monitoring
      - Crash reporting and debugging
      - User session recording
      - Heatmaps for mobile
      - Attribution tracking
      - Revenue analytics
    Projects built:
      - Analytics dashboard
      - A/B testing framework
      - Performance monitoring setup
      - User behavior tracker
    Practice: Add comprehensive analytics to all apps
  Store Readiness, Told Straight
    Topics:
      - How the Play Store and App Store actually work
      - Developer accounts for minors: parent-managed, explained step by step
      - Store listings: names, icons, screenshots that convert
      - Review guidelines: what gets apps rejected
      - Internal testing tracks and TestFlight-style distribution
      - Ratings, privacy labels and data disclosures
      - The costs, plainly: what Google and Apple charge
      - When a PWA is the smarter launch
    Projects built:
      - A complete store-ready listing pack for your app: icon, screenshots, copy
    Practice: Run your app against the store review checklist and fix the failures
    Assessment: Month 5 check: store-readiness review plus mixed questions from phases 1-2

Month 6: The Modern App (Weeks 21-24)
  AI Features in Your App
```

      Topics:
        - Calling an AI API from a mobile app
        - Why your API key must never ship in the app
        - Streaming responses so the UI does not freeze
        - On-device vs cloud inference, and the trade-off
        - Image and voice input as first-class features
        - Function calling: letting the model use your app's features
        - Building a small agent loop: plan, act, check
        - Handling refusals, timeouts and hallucinated answers
        - Caching and cost: what an AI feature actually costs per user
        - Rate limits and graceful degradation
        - Privacy: what leaves the device, and what must not
        - Telling users when they are talking to an AI
        - Accounts for AI services are set up with a parent where required
      Projects built:
        - AI assistant app
        - Photo-to-text app
        - Voice agent app
        - AI feature cost dashboard
      Practice: Add AI features to 3 apps
    Accessibility and App Safety
      Topics:
        - Accessibility: apps your grandmother and your classmate with a screen reader can use
        - Touch targets, contrast and dynamic text sizes
        - Security basics: secrets never ship in the app
        - Safe auth flows and session handling
        - Storing sensitive data properly
        - Rate limiting and abuse thinking, lightly
        - An empathy audit: using your app the hard way
      Projects built:
        - A full accessibility and safety pass on your best app, with a written report
      Practice: Navigate your app with the screen reader on
    An Honest Week of Flutter
      Topics:
        - Flutter: Google's UI toolkit
        - Why Flutter? Single codebase, native performance
        - Dart programming language basics
        - Flutter architecture overview
        - Setting up Flutter environment
        - Hot reload: Instant gratification
        - Widgets: Everything is a widget
        - Stateless vs Stateful widgets
        - Basic widgets: Container, Row, Column
        - Material Design and Cupertino widgets
        - Layout in Flutter
        - Building your first Flutter app
        - What transfers from React Native, and when Flutter is the better choice
      Projects built:
        - Flutter calculator app
        - Business card app
        - Dice game in Flutter
        - Quiz app with scoring
      Practice: Complete Flutter codelabs
    Phase 2 Capstone: The Polished App
      Topics:
        - Choosing the phase capstone: the app worth polishing to store-grade
        - Bringing it together: data, device features, polish, analytics, maybe AI
        - A real beta: five users, structured feedback
        - Iterating on feedback without losing the plot
        - A cumulative review of phases 1-2
      Projects built:
        - PHASE CAPSTONE: a polished, store-ready app with a real beta test behind it
      Practice: Ship two improvements straight from beta feedback
      Assessment: Phase 2 exam: capstone demo plus a written mixed paper spanning phases 1
      and 2

PHASE 3: THE WIDER CRAFT AND THE CAPSTONE BUILD (MONTHS 7-8, WEEKS 25-32)

The map of native development, notifications done right, professional Git workflow, and then
the main event: the final capstone designed and built.

  Month 7: The Wider World (Weeks 25-28)
    The Native Map: Kotlin and Swift, Honestly
      Topics:
        - What native development is and what it buys you
        - A guided tour of Android Studio and Kotlin, reading real code
        - A guided look at Swift and SwiftUI
        - When React Native is enough, and when teams go native

- How native modules plug into React Native
- Where our Kotlin and Swift courses continue this road
- Reading a job market map without hype

Projects built:
- A one-page written comparison: your app in RN vs native, costs and benefits

Practice: Rebuild one tiny screen natively, just to feel the difference

Push Notifications and Background Work

Topics:
- Push notifications end to end with Expo
- Notification design: helpful vs spam, decided honestly
- Deep links: notifications that open the right screen
- Background tasks and their limits on mobile
- Scheduling and reminders done reliably
- Battery respect: being a good citizen on the device
- Measuring whether notifications actually help

Projects built:
- A reminder or club-alerts feature with tasteful push notifications

Practice: A/B your own notification copy on real users, kindly

Git and Team Workflow for Apps

Topics:
- Version control recap: the professional loop
- Branches and pull requests on a real app repo
- Code review: reading a teammate's screen code kindly
- Release branches and versioning apps
- Changelogs users can read
- CI checks that catch broken builds early
- Where our full Git and GitHub course goes deeper

Projects built:
- Your app repo run professionally for two weeks: branches, PRs, releases

Practice: Review a classmate's pull request properly

Mini Product Sprint

Topics:
- One week, one tiny product: scope ruthlessly
- From idea to installed app in five sessions
- Cutting features without cutting the point
- A retrospective that actually teaches
- Cumulative review before the capstone months

Projects built:
- A one-week micro-app, built solo and shipped to your own phone

Practice: Write the honest retrospective: what you would do differently

Assessment: Month 7 check: sprint demo plus a mixed quiz reaching across the course

Month 8: The Capstone, Designed and Built (Weeks 29-32)

Capstone Spec and Design Sprint

Topics:
- Choosing the capstone: the app you wish existed
- A one-page spec: users, screens, data, features
- Wireframes before pixels, pixels before code
- Data model and Firebase plan reviewed
- Milestones: working core by week 2, feature-complete by week 4
- Instructor sign-off before the build begins

Projects built:
- Signed-off capstone spec, wireframes and repository

Practice: Pitch the spec to the batch and absorb one hard question

Capstone Build

Topics:
- Two focused weeks of building in vertical slices
- Instructor checkpoints and course corrections
- Using everything: navigation, data, device features, polish, maybe AI
- Daily commits and an always-working build
- A mid-build hallway test with a real user
- Scope cuts made early and honestly

Projects built:
- The capstone app, feature-complete with version control and a working build every day

Practice: A working build at the end of every session, no exceptions

User Testing and Iteration

Topics:
- Structured beta: five real users, real tasks, silent observation
- Turning feedback into a ranked fix list
- Shipping the fixes that matter first
- Crash and edge-case hunting
- The capstone at v1.0: what that honestly means

Projects built:
- Capstone v1.0: beta-tested, iterated, stable

Practice: Close out the top five feedback items

Assessment: Phase 3 exam: capstone v1.0 walkthrough plus a written mixed paper over phases 1-3

PHASE 4: LAUNCH (MONTHS 9-10, WEEKS 33-40)

The last mile real developers respect: hardening, honest distribution, real users, iteration,
portfolio, and the final exam at demo day.

  Month 9: Ship It Properly (Weeks 33-36)
    Hardening Week
      Topics:
        - Crash hunting: making the app boringly reliable
        - Edge cases: bad network, low storage, old phones
        - Error reporting so you know when it breaks
        - Performance passes on real low-end devices
        - The pre-launch checklist run end to end
      Projects built:
        - A hardening report: found, fixed, verified
      Practice: Test on the oldest phone in the family
    Distribution, For Real
      Topics:
        - Production builds with EAS
        - Play Store internal and closed testing tracks, parent-managed
        - The Apple path explained honestly: accounts, costs, review
        - PWA and direct-install fallbacks when stores are not the right move
        - Privacy policies and data disclosures written plainly
        - Version 1.0.0: cutting the release
      Projects built:
        - The capstone distributed to its beta audience through a real channel
      Practice: Onboard five users through the real install flow
    Launch Week
      Topics:
        - The launch: capstone in real users' hands
        - Watching analytics without vanity
        - Support: handling the first bug report gracefully
        - Collecting reviews and feedback honestly
        - The first patch release, done calmly
      Projects built:
        - Launch executed, first patch shipped
      Practice: A launch journal: what happened vs what you expected
    Portfolio and Devlog
      Topics:
        - An app developer portfolio: installable links and honest screenshots
        - The capstone case study: problem, decisions, results
        - A devlog post worth reading
        - GitHub profile polish
        - Explaining one hard bug like an engineer
      Projects built:
        - Portfolio page with the capstone case study and install links
      Practice: Publish the devlog and share it with the batch
      Assessment: Month 9 check: portfolio review plus a cumulative mixed quiz

  Month 10: The Finale (Weeks 37-40)
    Iteration Sprint
      Topics:
        - Reading launch data: what users actually did
        - Choosing one meaningful improvement, not five shiny ones
        - Building and shipping it inside a week
        - Regression care: not breaking what worked
      Projects built:
        - One meaningful post-launch improvement, shipped
      Practice: Ship it and tell your users what changed
    Final Polish and Demo Preparation
      Topics:
        - The v1.1 polish pass: details users feel
        - Demo craft: the story of the app in four minutes
        - A full-course spiral review before the exam
        - Mock demos with brutal, kind feedback
        - The written-exam revision plan
      Projects built:
        - Capstone v1.1 plus a rehearsed demo
      Practice: Two mock demos, each tighter than the last
    Demo Day and What Comes Next
      Topics:
        - Presenting the capstone: live on a real phone, plus the hardest bug story
        - An honest skills inventory: strong, shaky, next
        - Where each path leads: Kotlin, Swift, full-stack web or DSA
        - Staying sharp: shipping small things often
      Projects built:
        - Demo day presentation delivered to the batch and parents
      Assessment: FINAL EXAM: a practical build plus a written paper with questions mixed
      from every phase. Passing earns the certificate; a student who falls short gets a

focused revision plan and a free retest

PROJECTS THE STUDENT BUILDS AND KEEPS

- Phase 1: JavaScript builds, React projects, an installable PWA, and a first real app on the student's own phone
- Phase 2: an offline-capable app, camera and location features, a store-ready listing pack, an AI feature, and a polished beta-tested app
- Phase 3: a native comparison study, push notifications, a one-week micro-app, and the capstone built to v1.0
- Phase 4: hardening, real distribution, a launch with real users, an iteration release, and the portfolio case study

Total projects: 20+ builds across the course, crowned by a launched, user-tested capstone app

SKILLS THE STUDENT WILL HAVE AT THE END

- JavaScript and React: the language and interface thinking modern apps run on
- React Native with Expo: one codebase on Android and iOS, from any laptop
- Data: local storage, SQLite, offline-first patterns and Firebase sync
- Device powers: camera, location, notifications and permissions handled respectfully
- Product craft: polish, animations, analytics, accessibility and app safety
- AI features: model calls from the app done safely with guardrails
- Shipping: builds, store processes told honestly, beta testing, launch and iteration
- Professional habits: Git workflow, code review, testing and honest scoping

HOW A TYPICAL WEEK IS SPLIT

Live classes: 2 live one-hour classes per week, building along with the instructor
Homework: Homework after every class, and a mixed-review assignment at the end of every month so earlier skills stay sharp
Practice: 3-4 hours of building between classes
Review: Every submitted build reviewed with written feedback; recurring issues reopened in class

SUPPORT INCLUDED

Doubt support: WhatsApp doubt support between classes, so nobody stays stuck on a red screen for days
Progress updates: Regular progress notes to parents: what was built, what comes next, and where encouragement at home helps

CERTIFICATION DETAIL

Completion: Certificate from Modern Age Coders, awarded on passing the final exam. Fall short and there is focused revision and a free retest: the certificate certifies knowledge, not attendance

WHERE THIS CAN LEAD

- Kotlin and Swift courses: native depth on either platform, from a real foundation
- Full-stack web development: the JavaScript and React here carry straight across
- Data Structures and Algorithms: the computer science core for engineering paths
- Real small apps: tools for family, school clubs and local teams, shipped for real
- College applications: a launched app with real users is a rare and honest differentiator

COMMON QUESTIONS ABOUT THIS COURSE

For anything about cost, use PART 4 and RULE 1. Do not quote two regions.

Q: How long does it take a teenager to learn app development?
A: To a genuinely launched app: 10 months at 2 live classes a week plus 3 to 4 hours of practice. The syllabus keeps 2 months of margin in hand, students who need more repetition take up to 12 months with no rushing and no penalty. The first app lands on their own phone in month 3, so motivation never has to wait for the finish line.

Q: How is my teen assessed? Is the certificate just for attending?
A: No. Classwork runs inside every session, homework follows every class, and each month ends with an assignment that deliberately mixes new questions with earlier topics so knowledge compounds instead of fading. Every phase closes with a cumulative exam, and the course ends with a final exam: a practical build plus written questions drawn from the whole syllabus. Passing earns the certificate; falling short earns a focused revision plan and a free retest.

Q: Why React Native instead of Kotlin, Swift or Flutter?
A: Because one stack mastered beats four toured, and React Native is the honest choice for a one-person teen team: one codebase for Android and iOS, full development on a Windows laptop, JavaScript skills that transfer to and from the web, and real industry weight behind it. The course still gives Flutter an honest taste week and maps native Kotlin and Swift clearly, and our dedicated Kotlin and Swift courses continue those roads for students who want native

depth.

Q: Do we need a Mac or an iPhone?
A: No Mac is needed for the course: React Native with Expo runs fully on Windows, and cloud build services handle iOS packaging when needed. Any Android or iOS phone works for testing. The Apple publishing path, its account, cost and review process, is explained honestly in the store-readiness week for families who want to pursue it.

Q: Will my teen actually publish an app to the stores?
A: Here is the straight answer most courses avoid: store developer accounts have age and payment requirements, so for minors they are parent-managed, and we walk families through exactly that in the distribution weeks. Every student ships for real regardless: internal testing tracks, direct installs and PWA distribution put the capstone in real users' hands, and families who set up a parent-managed account can take it all the way to a public store listing.

Q: How is AI used in this course?
A: Two ways, both honest. Students build AI features into their own apps, model calls made safely, streaming responses, guardrails against misuse, with accounts set up with a parent where a service requires it. And they learn to use AI coding assistants the professional way: as accelerators for a developer who understands the code, never as a substitute for understanding it.

Q: Can my teen attend a free class first?
A: Yes, a free demo class with no commitment: book at learn.modernagecoders.com/contact or message us on WhatsApp at +91 91233 66161. Parents are welcome to sit in, and the equipment and accounts reality is explained right there. (Agent note: the free demo is a waiting list with no fixed date. The Priority Live Demo is a guaranteed class today or tomorrow, booked at https://learn.modernagecoders.com/priority-demo . Offer both, as RULE 3 says.)

Q: Are classes live or recorded?
A: Live, always: small interactive groups with a real instructor, never pre-recorded videos. Mobile tooling changes fast and beginners hit unique errors; live teaching is the only format that handles both honestly.

To enrol, message Shivam Sir on +91 9123366161 or send the parent this link: https://learn.modernagecoders.com/courses/complete-app-development-masterclass-for-teens
For a demo: the Priority Live Demo (guaranteed, today or tomorrow) is booked at https://learn.modernagecoders.com/priority-demo . The free demo is a waiting list with no fixed date.

==========
COURSE 24 OF 137: APP MAKING FOR KIDS: BUILD REAL APPS WITH BLOCKS
==========

Course link: https://learn.modernagecoders.com/courses/block-coding-app-development-masterclass
Subject area: Kids Coding
Designed for: Kids
Who can join: Complete beginner, ages 8 to 12
Course length: 6-8 months (26-32 weeks)
Time needed: 2 live classes/week + 2-3 hours practice
Certificate: Certificate from Modern Age Coders, awarded on passing the final exam

PRICE FOR THIS COURSE (quote only the one that applies to the person asking)
In India, per month: group Rs 1,499, mini batch Rs 2,999, one to one Rs 4,999
Outside India, per month: group $100, one to one $150
Classes: group and mini batch two live classes a week, eight a month; one to one in India one live class a week, four a month; one to one outside India two live classes a week, eight a month. Each class is one hour.

WHAT THIS COURSE IS

App development course for kids aged 8-12: build real mobile apps with block coding in live online classes, installed on the family phone, in 6-8 months.

In one line: The family phone becomes the launch device: real apps designed and built by the child, installed and used at home, in six honest months.

ABOUT THE PROGRAMME

Few moments beat a child opening an app on a real phone and saying "I made this". This live online course delivers that moment repeatedly for ages 8 to 12: visual programming logic learned through play, then real mobile apps built with block-based tools, screens designed on paper first, logic snapped together, data saved, and every build installed on the family phone for genuine daily use. The course keeps its promises honest: no app-store publishing pressure, no monetization talk for children, just skill and delight. Apps are shared safely with family through test links, and the course ends with a capstone, an app for the family, planned, built, tested by a real user and presented at demo day. Six months at two live classes a week plus two to three hours of playful practice, with two more months in hand when

needed. Homework after every class, a mixed challenge every month, and a final exam, capstone demo plus a friendly viva, that decides the certificate with a free retest. Real apps, real users, real pride.

WHAT MAKES THIS COURSE DIFFERENT

- Apps land on real phones: every month ends with something installed and used at home
- Design before blocks: children sketch screens on paper like real product designers
- No store pressure, no money talk: skill and joy are the whole syllabus at this age
- Family as users: testing with real people is taught as the heart of app making
- An honest 6-month arc with 2 months in hand
- Real assessment, gently done: monthly mixed challenges and a final capstone exam with a free retest

THE LEARNING PATH, STEP BY STEP

Phase 1: Visual logic (Months 1-2): the thinking behind every app, learned through play
Phase 2: Real mobile apps (Months 3-4): screens, buttons, data and sensors on real phones
Phase 3: Polish and the finale (Months 5-6): bigger builds, safe sharing, and the capstone exam

WHAT A STUDENT NEEDS BEFORE STARTING

Coding experience: None. Visual blocks make the start joyful
Reading: Comfortable reading simple instructions
Equipment: A computer or laptop with internet, plus any Android or iOS phone in the family for testing
Age: 8 to 12. Batches are grouped by age
Time commitment: 2 live classes plus 2-3 hours of playful practice a week

WHO THIS COURSE IS FOR

Idea kids: Children who keep saying "someone should make an app for that"
Complete beginners: Kids with zero coding background: blocks carry them
Scratch graduates: Children from Scratch who want their creations on a phone
Future builders: Kids who will grow into our teen app development course
Families: Households ready to be the world's kindest beta testers

FULL CURRICULUM, WEEK BY WEEK

This is the complete teaching plan. Parents can ask about any week.

THE COURSE: FROM LOGIC TO LAUNCHED-AT-HOME (MONTHS 1-6, WEEKS 1-26)

Visual programming logic, then real mobile apps built, tested by the family and presented at demo day.

Months 1-2: Visual Programming Fundamentals (Weeks 1-8)
Introduction to Block Coding & Scratch Basics
Topics:
- What is block-based programming?
- Why learn visual coding first?
- Introduction to Scratch interface
- Understanding sprites and stages
- Motion blocks: move, turn, go to, glide
- Looks blocks: say, think, show, hide, change costume
- Sound blocks: play sound, volume, tempo
- Events: when flag clicked, when key pressed
- Creating your first animation
- Saving and sharing projects
- Scratch community and remixing
- Basic debugging with blocks
Projects built:
- Animated greeting card
- Interactive story with characters
- Simple animation sequence
- Musical instrument app
Practice: Daily: Create one Scratch animation, explore 5 community projects
Programming Logic with Blocks
Topics:
- Variables: creating and using data storage
- Lists (arrays) in block coding
- Control blocks: forever, repeat, if-then
- If-then-else decision making
- Operators: math operations with blocks
- Comparison operators: greater than, less than, equals
- Logical operators: and, or, not
- Random numbers and probability

- Creating custom blocks (functions)
- Parameters in custom blocks
- Clone sprites for multiple objects
- Broadcasting messages between sprites

Projects built:
- Calculator with visual blocks
- Quiz game with scoring
- Number guessing game
- Drawing app with controls

Practice: Solve 20 logic puzzles using block programming

Assessment: Month 1 check: a small build or challenge live, plus a fun take-home mixing everything so far

Game Development in Scratch

Topics:
- Game design principles
- Player movement and controls
- Collision detection with blocks
- Score keeping and lives system
- Timer and countdown features
- Power-ups and bonuses
- Level progression design
- Game states: start, play, game over
- Sound effects and background music
- Particle effects with clones
- Saving high scores with cloud variables
- Multiplayer basics with cloud data

Projects built:
- Maze navigation game
- Platformer game with jumping
- Space shooter with enemies
- Puzzle game with levels

Practice: Create 5 different game mechanics

Introduction to MIT App Inventor

Topics:
- MIT App Inventor interface tour
- Designer vs Blocks view
- Screen components and properties
- Basic UI elements: buttons, labels, textboxes
- Layout components: arrangements, tables
- Connecting blocks to components
- Event handlers in App Inventor
- Testing apps with companion app
- Building APK files
- Screen navigation and multiple screens
- Basic app architecture
- Debugging techniques

Projects built:
- Hello World mobile app
- Personal information form
- Multi-screen navigation app
- Simple calculator for phones

Practice: Build 10 basic mobile app interfaces

Assessment: Month 2 check: a live challenge with questions reaching back to month 1

Months 3-4: Mobile App Development (Weeks 9-17)

Thunkable Platform Mastery

Topics:
- Thunkable vs MIT App Inventor
- Cross-platform development (iOS & Android)
- Thunkable interface and components
- Advanced UI components in Thunkable
- Data viewers: list and grid views
- Tab navigator and drawer navigator
- Working with images and media
- Responsive design for different screens
- Live testing on devices
- Thunkable live app for testing
- Component styling and themes
- Custom colors and fonts

Projects built:
- Photo gallery app
- Note-taking application
- To-do list with categories
- Recipe book app

Practice: Create 5 different app layouts in Thunkable

Working with Device Features

Topics:
- Camera component and photo capture
- Image picker from gallery

- Sound recorder and playback
- Text-to-speech functionality
- Speech recognition basics
- Location sensor and GPS
- Maps component integration
- Accelerometer for motion detection
- Gyroscope and orientation
- Vibration and haptic feedback
- QR code and barcode scanning
- Share functionality

Projects built:
- Camera app with filters
- Voice recorder with playback
- Location-based reminder app
- QR code scanner utility

Practice: Integrate 10 different device features

Data Storage and Persistence

Topics:
- Local storage with TinyDB
- Storing and retrieving data
- Lists and data structures
- Cloud variables for online storage
- Firebase realtime database basics
- Authentication with Firebase
- User accounts and profiles
- Storing user preferences
- Offline functionality
- Data synchronization
- Backup and restore features
- CSV file handling

Projects built:
- Diary app with local storage
- Expense tracker with categories
- Habit tracker with statistics
- Cloud-based notes app

Practice: Implement storage in 5 different app types

Advanced UI and User Experience

Topics:
- Animation blocks and transitions
- Timer-based animations
- Gesture recognition: swipe, pinch
- Custom components creation
- Reusable component blocks
- Advanced list viewers with templates
- Charts and data visualization
- Loading screens and progress bars
- Error handling and user feedback
- Accessibility features
- Multi-language support basics
- App theming and customization

Projects built:
- Animated story app
- Dashboard with charts
- Gesture-controlled game
- Customizable theme app

Practice: Create 10 custom UI components

Mid-Course Review and Showcase

Topics:
- Review of mobile app concepts
- Best practices recap
- Code organization with blocks
- Performance optimization
- Testing strategies

Projects built:
- CAPSTONE: Complete mobile app with all features
- Social media profile app
- Educational quiz app with levels
- Fitness tracking application

Assessment: Mid-course check: a showcase build plus a mixed challenge spanning months 1-4

Months 5-6: Advanced Features & Publishing (Weeks 18-26)

APIs and Web Services

Topics:
- What are APIs? Understanding web services
- Web API component in block platforms
- Making GET requests with blocks
- POST requests for sending data
- Working with JSON responses

    - Parsing API data with blocks
    - Weather API integration
    - News API for content
    - Translation API usage
    - Image recognition APIs
    - Error handling for API calls
    - API keys and security
  Projects built:
    - Weather forecast app
    - News reader application
    - Language translator app
    - Movie database browser
  Practice: Integrate 10 different public APIs
Game Development Advanced
  Topics:
    - Physics simulation with blocks
    - Sprite collision advanced techniques
    - Particle systems for effects
    - Leaderboards and achievements
    - In-app currency systems
    - Power-up and upgrade systems
    - Enemy AI with blocks
    - Procedural level generation
    - Save game progress
    - Multiplayer concepts
    - Game balancing and testing
    - Sound design for games
  Projects built:
    - Physics puzzle game
    - RPG with inventory system
    - Endless runner with upgrades
    - Multiplayer quiz game
  Practice: Develop 5 complete games with different mechanics
AI and Machine Learning Blocks
  Topics:
    - Introduction to AI in block coding
    - Image classification with blocks
    - Face detection and recognition
    - Emotion detection from images
    - Text sentiment analysis
    - Chatbot creation with blocks
    - Voice commands and control
    - Teachable Machine integration
    - Custom AI models with blocks
    - Personal AI assistant app
    - Computer vision applications
    - Natural language processing basics
  Projects built:
    - AI photo classifier app
    - Emotion detection camera
    - Chatbot assistant app
    - Voice-controlled smart app
  Practice: Create 5 AI-powered applications
IoT and Hardware Integration
  Topics:
    - Internet of Things concepts
    - Bluetooth connectivity blocks
    - Connecting to Arduino with blocks
    - micro:bit integration
    - Controlling LEDs and motors
    - Reading sensor data
    - Home automation apps
    - Robot control applications
    - Wearable device apps
    - MQTT protocol basics
    - Cloud IoT platforms
    - Real-time data monitoring
  Projects built:
    - Smart home controller app
    - Robot remote control
    - Plant watering system app
    - Fitness band companion app
  Practice: Build 5 IoT-connected applications
Capstone and the Final Exam
  Topics:
    - App store guidelines and policies
    - Preparing apps for publication
    - Creating app icons and screenshots
    - Writing app descriptions

- Google Play Console setup
- iOS App Store submission
- Analytics and user tracking
- App updates and versioning
- Marketing your apps
- Building an app portfolio

Projects built:
- THE CAPSTONE: an app for the family, a chore chart, pet log, quiz or the child's own idea, installed on a real phone and presented at demo day

Assessment: FINAL EXAM: capstone demo plus a friendly viva and a mixed quiz from the whole course. Passing earns the certificate; a child who falls short gets focused revision and a free retest

PROJECTS THE STUDENT BUILDS AND KEEPS

- Months 1-2: logic games and first interactive builds
- Months 3-4: real phone apps: soundboards, quizzes, drawing pads and trackers
- Months 5-6: bigger apps with saved data, then the family-app capstone at demo day

Total projects: 15+ working apps, crowned by a family-app capstone on a real phone

SKILLS THE STUDENT WILL HAVE AT THE END

- Visual programming: events, logic, loops and variables through blocks
- App design: screens sketched, layouts built, buttons that feel right
- Data: apps that remember, with saved lists and scores
- Device powers: camera, sounds and sensors used playfully and safely
- Product habits: testing with real users and improving from feedback

HOW A TYPICAL WEEK IS SPLIT

Live classes: 2 live one-hour classes per week, building along with the teacher
Homework: A small build after every class, and a mixed challenge at the end of every month
Practice: 2-3 hours of playful practice between classes
Review: Every app reviewed with teacher feedback; wobbly skills reopened in class

SUPPORT INCLUDED

Doubt support: WhatsApp doubt support between classes
Progress updates: Regular progress notes to parents, with the newest app to try installed

CERTIFICATION DETAIL

Completion: Certificate from Modern Age Coders, awarded on passing the final exam, a capstone demo plus a friendly viva. A child who falls short gets focused revision and a free retest

WHERE THIS CAN LEAD

- Kids Coding journey: the full block-to-code path
- Python for Kids: the typed-code step when ready
- App Development for Teens: React Native, from 13
- Web Development for Kids: a second builder skill
- The family app factory: every chore chart and quiz now gets an app

COMMON QUESTIONS ABOUT THIS COURSE

For anything about cost, use PART 4 and RULE 1. Do not quote two regions.

Q: What apps will my child actually build?
A: Fifteen-plus working apps across six months: soundboards, quizzes, drawing pads, trackers and games in the middle months, and a capstone, an app for the family such as a chore chart or pet log, installed on a real phone, tested by real family users and presented at demo day.

Q: Will the apps go on the App Store or Play Store?
A: No, and that is deliberate honesty: store publishing involves adult accounts, fees and review processes that do not belong in a course for 8-12 year olds. Apps are installed directly on family phones and shared safely through test links, which is everything a child needs for real users and real pride. Store publishing is taught honestly in our teen app course, where it belongs.

Q: How long does the course take?
A: Six months at 2 live classes a week plus 2 to 3 hours of playful practice takes a child from zero to the demo-day capstone in app making. The course keeps two more months in hand for children who need more repetition, no rushing and no penalty.

Q: How is my child assessed? Is the certificate just for attending?
A: No, and it is all gentle: classwork in every session, a small homework build after every class, a mixed challenge at the end of every month that revisits earlier skills, and a final exam, a capstone demo plus a friendly viva and short quiz. Passing earns the certificate; a

child who falls short gets focused revision and a free retest.

Q: What tools are used, and are they free?
A: Free block-based app builders in the MIT App Inventor family, run in the browser, with accounts set up alongside a parent. A computer for building and any family phone for testing is the whole kit.

Q: Is there a free trial class?
A: Yes, a free demo class with no commitment: book at learn.modernagecoders.com/contact or message us on WhatsApp at +91 91233 66161. Parents are welcome to sit in. (Agent note: the free demo is a waiting list with no fixed date. The Priority Live Demo is a guaranteed class today or tomorrow, booked at https://learn.modernagecoders.com/priority-demo . Offer both, as RULE 3 says.)

Q: Are classes live or recorded?
A: Live, always: small groups with a real teacher, never pre-recorded videos. Children build during class and get unstuck on the spot.

To enrol, message Shivam Sir on +91 9123366161 or send the parent this link: https://learn.modernagecoders.com/courses/block-coding-app-development-masterclass
For a demo: the Priority Live Demo (guaranteed, today or tomorrow) is booked at https://learn.modernagecoders.com/priority-demo . The free demo is a waiting list with no fixed date.

==========

COURSE 25 OF 137: ARTIFICIAL INTELLIGENCE COURSE: SEARCH, LOGIC & AGENTS

==========

Course link: https://learn.modernagecoders.com/courses/artificial-intelligence-complete-masterclass-college
Subject area: AI & Machine Learning
Designed for: College students
Who can join: Complete beginner (18+); college students, graduates and working professionals
Course length: 10-12 months (44-52 weeks)
Time needed: 2 live classes/week + 4-6 hours practice
Certificate: Certificate from Modern Age Coders, awarded on passing the final exam

PRICE FOR THIS COURSE (quote only the one that applies to the person asking)
In India, per month: group Rs 1,499, mini batch Rs 2,999, one to one Rs 4,999
Outside India, per month: group $100, one to one $150
Classes: group and mini batch two live classes a week, eight a month; one to one in India one live class a week, four a month; one to one outside India two live classes a week, eight a month. Each class is one hour.

WHAT THIS COURSE IS

Artificial intelligence course for college students and professionals: search, logic, planning, Bayesian reasoning, expert systems and multi-agent AI, the university AI canon taught live, in 10-12 months.

In one line: The AI beneath the hype: how machines search, reason, plan and decide, the canon university exams test and modern agent systems quietly reuse.

ABOUT THE PROGRAMME

Before AI meant chatbots, it meant something precise: algorithms that search enormous possibility spaces, represent knowledge in logic, reason under uncertainty and plan actions toward goals. That canon still runs the world, game AI, route planning, scheduling, robotics, diagnosis systems, it is what university AI papers actually examine, and it is exactly what modern LLM agent systems borrow when they need planning and search that works. This live online masterclass teaches it properly: search algorithms from BFS to A* and adversarial game play, propositional and first-order logic with constraint satisfaction, then reasoning under uncertainty, probability, Bayesian networks, Markov models, decision theory and classical planning, then intelligent systems: expert systems, agent architectures, robotics and vision from the AI perspective, and multi-agent systems with game theory. A finale month ships an intelligent-system capstone and sits the final exam. The pace is honest: ten teaching months at two live classes a week plus four to six hours of practice, with two more in hand. Problem sets, monthly mixed reviews, phase exams, and a final exam that decides the certificate with a free retest.

WHAT MAKES THIS COURSE DIFFERENT

- The real AI canon: search, logic, planning and probabilistic reasoning, taught with code
- University-aligned: this is the syllabus AI papers and competitive exams actually test
- Modern relevance made explicit: where game AI, robotics and LLM agents reuse each idea
- Every algorithm implemented: A* you wrote beats A* you memorized
- An honest 10-month arc with 2 months in hand
- Real assessment: weekly problem sets, monthly mixed reviews, phase exams and a final exam with a free retest

THE LEARNING PATH, STEP BY STEP

  Phase 1: Foundations (Months 1-3): search algorithms, adversarial game play, logic and CSPs
  Phase 2: Reasoning (Months 4-6): probability, Bayesian networks, decision theory and planning
  Phase 3: Intelligent systems (Months 7-9): expert systems, agents, embodied AI and
  multi-agent game theory
  Phase 4: The finale (Month 10): an intelligent-system capstone and the final exam

WHAT A STUDENT NEEDS BEFORE STARTING

  Coding experience: None. Everything is taught from the first line
  Equipment: Any computer with a stable internet connection; every tool used is free
  Age: 18+; college students, graduates and working professionals
  Time commitment: 2 live classes plus 4-6 hours of practice a week

WHO THIS COURSE IS FOR

  College students: Students whose university AI papers test exactly this canon
  Engineers: Developers who want AI understanding deeper than API calls
  Ml practitioners: ML users adding the reasoning-and-planning half of AI
  Exam aspirants: Aspirants for exams and interviews that probe AI fundamentals
  Systems thinkers: Builders drawn to how machines decide, not just how they predict

FULL CURRICULUM, WEEK BY WEEK

  This is the complete teaching plan. Parents can ask about any week.

  PHASE 1: CLASSICAL AI FOUNDATIONS (MONTHS 1-3, WEEKS 1-13)

  Build deep understanding of AI foundations, search algorithms, logic, knowledge
  representation, and problem-solving.

    Months 1-2: AI Foundations & Search Algorithms (Weeks 1-8)
      Introduction to Artificial Intelligence
        Topics:
          - What is Artificial Intelligence? Definitions and perspectives
          - History of AI: from Dartmouth Conference to present
          - AI winters and AI springs
          - Turing Test and philosophical foundations
          - Strong AI vs Weak AI
          - Narrow AI, General AI (AGI), Super AI
          - Symbolic AI vs Connectionist AI vs Hybrid AI
          - AI paradigms: logic-based, knowledge-based, learning-based
          - Rational agents and intelligent behavior
          - PEAS framework: Performance, Environment, Actuators, Sensors
          - Agent types: simple reflex, model-based, goal-based, utility-based
          - Agent environments: fully observable, deterministic, episodic, static
          - AI applications across industries
          - AI vs ML vs DL: relationships and differences
          - State of AI: current capabilities and limitations
          - Ethics and societal impact overview
        Projects built:
          - Simple reflex agent implementation
          - Model-based agent for grid world
          - Agent environment simulator
          - AI timeline and evolution visualization
          - Turing Test chatbot (rule-based)
        Practice: Study 20 landmark AI papers from history
      Search Algorithms - Part 1 (Uninformed Search)
        Topics:
          - Problem-solving as search
          - State space representation
          - Problem formulation: initial state, actions, goal test, path cost
          - Tree search vs graph search
          - Search strategies evaluation: completeness, optimality, time, space
          - Breadth-First Search (BFS): algorithm and analysis
          - Uniform Cost Search (UCS)
          - Depth-First Search (DFS): algorithm and analysis
          - Depth-Limited Search (DLS)
          - Iterative Deepening DFS (IDDFS)
          - Bidirectional search
          - Comparing uninformed search strategies
          - Search in continuous spaces
          - Memory-bounded search
          - Real-world applications: route finding, puzzle solving
        Projects built:
          - 8-puzzle solver with BFS/DFS
          - Maze solver with multiple algorithms

- Route finding system (city maps)
- N-Queens problem solver
- Missionaries and Cannibals problem
- Search visualization tool
- Performance comparison framework

Practice: Implement all uninformed search algorithms from scratch

Search Algorithms - Part 2 (Informed/Heuristic Search)

Topics:

- Heuristic functions and admissibility
- Greedy Best-First Search
- A* Search: algorithm, optimality proof
- Heuristic design and dominance
- Memory-bounded heuristic search: IDA*, RBFS, SMA*
- Weighted A* and bounded suboptimal search
- Bidirectional heuristic search
- Pattern databases for heuristics
- Local search algorithms
- Hill-climbing and variants
- Simulated annealing
- Genetic algorithms for search
- Local beam search
- Constraint satisfaction in search
- Search in game playing (preview)

Projects built:

- A* pathfinding implementation
- 15-puzzle solver with pattern databases
- Route optimization with A*
- Simulated annealing for TSP
- Genetic algorithm for optimization
- Hill-climbing variants comparison
- Heuristic function designer tool

Practice: Solve 30 search problems with optimal algorithms

Adversarial Search & Game Playing

Topics:

- Game theory basics for AI
- Game trees and game search
- Minimax algorithm
- Alpha-beta pruning
- Move ordering for better pruning
- Iterative deepening in games
- Evaluation functions for game states
- Quiescence search
- Transposition tables
- Monte Carlo Tree Search (MCTS)
- Upper Confidence Bounds (UCB)
- MCTS in AlphaGo
- Stochastic games and expectiminimax
- Partially observable games
- Multi-player games
- Real-time decision making in games

Projects built:

- Tic-Tac-Toe with minimax
- Chess AI with alpha-beta pruning
- Checkers AI implementation
- Connect-4 game AI
- Go AI with MCTS (simplified)
- Poker bot (partial information)
- Game AI framework with multiple algorithms

Practice: Build 10 different game-playing AI agents

Month 3: Logic & Knowledge Representation (Weeks 9-13)

Propositional Logic

Topics:

- Knowledge-based agents
- Logic as knowledge representation
- Propositional logic: syntax and semantics
- Logical connectives: AND, OR, NOT, IMPLIES, IFF
- Truth tables and logical equivalence
- Inference in propositional logic
- Inference rules: Modus Ponens, And-Elimination
- Resolution and refutation
- Conjunctive Normal Form (CNF)
- Horn clauses and forward/backward chaining
- SAT solvers and applications
- DPLL algorithm
- WalkSAT and local search for SAT
- Applications: circuit design, planning, verification
- Limitations of propositional logic

Projects built:

- Propositional logic inference engine
- SAT solver implementation
- Logic-based puzzle solver (Sudoku)
- Wumpus World agent with logic
- Circuit verification system
- Resolution theorem prover
- Knowledge base system

Practice: Solve 40 logical reasoning problems

First-Order Logic & Inference

Topics:

- First-Order Logic (FOL) syntax
- Predicates, functions, quantifiers
- Universal and existential quantification
- Semantics and interpretation
- Using FOL for knowledge representation
- Unification algorithm
- Generalized Modus Ponens
- Forward chaining in FOL
- Backward chaining in FOL
- Resolution in FOL
- Skolemization and CNF conversion
- Prolog and logic programming
- Herbrand universe and interpretations
- Completeness and decidability
- Description logics
- Semantic networks and frames

Projects built:

- FOL inference engine
- Prolog-like system in Python
- Automated theorem prover
- Knowledge base with FOL
- Family tree reasoning system
- Medical diagnosis system (logic-based)
- Natural language to FOL translator (simple)

Practice: Build 10 knowledge-based systems with FOL

Constraint Satisfaction Problems

Topics:

- CSP framework: variables, domains, constraints
- Examples: map coloring, N-Queens, scheduling
- Backtracking search for CSP
- Variable ordering heuristics: MRV, degree heuristic
- Value ordering: least-constraining-value
- Inference in CSP: forward checking
- Arc consistency (AC-3 algorithm)
- Path consistency and k-consistency
- Local search for CSP: min-conflicts
- Constraint propagation
- Structure in CSP: tree-structured, nearly tree-structured
- Cutset conditioning
- Temporal CSPs
- Soft constraints and optimization
- Applications: scheduling, resource allocation, configuration

Projects built:

- N-Queens CSP solver
- Sudoku solver with constraint propagation
- Map coloring problem
- Course scheduling system
- Resource allocation optimizer
- Timetable generator
- PHASE 1 MINI CAPSTONE: Intelligent Planning System with CSP

Assessment: Phase 1 exam: a practical build defended live, plus a written paper mixing this phase with everything before it

---

PHASE 2: REASONING, PLANNING & PROBABILISTIC AI (MONTHS 4-6, WEEKS 14-26)

Master probabilistic reasoning, planning algorithms, decision theory, and uncertainty management in AI.

Months 4-5: Uncertainty & Probabilistic Reasoning (Weeks 14-20)

Probability Theory for AI

Topics:

- Uncertainty in AI systems
- Probability basics: events, axioms, rules
- Conditional probability and Bayes' Rule
- Bayesian reasoning
- Random variables: discrete and continuous
- Probability distributions
- Joint probability distributions

    - Independence and conditional independence
    - Inference using full joint distributions
    - Marginalization and conditioning
    - Naive Bayes classifier
    - Bayesian networks introduction
    - Belief propagation basics
    - Applications: diagnosis, prediction, classification
    - Probabilistic reasoning under uncertainty
  Projects built:
    - Bayesian inference engine
    - Naive Bayes spam filter
    - Medical diagnosis system (probabilistic)
    - Weather prediction system
    - Probabilistic reasoning toolkit
    - Bayesian calculator and visualizer
  Practice: Solve 50 probabilistic reasoning problems
Bayesian Networks
  Topics:
    - Bayesian Network structure and semantics
    - Conditional independence in Bayes nets
    - Constructing Bayesian networks
    - Compact conditional distributions: CPTs
    - Exact inference in Bayesian networks
    - Inference by enumeration
    - Variable elimination algorithm
    - Clustering algorithms for inference
    - Junction tree algorithm
    - Approximate inference: sampling methods
    - Direct sampling and rejection sampling
    - Likelihood weighting
    - Markov Chain Monte Carlo (MCMC)
    - Gibbs sampling
    - Learning Bayesian networks from data
    - Parameter learning: MLE and MAP
    - Structure learning: score-based, constraint-based
  Projects built:
    - Bayesian Network inference engine
    - Variable elimination implementation
    - MCMC sampler for Bayes nets
    - Medical diagnosis Bayes net
    - Risk assessment system
    - Bayes net learning from data
    - Decision support system with Bayes nets
  Practice: Build 15 Bayesian network applications
Markov Models & Temporal Reasoning
  Topics:
    - Time and uncertainty
    - Markov processes and Markov assumption
    - Hidden Markov Models (HMM)
    - HMM representation and semantics
    - Forward algorithm for filtering
    - Viterbi algorithm for most likely sequence
    - Forward-backward algorithm for smoothing
    - Baum-Welch algorithm for learning HMMs
    - Applications: speech recognition, POS tagging
    - Kalman filters for continuous state
    - Extended Kalman filters
    - Particle filters (Sequential Monte Carlo)
    - Dynamic Bayesian Networks (DBN)
    - Temporal reasoning and prediction
    - Applications: tracking, localization, time-series
  Projects built:
    - HMM for speech recognition (simplified)
    - POS tagger with HMM
    - Robot localization with Kalman filter
    - Particle filter for tracking
    - Weather prediction with HMM
    - Stock market HMM (simplified)
    - Dynamic Bayesian network system
  Practice: Implement all temporal reasoning algorithms
Decision Theory & Utility
  Topics:
    - Making decisions under uncertainty
    - Utility theory and preferences
    - Utility functions and axioms
    - Maximum Expected Utility (MEU)
    - Decision networks (influence diagrams)
    - Value of information
    - Value of perfect information (VPI)

- Sequential decision problems
- Markov Decision Processes (MDPs)
- MDP formulation: states, actions, transitions, rewards
- Bellman equations
- Value iteration algorithm
- Policy iteration algorithm
- Partially Observable MDPs (POMDPs)
- POMDP value iteration
- Applications: robotics, game playing, resource allocation

Projects built:
- Decision network solver
- MDP solver (value iteration, policy iteration)
- Grid world MDP
- Inventory management with MDPs
- Robot navigation with POMDP
- Medical treatment decision system
- Resource allocation optimizer

Practice: Solve 25 decision-theoretic problems

Planning Under Uncertainty

Topics:
- Planning with probabilistic effects
- Contingency planning
- Conditional plans and execution monitoring
- Replanning strategies
- Online planning and acting
- Information gathering actions
- Exploration vs exploitation
- Multi-armed bandit problems
- UCB algorithms for exploration
- Monte Carlo planning
- Rollout algorithms
- Hierarchical planning under uncertainty
- Applications: robotics, autonomous systems

Projects built:
- Contingent planner
- Multi-armed bandit solver
- Robot exploration system
- Adaptive planning agent
- Online planning framework
- Monte Carlo planner

Practice: Build 10 planning under uncertainty systems

Month 6: Classical Planning & Knowledge Integration (Weeks 21-26)

Classical Planning

Topics:
- Planning problem representation
- STRIPS representation
- Actions: preconditions and effects
- State-space search for planning
- Forward (progression) state-space search
- Backward (regression) state-space search
- Heuristics for planning: ignore-preconditions, ignore-delete-lists
- Plan-space planning (partial-order planning)
- Graphplan algorithm
- Planning graphs and graph heuristics
- SAT-based planning
- PDDL (Planning Domain Definition Language)
- Hierarchical Task Network (HTN) planning
- Temporal planning
- Planning with resources and time
- Multi-agent planning basics

Projects built:
- STRIPS planner implementation
- Graphplan algorithm
- Blocks world planner
- Logistics planning system
- Robot task planner
- SAT-based planner
- HTN planner (simplified)

Practice: Solve 20 classical planning problems

Ontologies & Knowledge Engineering

Topics:
- Knowledge engineering process
- Ontology definition and components
- Upper ontologies: Cyc, SUMO
- OWL (Web Ontology Language)
- RDF and semantic web
- Knowledge graphs
- Ontology design patterns

    - Domain modeling
    - Taxonomies and hierarchies
    - Relationships and properties
    - Reasoning with ontologies
    - Ontology alignment and merging
    - Protégé for ontology development
    - SPARQL for querying knowledge
    - Applications: healthcare, e-commerce, IoT
  Projects built:
    - Domain ontology creation (healthcare/e-commerce)
    - Knowledge graph builder
    - Ontology-based reasoning system
    - Semantic search engine
    - Question answering with knowledge graphs
    - Ontology alignment tool
    - SPARQL query system
  Practice: Build 5 ontologies for different domains
Learning in AI Systems
  Topics:
    - Learning agents architecture
    - Supervised learning integration in AI
    - Decision tree learning: ID3, C4.5
    - Information gain and entropy
    - Ensemble learning in AI
    - Unsupervised learning for AI: clustering
    - Reinforcement learning fundamentals (AI perspective)
    - Q-learning in AI agents
    - Temporal difference learning
    - Exploration strategies
    - Function approximation in RL
    - Deep RL overview for AI
    - Transfer learning in AI systems
    - Meta-learning and learning to learn
    - Hybrid symbolic-neural systems
  Projects built:
    - Decision tree AI agent
    - Reinforcement learning grid world
    - Q-learning robot navigator
    - Learning agent framework
    - Hybrid reasoning system (logic + learning)
    - Transfer learning AI agent
    - Meta-learning experiment
  Practice: Integrate learning into 15 AI systems
Explanation & Interpretability in AI
  Topics:
    - Explainable AI (XAI) importance
    - Explanation in expert systems
    - Trace-based explanations
    - Rule-based explanation generation
    - Argumentation and justification
    - Counterfactual explanations
    - Contrastive explanations
    - Transparency vs performance tradeoffs
    - LIME for model explanations
    - SHAP values in AI
    - Attention mechanisms for interpretability
    - Causal reasoning for explanations
    - User interfaces for explanations
    - Evaluating explanation quality
    - Regulatory requirements for explainability
  Projects built:
    - Explainable expert system
    - Explanation generator for decisions
    - Argumentation framework
    - Counterfactual explanation system
    - XAI dashboard
    - Causal reasoning engine
    - Interactive explanation interface
  Practice: Add explanations to all AI systems built
Phase 2 Capstone Project
  Topics:
    - Integrated AI system design
    - Combining multiple AI techniques
    - Reasoning under uncertainty
    - Planning and decision-making
    - Learning and adaptation
    - Explanation generation
  Projects built:
    - PHASE 2 CAPSTONE: Intelligent Decision Support System

- Requirements: Bayesian reasoning, planning, decision theory, learning, explanations
- Option 1: Medical diagnosis and treatment planning system
- Option 2: Autonomous robot mission planner
- Option 3: Smart home energy management system
- Option 4: Financial portfolio advisor with uncertainty

Assessment: Phase 2 exam: a practical build defended live, plus a written paper mixing this phase with everything before it

---

PHASE 3: INTELLIGENT SYSTEMS & APPLICATIONS (MONTHS 7-9, WEEKS 27-39)

Master expert systems, intelligent agents, robotics, computer vision, NLP, and multi-agent systems.

Months 7-8: Expert Systems & Intelligent Agents (Weeks 27-34)

Expert Systems Architecture

Topics:

- Expert systems overview and history
- MYCIN, DENDRAL, XCON case studies
- Expert system architecture: knowledge base, inference engine, UI
- Rule-based expert systems
- Forward chaining systems
- Backward chaining systems
- Conflict resolution strategies
- Certainty factors and fuzzy logic
- Dempster-Shafer theory
- Knowledge acquisition bottleneck
- Knowledge elicitation techniques
- Knowledge engineering methodology
- Explanation facilities in expert systems
- Expert system shells
- Modern applications of expert systems
- Limitations and decline of expert systems

Projects built:

- Medical diagnosis expert system
- Legal reasoning expert system
- Technical troubleshooting system
- Financial advisory expert system
- Expert system shell development
- Rule-based configurator
- Fuzzy logic controller

Practice: Build 10 domain-specific expert systems

Intelligent Agent Architectures

Topics:

- Agent theory and design
- Deliberative agents (BDI: Belief-Desire-Intention)
- Reactive agents and subsumption architecture
- Hybrid agent architectures
- Layered architectures: InteRRaP, TouringMachines
- Agent communication languages (ACL)
- FIPA specifications
- Agent reasoning cycles
- Agent planning and execution
- Agent learning and adaptation
- Situated agents and embodiment
- Software agents vs physical agents
- Agent-oriented programming
- Agent development frameworks: JADE, Jason
- Applications: virtual assistants, bots, automation

Projects built:

- BDI agent implementation
- Reactive agent for dynamic environment
- Hybrid agent architecture
- Communicating agents system
- Personal assistant agent
- Agent-based automation system
- Situated agent in simulation

Practice: Design and implement 12 intelligent agents

Robotics & Embodied AI

Topics:

- AI in robotics overview
- Robot perception: sensors and processing
- Computer vision for robotics
- Object recognition and tracking
- SLAM (Simultaneous Localization and Mapping)
- Robot motion planning: configuration space
- Path planning algorithms for robots
- Potential field methods
- Probabilistic roadmaps (PRM)

- Rapidly-exploring Random Trees (RRT)
- Robot control architectures
- Behavior-based robotics
- Robot learning: imitation, reinforcement
- Human-robot interaction
- ROS (Robot Operating System) basics
- Applications: autonomous vehicles, drones, industrial robots

Projects built:
- Robot simulator with AI planning
- Path planning visualizer (PRM, RRT)
- SLAM implementation (simplified)
- Behavior-based robot controller
- Robot learning from demonstration
- Autonomous navigation system
- ROS-based AI agent (if feasible)

Practice: Implement 10 robotics AI algorithms

Computer Vision for AI Systems

Topics:
- Vision as AI problem
- Image formation and camera models
- Image processing fundamentals
- Edge detection: Canny, Sobel
- Feature detection: SIFT, SURF, ORB
- Image segmentation techniques
- Object recognition classical methods
- Template matching
- Hough transform for shape detection
- Optical flow and motion analysis
- Stereo vision and depth perception
- 3D reconstruction from images
- Deep learning for vision (integration)
- Scene understanding and reasoning
- Visual reasoning and question answering
- Applications: surveillance, medical imaging, autonomous systems

Projects built:
- Object detector (classical methods)
- Face recognition system
- Motion tracking application
- Image segmentation tool
- 3D reconstruction (simple)
- Visual reasoning system
- Autonomous vehicle perception (simulated)

Practice: Build 12 computer vision AI applications

Natural Language Understanding (AI Perspective)

Topics:
- Language as AI challenge
- Syntax: parsing and grammars
- Context-free grammars
- Parsing algorithms: CKY, Earley
- Semantic analysis and representation
- First-order logic for semantics
- Lambda calculus for meaning
- Discourse and pragmatics
- Coreference resolution
- Information extraction
- Question answering systems
- Dialogue systems and conversational AI
- Natural language generation
- Machine translation (symbolic approaches)
- Integrating NLP with knowledge systems
- Semantic parsing and understanding

Projects built:
- Parser for natural language
- Semantic representation generator
- Question answering system (logic-based)
- Dialogue system with state management
- Information extraction system
- Natural language interface to database
- Story understanding system

Practice: Build 10 NLU systems with AI techniques

Month 9: Multi-Agent Systems & Collective Intelligence (Weeks 35-39)

Multi-Agent Systems Fundamentals

Topics:
- Multi-agent systems (MAS) introduction
- Agent interactions and coordination
- Cooperation, collaboration, competition
- Agent communication protocols
- Speech acts and performatives

    - Contract Net Protocol
    - Negotiation and bargaining
    - Auction mechanisms
    - Coalition formation
    - Task allocation in MAS
    - Distributed problem solving
    - Distributed constraint satisfaction
    - Multi-agent planning
    - Emergent behavior in MAS
    - Applications: smart grids, traffic systems, e-commerce
  Projects built:
    - Multi-agent coordination system
    - Negotiation protocol implementation
    - Auction system with agents
    - Coalition formation simulator
    - Distributed task allocation
    - Multi-agent marketplace
    - Swarm intelligence application
  Practice: Implement 12 multi-agent scenarios
Game Theory for Multi-Agent AI
  Topics:
    - Game theory foundations
    - Normal form games
    - Nash equilibrium concept
    - Finding Nash equilibria
    - Dominant strategies
    - Mixed strategies
    - Extensive form games
    - Subgame perfect equilibrium
    - Repeated games and folk theorem
    - Evolutionary game theory
    - Mechanism design basics
    - Voting and social choice
    - Cooperative game theory
    - Shapley value
    - Applications in AI: auctions, negotiations, resource allocation
  Projects built:
    - Game theory solver (Nash equilibrium)
    - Repeated game simulator
    - Auction mechanism with game theory
    - Voting system analyzer
    - Cooperative game solver
    - Mechanism design implementation
    - Multi-agent game scenarios
  Practice: Analyze 20 game-theoretic scenarios
Swarm Intelligence & Collective Behavior
  Topics:
    - Swarm intelligence principles
    - Ant Colony Optimization (ACO)
    - Particle Swarm Optimization (PSO)
    - Bee algorithms
    - Flocking and bird behavior (Boids)
    - Stigmergy and indirect communication
    - Self-organization in swarms
    - Emergent intelligence
    - Distributed sensing and actuation
    - Robot swarms
    - Applications: optimization, robotics, routing
    - Cellular automata and emergence
    - Conway's Game of Life
    - Wolfram's cellular automata
    - Artificial life and ALife
  Projects built:
    - Ant Colony Optimization for TSP
    - Particle Swarm Optimizer
    - Flocking simulation (Boids)
    - Robot swarm simulator
    - Stigmergy-based system
    - Cellular automata explorer
    - Artificial life simulation
  Practice: Implement 8 swarm intelligence algorithms
Social AI & Human-AI Interaction
  Topics:
    - Social intelligence in AI
    - Theory of Mind in AI
    - Emotion recognition and affective computing
    - Sentiment analysis for AI
    - Social robots and companions
    - Conversational AI and chatbots

- Personality in AI agents
- Trust and transparency in AI
- Anthropomorphism and uncanny valley
- Human-in-the-loop AI systems
- Collaborative AI (AI as teammate)
- Explainability for non-experts
- AI ethics in social contexts
- Cultural considerations in AI
- Applications: healthcare, education, customer service

Projects built:
- Emotion-aware chatbot
- Social robot behavior system
- Theory of Mind agent
- Personality-based AI assistant
- Collaborative AI system
- Human-AI teaming framework
- Culturally-aware AI agent

Practice: Build 10 social AI applications

Phase 3 Capstone Project

Topics:
- Complex multi-agent system design
- Intelligent agent development
- Coordination and cooperation
- Real-world application
- Evaluation and analysis

Projects built:
- PHASE 3 CAPSTONE: Intelligent Multi-Agent System
- Requirements: Multiple agents, coordination, learning, real-world application
- Option 1: Smart city traffic management with agents
- Option 2: Multi-robot warehouse automation
- Option 3: Distributed energy grid management
- Option 4: Multi-agent trading and auction system
- Option 5: Disaster response coordination system

Assessment: Phase 3 exam: a practical build defended live, plus a written paper mixing this phase with everything before it

---
PHASE 4: THE FINALE (MONTH 10, WEEKS 40-44)

The capstone month: spec, build, ship and defend, then the final exam that decides the certificate.

Month 10: Capstone and the Final Exam (Weeks 40-44)

Capstone Spec and Setup

Topics:
- Choosing the capstone: an intelligent system: a game-playing agent, a planner, a constraint solver or a knowledge-based reasoner
- A one-page spec: scope, milestones, stack
- Repository and skeleton ready on day one
- Instructor sign-off before the build begins

Projects built:
- Approved capstone spec plus the running skeleton

Practice: Pitch the spec to the batch and absorb one hard question

Capstone Build

Topics:
- Two focused weeks in vertical slices
- Instructor checkpoints and honest scope cuts
- Using the whole course: search, knowledge representation, probabilistic reasoning and agent design, chosen to fit the build
- Daily commits and an always-working build

Projects built:
- The capstone, feature-complete with version control

Practice: A working build at the end of every session

Ship and Polish

Topics:
- The finishing pass: edge cases, errors, documentation
- Benchmarked honestly: your system measured against baselines, with its limits stated
- A README worth reading and a demo worth watching
- A full-course spiral review before the exam

Projects built:
- The capstone shipped, documented and rehearsed

Practice: Two mock demos, each tighter than the last

Demo Day and the Final Exam

Topics:
- Presenting the capstone: live demo plus the hardest bug story
- The honest map of next roads: AI engineering, robotics and planning systems, or ML depth in our AI/ML course
- Where our other courses continue the journey

Projects built:

- Demo day presentation delivered to the batch
Assessment: FINAL EXAM: a practical build plus a written paper with questions mixed from every phase. Passing earns the certificate; falling short earns a focused revision plan and a free retest

PROJECTS THE STUDENT BUILDS AND KEEPS

- Phase 1: search solvers, game-playing agents and constraint systems you wrote yourself
- Phase 2: Bayesian reasoners, decision systems and classical planners
- Phase 3: expert systems, agent architectures and multi-agent simulations
- Phase 4: the intelligent-system capstone, benchmarked and defended

Total projects: 15+ implemented AI systems, crowned by a benchmarked capstone

SKILLS THE STUDENT WILL HAVE AT THE END

- Search mastery: uninformed, heuristic and adversarial, implemented from scratch
- Knowledge representation: propositional and first-order logic, CSPs, ontologies
- Reasoning under uncertainty: Bayesian networks, Markov models, decision theory
- Planning: classical planning and planning under uncertainty
- Agent design: expert systems, agent architectures and multi-agent game theory

HOW A TYPICAL WEEK IS SPLIT

Live classes: 2 live one-hour classes per week, coding along with the instructor
Homework: A problem set after every class, and a mixed-review assignment at the end of every month
Practice: 4-6 hours of building between classes
Review: Every submission reviewed with written feedback; recurring gaps reopened in class

SUPPORT INCLUDED

Doubt support: WhatsApp doubt support between classes
Progress updates: Honest monthly progress reviews: what is solid, what is wobbly, and the plan for the wobble

CERTIFICATION DETAIL

Completion: Certificate from Modern Age Coders, awarded on passing the final exam. Fall short and there is focused revision and a free retest: the certificate certifies knowledge, not attendance

WHERE THIS CAN LEAD

- AI engineering: agent systems reuse this canon daily
- Our AI/ML course adds the statistical learning half
- Robotics and planning systems: this is their native language
- Our generative AI course connects the canon to LLM-era practice

EARNING POTENTIAL (share only if asked, and never promise it)

Market context: The ranges below are general market salary bands for these roles in India and abroad, drawn from public industry data. They are shown for career context only and are not a promise or guarantee of income. Actual pay depends on your skills, experience, location, and the job market.
Other roles: Rs 15-30 LPA (India), $120k-200k (USA); Rs 25-50 LPA (India), $180k-350k (USA); Rs 40-80 LPA (India), $250k-500k (USA); Rs 60-150 LPA (India), $350k-800k+ (USA); DeepMind, OpenAI pay $300k-$1M+ for top researchers; Rs 10-30 LPA (India), $80k-150k (USA) as Assistant Professor
Consulting: Rs 200-500/hour for expert AI consulting

COMMON QUESTIONS ABOUT THIS COURSE

For anything about cost, use PART 4 and RULE 1. Do not quote two regions.

Q: What does this artificial intelligence course cover?
A: The classical AI canon, implemented in code: search algorithms from BFS to A* and adversarial game playing, propositional and first-order logic, constraint satisfaction, probability and Bayesian networks, Markov models, decision theory, classical planning and planning under uncertainty, expert systems, intelligent agent architectures, robotics and vision from the AI perspective, and multi-agent systems with game theory. A finale month ships an intelligent-system capstone and sits the final exam.

Q: How long does it take to learn artificial intelligence properly?
A: Ten months of teaching at 2 live classes a week plus 4 to 6 hours of practice, with two more months in hand for learners who need them. The three teaching phases build the skill and its real-world application; the finale month ships a capstone and sits the final exam.

Q: How am I assessed? Is the certificate just for attending?

A: No. Problem sets follow every class with written feedback, monthly reviews deliberately mix new material with earlier topics, each phase ends with a cumulative exam, and the course ends with a final exam: a practical build plus written questions from the whole syllabus. Passing earns the certificate; falling short earns focused revision and a free retest.

Q: Is classical AI still worth learning in the LLM era?
A: More than ever, for two honest reasons. First, this canon still runs real systems: game AI, route planning, scheduling, logistics, diagnosis and robotics never stopped using it. Second, the LLM era is converging back onto it: agent frameworks reach for planning, search and knowledge representation the moment a chatbot has to actually do something. Prediction is the new part; deciding what to do with predictions is this course.

Q: How is this different from your AI/ML and machine learning courses?
A: By which half of intelligence they teach. The AI/ML course teaches learning: models trained on data to make predictions. This course teaches reasoning: search, logic, planning and decision-making under uncertainty, the half that universities examine as artificial intelligence and that agent systems are built from. The two halves complete each other, and serious AI work increasingly wants both.

Q: Can I try a class before enrolling?
A: Yes, a free demo class with no commitment: book at learn.modernagecoders.com/contact or message us on WhatsApp at +91 91233 66161. (Agent note: the free demo is a waiting list with no fixed date. The Priority Live Demo is a guaranteed class today or tomorrow, booked at https://learn.modernagecoders.com/priority-demo . Offer both, as RULE 3 says.)

Q: Are classes live or recorded?
A: Live, always: small groups with a real instructor reading your actual code, never pre-recorded videos.

To enrol, message Shivam Sir on +91 9123366161 or send the parent this link: https://learn.modernagecoders.com/courses/artificial-intelligence-complete-masterclass-college
For a demo: the Priority Live Demo (guaranteed, today or tomorrow) is booked at https://learn.modernagecoders.com/priority-demo . The free demo is a waiting list with no fixed date.

==========

COURSE 26 OF 137: BACKEND DEVELOPMENT FOR TEENS: NODE, APIS AND DATABASES

==========

Course link: https://learn.modernagecoders.com/courses/backend-coding-masterclass-for-teens
Subject area: Web Development
Designed for: Teens
Who can join: Absolute beginner, ages 13 to 18
Course length: 9-11 months (36-44 weeks)
Time needed: 2 live classes/week + 3-4 hours practice
Certificate: Certificate from Modern Age Coders, awarded on passing the final exam

PRICE FOR THIS COURSE (quote only the one that applies to the person asking)
In India, per month: group Rs 1,499, mini batch Rs 2,999, one to one Rs 4,999
Outside India, per month: group $100, one to one $150
Classes: group and mini batch two live classes a week, eight a month; one to one in India one live class a week, four a month; one to one outside India two live classes a week, eight a month. Each class is one hour.

WHAT THIS COURSE IS

Backend course for teens aged 13-18: Node.js, Express, REST APIs, MongoDB and PostgreSQL, auth, security, AI backends and a deployed capstone in 9-11 months.

In one line: The invisible half of every app, made visible: servers, APIs and databases built by a teenager who understands what happens after the button is pressed.

ABOUT THE PROGRAMME

Every tap in every app fires a request at a backend, and almost nobody a teen knows can build one. This live online course fixes that for ages 13 to 18: how the internet really works, JavaScript learned properly, then Node.js and Express, REST APIs designed like a professional, both database families (MongoDB and PostgreSQL), authentication done safely, security against the attacks that actually happen, real-time features, background jobs, testing, and the modern layer, AI backends and agent APIs, built with guardrails. Everything runs for real: APIs are deployed and consumed by classmates, the capstone is a documented, authenticated backend live on a public URL, and the final month adds performance judgment and an honest week of Docker. What the course refuses to fake: Kubernetes, microservices and cloud infrastructure are professional specializations, named truthfully as later roads rather than stuffed in as teen filler. The pace is honest: nine months at two live classes a week plus three to four hours of practice, with two more months in hand. Homework, monthly mixed reviews, phase exams, and a final exam that decides the certificate with a free retest. Real servers, real data, depth over dopamine.

WHAT MAKES THIS COURSE DIFFERENT

- The rare skill: most teen courses stop at the frontend; this one builds the engine room
- Both database families: MongoDB and PostgreSQL, with honest judgment about when each wins
- Security taught early: hashing, tokens and the OWASP basics, because backends are where it matters
- AI backends included: model calls, streaming and agent endpoints with guardrails
- APIs consumed by real classmates: documentation quality gets tested socially
- Real assessment: weekly homework, monthly mixed reviews, and a final exam that decides the certificate, with a free retest

THE LEARNING PATH, STEP BY STEP

Phase 1: Foundations (Months 1-3): how the internet works, JavaScript properly, algorithms, then Node, Express and REST design
Phase 2: Data and product features (Months 4-6): MongoDB and PostgreSQL, authentication, API security, uploads and media
Phase 3: Real systems (Months 7-8): real-time features, background jobs and email, testing, AI backends and agent APIs
Phase 4: Ship (Month 9): performance judgment, an honest Docker week, and the deployed capstone exam

WHAT A STUDENT NEEDS BEFORE STARTING

Coding experience: None. JavaScript is taught from the first variable
Computer skills: Comfortable typing and managing files and folders
Equipment: A computer with a stable internet connection; every tool used is free
Age: 13 to 18. Batches are grouped by age and pace
Time commitment: 2 live classes plus 3-4 hours of practice a week

WHO THIS COURSE IS FOR

How does it work kids: Teens who keep asking what actually happens when you press the button
Frontend graduates: Students from our web courses ready for the other half
Logic lovers: Teens who prefer systems and data to pixels and colors
Future engineers: Students aiming at serious software careers, where backend depth is the differentiator
Complete beginners: No experience needed: the JavaScript foundation is built in

FULL CURRICULUM, WEEK BY WEEK

This is the complete teaching plan. Parents can ask about any week.

PHASE 1: FOUNDATIONS (MONTHS 1-3, WEEKS 1-12)

The internet demystified, JavaScript learned properly, problem-solving sharpened, then the first real servers with Node and Express.

Month 1: The Internet and JavaScript (Weeks 1-4)
How The Internet Actually Works
Topics:
- What happens when you open Instagram/TikTok?
- Clients vs Servers: The restaurant analogy
- IP addresses: The internet's phone numbers
- DNS: The internet's phonebook
- HTTP/HTTPS: How computers talk
- APIs: The waiter between frontend and database
- Why backend matters: Facebook's 100,000 servers
- Setting up your coding environment
- Installing VS Code and essential extensions
- Terminal/Command line: Hacker mode activated
- Git & GitHub: Your code's Instagram
- Creating your developer profile
Projects built:
- Draw your favorite app's architecture
- Set up your ultimate coding environment
- Create your GitHub profile README
Practice: Daily: Explore 5 websites with Chrome DevTools Network tab
JavaScript Fundamentals - The Language of Backend
Topics:
- Why JavaScript runs the internet
- Variables: Storing game scores and user data
- Data types: Numbers, strings, booleans explained with memes
- Arrays: Managing Spotify playlists
- Objects: Describing a YouTube video
- Functions: Reusable cheat codes
- If/else: Making decisions like game AI
- Loops: Automation for lazy programmers

```
      - Template literals: Dynamic message creation
      - Console.log debugging: Your best friend
      - Comments: Leaving notes for future you
      - Code style: Writing clean, readable code
    Projects built:
      - Discord bot message generator
      - Minecraft inventory manager
      - YouTube stats calculator
      - Grade calculator with GPA
    Practice: Code 30 minutes daily on CodeWars/HackerRank
    Assessment: Month 1 check: a JavaScript logic challenge live, plus a take-home mixing
    everything so far

Month 2: Problem Solving and First Servers (Weeks 5-8)
  Algorithms and Problem Solving
    Topics:
      - What are algorithms? TikTok's 'For You' page explained
      - Big O notation: Why Instagram loads fast
      - Searching algorithms: Finding a friend in contacts
      - Sorting algorithms: Organizing Spotify playlists
      - Recursion: Inception for programmers
      - Hash tables: How Discord finds users instantly
      - Stacks & Queues: YouTube video buffer explained
      - Trees: Folder structures and game decision trees
      - Problem-solving strategies
      - Debugging like a detective
      - Code optimization basics
      - Common coding patterns
    Projects built:
      - Build TikTok's recommendation algorithm (simplified)
      - Create a matchmaking system for games
      - Implement Instagram's hashtag search
      - Design a tournament bracket system
    Practice: Solve 50 algorithm problems on LeetCode Easy
  Node.js - JavaScript on Servers
    Topics:
      - What is Node.js? V8 engine explained
      - Why Discord and Netflix use Node.js
      - Installing Node.js and npm
      - Your first server: Hello World
      - Understanding the event loop with game examples
      - Modules: Organizing code like Minecraft mods
      - NPM: The app store for code
      - Package.json: Your project's ID card
      - Core modules: fs, path, http, crypto
      - Reading/writing files: Save game systems
      - Asynchronous programming: Not freezing like games
      - Callbacks, Promises, Async/Await explained with memes
    Projects built:
      - File-based todo list for homework
      - Discord webhook notifier
      - Local multiplayer game server
      - Meme generator backend
    Practice: Build 10 small Node.js utilities
    Assessment: Month 2 check: a tiny Node server built live, plus mixed review

Month 3: Express and REST Design (Weeks 9-12)
  Express.js - Professional Backend Framework
    Topics:
      - What is Express? The backend framework everyone uses
      - Setting up your first Express server
      - Routes: Different URLs for different features
      - GET, POST, PUT, DELETE: The four horsemen of APIs
      - Request and Response objects
      - Middleware: Instagram filters for your server
      - Handling JSON data: The language of APIs
      - Query parameters: YouTube search explained
      - Route parameters: Twitter.com/:username
      - Error handling: When things go wrong
      - Static files: Serving images and videos
      - Environment variables: Keeping secrets safe
    Projects built:
      - School assignment submission API
      - Gaming stats tracker API
      - Social media post API
      - Music playlist backend
    Practice: Create 5 different Express APIs
  RESTful API Design
    Topics:
```

- REST principles: The rules everyone follows
- Designing URLs like a pro
- HTTP status codes: 200 OK, 404 Not Found, and friends
- API versioning: Why apps need updates
- Request/Response best practices
- Pagination: Loading Instagram posts efficiently
- Filtering and sorting data
- API documentation with Swagger
- Testing APIs with Postman/Insomnia
- Rate limiting: Preventing spam
- CORS: Letting websites talk to your API
- API security basics

Projects built:
- Complete RESTful blog API
- E-commerce product API
- Video game inventory API
- School management system API

Practice: Document and test all your APIs professionally

Assessment: Phase 1 exam: design and build a small API live, plus a written mixed paper

---

PHASE 2: DATA AND PRODUCT FEATURES (MONTHS 4-6, WEEKS 13-24)

The features every real product needs: both database families, safe authentication, hardened APIs, and file uploads done properly.

Month 4: Databases, Both Families (Weeks 13-16)

MongoDB - NoSQL for Modern Apps

Topics:
- MongoDB basics: Documents instead of tables
- Why Snapchat and Fortnite use MongoDB
- Installing MongoDB and Compass GUI
- Collections and documents
- CRUD operations: Create, Read, Update, Delete
- Querying data: Finding specific posts
- Advanced queries: $gt, $lt, $in, $regex
- Aggregation pipeline: Data transformation
- Indexes for performance
- Mongoose ODM: MongoDB made easy
- Schema design in MongoDB
- Embedding vs Referencing data

Projects built:
- Social media posts database
- Game inventory system
- Chat application database
- Movie recommendation database

Practice: Build 5 MongoDB databases for different apps

PostgreSQL - Powerful SQL Database

Topics:
- PostgreSQL: The world's most advanced open source database
- SQL basics: SELECT, INSERT, UPDATE, DELETE
- Creating tables with constraints
- Joins: Connecting data from multiple tables
- GROUP BY: Analytics and statistics
- Aggregate functions: COUNT, SUM, AVG
- Subqueries: Queries within queries
- Views: Saved queries for complex data
- Transactions: All or nothing operations
- Database migrations: Updating schemas safely
- Backup and restore strategies
- Performance optimization with EXPLAIN
- Prisma in one honest lesson: the typed modern workflow

Projects built:
- E-commerce database with orders
- School management system
- Banking transaction system
- Analytics dashboard database

Practice: Write 100 SQL queries of increasing complexity

Assessment: Month 4 check: model one domain in both databases and defend the choice, plus mixed review

Month 5: Auth and Security (Weeks 17-20)

User Authentication Systems

Topics:
- Authentication vs Authorization: Who you are vs What you can do
- How Instagram knows it's really you
- Password hashing: Never store passwords as text
- Bcrypt: Making passwords uncrackable
- Salt: Extra security seasoning

```
        - Sessions: Remembering logged-in users
        - Cookies: Not the edible kind
        - JWT tokens: Passport for APIs
        - Access tokens vs Refresh tokens
        - OAuth 2.0: Login with Google/Discord
        - Two-factor authentication (2FA)
        - Password reset flows
      Projects built:
        - Complete authentication system
        - Discord OAuth integration
        - JWT-based API auth
        - 2FA implementation
      Practice: Add authentication to 5 different projects
    API Security & Best Practices
      Topics:
        - Common security vulnerabilities
        - SQL injection: The classic hack
        - XSS attacks: Injecting evil JavaScript
        - CSRF: Tricking users into actions
        - Rate limiting: Preventing spam and DDoS
        - Input validation: Never trust user input
        - Sanitization: Cleaning dangerous data
        - HTTPS and SSL certificates
        - API keys and secrets management
        - Environment variables for sensitive data
        - Security headers with Helmet.js
        - CORS configuration and security
      Projects built:
        - Secure API with all protections
        - Vulnerability scanner tool
        - Rate limiting service
        - Security audit checklist app
      Practice: Security audit all your previous projects
      Assessment: Month 5 check: harden an API live against a checklist, plus mixed review

  Month 6: Uploads, Media and the Phase Capstone (Weeks 21-24)
    File Uploads & Media Handling
      Topics:
        - Handling file uploads like Instagram
        - Multer for file processing
        - Image optimization and resizing
        - Video processing basics
        - Cloud storage: AWS S3, Cloudinary
        - CDN for fast media delivery
        - File type validation
        - Upload progress tracking
        - Chunked uploads for large files
        - Generating thumbnails
        - PDF generation and manipulation
        - QR code generation
      Projects built:
        - Instagram-like photo upload system
        - Video streaming service
        - File sharing platform
        - Avatar upload system
      Practice: Add file upload to previous projects
    Phase 2 Capstone: A Product Backend
      Topics:
        - Scoping a backend product: resources, auth, uploads
        - Building in vertical slices with the whole toolkit
        - Documentation a classmate can build against
        - Deploying with environment variables done right
        - A cumulative review of phases 1-2
      Projects built:
        - PHASE CAPSTONE: an authenticated, documented API with file uploads, deployed
      Practice: Have a classmate integrate against your API using only your docs
      Assessment: Phase 2 exam: capstone walkthrough plus a cumulative written paper

------------------------------------------------------------
PHASE 3: REAL SYSTEMS (MONTHS 7-8, WEEKS 25-32)
------------------------------------------------------------
What separates demos from systems: live features, background work, tests, and the modern
AI-backend layer built with guardrails.

  Month 7: Live Features and Background Work (Weeks 25-28)
    Real-time Features & WebSockets
      Topics:
        - Real-time communication explained
        - How Discord chat works instantly
```

- WebSockets vs HTTP: Persistent connections
- Socket.io library mastery
- Events: emit, on, broadcast
- Rooms: Private group chats
- Namespaces: Organizing connections
- Real-time notifications
- Live collaboration features
- Online presence indicators
- Typing indicators
- Real-time gaming backends

Projects built:
- Real-time chat application
- Multiplayer game server
- Live collaboration tool
- Real-time dashboard

Practice: Add real-time features to 3 projects

Background Jobs, Scheduling and Email

Topics:
- Why background jobs matter
- Queue systems with Bull/BullMQ
- Job scheduling with node-cron
- Email queues for bulk sending
- Image processing queues
- Scheduled reports generation
- Cleanup jobs for old data
- Retry strategies for failed jobs
- Job monitoring dashboards
- Distributed job processing
- Rate-limited API calls
- Batch processing patterns
- Transactional email that actually arrives

Projects built:
- Email campaign scheduler
- Automated backup system
- Report generation service
- Social media post scheduler

Practice: Add background jobs to existing projects

Assessment: Month 7 check: a scheduled job plus notification flow built live, plus mixed review

Month 8: Testing and AI Backends (Weeks 29-32)

Testing Fundamentals

Topics:
- Why testing prevents embarrassing bugs
- Types of testing: Unit, Integration, E2E
- Test-Driven Development (TDD)
- Jest testing framework
- Writing your first tests
- Testing async code
- Mocking external services
- Test coverage metrics
- Continuous testing practices
- Debugging failed tests
- Test organization and naming
- Testing best practices

Projects built:
- Add unit tests to all functions
- Integration tests for APIs
- TDD for new feature
- 100% coverage challenge

Practice: Write 200+ tests for your projects

AI Backends and Agent APIs

Topics:
- Putting a model behind your own API
- Secrets management: keys on the server, never the client
- Streaming responses (SSE) and why clients need them
- Queues and background jobs for slow AI calls
- Function calling and tool use from a backend
- Retrieval: giving the model your data without retraining
- Vector search basics, and when plain SQL is better
- Caching AI responses, and when caching is wrong
- Rate limiting, quotas and per-user cost caps
- Guardrails: validating what the model gives back
- Logging and auditing AI decisions
- Failure design: what happens when the provider is down
- Accounts for AI services set up with a parent where required

Projects built:
- AI chat API
- Retrieval-backed Q&A service

- Agent with tool access
- Cost + rate-limit middleware

Practice: Add an AI backend to a project

Assessment: Phase 3 exam: an AI-powered endpoint with guardrails defended, plus a cumulative paper

---

PHASE 4: SHIP (MONTH 9, WEEKS 33-36)

Performance judgment, one honest week of Docker, and the capstone deployed, documented and defended.

Month 9: Performance, Docker, Capstone (Weeks 33-36)

Performance and Monitoring Basics

Topics:

- Performance profiling tools
- Identifying bottlenecks
- Memory leak detection
- CPU profiling and optimization
- Database query optimization
- N+1 query problem solutions
- Caching at multiple layers
- CDN optimization strategies
- Code optimization techniques
- Async processing patterns
- Load testing with Artillery/k6
- Performance monitoring setup

Projects built:

- Optimize slow API to handle 10x load
- Build performance monitoring dashboard
- Create load testing suite
- Implement multi-layer caching

Practice: Performance test and optimize all APIs

Docker in One Honest Week

Topics:

- What is Docker? Shipping containers for code
- Containers vs Virtual Machines
- Docker installation and setup
- Docker images and containers explained
- Writing your first Dockerfile
- Docker commands mastery
- Multi-stage builds for optimization
- Docker volumes for data persistence
- Docker networks for container communication
- Docker Compose for multi-container apps
- Docker Hub and registries
- Container security best practices

Projects built:

- Dockerize Node.js application
- Multi-container app with database
- Docker development environment
- Production Docker setup

Practice: Dockerize all your major projects

Capstone Build

Topics:

- One focused week: a complete backend product
- Auth, data, uploads, one live feature, maybe an AI endpoint
- Tests on the logic that must not break
- Instructor checkpoint and honest scope cuts
- Deployed with documentation worth reading

Projects built:

- THE CAPSTONE: a deployed, authenticated, documented backend product

Practice: A working deployed build at the end of every session

Demo Day and the Final Exam

Topics:

- Presenting the capstone: request to response, live
- A full-course spiral review before the exam
- The honest map: Kubernetes, microservices and cloud as later professional roads
- Where each path leads: full-stack, DSA, or GenAI engineering later

Projects built:

- Demo day presentation delivered to the batch and parents

Assessment: FINAL EXAM: a practical build plus a written paper with questions mixed from every phase. Passing earns the certificate; a student who falls short gets a focused revision plan and a free retest

PROJECTS THE STUDENT BUILDS AND KEEPS

- Phase 1: JavaScript builds, first Node servers and a designed REST API
- Phase 2: dual-database models, safe auth, hardened endpoints and an uploads-capable capstone

- Phase 3: live features, scheduled jobs with email, test suites and an AI-powered endpoint
- Phase 4: performance passes, a Docker week and the deployed capstone at demo day

Total projects: 20+ real backend builds, crowned by a deployed, documented capstone

SKILLS THE STUDENT WILL HAVE AT THE END

- How the internet actually works, from socket to response
- Node.js and Express with professional REST design
- Both database families: MongoDB and PostgreSQL with honest judgment
- Safety: password hashing, tokens, OWASP basics and secure configuration
- Systems: real-time features, background jobs, email and testing
- The modern layer: AI backends and agent endpoints with guardrails

HOW A TYPICAL WEEK IS SPLIT

Live classes: 2 live one-hour classes per week, building along with the instructor
Homework: Homework after every class, and a mixed-review assignment at the end of every month
Practice: 3-4 hours of building between classes
Review: Every submission reviewed with written feedback; recurring gaps reopened in class

SUPPORT INCLUDED

Doubt support: WhatsApp doubt support between classes, for the 500 error with no message
Progress updates: Regular progress notes to parents: what was built, what comes next, and where encouragement helps

CERTIFICATION DETAIL

Completion: Certificate from Modern Age Coders, awarded on passing the final exam. Fall short and there is focused revision and a free retest: the certificate certifies knowledge, not attendance

WHERE THIS CAN LEAD

- Full-stack web development: add the frontend half and own the whole product
- Data Structures and Algorithms: the interview muscle on top of real building
- GenAI engineering later: AI backends here are the on-ramp
- The professional roads, named honestly: microservices, Kubernetes and cloud at career time
- Real services now: APIs for school clubs, family projects and friends' frontends

COMMON QUESTIONS ABOUT THIS COURSE

For anything about cost, use PART 4 and RULE 1. Do not quote two regions.

Q: Backend or frontend first for a teenager?
A: Either genuinely works, and they meet in our full-stack road. Backend first suits teens who love logic, data and how-does-it-work questions; frontend suits visual builders. Backend skill is rarer at this age, which makes it a quiet differentiator in college applications and team projects, everyone needs the person who can build the API.

Q: How long does it take, and how is my teen assessed?
A: Nine months at 2 live classes a week plus 3 to 4 hours of practice, with two more months in hand. Homework follows every class, monthly assignments mix new questions with earlier topics, each phase ends with an exam, and a final exam, practical plus written, decides the certificate with a free retest after revision.

Q: Does this course cover Kubernetes, microservices or AWS?
A: Honestly, no, and the course says why: those are professional specializations layered on years of fundamentals, and stuffing them into a teen syllabus produces vocabulary without capability. This course builds the fundamentals deeply, includes an honest Docker week, and names the infrastructure road truthfully as a later step.

Q: How is AI part of a backend course?
A: As the modern backend layer: month 8 builds AI-powered endpoints properly, model calls made server-side, responses streamed, guardrails against misuse, costs controlled, and a look at agent APIs. Accounts for AI services are set up with a parent where required. Backends are exactly where AI features live in real products.

Q: Is there a free trial class?
A: Yes, a free demo class with no commitment: book at learn.modernagecoders.com/contact or message us on WhatsApp at +91 91233 66161. (Agent note: the free demo is a waiting list with no fixed date. The Priority Live Demo is a guaranteed class today or tomorrow, booked at https://learn.modernagecoders.com/priority-demo . Offer both, as RULE 3 says.)

Q: Are classes live or recorded?
A: Live, always: small groups with a real instructor reading real code and real logs, never pre-recorded videos. Backend errors are invisible by nature; live debugging together is how the skill actually forms.

To enrol, message Shivam Sir on +91 9123366161 or send the parent this link: https://learn.modernagecoders.com/courses/backend-coding-masterclass-for-teens
For a demo: the Priority Live Demo (guaranteed, today or tomorrow) is booked at https://learn.modernagecoders.com/priority-demo . The free demo is a waiting list with no fixed date.

==========

COURSE 27 OF 137: BUILD AI AGENTS WITH GOOGLE GEMINI ENTERPRISE

==========

Course link: https://learn.modernagecoders.com/courses/build-ai-agents-with-google-gemini-enterprise-course
Subject area: AI Agents & Automation
Designed for: College students
Who can join: Intermediate to advanced · working professionals, founders, team leads and developers
Course length: 16 classes (2 months · 2 classes/week · 1 hour each)
Time needed: 2 live hours a week plus 3-4 hours of build time
Certificate: Certificate from Modern Age Coders, awarded on passing the final assessment

PRICE FOR THIS COURSE (quote only the one that applies to the person asking)
In India, per month: one to one Rs 14,999
Outside India, per month: one to one $250
Classes: one to one in India two live classes a week, eight a month; one to one outside India two live classes a week, eight a month. Each class is one hour.
Note: this course is taught one to one only. There is no group or mini batch option.

WHAT THIS COURSE IS

Build AI agents with Google Gemini Enterprise in 16 live 1-on-1 classes: Workflow Builder, connectors, MCP, A2A, ADK and governance on Google Cloud. 2 months.

In one line: 16 live 1-on-1 classes over 2 months. Build, connect, govern and ship enterprise AI agents with Workflow Builder, connectors, MCP, A2A and the Agent Development Kit, with a dedicated mentor and your own organisation's work as the material.

ABOUT THE PROGRAMME

Google rebuilt its enterprise AI story around agents. At Google Cloud Next in April 2026 it introduced the Gemini Enterprise Agent Platform, the evolution of Vertex AI, and positioned the Gemini Enterprise app as the single place where teams discover, create, share and run agents. Since then the platform has shipped at a pace that makes recorded courses obsolete within weeks: Workflow Builder (formerly Agent Designer) reached general availability on 2 September 2026 with multi-step automation, chat agents and enterprise connectors; Skills, Projects, the Inbox, observability dashboards, Agent Registry governance, custom MCP server data stores and A2A agent registration all went GA between June and September; and the model lineup moved through Gemini 3.1 Pro to Gemini 3.5, 3.6, 3.7 and 3.8 Flash. This programme teaches that platform as it stands today, in sixteen private one-hour classes over two months. You start on the no-code side: chat agents and workflows in Workflow Builder, grounded in Google Workspace and third-party data stores, calling real actions in Slack, ServiceNow, Jira and GitHub, gated by human approvals and run on schedules and triggers. You then cross to the pro-code side that the same platform exposes: the Agent Development Kit (ADK) in Python, the Agent Runtime with Sessions, Memory Bank and Code Execution, Agent Identity, Model Armor and Agent Simulation, and the open protocols, Agent2Agent (A2A) and the Model Context Protocol (MCP), that let agents from different builders work together and be registered and governed inside Gemini Enterprise. The final phase is the part most agent courses skip and most organisations pay for: observability, cost modelling across seat editions and pay-as-you-go, data residency (the India region reached general availability in June 2026), organisation policy constraints, content policies for sensitive data, and the exam map for Google Cloud's Professional Agentic Architect certification. You finish with a capstone agent estate for your own team, defended live with the governance and cost pack to match. Because every class is 1-on-1, the depth follows your role, and the syllabus is a Living Syllabus, re-verified against Google Cloud's release notes as the platform ships.

WHAT MAKES THIS COURSE DIFFERENT

- 1-on-1 only, by design: enterprise agent work touches your data, your connectors, your admin posture and your budget, none of which belongs in a group class. A dedicated mentor builds every class around your organisation and goes exactly as deep as your role needs.
- Both halves of Google's platform in one programme: no-code Workflow Builder, Skills and Projects in the Gemini Enterprise app, and pro-code ADK, Agent Runtime, Agent Identity and Model Armor in the Gemini Enterprise Agent Platform, plus the honest rules for when each is the right tool.
- Real connectors, real actions: agents that read and write Slack, ServiceNow, Jira, Confluence, GitHub, Google Workspace and Microsoft Teams through the data stores Google ships, not demo data, with organisation policy constraints and content policies applied the way an administrator would.
- Open protocols taught as a skill you keep: the Model Context Protocol for tools and the Agent2Agent protocol for agent collaboration, both supported natively in Gemini Enterprise and now backed by more than 150 organisations through the Linux Foundation.
- Cost and governance fluency most builders lack: seat editions, the pay-as-you-go edition,

overage controls, Agent Runtime metering, observability with p50 and p95 latency, data residency and the certification ladder, so your capstone ships with a defensible bill and audit trail.
- Living Syllabus: Gemini Enterprise ships changes every week (Workflow Builder went GA on 2 September 2026 and Gemini 3.8 Flash the same day), and this course is re-verified against Google Cloud's release notes as features land, which is why it is taught live, never recorded.

WHAT A STUDENT NEEDS BEFORE STARTING

Device: A laptop or desktop (Windows, Mac or Linux) with Chrome and a reliable internet connection; the Gemini Enterprise app and Workflow Builder run fully in the browser, and the ADK classes need Python 3.10 or newer installed
Coding experience: None required for the no-code half. Workflow Builder, Skills, Projects and connectors are taught without code, and the pro-code classes on the Agent Development Kit are paced to you: developers go deeper into ADK and Agent Runtime, non-developers learn to read and direct that work
Accounts: A Google Cloud account with Gemini Enterprise access (Standard, Plus or the pay-as-you-go edition unlocks Workflow Builder). Ideally you use your employer's environment with your administrator's awareness; where that is not possible, we help you set up a pay-as-you-go project or a practice environment in the first class, at your own cloud cost
Mindset: The willingness to treat agents as production software: tested before trusted, costed before scaled, and governed before shipped. No prior agent-building experience is assumed; comfort with everyday business software is. The course rewards professionals who ask what does this cost and who approved it as instinctively as does it work

WHO THIS COURSE IS FOR

Operations and business leads: Process owners, analysts and operations leads who know exactly which workflow is broken and want to ship the agent that fixes it, with the evidence to defend it
It and workspace admins: IT professionals and Google Workspace or Google Cloud administrators who will be asked to govern agents either way, and would rather understand Agent Registry, policy constraints and residency before the first incident
Developers and architects: Developers and solution architects adding the Google agent stack (ADK, Agent Runtime, A2A, MCP) to skills employers already list, and preparing for the Professional Agentic Architect certification
Founders and team leads: Founders, product managers and team leads who must decide what gets automated, what it costs per seat or per run, and which agent projects deserve to ship
Consultants and partners: Consultants and Google Cloud partners who want to sell agent builds that pass a client's security review, with governance and cost packs as deliverables, not afterthoughts

FULL CURRICULUM, WEEK BY WEEK

This is the complete teaching plan. Parents can ask about any week.

PHASE 1: THE GEMINI ENTERPRISE PLATFORM

Map Google's two-sided agent stack, get the right edition and access, learn the anatomy of a Workflow Builder agent, build instruction and testing discipline, and make the model and Skills decisions that shape cost and capability.

Class 1: Google's Agent Stack in September 2026 and Where You Build
Topics:
- The two halves by their exact names: the Gemini Enterprise app (where teams discover, create, share and run agents) and the Gemini Enterprise Agent Platform (the evolution of Vertex AI, announced at Google Cloud Next on 23 April 2026, where developers build, scale, govern and optimise agents)
- What lives on each side: Workflow Builder, Skills, Projects, Inbox, Canvas and the Agent Gallery in the app; the Agent Development Kit, Agent Runtime, Agent Identity, Agent Gateway, Model Armor, Agent Simulation and Agent Observability on the platform
- Editions and what they unlock: Business, Standard and Plus seats, the Frontline edition, and the pay-as-you-go edition that reached general availability on 1 August 2026; Workflow Builder is documented for Standard, Plus, pay-as-you-go and Frontline, which decides where your organisation must be
- Access and roles honestly stated: the Gemini Enterprise Admin and Gemini Enterprise User IAM roles (available since 15 April 2026), licence distribution in the Google Cloud console, and what a maker can and cannot do without an administrator
- The prebuilt agents you inherit: the Core Assistant root agent, Deep Research and Co-Scientist, and why the Idea Generation agent was retired in July 2026 (its work moved to the assistant and Deep Research)
- Reading the release notes like an architect: GA versus Public Preview versus allowlist, and the rule this course lives by, production commitments only on GA features
- Choosing your capstone: one real process from your own team, nominated today and refined for sixteen classes
Projects built:
- Write your organisation's one-page agent opportunity memo: three candidate processes, the

data and systems each needs, the risks each carries, the edition it requires, and the one that becomes your capstone

Practice: Audit two agents you already meet at work or online and reverse-engineer what they are grounded in, what they can act on, and where a human is in the loop.

Assessment: Defend your capstone choice in five minutes: process, users, data, edition, risk, and what measurably better will mean.

Class 2: Agent Anatomy in Workflow Builder

Topics:

- Workflow Builder, formerly Agent Designer, generally available since 2 September 2026: the two build artifacts, chat agents (conversational, task-specific, largely non-deterministic) and workflows (sequential multi-step processes that combine AI steps with human intervention)
- The two creation modes and when to use each: describing the agent in natural language, and building on the visual canvas with steps, triggers and actions
- Instructions as the real product: identity, scope, tone, format rules, refusals and escalation, written in that order and versioned outside the tool from day one
- The permission model that governs everything: actions and tools available to any agent or workflow are limited to the data connectors, tools and permissions the Gemini Enterprise administrator has provisioned
- The default model decision made for you: Workflow Builder agents default to Gemini 3.1 Pro in the US and Global regions (since 17 May 2026), and what that means for reasoning quality and cost
- Publishing, turning on and sharing: agents shared with specific users or Google Groups (end-user sharing to Groups has been GA since June 2026), and why sharing scope is a governance decision
- Instruction anti-patterns from real deployments: contradictions, vague verbs, policy text pasted verbatim, and instructions that fight the knowledge sources

Projects built:

- Build Policy Desk v1: an internal chat agent for one real policy area of your organisation, with a complete instruction stack, five tested refusals and a designed hand-off to a human

Practice: Run the same ten workplace questions against two instruction variants and score every difference in a comparison table.

Assessment: Present your instruction stack line by line and state, for each line, what production incident removing it would eventually cause.

Class 3: Testing Like It Is Already in Production

Topics:

- The fixed test set written before tuning: happy path, edge case and adversarial questions for Policy Desk, with expected behaviour recorded first
- The integrated testing environment in Workflow Builder: previewing and simulating chat agents and workflows before publishing, and what a simulation can and cannot prove
- Adversarial testing for business agents: prompt injection attempts, policy-boundary probes, the disgruntled-user tone test, and the transparent thinking view (GA July 2026) as a debugging aid
- Hallucination triage: distinguishing missing knowledge, bad grounding and model overreach, because each has a different fix
- Regression discipline: rerunning the full set after every instruction, knowledge or tool change, and logging verdicts in a form a reviewer can read
- Escalation as a tested feature: the designed path to a human is an outcome you verify, not a failure you apologise for
- Preview of Phase 4: Agent Simulation on the Agent Platform stress-tests agents against real-world scenarios before deployment; today you build the manual version of that discipline

Projects built:

- Build the permanent 25-question test set for Policy Desk, including five adversarial probes, and run it end to end in the testing environment with verdicts logged

Practice: Attempt three prompt-injection attacks on your own agent, document the outcomes, and patch the weakest point.

Assessment: Given a transcript with three subtle failures, identify each one and classify it: instructions, knowledge or escalation gap.

Class 4: Models, Skills and Projects: The Decisions Underneath

Topics:

- The Gemini lineup inside Gemini Enterprise as of September 2026: Gemini 3.1 Pro as the Pro flagship and Workflow Builder default; Gemini 3.5 Flash (GA 19 May 2026), 3.6 Flash, 3.7 Flash (GA 13 August) and 3.8 Flash (GA 2 September), each with its own regional rollout
- Reading model status correctly: Limited Availability, allowlist, GA per region, and deprecation notices (the 3.5 Flash toggle was retired in June; its Global-region removal was postponed in August), so production agents pin to what is GA where your data lives
- Data residency as a model decision: DRZ (data residency zone) and MLP commitments per region, and the India and Singapore regions reaching GA with DRZ in June 2026
- Skills, generally available since June 2026: reusable, shareable capabilities that end users can create, upload and share once an administrator turns the toggle on, and the governance conversation that toggle starts
- Projects, GA since 4 September 2026: private knowledge bases with file upload and web search, shared by teams and agents as a persistent workspace
- Choosing a model with evidence: the same test set run against two models, scored on accuracy, tone and latency, and written up as a one-paragraph decision
- Phase 1 gate: the platform map, edition, access and model decisions for your capstone, in writing

Projects built:
- Run your Policy Desk test set against two Gemini models, score the differences, and write the model decision with evidence attached; then package the agent's reusable behaviour as a Skill and put its source documents in a Project

Practice: Draft the request you would send to your Gemini Enterprise administrator to enable Skills sharing and confirm the region your agents run in.

Assessment: Phase 1 gate: rebuild a small business agent from a written spec in 30 minutes, with instruction stack, refusals, a 10-question test and a defended model choice.

PHASE 2: KNOWLEDGE, CONNECTORS AND ACTIONS

Ground agents in Google Workspace and third-party data at scale, understand federated versus indexed sources, give agents actions that write to real systems, add custom MCP servers under Agent Registry governance, and prove accuracy the way an auditor would.

Class 5: Grounding Strategy: The Data Store Estate

Topics:
- Data stores as the knowledge layer: Google Workspace sources (Drive, Gmail, Calendar, Chat, Sites), and the third-party estate Google has been adding at the rate of roughly ten a fortnight through 2026, from Jira, Confluence, Slack, ServiceNow, Box, Dropbox, GitLab and GitHub to Smartsheet, Asana, Airtable, Dynamics 365 and Microsoft Teams
- Federated versus indexed sources: what a federated data store searches live in the source system, what an indexed store copies and ranks, and the latency, freshness and permission consequences of each
- Status discipline again: which connectors are GA (Slack, ServiceNow, Jira and Confluence Data Center, HubSpot, Box, Microsoft Teams, GitHub, Google Sites) and which are still Public Preview, and why a capstone grounds only on GA sources
- Filtering as a design tool: data store filters (SharePoint and Google Sites filters reached GA in mid-2026) that scope an agent to the folders, spaces and sites it should actually see
- Permissions reality: agents surface what their data stores can reach for the signed-in user, so source selection is a security decision, not just a quality one
- Citations as a compliance feature: grounded, cited answers as the difference between an answer and a liability
- Designing the capstone's source map: authoritative, current, permissioned and small enough to audit

Projects built:
- Ground Policy Desk in a real Google Drive or SharePoint source (or a mirrored practice copy) and prove ten answers cite the correct document and passage

Practice: Ask your grounded agent five questions its sources cannot answer and document the exact edge-of-knowledge behaviour.

Assessment: Present your capstone source map: every source, its owner, its type (federated or indexed), its update cadence, and why it earns its place.

Class 6: Documents, Workspace and Third-Party Knowledge Done Right

Topics:
- Writing documents for retrieval: headings that answer questions, one fact per paragraph, consistent terminology, and the anti-pattern of the 40-page PDF
- Drive and SharePoint hygiene that grounding exposes: stale copies, duplicate policies, draft folders, and the librarian pass that fixes them before the agent embarrasses you
- Structured versus prose knowledge: when a Jira project, a ServiceNow table or a Smartsheet grid should answer instead of a document, and how instructions route question types to source types
- Source arbitration: what happens when Confluence, a Google Doc and Slack disagree, and the scoping instructions that decide which wins
- Freshness engineering: which source updates win, what happens when an indexed document changes, and update cadences you can promise a stakeholder
- Data minimisation at the source: what never belongs in agent knowledge (personal data, credentials, unreleased financials), previewing the content policies of Class 15
- The curation multiplier: five well-structured pages outperform fifty messy ones, demonstrated live on your own content

Projects built:
- Rebuild one messy real document into a retrieval-optimised version, ground both versions side by side, and publish the before-and-after accuracy comparison; then add a second, structured source and document the arbitration behaviour with five conflict questions

Practice: Run a librarian audit on one Drive or Confluence area you actually use: what is in, what is stale, what would embarrass the agent that cites it.

Assessment: Given two document structures, predict which grounds better and prove it with a five-question retrieval test.

Class 7: Actions: Agents That Write to Real Systems

Topics:
- From answering to acting: connector actions in Gemini Enterprise, and the GA action sets that ship with the platform (sending and scheduling Slack messages since May 2026, creating and updating ServiceNow incidents since June, Microsoft Teams channel and chat actions since July)
- Action filtering as governance: the filters that restrict which actions an agent may take on SharePoint, OneDrive and Jira Data Center, and why an administrator, not a maker, decides

them
- The consent question: connection credentials, who authorises what, and why connecting an account is a governance event you document
- Designing a write-safe agent: confirm before act, idempotence (running twice must not double the damage), and the safe default when inputs surprise you
- Custom actions and custom fields (Private Preview as of 8 September 2026): where Google is taking action configuration, flagged honestly as preview, not promised
- Error paths as product: what the user sees when the action fails, times out or is refused, designed before the happy path is polished
- The action inventory for your capstone: every write the agent will ever make, with an owner and a rollback

Projects built:
- Build Support Triage v1: a chat agent that collects an issue, searches the right knowledge, and creates the ServiceNow incident or Jira issue (or posts to the right Slack channel) with a confirmation step and tested failure messages

Practice: Break your action deliberately (missing field, revoked permission, timeout) and verify the user sees a designed message for each failure.

Assessment: Sketch one action end to end (utterance, agent, action selection, auth, call, result, reply) and mark every point where governance can intervene.

Class 8: Custom MCP Servers, Agent Registry and the Accuracy Audit

Topics:
- The Model Context Protocol in one sentence: the open standard for plugging tool servers into agents, supported in Gemini Enterprise through custom MCP server data stores (GA since 7 August 2026) and through Workflow Builder's MCP server connections
- The governance facts that make MCP enterprise-safe here: custom MCP server data stores are disabled by default and need an organisation policy constraint override, tools are auto-discovered through the server's tools/list endpoint, and unauthenticated connections are a separate Public Preview you keep out of production
- Agent Registry, GA since June 2026: registering, importing and governing MCP servers and agents from one place, so a security lead can see every tool surface an agent has
- Evaluating a third-party MCP server before connecting it: capabilities, data flows, failure modes and the least-power principle, written as a one-page security note
- The Gemini Enterprise Agent Platform's own remote MCP server: letting coding agents and IDEs operate the platform through MCP, and where that helps a builder
- The accuracy audit protocol: scoring 25 grounded answers against the actual source text with a rubric a non-builder could apply, plus uncertainty language as policy
- Phase 2 gate: the grounding and tooling checklist you will apply to every agent for the rest of your career

Projects built:
- Connect one custom MCP server to a practice agent with only the tools you need enabled and a one-page security note, then run the full 25-answer accuracy audit on Policy Desk and publish the result with methodology and a remediation list

Practice: Draft the organisation policy request for your MCP integration as you would submit it to your Google Cloud administrator, naming the data boundaries.

Assessment: Phase 2 exam: design the complete knowledge, action and tool plan for a new use case in writing (sources, filters, actions, MCP, refusals, audit protocol) in 30 minutes.

PHASE 3: WORKFLOWS, AUTONOMY AND MULTI-AGENT SYSTEMS

Build multi-step workflows with triggers, schedules and human approvals, run them from the Inbox, compose sub-agents and Agent Gallery agents, register agents over A2A and A2UI, then cross to the pro-code side: ADK, Agent Runtime, Agent Identity and Model Armor.

Class 9: Workflows: Deterministic Automation with a Human in the Loop

Topics:
- Workflows in Workflow Builder: triggers, steps and actions on the visual canvas, and the difference between a deterministic step sequence and a non-deterministic chat agent
- Flow control that survives real inputs: conditions, branches, loops over lists, and the outputs handed from one step to the next
- Human-in-the-loop as architecture: approval stages where a task waits for a person to sign off, who the approver is on paper, and what the approval message must contain
- Running a workflow three ways: on an automated schedule, manually on demand, or by @-mentioning it inside a Gemini Enterprise chat conversation
- The Inbox: the unified hub for monitoring active and long-running agents, adjusting configurations and receiving real-time status alerts through email and chat
- The approvals pattern as the single most reused business workflow: request, validate, route, approve, act, report
- Notification etiquette: a workflow that spams gets disabled by its own users, so frequency and channel are design decisions

Projects built:
- Build Expense Helper: a workflow that collects an expense claim, validates it against policy, pauses for a manager's approval, files the result in the right system and reports back, with tested error paths for every step

Practice: Trigger Expense Helper from chat, from the canvas and from a schedule, and record how the Inbox shows each run.

Assessment: Given five business tasks, assign each to chat agent, workflow, Skill or

plain knowledge, and justify each assignment in two sentences.

Class 10: Triggers, Schedules and Hardened Autonomy
Topics:
- Trigger-based and schedule-based agents: workflows that start from a business event or a recurrence rather than a person, and the generative planning they rely on
- The first autonomous job: small, observable, reversible and logged, with the operations note that says what it does, when, with whose permissions, and how to switch it off
- Idempotence, retries and safe defaults: the three properties every unattended workflow must prove before it touches a real system
- Failure diaries: structured capture of what went wrong so Tuesday's incident is not repeated on Thursday
- Scope creep in autonomy: the it-could-also-just trap, and the change-control habit that resists it
- Observability settings per agent (Public Preview since June 2026) and what they add to the traces you will read in Class 13
- Autonomy scoping for the capstone: which jobs deserve a trigger, which must stay human-initiated, and why

Projects built:
- Build Weekly Reporter: a scheduled workflow that compiles a weekly status summary from real sources, drafts it into a Google Doc, and posts it for review, never directly to stakeholders; then harden it with an approval pause, an error diary and a self-report of its own actions

Practice: Let Weekly Reporter run unattended for three real cycles and audit every action against what you intended, scoring each.
Assessment: Live drill: your mentor corrupts one input source; your workflow must fail gracefully and your diary must show why, unedited.

Class 11: Multi-Agent Systems: Sub-Agents, the Agent Gallery, A2A and A2UI
Topics:
- When one agent becomes several: the router-plus-specialists pattern, sub-agents inside Workflow Builder, and the hand-off contracts that keep them debuggable
- The Agent Gallery: partner-built agents from the Google Cloud Marketplace (Adobe, Salesforce, ServiceNow, Workday and Oracle among the launch partners) inside the Gemini Enterprise app, behind a request-and-approval gateway
- The Agent2Agent protocol: created by Google, donated to the Linux Foundation in 2025, now supported by more than 150 organisations and integrated across Google, Microsoft and AWS platforms; what an agent card is and how discovery and delegation work
- Registering A2A agents in Gemini Enterprise (GA since 17 August 2026), including agents built elsewhere, and the governance that applies to them through Agent Registry
- A2UI: the companion standard for agent-driven user interfaces, with v0.9 Material Design components supported in Gemini Enterprise since August 2026
- Failure across agent boundaries: timeouts, unclear hand-offs and the tracing habits that keep multi-agent systems debuggable
- Architecture review: when multi-agent is real engineering and when it is complexity for its own sake

Projects built:
- Refactor Support Triage into a two-agent design: a routing agent plus a specialist sub-agent, with documented hand-off contracts and a failure-mode table; then register an external A2A agent and delegate one task to it

Practice: Diagram your capstone as both a single agent and a multi-agent design, and write the three-sentence verdict on which ships.
Assessment: Defend one hand-off contract: what crosses the boundary, what must never cross it, and what happens when the far side fails.

Class 12: The Pro-Code Bridge: ADK, Agent Runtime, Agent Identity and Model Armor
Topics:
- When no-code is not enough, and the platform's answer: the Agent Development Kit (ADK), Google's open-source framework in Python, Java and Go, with the graph-based structure for organising agents into networks of sub-agents and native MCP support
- Reading and writing a real ADK agent: an LlmAgent with a Gemini model, tools, instructions and sub-agents, run locally with the ADK developer UI before anything is deployed
- Agent Runtime: the managed runtime for fast, persistent agents, with Sessions and Memory Bank (GA December 2025), Code Execution (GA February 2026) and metered usage since 11 February 2026; one-command deployment with adk deploy
- Bringing code agents into the app: ADK agents hosted on Agent Runtime can be registered with Gemini Enterprise (since April 2026), so business users run what developers build
- The security layer by its exact names: Agent Identity (a unique cryptographic identity per agent for traceability), Agent Gateway (the control point between agents and data), and Model Armor (protection against prompt injection, tool poisoning and sensitive data leakage)
- Agent Simulation: stress-testing an agent against real-world scenarios before deployment, and how it industrialises the discipline you built by hand in Class 3
- The decision tree you will reuse for years: Workflow Builder, ADK, or a partner agent from the Gallery, chosen by governance posture, team skills and cost, not fashion

Projects built:
- Build and run a small ADK agent in Python that wraps one tool your capstone needs, deploy it to Agent Runtime, register it in Gemini Enterprise, and call it from a Workflow Builder agent; document the identity and Model Armor settings you applied

Practice: Rewrite one Workflow Builder step as an ADK tool and one ADK behaviour as a

Workflow Builder step, and write down which felt right and why.
Assessment: Phase 3 exam: given a use case, design the full architecture (no-code versus pro-code split, agents and sub-agents, protocols, identity, guardrails) and defend it.

PHASE 4: OBSERVABILITY, COST, GOVERNANCE AND CAPSTONE

Prove agents work and know what they cost: tracing and metrics, seat and pay-as-you-go economics, data residency and policy controls, the Professional Agentic Architect exam map, then a production capstone defended with its governance and cost pack.

Class 13: Observability: Traces, Metrics and the Improvement Loop
Topics:
- Observability for Gemini Enterprise, GA since 24 June 2026: the metrics dashboards and trace viewing in the Observability tab, and the latency and error-rate views (p50 and p95, GA 3 September) that tell you whether an agent is getting slower
- Reading a trace: the execute_tool and invoke_connector spans added in August 2026, and how a slow connector, a failing tool and a bad prompt each look different
- Standards you can export: agent telemetry aligned with the OpenTelemetry generative AI semantic conventions, gen_ai attributes in Cloud Logging, and the Cloud Monitoring dimensions (tool_id, engine_id, response_code) for connectors
- The improvement loop as a weekly ritual: dashboards, hypothesis, one change, retest, remeasure
- Finding the gap: unanswered and escalated questions, ranked, as the roadmap for the next iteration
- Instrumenting the capstone: the three numbers that will define success in front of your leadership
- Observability as governance evidence: the artefact you hand a reviewer instead of a demo

Projects built:
- Observability sprint: run one agent with at least five real users for a week, review its traces and metrics, ship two data-demanded improvements, and write the before-and-after with p95 latency and error rate on the page

Practice: Draft the monthly one-page agent report your leadership would actually read: usage, outcomes, latency, errors, next actions.
Assessment: From a set of traces, diagnose the top failure pattern, propose the fix, and prove it with a retest.

Class 14: Cost: Seats, Pay-As-You-Go, Overage and Runtime Metering
Topics:
- The seat model: Business, Standard and Plus editions of Gemini Enterprise (Business around 21 US dollars per seat per month and Standard around 30 at launch, Plus through sales), what each edition includes, and which features (Workflow Builder among them) the Business edition does not unlock
- The pay-as-you-go edition (GA 1 August 2026, invoice-based billing, no pooled quotas) and the AI developer tools bundle, now open to all invoiced Cloud Billing accounts
- Overage billing controls (launched 17 August 2026, opened to all invoiced accounts on 1 September): what an overage cap protects you from and what it silently switches off
- Agent Runtime economics: Sessions, Memory Bank and Code Execution have been metered since 11 February 2026, so a pro-code agent has a bill a no-code agent does not
- Model cost as a design input: Pro versus Flash models, why the Flash line moved through 3.5, 3.6, 3.7 and 3.8 in four months, and how to read Google's pricing pages rather than memorise numbers that change
- Modelling a real workload: seats, agents, sessions per week, runtime hours and model calls, at three adoption levels, under seats versus pay-as-you-go
- Cost as a design input: grounding choices, action counts, model tier and autonomy all move the bill, and you now know roughly by how much

Projects built:
- Build the complete cost model for your capstone: edition recommendation, seat count, pay-as-you-go versus seats comparison, Agent Runtime line if any, overage cap, and a monthly projection at three adoption levels

Practice: Re-estimate the model twice, once with a Pro model and once with a Flash model on the same test set, and write down what the difference buys.
Assessment: Given a described workload, produce the edition recommendation, the cost estimate and the overage plan in 30 minutes.

Class 15: Governance: Residency, Policy Constraints, Content Policies and the Certification Map
Topics:
- Data residency you can promise: DRZ and MLP commitments per region, the India and Singapore regions GA in June 2026, Japan and the UK in July, and what an Indian enterprise can now sign off on
- Managed organisation policy constraints for data connectors (GA since 7 July 2026): restricting allowed sources and egress FQDNs, and the custom MCP server constraint that ships disabled by default
- Content policies for sensitive data protection (GA since 31 August 2026): what the policies catch, where they apply, and how they pair with Model Armor on the pro-code side
- Identity and access end to end: Gemini Enterprise Admin and User roles, Okta SCIM and third-party identity (BYOID) for the app, Agent Identity for agents, and the Agent Registry as the record of what exists
- Compliance surfaces: Assured Workloads with FedRAMP High for federated data stores, VPC

Service Controls, and the honest note that a live web crawl can violate a perimeter
- The certification map: Google Cloud's Professional Agentic Architect (a three-hour proctored exam of around 80 questions plus hands-on labs, in beta until 30 September 2026) and its five domains (low-code agents, coding agents, custom agents, evaluation and deployment, security and governance), with the Generative AI Leader credential as the on-ramp for teammates
- The 20-point production checklist covering grounding, actions, protocols, observability, cost, residency, policy and rollback

Projects built:
- Write the governance pack for your capstone: region and residency decision, organisation policy and content policy plan, identity and sharing plan, Agent Registry entries, compliance notes, and the rollout runbook with rollback

Practice: Role-play the security review with your mentor as the Cloud administrator: your pack must answer every who-approved-this and where-does-the-data-go question.
Assessment: Run the 20-point production checklist against your capstone as it stands today and file every failure into the Class 16 build plan.

Class 16: Capstone Build and Defence
Topics:
- Freezing the spec: the capstone's job, users, sources, actions, workflows, triggers, agents, model, edition, region and cost model on one page
- Building in production order: knowledge first, chat agent second, actions third, workflows and triggers fourth, sub-agents last, with the test set running throughout
- Beating your baseline: the Class 3 test set and the Class 13 observability numbers as the bar, rerun at every milestone
- Polish that earns trust: greeting, transparency statement, escalation tone, approval messages, error messages
- The live defence: your agent estate demonstrated in the Gemini Enterprise app, with traces, the cost model and the governance pack on the table
- Defending decisions like an architect: why these sources, this no-code versus pro-code split, these actions, this model, this region, this edition
- The Living Syllabus promise: what changed in Gemini Enterprise while you were learning it, reviewed together, plus your next step, whether that is the Professional Agentic Architect exam or the internal pitch for your organisation's agent playbook

Projects built:
- Deliver the capstone: a production-grade agent estate for your own team on Gemini Enterprise, with grounded knowledge, at least one real action, one governed workflow with a human approval, a passing test set, observability in place, and the complete cost and governance pack, defended live

Practice: Run the dress rehearsal for a colleague outside the course and fix the two weakest moments they point at.
Assessment: Final evaluation: capstone defence, governance and cost pack review, and the complete documentation packet, graded against the Class 15 production checklist.

PROJECTS THE STUDENT BUILDS AND KEEPS

- Phase 1: an agent opportunity memo for your organisation, Policy Desk v1 with a tested instruction stack, a 25-question adversarial test set, and a defended model decision packaged as a Skill and a Project
- Phase 2: a Drive or SharePoint-grounded Policy Desk with citation proofs, a retrieval-optimised document rebuild with before-and-after accuracy, Support Triage v1 writing real ServiceNow, Jira or Slack actions, a governed custom MCP server integration with a security note, and a published 25-answer accuracy audit
- Phase 3: the Expense Helper approval workflow, the scheduled Weekly Reporter and its hardened successor with an operations note, a two-agent Support Triage with A2A delegation, and a Python ADK agent deployed to Agent Runtime and registered in Gemini Enterprise
- Phase 4: an observability sprint with shipped improvements, a complete edition and pay-as-you-go cost model, the governance pack with residency, policy and identity decisions, and the capstone build and live defence
- Total: 16 professional deliverables, one per class, finishing with a production capstone agent estate plus a governance and cost pack

Total projects: 16 professional deliverables, one per class, finishing with a production capstone agent estate plus a governance and cost pack

SKILLS THE STUDENT WILL HAVE AT THE END

- Agent design for business: instruction stacks, scope fences, refusals and escalation paths in Workflow Builder chat agents
- Enterprise knowledge grounding: Google Workspace and third-party data stores, federated versus indexed sources, filters and citations, within real platform limits
- Actions that write to real systems: Slack, ServiceNow, Jira, Confluence, GitHub and Microsoft Teams actions with confirmation, idempotence and designed failure paths
- Custom MCP servers under Agent Registry governance, and the security note that earns a policy override
- Workflows with triggers, schedules, flow control and human-in-the-loop approvals, monitored from the Inbox
- Multi-agent systems: sub-agents, Agent Gallery partner agents, A2A registration and A2UI interfaces
- The pro-code path: Agent Development Kit agents in Python, Agent Runtime with Sessions,

Memory Bank and Code Execution, Agent Identity and Model Armor
- Observability: traces, p50 and p95 latency, error rates and OpenTelemetry-aligned telemetry, run as a weekly improvement loop
- Cost management: seat editions, pay-as-you-go, overage controls and Agent Runtime metering, modelled at three adoption levels
- Governance: data residency, organisation policy constraints, content policies, identity and sharing, Agent Registry, and the Professional Agentic Architect exam map

HOW A TYPICAL WEEK IS SPLIT

Live classes: 2 private 1-on-1 classes per week, 1 hour each, across 8 weeks (two months)
Hands on agent work: 2-3 hours building, testing and observing in Gemini Enterprise between classes
Project time: 1-1.5 hours completing each class deliverable, usually against your own organisation's use case
Review and doubts: 30-60 minutes reviewing feedback and clearing doubts over WhatsApp before the next class
Homework: A task after every class, and a phase-gate review at the end of each phase that deliberately folds in earlier topics

SUPPORT INCLUDED

Dedicated mentor: The same mentor for all 16 classes, who knows your organisation's context, your capstone and your governance constraints
Whatsapp doubts: Doubt support between classes over WhatsApp
Practice environment: Help arranging your Gemini Enterprise access in Class 1: employer environment, a pay-as-you-go project, or a practice environment we help you set up
Session recordings: Class recordings available for revision, so a missed detail is never lost

CERTIFICATION DETAIL

Completion: Certificate from Modern Age Coders, awarded on passing the final assessment. Fall short and there is focused revision and a free retest: the certificate certifies real learning, not attendance

WHERE THIS CAN LEAD

- AI agent builder, automation specialist or agentic solutions roles, the titles now appearing in real job listings as organisations move from pilots to agent estates
- Google Cloud Professional Agentic Architect certification, for which this syllabus is direct preparation across all five exam domains, with the Generative AI Leader credential as a lighter first step
- The internal agent champion or centre-of-excellence role: the person who owns the organisation's agent playbook, governance posture and cost model on Gemini Enterprise
- Consulting and partner delivery, with a portfolio capstone that includes the governance and cost artefacts clients' security and finance teams actually ask for
- A bridge to code-first agent engineering: the ADK and Agent Runtime work here, and our Codex + Claude Code masterclass when you want to build agents entirely in code

COMMON QUESTIONS ABOUT THIS COURSE

For anything about cost, use PART 4 and RULE 1. Do not quote two regions.

Q: Do I need to be a developer to build agents with Google Gemini Enterprise?
A: No. Workflow Builder, Skills, Projects, connectors and actions are all no-code, and the hard parts they involve are design, testing, governance and cost, which are not programming skills. The programme does cross into the Agent Development Kit for the pro-code path, but that phase is paced to you: developers go deep into ADK and Agent Runtime, while non-developers learn to read, direct and govern that work. Both audiences finish the same capstone.

Q: What is the difference between Gemini Enterprise and the Gemini Enterprise Agent Platform?
A: The Gemini Enterprise app is where teams discover, create, share and run agents: Workflow Builder, Skills, Projects, the Inbox, Canvas and the Agent Gallery live there. The Gemini Enterprise Agent Platform, announced at Google Cloud Next in April 2026 as the evolution of Vertex AI, is where developers build, scale, govern and optimise agents with the Agent Development Kit, Agent Runtime, Agent Identity, Model Armor and Agent Simulation. This course teaches both halves and, more importantly, when each is the right tool.

Q: Why is this course taught 1-on-1 only?
A: Because the material is your organisation's material. The mentor reviews your actual instruction stacks, workflows, traces and governance artefacts every session, and adjusts depth to your role, whether you are an analyst, an administrator or an architect.

Q: How is the course structured and how long does it take?
A: Sixteen private classes over two months: two live one-hour classes a week for eight weeks, in four phases of four classes each. Phase 1 covers the platform and agent foundations, Phase 2 knowledge, connectors and actions, Phase 3 workflows, autonomy and multi-agent systems including the pro-code bridge to ADK, and Phase 4 observability, cost, governance and the

capstone. Every class ends with a deliverable, and each phase ends with a gate review.

Q: What do I need in terms of Google Cloud access for the course?
A: A Google Cloud account with Gemini Enterprise access. Workflow Builder is documented for the Standard, Plus, pay-as-you-go and Frontline editions, so the Business edition alone will not unlock the workflow classes. The best path is your employer's environment with your administrator's awareness, and the course includes drafting exactly that request. Where that is not possible, we help you set up a pay-as-you-go project or a practice environment in the first class, at your own cloud cost, and your mentor sorts access out with you before the second class.

Q: Which Google Cloud certification does this course prepare me for?
A: The headline target is Google Cloud's Professional Agentic Architect certification, a three-hour proctored exam of around 80 multiple-choice questions followed by hands-on labs, in beta until 30 September 2026. Its five domains, building agents with low-code tools, using coding agents, developing custom agents, evaluating and deploying agentic workflows, and securing and governing them, track this syllabus phase by phase. The Generative AI Leader credential is the lighter on-ramp we recommend for teammates you later onboard.

Q: How current is the syllabus, given how fast Gemini Enterprise is changing?
A: It is a Living Syllabus, re-verified against Google Cloud's release notes as features ship. The current version covers the September 2026 platform: Workflow Builder GA, Skills and Projects, custom MCP server data stores, Agent Registry governance, A2A and A2UI registration, observability with p50 and p95 latency, pay-as-you-go and overage controls, the Gemini 3.1 Pro and 3.8 Flash lineup, and India-region data residency. When the platform changes, the course changes, and your mentor tells you what moved while you were learning.

Q: What do I walk away with at the end of the programme?
A: A production-grade agent estate for your own team on Gemini Enterprise, demonstrated and defended live, plus the full professional packet: source map, action inventory, test set, workflow and approval design, observability report, cost model, governance pack with residency, policy and identity decisions, and a rollout runbook. You also leave with a Modern Age Coders certificate earned by that defence, and a mapped route to the Professional Agentic Architect exam if you want Google's official stamp.

To enrol, message Shivam Sir on +91 9123366161 or send the parent this link: https://learn.modernagecoders.com/courses/build-ai-agents-with-google-gemini-enterprise-course
For a demo: the Priority Live Demo (guaranteed, today or tomorrow) is booked at https://learn.modernagecoders.com/priority-demo . The free demo is a waiting list with no fixed date.

==========

COURSE 28 OF 137: BUSINESS & FINANCE MATHEMATICS: INVESTMENT TO RISK

==========

Course link: https://learn.modernagecoders.com/courses/complete-business-finance-mathematics-mastery
Subject area: Business & Finance Education
Designed for: Working professionals
Who can join: Complete Beginner to Advanced Professional
Course length: 12-14 months (52-60 weeks)
Time needed: 2 live classes/week + 3-5 hours practice
Certificate: Certificate from Modern Age Coders, awarded on passing the final exam

PRICE FOR THIS COURSE (quote only the one that applies to the person asking)
In India, per month: group Rs 1,499, mini batch Rs 2,999, one to one Rs 4,999
Outside India, per month: group $100, one to one $150
Classes: group and mini batch two live classes a week, eight a month; one to one in India one live class a week, four a month; one to one outside India two live classes a week, eight a month. Each class is one hour.

WHAT THIS COURSE IS

A 1-year business and finance mathematics course covering investment analysis, risk management, accounting maths, derivatives and portfolio optimization.

In one line: From Basic Calculations to Quantitative Finance in 12 Months

ABOUT THE PROGRAMME

This intensive program transforms you into a financial mathematics expert capable of complex business analysis, investment decisions, and risk management. Whether you're aspiring to investment banking, corporate finance, actuarial science, or entrepreneurship, this course provides the mathematical foundation for success. You'll master everything from compound interest and annuities to options pricing and portfolio optimization. Each concept is taught through real-world business cases, Excel modeling, and Python applications. By completion, you'll think like a quantitative analyst and make data-driven financial decisions.

WHAT MAKES THIS COURSE DIFFERENT

- Business-focused from day one - no abstract math
- Excel and Python integration throughout
- Real company case studies and datasets
- Trading simulations and portfolio management
- Professional financial modeling templates
- CFA/FRM/Actuarial exam preparation included
- Industry-standard software training
- Live market data analysis

THE LEARNING PATH, STEP BY STEP

Phase 1: Foundation (Months 1-3): Business Math Basics, Financial Calculations, Accounting Mathematics
Phase 2: Intermediate (Months 4-6): Statistics for Business, Economic Mathematics, Financial Analysis
Phase 3: Advanced (Months 7-9): Investment Mathematics, Risk Management, Corporate Finance
Phase 4: Professional (Months 10-12): Derivatives, Portfolio Theory, Quantitative Methods, Financial Modeling

WHAT A STUDENT NEEDS BEFORE STARTING

Education: High school mathematics
Coding experience: None required - will teach Excel/Python
Equipment: Computer with Excel, internet connection
Time commitment: 2 live classes plus 3 to 5 hours of practice a week
English: Business English comprehension
Motivation: Strong interest in finance/business

WHO THIS COURSE IS FOR

Students: Business/Finance/Economics students
Working professionals: Career switchers to finance
Entrepreneurs: Business owners needing financial skills
Freelancers: Financial consultants and advisors
Kids: Advanced high school students (16+)
Anyone: Anyone pursuing finance careers

FULL CURRICULUM, WEEK BY WEEK

This is the complete teaching plan. Parents can ask about any week.

PHASE 1: BUSINESS MATHEMATICS FOUNDATIONS (WEEKS 1-13)

Build rock-solid foundations in business calculations, financial mathematics, and accounting principles. Master the mathematical tools used daily in business.

Months 1-2: Core Business Mathematics (Weeks 1-8)
Percentages & Business Applications
Topics:
- Percentage calculations and conversions
- Percentage increase and decrease
- Percentage points vs percentage change
- Markup and markdown calculations
- Profit margins: gross, operating, net
- Break-even analysis
- Sales tax and VAT calculations
- Discount calculations: single and series
- Commission structures and calculations
- Percentage allocation and distribution
- Market share calculations
- Growth rates and CAGR
Projects built:
- Profit margin calculator for business
- Sales commission tracker
- Break-even analysis tool
Practice: Daily: 50 business percentage problems with real scenarios
Time Value of Money Fundamentals
Topics:
- Simple interest calculations
- Compound interest formula and applications
- Continuous compounding
- Effective vs nominal interest rates
- Present value concepts
- Future value calculations
- Discounting and discount factors
- Rule of 72 and quick estimations
- Interest rate conversions
- Day count conventions

- Currency exchange calculations
- Inflation and real vs nominal values

Projects built:
- Compound interest calculator
- Investment growth simulator
- Currency converter with live rates

Practice: Complete 100 time value of money problems

Annuities & Loan Mathematics

Topics:
- Ordinary annuities and annuities due
- Present value of annuity streams
- Future value of annuity calculations
- Perpetuities and growing perpetuities
- Loan amortization schedules
- EMI (Equated Monthly Installment) calculations
- Principal and interest components
- Balloon payments and refinancing
- Mortgage mathematics
- Auto loan calculations
- Credit card mathematics
- Effective cost of borrowing

Projects built:
- Loan amortization calculator
- Mortgage comparison tool
- Retirement planning calculator

Practice: Build 10 different loan amortization schedules

Business Ratios & Analysis

Topics:
- Liquidity ratios: current, quick, cash
- Profitability ratios: ROE, ROA, ROCE
- Efficiency ratios: inventory turnover, receivables
- Leverage ratios: debt-to-equity, interest coverage
- Market ratios: P/E, P/B, dividend yield
- DuPont analysis
- Ratio trend analysis
- Industry comparison metrics
- Working capital calculations
- Cash conversion cycle
- Economic Value Added (EVA)
- Balanced scorecard metrics

Projects built:
- Financial ratio analyzer
- Company comparison dashboard
- Industry benchmark tool

Practice: Analyze 20 real company financial statements

Month 3: Accounting Mathematics & Cost Analysis (Weeks 9-13)

Accounting Mathematics Fundamentals

Topics:
- Double-entry bookkeeping mathematics
- Trial balance and mathematical checks
- Depreciation calculations: straight-line, declining balance
- MACRS depreciation
- Inventory valuation: FIFO, LIFO, weighted average
- Cost of Goods Sold calculations
- Gross profit and net profit calculations
- Balance sheet equation
- Cash flow calculations
- Accrual vs cash basis mathematics
- Bank reconciliation mathematics
- Foreign currency accounting

Projects built:
- Depreciation schedule generator
- Inventory management calculator
- Cash flow statement builder

Practice: Complete 100 accounting calculation problems

Cost Accounting & Budgeting

Topics:
- Fixed vs variable cost analysis
- Cost-Volume-Profit (CVP) analysis
- Contribution margin calculations
- Operating leverage
- Activity-based costing
- Standard costing and variance analysis
- Material, labor, and overhead variances
- Budget preparation mathematics
- Flexible budgeting
- Zero-based budgeting calculations
- Capital budgeting introduction

- Cost allocation methods
      Projects built:
        - CVP analysis tool
        - Variance analysis dashboard
        - Budget vs actual analyzer
      Practice: Solve 75 cost accounting problems
    Phase 1 Assessment & Integration
      Topics:
        - Integration of financial concepts
        - Complex multi-step problems
        - Case study methodology
        - Financial calculator mastery
        - Excel functions for finance
        - Common business math errors
        - Professional presentation of calculations
      Projects built:
        - Comprehensive business analysis case
        - Build financial calculator app
        - Create business math reference guide
      Assessment: Phase 1 cumulative exam: a written paper mixing this phase with everything
      before it, plus targeted revision for anything shaky

PHASE 2: STATISTICAL ANALYSIS AND ECONOMIC MATHEMATICS (WEEKS 14-26)

Master statistical methods for business decision-making, economic analysis, and financial
forecasting.

  Months 4-5: Business Statistics & Analytics (Weeks 14-21)
    Descriptive Statistics for Business
      Topics:
        - Business data types and collection methods
        - Measures of central tendency in business context
        - Variance and standard deviation in finance
        - Coefficient of variation for risk
        - Skewness and kurtosis in returns
        - Business data visualization
        - Time series components
        - Moving averages and smoothing
        - Seasonal adjustments
        - Index numbers and deflators
        - Business survey analysis
        - Customer analytics metrics
      Projects built:
        - Sales data analyzer
        - Customer behavior dashboard
        - Market trend visualizer
      Practice: Analyze 50 business datasets
    Probability in Business Decisions
      Topics:
        - Probability in risk assessment
        - Expected value in business decisions
        - Decision trees and expected monetary value
        - Bayesian analysis for business
        - Conditional probability in market analysis
        - Joint probability distributions
        - Risk and return relationships
        - Value at Risk (VaR) introduction
        - Monte Carlo simulation basics
        - Scenario analysis
        - Sensitivity analysis
        - Business forecasting with probability
      Projects built:
        - Decision tree analyzer
        - Monte Carlo simulator for projects
        - Risk assessment tool
      Practice: Solve 100 business probability problems
    Regression & Predictive Analytics
      Topics:
        - Simple linear regression for business
        - Multiple regression analysis
        - Interpreting regression coefficients
        - R-squared and model fit
        - Residual analysis
        - Multicollinearity detection
        - Dummy variables in regression
        - Time series regression
        - Logistic regression for classification
        - Forecasting with regression

- Sales prediction models
- Price elasticity estimation

Projects built:
- Sales forecasting model
- Price optimization tool
- Customer churn predictor

Practice: Build 20 regression models with real data

Hypothesis Testing for Business

Topics:
- Hypothesis testing framework in business
- A/B testing mathematics
- Type I and Type II errors in business context
- T-tests for marketing campaigns
- ANOVA for multiple group comparison
- Chi-square tests for independence
- Non-parametric tests
- Sample size determination
- Power analysis for business experiments
- Confidence intervals for business metrics
- Statistical significance vs practical significance
- P-value interpretation pitfalls

Projects built:
- A/B testing calculator
- Marketing campaign analyzer
- Quality control dashboard

Practice: Conduct 50 business hypothesis tests

Time Series Analysis

Topics:
- Time series decomposition
- Trend analysis methods
- Seasonal patterns identification
- Cyclical variations
- Autocorrelation and ACF
- ARIMA models introduction
- Exponential smoothing methods
- Holt-Winters forecasting
- Leading and lagging indicators
- Business cycle analysis
- Forecast accuracy measures
- Real-time data analysis

Projects built:
- Time series forecasting tool
- Seasonal adjustment calculator
- Economic indicator dashboard

Practice: Analyze 25 business time series

Month 6: Economic & Market Mathematics (Weeks 22-26)

Microeconomic Mathematics

Topics:
- Supply and demand curves
- Elasticity calculations
- Consumer and producer surplus
- Utility maximization mathematics
- Budget constraint optimization
- Production functions
- Cost curves and optimization
- Profit maximization calculus
- Market equilibrium calculations
- Game theory basics
- Nash equilibrium
- Oligopoly and monopoly pricing

Projects built:
- Market equilibrium calculator
- Pricing strategy optimizer
- Game theory simulator

Practice: Solve 75 microeconomic problems

Macroeconomic Mathematics

Topics:
- GDP calculations and components
- Inflation rate calculations
- Real vs nominal GDP
- Unemployment rate metrics
- Money multiplier effect
- Interest rate parity
- Exchange rate calculations
- Purchasing power parity
- IS-LM model basics
- Phillips curve relationship
- Economic growth models

- Business cycle indicators
    Projects built:
      - Economic indicator tracker
      - Currency exchange analyzer
      - Inflation impact calculator
    Practice: Complete 50 macroeconomic calculations
  Financial Markets Mathematics
    Topics:
      - Stock market indices calculation
      - Market capitalization weighting
      - Price-weighted vs value-weighted indices
      - Bond pricing fundamentals
      - Yield to maturity calculations
      - Duration and convexity
      - Term structure of interest rates
      - Forward rates calculation
      - Swap valuation basics
      - Foreign exchange forwards
      - Covered interest parity
      - Market efficiency metrics
    Projects built:
      - Bond pricing calculator
      - Yield curve analyzer
      - Index tracking tool
    Practice: Price 50 different financial instruments
  International Finance Mathematics
    Topics:
      - Exchange rate systems
      - Cross rates calculation
      - Triangular arbitrage
      - Forward exchange rates
      - Interest rate parity theory
      - International Fisher effect
      - Currency hedging calculations
      - Translation and transaction exposure
      - International capital budgeting
      - Country risk assessment
      - Emerging market analysis
      - Global portfolio considerations
    Projects built:
      - Currency arbitrage detector
      - International investment analyzer
      - Hedging strategy calculator
    Practice: Analyze 30 international finance scenarios
  Phase 2 Capstone Project
    Topics:
      - Integrated statistical analysis
      - Economic forecasting project
      - Market analysis presentation
      - Data visualization mastery
      - Professional reporting
      - Peer review process
    Projects built:
      - Complete market analysis report
      - Economic forecast model
      - Statistical analysis of business case
    Assessment: Phase 2 cumulative exam: a written paper mixing this phase with everything
    before it, plus targeted revision for anything shaky

PHASE 3: INVESTMENT MATHEMATICS AND RISK MANAGEMENT (WEEKS 27-39)

Master investment analysis, portfolio management, risk assessment, and corporate finance
decisions.

Months 7-8: Investment Analysis & Valuation (Weeks 27-34)
  Equity Valuation Mathematics
    Topics:
      - Discounted Cash Flow (DCF) models
      - Free cash flow calculations
      - WACC (Weighted Average Cost of Capital)
      - Terminal value calculations
      - Dividend discount models
      - Gordon growth model
      - Multi-stage growth models
      - Price multiples valuation
      - Comparable company analysis
      - Precedent transaction analysis
      - Asset-based valuation

    - Sum-of-the-parts valuation
  Projects built:
    - DCF valuation model
    - Comparable analysis template
    - Valuation dashboard
  Practice: Value 25 real companies using different methods
Fixed Income Mathematics
  Topics:
    - Bond pricing with different frequencies
    - Yield measures: current, YTM, YTC
    - Duration: Macaulay and modified
    - Convexity calculations
    - Immunization strategies
    - Credit spreads and ratings
    - Floating rate notes
    - Convertible bond valuation
    - Mortgage-backed securities basics
    - Prepayment risk modeling
    - Z-spread and OAS
    - Fixed income portfolio management
  Projects built:
    - Bond portfolio analyzer
    - Duration matching tool
    - Yield curve trading strategy
  Practice: Analyze 50 different bond structures
Portfolio Theory & Optimization
  Topics:
    - Risk and return measures
    - Portfolio expected return
    - Portfolio variance and standard deviation
    - Correlation and covariance matrices
    - Diversification benefits
    - Efficient frontier construction
    - Markowitz optimization
    - Capital Asset Pricing Model (CAPM)
    - Beta calculation and interpretation
    - Security Market Line
    - Arbitrage Pricing Theory basics
    - Factor models
  Projects built:
    - Portfolio optimizer
    - Efficient frontier visualizer
    - Beta calculator for stocks
  Practice: Construct 20 optimal portfolios
Performance Measurement & Attribution
  Topics:
    - Absolute vs relative returns
    - Time-weighted vs money-weighted returns
    - Sharpe ratio calculation
    - Treynor ratio
    - Jensen's alpha
    - Information ratio
    - Sortino ratio
    - Maximum drawdown
    - Value at Risk (VaR) methods
    - Conditional VaR (CVaR)
    - Performance attribution analysis
    - Risk-adjusted performance measures
  Projects built:
    - Performance analytics dashboard
    - Risk metrics calculator
    - Attribution analysis tool
  Practice: Evaluate 30 portfolio performances
Alternative Investments Mathematics
  Topics:
    - Real estate investment mathematics
    - Cap rates and NOI calculations
    - Private equity valuation
    - Venture capital metrics
    - Hedge fund fee structures
    - Commodity futures pricing
    - Infrastructure project valuation
    - Art and collectibles valuation
    - Cryptocurrency valuation models
    - Crowdfunding mathematics
    - REIT analysis
    - Master Limited Partnerships
  Projects built:
    - Real estate investment analyzer

- Private equity return calculator
- Alternative asset portfolio tool

Practice: Analyze 20 alternative investments

Month 9: Risk Management & Insurance (Weeks 35-39)

Risk Measurement & Modeling

Topics:

- Types of financial risk
- Risk metrics: volatility, beta, duration
- Value at Risk (VaR) models
- Historical simulation
- Parametric VaR
- Monte Carlo VaR
- Stress testing methodologies
- Scenario analysis frameworks
- Credit risk modeling
- Probability of default estimation
- Loss given default
- Expected loss calculations

Projects built:

- VaR calculator (3 methods)
- Stress testing framework
- Credit risk scorecard

Practice: Calculate risk metrics for 40 portfolios

Insurance Mathematics

Topics:

- Life insurance mathematics
- Mortality tables and life expectancy
- Present value of life insurance
- Annuity calculations for insurance
- Premium calculation principles
- Reserve calculations
- Property insurance mathematics
- Deductibles and co-insurance
- Loss distributions
- Ruin theory basics
- Reinsurance mathematics
- Health insurance metrics

Projects built:

- Life insurance premium calculator
- Insurance portfolio analyzer
- Claims prediction model

Practice: Solve 50 actuarial problems

Operational & Market Risk

Topics:

- Operational risk measurement
- Key risk indicators (KRIs)
- Loss distribution approach
- Market risk factors
- Greeks: delta, gamma, theta, vega, rho
- Hedging strategies mathematics
- Basis risk calculations
- Liquidity risk measures
- Counterparty risk assessment
- Systemic risk indicators
- Risk appetite frameworks
- Economic capital calculation

Projects built:

- Greeks calculator
- Hedging strategy optimizer
- Risk dashboard creator

Practice: Design 25 risk management strategies

Regulatory Capital & Compliance

Topics:

- Basel III requirements
- Capital adequacy ratios
- Tier 1 and Tier 2 capital
- Risk-weighted assets calculation
- Leverage ratio
- Liquidity coverage ratio (LCR)
- Net stable funding ratio (NSFR)
- IFRS 9 impairment models
- Solvency II for insurance
- Dodd-Frank Act implications
- MiFID II requirements
- Regulatory reporting mathematics

Projects built:

- Capital adequacy calculator
- Regulatory report generator

- Compliance tracking tool
Practice: Calculate regulatory metrics for 20 institutions
Phase 3 Integration & Assessment
Topics:
- Integrated risk management
- Portfolio construction with constraints
- Risk-return optimization
- Comprehensive case studies
- Professional presentation skills
- Industry best practices
Projects built:
- Complete investment analysis case
- Risk management framework design
- Portfolio optimization project
Assessment: Phase 3 cumulative exam: a written paper mixing this phase with everything before it, plus targeted revision for anything shaky

---

PHASE 4: ADVANCED FINANCE AND FINAL REVISION (WEEKS 40-52)

Master derivatives pricing, quantitative finance, financial modeling, and advanced corporate finance.

Month 10: Derivatives & Structured Products (Weeks 40-45)
Options Mathematics
Topics:
- Call and put option payoffs
- Intrinsic and time value
- Put-call parity
- Option strategies: spreads, straddles, strangles
- Binomial option pricing model
- Risk-neutral valuation
- Black-Scholes model derivation
- Black-Scholes formula application
- Implied volatility calculation
- American option valuation
- Exotic options: barrier, Asian, lookback
- Real options valuation
Projects built:
- Options pricing calculator
- Strategy payoff visualizer
- Implied volatility surface
Practice: Price 100 different option structures
Futures & Forwards
Topics:
- Forward pricing theory
- Cost of carry model
- Futures margin mechanics
- Basis and basis risk
- Hedging with futures
- Optimal hedge ratios
- Duration-based hedging
- Cross-hedging
- Commodity futures pricing
- Interest rate futures
- Currency futures strategies
- Index futures and arbitrage
Projects built:
- Futures pricing model
- Hedge effectiveness analyzer
- Arbitrage opportunity scanner
Practice: Design 50 hedging strategies
Swaps & Interest Rate Derivatives
Topics:
- Interest rate swap mechanics
- Swap valuation methods
- Currency swap valuation
- Credit default swaps
- Total return swaps
- Swap spread analysis
- Forward rate agreements (FRAs)
- Caps, floors, and collars
- Swaptions
- Constant maturity swaps
- Basis swaps
- Structured notes design
Projects built:
- Swap pricing calculator
- Structured product designer

- Interest rate hedge optimizer
Practice: Structure 40 derivative solutions
Credit Derivatives & Structured Finance
Topics:
- Credit default swap pricing
- CDO and CLO structures
- Synthetic CDOs
- Credit spread options
- First-to-default baskets
- Correlation trading
- Securitization mathematics
- Waterfall structures
- Tranching and subordination
- Prepayment modeling
- Default correlation
- Copula models basics
Projects built:
- CDO structuring tool
- Credit portfolio simulator
- Securitization analyzer
Practice: Analyze 30 structured products
Volatility & Advanced Greeks
Topics:
- Volatility smile and skew
- Term structure of volatility
- Local volatility models
- Stochastic volatility basics
- Volatility trading strategies
- Vega hedging
- Higher-order Greeks
- Cross-Greeks
- Portfolio Greeks management
- Dynamic hedging
- Volatility arbitrage
- Dispersion trading
Projects built:
- Volatility surface modeler
- Greeks risk manager
- Dynamic hedging simulator
Practice: Implement 25 volatility strategies

Month 11: Quantitative Finance and Modelling (Weeks 46-48)
Financial Modeling Excellence
Topics:
- Financial model architecture
- Three-statement modeling
- Revenue and cost projections
- Working capital modeling
- Debt schedules and waterfalls
- Circular reference resolution
- Scenario and sensitivity tables
- Monte Carlo in Excel
- Model auditing techniques
- Dashboard design
- VBA for financial modeling
- Model documentation standards
Projects built:
- Complete financial model template
- LBO model
- Project finance model
Practice: Build 10 professional financial models
Algorithmic Trading Mathematics
Topics:
- Trading system components
- Backtesting methodology
- Performance metrics for strategies
- Market microstructure
- Order types and execution
- Slippage and transaction costs
- Mean reversion strategies
- Momentum strategies
- Pairs trading mathematics
- Statistical arbitrage
- High-frequency trading basics
- Machine learning in trading
Projects built:
- Trading strategy backtester
- Pairs trading system
- Performance analytics platform

```
    Practice: Backtest 20 trading strategies
  Corporate Finance Advanced
    Topics:
      - Advanced capital budgeting
      - Real options in capital budgeting
      - Cost of capital estimation
      - Capital structure optimization
      - Modigliani-Miller theorems
      - Trade-off theory
      - Pecking order theory
      - Dividend policy mathematics
      - Share buyback analysis
      - Merger and acquisition valuation
      - Synergy valuation
      - Leveraged buyout modeling
    Projects built:
      - M&A valuation model
      - LBO returns analyzer
      - Capital structure optimizer
    Practice: Analyze 25 corporate finance decisions

Month 12: Professional Applications and Revision (Weeks 49-50)
  Industry Case Studies
    Topics:
      - Investment banking case studies
      - Private equity deal analysis
      - Hedge fund strategies review
      - Insurance company ALM
      - Pension fund management
      - Sovereign wealth funds
      - Central bank operations
      - Corporate treasury management
      - Family office structures
      - Endowment management
    Projects built:
      - Complete industry analysis
      - Deal structure proposal
      - Investment committee presentation
    Practice: Analyze 10 real-world cases
  Financial Technology Tools
    Topics:
      - Bloomberg Terminal mastery
      - Reuters Eikon navigation
      - FactSet essentials
      - S&P Capital IQ
      - Morningstar Direct
      - Python for finance
      - R for financial analysis
      - SQL for financial data
      - Tableau for finance
      - Power BI dashboards
      - Advanced Excel techniques
      - Financial APIs integration
    Projects built:
      - Multi-source data aggregator
      - Automated report generator
      - Real-time market dashboard
    Practice: Master 10 professional tools

Month 13: Final Projects & Certification (Weeks 51-52)
  Capstone Project - Part 2 & Presentation
    Topics:
      - Final model refinement
      - Peer review process
      - Presentation preparation
      - Executive summary writing
      - Q&A preparation
      - Professional formatting
      - Submission guidelines
      - Public presentation
    Deliverables:
      - Complete financial model
      - 50-page analysis report
      - Executive presentation
      - Video walkthrough
      - Peer review feedback
      - GitHub repository
  Final Assessment & Certification
    Topics:
```

- Comprehensive knowledge review
- Final examination preparation
- Portfolio compilation
- Skills self-assessment
- Future learning roadmap
- Alumni network access
- Industry connections
- Certification ceremony

Deliverables:
- Final comprehensive exam (4 hours)
- Complete project portfolio
- Professional references
- Certification of completion
- LinkedIn certification badge
- Transcript of achievements

Assessment: FINAL EXAM: a comprehensive written paper covering every phase of the course. Passing earns the certificate; falling short earns a focused revision plan and a free retest

PROJECTS THE STUDENT BUILDS AND KEEPS

- Phase 1: Business calculators, Loan analyzers, Accounting tools
- Phase 2: Statistical models, Economic forecasts, Regression analyses
- Phase 3: Investment valuations, Portfolio optimizers, Risk dashboards
- Phase 4: Derivatives pricers, Trading systems, Financial models
- Final: Professional-grade financial analysis project

Total projects: 150+ financial tools, models, calculators, and analytical dashboards

SKILLS THE STUDENT WILL HAVE AT THE END

- Financial Mathematics: TVM, annuities, loans, bonds, derivatives
- Statistical Analysis: Regression, time series, hypothesis testing, forecasting
- Investment Analysis: Valuation, portfolio theory, performance measurement
- Risk Management: VaR, stress testing, credit risk, operational risk
- Corporate Finance: Capital budgeting, capital structure, M&A, LBO
- Quantitative Methods: Monte Carlo, optimization, algorithmic trading
- Financial Modeling: Excel, VBA, Python, professional models
- Professional Tools: Bloomberg, Excel advanced, Python, SQL
- Certifications Prep: CFA, FRM, actuarial exam readiness

HOW A TYPICAL WEEK IS SPLIT

Live classes: 2 live one-hour classes per week with a real teacher, working problems together
Homework: A problem set after every class, and a mixed-review assignment at the end of every month that deliberately folds in earlier topics
Practice: 3-5 hours of problem-solving between classes
Review: Every set reviewed with written feedback; recurring mistakes reopened in class until they are gone

SUPPORT INCLUDED

Doubt support: WhatsApp doubt support between classes
Progress updates: Honest monthly progress reviews: which topics are solid, which are wobbly, and the plan for the wobble

CERTIFICATION DETAIL

Completion: Certificate from Modern Age Coders, awarded on passing the final exam. Fall short and there is focused revision and a free retest: the certificate certifies mastery, not attendance

WHERE THIS CAN LEAD

- Financial Analyst
- Investment Banking Analyst
- Risk Analyst
- Equity Research Analyst
- Credit Analyst
- Portfolio Manager
- Quantitative Analyst
- Corporate Finance Manager
- Financial Consultant
- Actuarial Analyst

EARNING POTENTIAL (share only if asked, and never promise it)

Market context: The ranges below are general market salary bands for these roles in India and abroad, drawn from public industry data. They are shown for career context only and are not a

promise or guarantee of income. Actual pay depends on your skills, experience, location, and the job market.
Growing roles: Rs 4-8 LPA (Entry-level analyst)
Experienced roles: Rs 8-15 LPA (Financial Analyst); Rs 12-25 LPA (Senior Analyst); Rs 15-40 LPA (Manager/Specialist)
Freelance: Rs 1,000-5,000/hour consulting
International: $60k-150k based on role and location

COMMON QUESTIONS ABOUT THIS COURSE

For anything about cost, use PART 4 and RULE 1. Do not quote two regions.

Q: What will I learn in the Business & Finance Mathematics program?
A: Across 12 months you move from core business maths, percentages, interest, financial calculations and accounting mathematics, through business statistics and economic mathematics, into investment analysis, valuation and risk management, and finish with derivatives, portfolio theory and quantitative financial modeling. Excel is used throughout, with Python introduced for the quantitative work.

Q: Who is this course for?
A: It starts from genuine basics, so you do not need a finance background to begin.

Q: Do I need Excel or coding skills before starting?
A: No. High school mathematics is the only prerequisite; Excel is taught from scratch inside the course and Python is introduced gently when the quantitative topics need it. You will need a computer with Excel and a stable internet connection.

Q: How is progress measured?
A: Through weekly applied exercises, case style projects such as building valuation and risk models, and phase-end assessments. By the final months you are building complete financial models, which become the clearest proof of progress.

Q: Is this course theoretical or practical?
A: Deliberately practical: every concept is anchored in a business situation, from break-even analysis and loan amortization to portfolio optimization. The final phase is essentially a professional toolkit of models you can reuse in a job, a business or further study.

Q: How is my child assessed, and is the certificate just for attending?
A: No. A problem set follows every class with written feedback, monthly reviews deliberately mix new material with earlier topics so nothing is forgotten, each phase ends with a cumulative exam, and the course ends with a final exam covering the whole syllabus. Passing earns the certificate; falling short earns focused revision and a free retest. We measure understanding, not attendance.

Q: Can I sit in on a class first?
A: Yes, start with a free demo class, no commitment: book it at learn.modernagecoders.com/contact or message us on WhatsApp at +91 91233 66161. The demo also helps us gauge your starting level honestly. (Agent note: the free demo is a waiting list with no fixed date. The Priority Live Demo is a guaranteed class today or tomorrow, booked at https://learn.modernagecoders.com/priority-demo . Offer both, as RULE 3 says.)

Q: Are classes live?
A: Every session is a live one hour online class with a real teacher; nothing is pre-recorded.

Q: What certification do I receive?
A: The Professional Business & Finance Mathematics Certificate on completion, plus a portfolio of the financial models and case projects you built, which is often more persuasive to employers than the certificate itself.

To enrol, message Shivam Sir on +91 9123366161 or send the parent this link: https://learn.modernagecoders.com/courses/complete-business-finance-mathematics-mastery
For a demo: the Priority Live Demo (guaranteed, today or tomorrow) is booked at https://learn.modernagecoders.com/priority-demo . The free demo is a waiting list with no fixed date.

==========
COURSE 29 OF 137: C PROGRAMMING FOR BEGINNERS: POINTERS, MEMORY & STRUCTS
==========

Course link: https://learn.modernagecoders.com/courses/c-programming-course-for-college-beginners
Subject area: Programming Languages
Designed for: College students
Who can join: Beginner, college students and first-year engineers
Course length: 6 months (24 weeks)
Time needed: 2 live classes/week + 3-4 hours practice
Certificate: Certificate from Modern Age Coders, awarded on passing the final assessment

PRICE FOR THIS COURSE (quote only the one that applies to the person asking)

In India, per month: group Rs 1,499, mini batch Rs 2,999, one to one Rs 4,999
Outside India, per month: group $100, one to one $150
Classes: group and mini batch two live classes a week, eight a month; one to one in India one live class a week, four a month; one to one outside India two live classes a week, eight a month. Each class is one hour.

WHAT THIS COURSE IS

C programming course for college students and beginners: live online classes on pointers, memory, structs, file handling and data structures, taught from zero.

In one line: Most C courses skip past pointers as fast as possible. This one is built around them.

ABOUT THE PROGRAMME

C is the language underneath everything: operating systems, databases, embedded firmware, and the interpreters that run Python and JavaScript are written in it. It is also the language most engineering students meet first and understand least, because the part that matters, pointers and memory, is usually rushed in two lectures. This 6-month live course inverts that. Months 1 and 2 build the language core properly: types, control flow, functions, and how a .c file actually becomes an executable. Months 3 and 4 are the heart of the course: a full month on pointers taught with memory diagrams for every operation, then a month on dynamic memory, the heap, and structs, including the bugs (leaks, dangling pointers, buffer overflows) demonstrated live and safely. Months 5 and 6 put it to work: file handling, linked lists, stacks, queues, and sorting built from scratch, a look at where C runs in the real world from kernels to microcontrollers, and a capstone project compiled, debugged, and defended. Classes are live and small. Students write and compile code in every session, homework is real programming with written feedback, and the instructor draws memory on a whiteboard until it stops being mysterious.

WHAT MAKES THIS COURSE DIFFERENT

- Pointers get a full month, not two lectures, and every operation comes with a memory diagram before any code
- Memory bugs are taught on purpose: students create a leak, a dangling pointer, and an overflow in controlled exercises, then learn to catch them
- Standard library functions like strlen and strcpy are written by hand first, so nothing in string.h is magic
- Data structures are built from raw structs and malloc, the way university exams and real systems code expect
- The compilation pipeline is taught, not skipped: preprocessor, compiler, linker, and what an executable actually is
- The syllabus deliberately covers the C programming paper taught in Indian engineering first year, so college exams and this course reinforce each other

THE LEARNING PATH, STEP BY STEP

Phase 1: Language core and the machine: types, control flow, functions, the stack, and how source code becomes an executable
Phase 2: The heart of C: pointers with memory diagrams, arrays and strings at the memory level, malloc and the heap, and structs
Phase 3: C at work: file handling, linked lists, stacks, queues, sorting, bitwise operations and embedded context, then a capstone

WHAT A STUDENT NEEDS BEFORE STARTING

Coding experience: None required. The course starts from the first compile. Students who know another language will simply move faster in month 1
Mathematics: School-level maths is plenty; no calculus or advanced topics are needed
Equipment: Any Windows, Mac, or Linux computer that can run a compiler and VS Code, plus a stable internet connection
Mindset: Willingness to trace code on paper. C rewards students who slow down, and the course is built around that

WHO THIS COURSE IS FOR

First year engineers: College students taking the compulsory C paper who want to actually understand it, not just pass it
Cs and it students: Students whose degree assumes C fluency for data structures, operating systems, and GATE later
Self taught switchers: Programmers from Python or JavaScript who keep hearing about pointers and want the real story
Embedded curious: Students eyeing electronics, robotics, or firmware, where C remains the working language
Fundamentals seekers: Anyone who wants to know what actually happens under high-level languages, one memory diagram at a time

FULL CURRICULUM, WEEK BY WEEK

This is the complete teaching plan. Parents can ask about any week.

PHASE 1: THE LANGUAGE CORE AND THE MACHINE (MONTHS 1-2, WEEKS 1-8)

C fundamentals built on honest ground: what the compiler does, what types really are, and how functions and the call stack work, so the pointer month lands on solid footing.

Month 1: From Source Code to Executable (Weeks 1-4)

Hello, Compiler

Topics:

- Setting up GCC and VS Code on Windows, Mac, or Linux
- Your first program: main, printf, and the return value
- The compilation pipeline: preprocessor, compiler, linker, executable
- Compiling from the terminal and reading compiler errors calmly
- Why C has no training wheels, and why that is the point
- Comments, formatting, and code that reads like it was written on purpose

Projects built:

- Banner program: compile, break, and fix a program five different ways to learn the error messages early

Practice: Compile six small programs from the terminal, deliberately triggering and decoding one error each

Types, Variables, and Their Limits

Topics:

- int, char, float, double, and the unsigned variants
- sizeof: asking the machine how big things are
- Integer overflow demonstrated live: what happens at the edge
- Type conversion and casting, implicit and explicit
- printf and scanf format specifiers, and the crashes wrong ones cause
- Constants with const and #define

Projects built:

- Limits explorer: a program that prints the size and range of every basic type on your machine

Practice: Ten input-output exercises with mixed types, including two that overflow on purpose so you see it happen

Operators and Control Flow

Topics:

- Arithmetic operators and the integer division surprise
- Relational and logical operators, and short-circuit evaluation
- if, else if, else, and the switch statement
- The ternary operator, used where it helps
- Operator precedence: when to just use parentheses
- = vs ==: the classic C bug, met early

Projects built:

- Grade and tax calculator: branching logic with real edge cases, negative inputs, and boundary values

Practice: Twelve control-flow drills, including a leap year checker and a menu-driven calculator with switch

Loops

Topics:

- while, for, and do-while, and choosing between them
- Loop counters, accumulators, and running totals
- Nested loops: printing patterns the exam way
- break and continue, used sparingly
- Off-by-one errors: finding them before the compiler cannot
- Tracing a loop by hand: the skill exams actually test

Projects built:

- Pattern engine: pyramids, diamonds, and number triangles from nested loops
- Prime and perfect number finder with a hand-traced dry run submitted alongside the code

Practice: Fifteen loop problems ranging from digit reversal to a simple guessing game

Assessment: Month 1 lab exam: three programs written live under light time pressure, compiled and demonstrated

Month 2: Functions and the Call Stack (Weeks 5-8)

Functions Done Properly

Topics:

- Defining functions: parameters, return types, and void
- Declarations vs definitions, and why prototypes exist
- Pass by value: what the function actually receives
- Designing small functions with one job each
- Header files and splitting code across files
- Reading a function signature like documentation

Projects built:

- Number theory library: gcd, lcm, prime check, and digit sum as clean reusable functions in their own file

Practice: Write eight functions from written specifications, then refactor month 1 projects to use them

Scope, Storage, and the Stack

Topics:

- Local vs global variables, and why globals age badly

- The call stack drawn frame by frame for a real program
- static variables: memory that survives the function
- Automatic storage: why locals vanish when the function returns
- Stack overflow: what it literally means
- Debugging with a stack diagram next to the code

Projects built:
- Stack tracer: a set of nested function calls with a hand-drawn stack diagram matched against actual output

Practice: Predict the output of six scope puzzles before running them, and score your predictions

Recursion

Topics:
- Recursion as functions calling themselves, with the stack diagrams to prove it
- Base case and recursive case: the two-part contract
- Factorial, Fibonacci, and sum of digits, traced fully
- Recursion vs loops: cost, clarity, and when each wins
- Stack depth limits demonstrated by crashing one on purpose
- Reading recursive code without re-tracing every call

Projects built:
- Recursive toolkit: power, GCD, decimal-to-binary, and Tower of Hanoi with move printing

Practice: Convert three loop solutions to recursion and three recursive solutions to loops, and note which direction felt harder

Multi-File Programs and the Build

Topics:
- Organizing a project: headers, source files, and include guards
- Compiling multiple files and linking them together
- A first Makefile: stop retyping compiler commands
- The preprocessor: #include, #define, and conditional compilation
- Naming, formatting, and structure conventions used in real C codebases
- Reading someone else's C file without fear

Projects built:
- Unit converter suite: a menu-driven multi-file program with separate modules for length, weight, and temperature

Practice: Split a provided 300-line single-file program into clean modules with headers and a Makefile

Assessment: Month 2 review: a multi-file program built from a spec, plus an oral walkthrough of one stack diagram

---

PHASE 2: POINTERS AND MEMORY, TAUGHT PROPERLY (MONTHS 3-4, WEEKS 9-16)

The month most courses rush is the month this course is named for: pointers with a memory diagram for every operation, then dynamic memory, the heap, and structs, including the famous bugs made visible.

Month 3: Pointers, One Diagram at a Time (Weeks 9-12)

Addresses and the & Operator

Topics:
- Memory as numbered boxes: the mental model everything rests on
- The & operator: every variable lives somewhere
- Declaring pointers: what int* p actually says
- Dereferencing with *: reading and writing through a pointer
- NULL and why pointers should never dangle uninitialized
- Printing addresses with %p and watching them change between runs

Projects built:
- Memory mapper: a program that prints the address and value of every variable it owns, matched to a hand-drawn diagram

Practice: Ten pointer basics drills, each answered first on paper with a box diagram, then verified in code

Pointers and Functions

Topics:
- Why pass by value cannot swap two numbers
- Passing addresses: functions that modify their arguments
- The classic swap written and traced completely
- Out-parameters: returning more than one result
- scanf finally explained: why it always wanted the &
- Pointer parameters in library functions you already used

Projects built:
- Statistics engine: one function that fills min, max, and mean through pointer parameters from a single pass

Practice: Rewrite five month 2 functions to use pointer parameters, and explain in comments what changed in memory terms

Arrays and Pointer Arithmetic

Topics:
- Arrays in memory: contiguous boxes with one name
- Array names and pointers: the decay rule stated honestly
- Pointer arithmetic: what p+1 really adds
- Walking an array with a pointer instead of an index
- Passing arrays to functions, and why size must travel with them

- Out-of-bounds access: the bug C will not catch for you, demonstrated safely
Projects built:
- Array toolkit: reverse, rotate, and search implemented twice, once with indices and once with pointers
Practice: Trace eight pointer arithmetic snippets on paper, predicting values and addresses before running them

Strings at the Memory Level
Topics:
- Strings as char arrays with a null terminator, no magic
- String literals vs char arrays, and what is writable
- Writing strlen, strcpy, and strcmp by hand before touching string.h
- Buffer overflow demonstrated in a controlled exercise, and why it matters for security
- Safer patterns: bounds checking and fgets over gets
- Arrays of strings and the char* array
Projects built:
- mini_string.h: your own implementation of five standard string functions, tested against the real library
Practice: Solve six string problems using only your own mini_string functions, no string.h allowed
Assessment: Pointer month exam: paper diagrams plus live coding, including one swap variant and one string function from scratch

Month 4: The Heap, Dynamic Memory, and Structs (Weeks 13-16)

malloc and the Heap
Topics:
- Stack vs heap: two kinds of memory with different lifetimes
- malloc and free: asking for memory and giving it back
- sizeof in allocation: the pattern that avoids a whole bug family
- Checking for NULL: allocation can fail
- Memory leaks: creating one on purpose, then finding it
- Ownership thinking: who allocated this, and who must free it
Projects built:
- Runtime array: a program that asks the user how much data is coming, allocates exactly that, and cleans up properly
Practice: Six allocation exercises, each submitted with a one-line ownership note stating where every free happens

Dynamic Arrays and the Famous Bugs
Topics:
- realloc: growing storage as data arrives
- Building a growable array with capacity doubling
- Dangling pointers: use-after-free demonstrated and diagnosed
- Double free and what the runtime does about it
- AddressSanitizer: making the invisible bugs report themselves
- Valgrind on Linux, and what a clean report looks like
Projects built:
- Growable list: a dynamic array module with append, insert, and remove that survives a sanitizer run cleanly
Practice: Fix five provided programs, each hiding one memory bug: a leak, a dangle, a double free, an overflow, and an uninitialized read

Structs
Topics:
- struct: modeling a real thing with named fields
- Declaring, initializing, and copying structs
- Arrays of structs: a table of records in memory
- Pointers to structs and the arrow operator
- typedef for names that read like types
- Nested structs and designing the record before coding it
Projects built:
- Student database, part one: an array-of-structs record system with add, list, search, and update
Practice: Model three real records as structs: a bank account, a library book, and a cricket scorecard entry

Structs Meet the Heap
Topics:
- Allocating structs dynamically
- Structs containing pointers: records with variable-length fields
- Deep copy vs shallow copy, and the bug hiding between them
- Freeing nested allocations in the right order
- Designing a small module: header, implementation, and a test file
- Code review: reading a classmate's memory management critically
Projects built:
- Contact book: a fully dynamic record system where both the list and each name grow to fit, sanitizer-clean
Practice: Extend the contact book with delete and sort, keeping the sanitizer report clean
Assessment: Month 4 practical: build a small dynamic record system from a spec in one sitting, leak-free, and defend the design

---

PHASE 3: C AT WORK: FILES, DATA STRUCTURES, AND THE CAPSTONE (MONTHS 5-6, WEEKS 17-24)

The skills become systems: file handling, linked lists, stacks, queues, and sorting built
from raw structs and malloc, a grounded look at where C runs in industry, and a capstone
project compiled and defended.

  Month 5: File Handling and Data Structures from Scratch (Weeks 17-20)
    File Handling
      Topics:
        - fopen, fclose, and file modes that actually matter
        - Reading lines with fgets and parsing them
        - Writing structured data with fprintf
        - Binary files: fread and fwrite for whole records
        - Error handling: what to do when the file is not there
        - Saving and loading the contact book: persistence at last
      Projects built:
        - Persistent contact book: records saved to disk in both text and binary form, reloaded on
          startup
      Practice: Write a CSV report generator that reads raw marks from one file and writes a
      formatted result sheet to another
    Linked Lists
      Topics:
        - Why arrays are not enough: the case for nodes and links
        - The node struct: data plus a pointer to the next
        - Insertion at head, tail, and middle, each with a diagram first
        - Traversal and search
        - Deletion without losing the rest of the list
        - The pointer-rewiring discipline: draw, then code, always
      Projects built:
        - Singly linked list module: insert, delete, search, reverse, and print, built from scratch and
          sanitizer-clean
      Practice: Solve six classic list problems including middle element, nth from end, and
      cycle detection by hand-tracing first
    Stacks and Queues
      Topics:
        - The stack as a discipline: push, pop, peek
        - Array-backed and list-backed stack implementations
        - Balanced brackets: the interview classic, solved properly
        - Queues: enqueue, dequeue, and the circular buffer trick
        - Where the machine itself uses stacks and queues
        - Choosing a backing structure and defending the choice
      Projects built:
        - Bracket validator and a printer-queue simulator, each built on your own stack and queue
          modules
      Practice: Implement a stack-based postfix expression evaluator and test it against ten
      expressions
    Searching, Sorting, and Function Pointers
      Topics:
        - Linear and binary search, with the sorted-input contract
        - Bubble, selection, and insertion sort, traced and timed
        - Counting comparisons: a first taste of efficiency analysis
        - Function pointers: passing behavior as an argument
        - qsort from the standard library and writing its comparator
        - Sorting an array of structs by any field
      Projects built:
        - Sortable student database: the record system gains sort-by-marks, sort-by-name, and binary
          search, using function pointers
      Practice: Time three sorts on arrays of 1k, 10k, and 100k elements and write four
      sentences on what the numbers show
      Assessment: Data structures lab exam: one list problem and one stack or queue problem
      implemented live from scratch

  Month 6: Systems Context and the Capstone (Weeks 21-24)
    Where C Runs: Bits, Kernels, and Microcontrollers
      Topics:
        - Bitwise operators: and, or, xor, shifts, and masks
        - Flags and registers: why embedded code reads and writes single bits
        - A grounded tour: C in operating systems, databases, firmware, and language runtimes
        - What embedded development actually involves, without the hype
        - Reading a small piece of real open-source C and surviving
        - gdb basics: breakpoints, stepping, and inspecting memory in a debugger
      Projects built:
        - Bit toolkit: set, clear, toggle, and test any bit, plus a permissions system stored in a
          single byte
      Practice: Use gdb to find the planted bug in a provided program without reading its
      source first
    Capstone: Scope and Foundations
      Topics:
        - Choosing a capstone: bank record system, inventory manager, text-based game with saves, or a

proposal of your own
- Writing the spec: features, data structures, and file format decided before coding
- Project skeleton: modules, headers, and a Makefile from day one
- Building the data layer first
- Estimating honestly what three weeks can hold
- Instructor sign-off on scope before the sprint starts

Projects built:
- Approved capstone spec plus a compiling skeleton with the core data structures in place

Practice: Implement and test your capstone's data module in isolation before any menus or files exist

Capstone: Build and Review

Topics:
- Feature-by-feature building, smallest first
- Keeping the sanitizer clean while the codebase grows
- Instructor code review: memory management and module boundaries
- Debugging your own project with gdb instead of printf sprinkles
- Handling bad input like software that respects its user
- Trimming scope with a straight face when the clock demands it

Projects built:
- Feature-complete capstone: all core features working, file persistence in, sanitizer report clean

Practice: Exchange builds with a classmate, file two bug reports on theirs, and fix the ones filed on yours

Ship and Defend

Topics:
- The final pass: a written test checklist run against every feature
- README and build instructions a stranger could follow
- Publishing the semester's work to GitHub properly
- Presenting a systems project: what it does, then how memory flows through it
- Answering pointed questions about your own pointers
- What comes next: C++, embedded, operating systems, or DSA in depth

Projects built:
- Delivered capstone: compiled, documented, pushed to GitHub, and defended in a live walkthrough

Practice: Write the README, then have someone outside the class build and run your project using only that file

Assessment: Capstone defense: live demo, memory-flow explanation, and Q&A, plus course-completion certificate review

PROJECTS THE STUDENT BUILDS AND KEEPS

- Limits explorer that maps every basic type on your machine
- Pattern engine and number theory function library
- Recursive toolkit with Tower of Hanoi
- Multi-file unit converter with its own Makefile
- mini_string.h: five standard string functions written from scratch
- Growable dynamic array that passes sanitizer checks
- Fully dynamic contact book with file persistence
- Singly linked list, stack, and queue modules built from raw structs
- Sortable student database using function pointers and qsort
- Bit toolkit with a one-byte permissions system
- Capstone: a complete record system or text game, compiled, documented, and defended

Total projects: 15+ compiled programs and modules, ending with a defended capstone on GitHub

SKILLS THE STUDENT WILL HAVE AT THE END

- The compilation pipeline: preprocessor, compiler, linker, and multi-file builds with Makefiles
- Pointers with total confidence: addresses, dereferencing, pointer arithmetic, and pointer parameters
- Dynamic memory: malloc, realloc, free, ownership discipline, and hunting leaks with sanitizers
- Structs and file handling: record systems that persist to text and binary files
- Data structures from scratch: linked lists, stacks, queues, searching, and sorting
- Systems literacy: bitwise operations, gdb debugging, and reading real-world C

HOW A TYPICAL WEEK IS SPLIT

Live classes: 2 live one-hour classes per week, writing and compiling code alongside the instructor

Practice: 3-4 hours of problem sets and project work between classes, with paper tracing where it teaches best

Review: Homework reviewed with written feedback; memory diagrams corrected line by line when needed

Homework: A task or problem set after every class, and a monthly mixed-review assignment that deliberately folds in earlier topics

SUPPORT INCLUDED

  Doubt support: WhatsApp doubt support between classes, so a segfault at midnight has
    somewhere to go
  Progress updates: Regular progress notes covering what was mastered and what needs another
    pass
  Career guidance: Honest direction on next steps: C++, embedded, operating systems coursework,
    or DSA, based on what each student showed aptitude for

CERTIFICATION DETAIL

  Completion: Certificate from Modern Age Coders, awarded on passing the final assessment. Fall
    short and there is focused revision and a free retest: the certificate certifies real
    learning, not attendance

WHERE THIS CAN LEAD

  - Our C++ programming course, which builds directly on C and adds objects, templates, and the
    STL
  - Data structures and algorithms in depth, for placements and competitive programming
  - Embedded systems and firmware learning paths, where C is the industry default
  - Operating systems and computer architecture coursework, met with real preparation
  - Contributing to open-source C projects with a working command of memory and build tools

COMMON QUESTIONS ABOUT THIS COURSE

  For anything about cost, use PART 4 and RULE 1. Do not quote two regions.

  Q: Should I learn C or C++ first?
  A: If your college teaches a C paper, learn C first; you will be examined on it either way,
  and C's small size makes memory concepts unavoidable rather than optional. C++ then becomes a
  comfortable extension: our C++ course assumes exactly the ground this one covers. Students
  heading straight for application development or game engines can start with C++ instead, and
  we will tell you honestly in the demo class which fits your situation.

  Q: Is C still worth learning, or is it outdated?
  A: C is old and very much alive. Operating system kernels including Linux and Windows
  internals, databases like PostgreSQL and SQLite, embedded firmware in cars and appliances,
  and the reference interpreters of Python and PHP are all C codebases maintained today. Nobody
  builds websites in C, and we will not pretend otherwise; you learn it because it teaches how
  computers actually work and because systems, embedded, and university curricula still run on
  it.

  Q: I have never programmed before. Can I start with C?
  A: Yes, and roughly half of each batch does. The course assumes nothing and moves through
  fundamentals at a deliberate pace with paper tracing built into the homework. C as a first
  language is demanding but honest: there is no framework hiding what your code does, so what
  you learn here transfers to every language you touch afterwards.

  Q: Everyone says pointers are the hard part. How do you teach them?
  A: Slowly, visually, and for a full month. Students who finish month 3 routinely say pointers
  were explained backwards everywhere else.

  Q: Will this course help with my university C syllabus and exams?
  A: Deliberately, yes. Lab-exam-style live coding is part of the monthly assessments, so the
  exam format itself gets practiced, not just the content.

  Q: Do I need Linux, or will Windows work?
  A: Windows works fine; we set up GCC and VS Code on whatever machine you have in the first
  week, and Mac and Linux are equally supported. Linux-specific tools like Valgrind are
  demonstrated for those who have access, but every required exercise runs on all three
  platforms using the compiler and sanitizers alone.

  Q: What will I have to show at the end of six months?
  A: A GitHub profile with fifteen or more compiled projects, including your own string
  library, a dynamic contact book, linked list and stack modules built from scratch, and a
  capstone record system or text game with file persistence and a README a stranger can build
  from. Just as importantly, you will be able to defend the memory behavior of your own code
  out loud, which is exactly what interviews and vivas probe.

  Q: How am I assessed, and is the certificate just for showing up?
  A: No. A task follows every class with feedback, monthly reviews deliberately mix new
  material with earlier topics so nothing is forgotten, and the course ends with a final exam
  covering the whole course. Passing earns the certificate; falling short earns focused
  revision and a free retest. We measure real learning, not attendance.

  Q: Can I try a class before enrolling?
  A: Yes, the first demo class is free and carries no obligation. Book it at
  learn.modernagecoders.com/contact or message us on WhatsApp at +91 91233 66161. Bring a
  question about pointers if you have one; it is our favorite kind of demo.

To enrol, message Shivam Sir on +91 9123366161 or send the parent this link: https://learn.modernagecoders.com/courses/c-programming-course-for-college-beginners
For a demo: the Priority Live Demo (guaranteed, today or tomorrow) is booked at https://learn.modernagecoders.com/priority-demo . The free demo is a waiting list with no fixed date.

==========

COURSE 30 OF 137: C++ FOR KIDS: FIRST REAL CODE, GAMES AND PUZZLES (AGES 9-12)

==========

Course link: https://learn.modernagecoders.com/courses/cpp-programming-for-kids-course
Subject area: C++ Programming
Designed for: Kids
Who can join: Complete beginner to text coding, ages 9 to 12
Course length: 6 months (24 weeks)
Time needed: 2 live classes/week + 1-2 hours practice
Certificate: Certificate from Modern Age Coders, awarded on passing the final assessment

PRICE FOR THIS COURSE (quote only the one that applies to the person asking)
In India, per month: group Rs 1,499, mini batch Rs 2,999, one to one Rs 4,999
Outside India, per month: group $100, one to one $150
Classes: group and mini batch two live classes a week, eight a month; one to one in India one live class a week, four a month; one to one outside India two live classes a week, eight a month. Each class is one hour.

WHAT THIS COURSE IS

C++ course for kids aged 9 to 12: live online classes from a first program to loops, functions, vectors and text games, taught slowly and clearly in 6 months.

In one line: A serious language, taught at a child's pace, with a game or puzzle at the end of every lesson.

ABOUT THE PROGRAMME

C++ has a reputation for being hard, and for adults learning alone it can be. For a 9 to 12-year-old with a patient teacher, it is something else: a language that makes the computer's thinking visible. Every variable has a type, every line ends with a semicolon, and the compiler says exactly what it did not understand. Children who learn this way pick up habits of precision that make every later language easier. This 6-month live course is written for that age. It starts with what a program is and what a compiler does, then builds one idea at a time: printing and input, variables and arithmetic, decisions with if and else, loops, functions, lists with vectors, strings and finally grouping data with structs. Each idea arrives inside something a child wants to make, such as a times-table trainer, a number guessing game, a secret code machine, a pet simulator, tic-tac-toe or a maze. Topics that need more maturity, like pointers and memory management, are left for our C++ for Teens course. The final month introduces the kind of short puzzle problems used in programming contests. USACO, the USA Computing Olympiad, accepts C++ solutions and starts every new participant in its Bronze division, so students finish with a clear picture of what that next step looks like if they enjoy it. Classes are live and small enough for the teacher to read every child's code, and every month ends with a short check so parents can see real progress.

WHAT MAKES THIS COURSE DIFFERENT

- Written for ages 9 to 12: one new idea at a time, explained with pictures and everyday examples before any syntax
- A game or puzzle in every lesson, so practice feels like play while the habits stay rigorous
- Compiler errors taught as clues, not failures: children learn to read them and fix their own code
- Pointers and manual memory left for later on purpose, so younger students build confidence before complexity
- A first taste of contest-style problem solving in the final month, with USACO Bronze as a visible next step
- A clear bridge to our C++ for Teens course for students who want to keep going

THE LEARNING PATH, STEP BY STEP

Phase 1: First programs: what code and compilers are, printing, input, variables, arithmetic, decisions and loops
Phase 2: Building blocks: functions, vectors, strings and structs, each inside a small game or tool
Phase 3: Games and puzzles: random numbers, grids and nested loops, contest-style problems and a capstone project

WHAT A STUDENT NEEDS BEFORE STARTING

Coding experience: None required. Children who have tried Scratch or similar often settle in faster, but it is not needed
Computer skills: Can type short words, use a mouse and open a browser

Equipment: A laptop or desktop with a stable internet connection. We start with a free online C++ compiler in the browser, so nothing needs installing at first
Age: 9 to 12. Teens aged 13 and up should take our C++ for Teens course instead
Time commitment: 2 live hours plus 1-2 hours of practice each week

WHO THIS COURSE IS FOR

Scratch graduates: Children who have done block coding and are ready for real typed code
Curious beginners: Children who have never coded and want to start with a language that teaches careful thinking
Puzzle lovers: Kids who enjoy logic puzzles, codes and number games
Future contest coders: Children who might enjoy programming contests later and want the right foundation now
Families planning ahead: Parents who want their child ready for C++ for Teens or computer science at school

FULL CURRICULUM, WEEK BY WEEK

This is the complete teaching plan. Parents can ask about any week.

PHASE 1: FIRST PROGRAMS (MONTHS 1-2, WEEKS 1-8)

From what a program is to loops that draw patterns and run games. Every concept is shown on paper first, then typed, run and changed.

Month 1: Hello, C++ (Weeks 1-4)

Weeks 1-2: What Code Is and Your First Program

Topics:
- What a program is: instructions a computer follows exactly
- What a compiler does, explained as a translator
- The shape of a C++ program: include, main, braces and semicolons
- Printing words and numbers with cout
- Comments as notes to your future self
- Reading a compiler error and finding the line it points to

Projects built:
- Name banner: a program that prints a decorated banner with the student's name and favourite things

Practice: Write three short programs that print a joke, a poem and a box drawn with symbols

Weeks 3-4: Variables, Input and Arithmetic

Topics:
- Variables as labelled boxes, and the types int, double, char and string
- Reading input with cin
- Plus, minus, times and divide in code
- Why 7 / 2 gives 3 with whole numbers, and what % does
- Updating a variable: score = score + 10 and the shortcut +=
- Choosing clear variable names

Projects built:
- Pocket calculator and age-in-days converter that ask the user for numbers and print answers

Practice: Build a pizza-sharing program that works out slices each and slices left over using / and %

Assessment: Month 1 check: write a short input and arithmetic program from a plain-English description

Month 2: Decisions and Loops (Weeks 5-8)

Weeks 5-6: If, Else and Making Choices

Topics:
- Comparing values with ==, !=, <, >, <= and >=
- if, else if and else
- Combining conditions with and, or and not
- The classic mistake of = instead of ==
- Tracing a program by hand with a table
- Planning decisions with a simple flowchart

Projects built:
- Quiz show: a five-question quiz that keeps score and gives a message based on the result

Practice: Write a rock, paper, scissors judge that decides the winner from two typed choices

Weeks 7-8: Loops That Repeat

Topics:
- while loops and the idea of repeating until something changes
- for loops for counting
- Loop counters, totals and running scores
- Avoiding loops that never end
- Drawing star patterns and triangles with loops
- break and continue, used sparingly

Projects built:
- Times-table trainer and a number guessing game that says higher or lower until the player wins

Practice: Print the 1 to 12 times tables neatly, then a staircase of stars of any height the user chooses
Assessment: Phase 1 assessment: a loop and decision program built in class, plus a short explanation of how it works

---

PHASE 2: BUILDING BLOCKS (MONTHS 3-4, WEEKS 9-16)

The tools that let programs grow without getting messy: functions, lists, text and grouped data, each taught inside a small game or tool.

Month 3: Functions and Vectors (Weeks 9-12)
Weeks 9-10: Functions
Topics:
- Why we split programs into functions
- Writing a function, calling it and passing values in
- Returning an answer from a function
- void functions that just do something
- Local variables and why they stay inside their function
- Testing a function with a few known answers

Projects built:
- Shape helper: functions that draw squares and triangles and work out area and perimeter

Practice: Rewrite the quiz show from month 2 so each question is one function call
Weeks 11-12: Lists with Vectors
Topics:
- Storing many values in a vector
- Adding items with push_back and reading them by position
- Looping over a vector to total, count and find the biggest
- Positions start at zero, and what happens past the end
- Sorting a list with sort
- Choosing between a single variable and a list

Projects built:
- High score board: enter scores, sort them and print the top five with medals beside them

Practice: Store a week of temperatures and print the warmest day, the coldest day and the average
Assessment: Month 3 check: a function and vector task solved from a written problem

Month 4: Strings and Structs (Weeks 13-16)
Weeks 13-14: Working with Text
Topics:
- Strings as lists of characters
- Length, indexing and looping through a string
- Changing letters to upper or lower case
- Characters as numbers underneath
- Counting vowels, reversing words and checking palindromes
- Reading a full line of text with getline

Projects built:
- Secret code machine: a shift cipher that encodes and decodes messages between friends

Practice: Write a word game that tells the player how many letters their guess shares with a secret word
Weeks 15-16: Grouping Data with Structs
Topics:
- Why related values belong together
- Defining a struct with fields such as name, hunger and happiness
- Creating and changing struct values
- A vector of structs for a class list or a team
- Passing a struct to a function
- Designing data before writing code

Projects built:
- Virtual pet: a pet that gets hungry and bored over time and responds to feeding and play commands

Practice: Extend the pet so the player can look after three pets stored in one vector
Assessment: Phase 2 assessment: a small program that uses functions, a vector and a struct together

---

PHASE 3: GAMES AND PUZZLES (MONTHS 5-6, WEEKS 17-24)

Everything comes together in bigger text games, grid puzzles and the short problem-solving tasks used in programming contests, ending with a capstone each child designs.

Month 5: Bigger Games (Weeks 17-20)
Weeks 17-18: Random Numbers and a Text Adventure
Topics:
- Making random numbers for dice, cards and surprises
- Planning a game as rooms, choices and items
- A game loop that runs until the player wins or quits
- Keeping track of health, gold and inventory
- Splitting a bigger program into many small functions

- Testing every path through the game
    Projects built:
      - Dungeon adventure: a text adventure with rooms, random encounters, an inventory and a win condition
    Practice: Add two new rooms and one new item, then ask someone at home to play it
  Weeks 19-20: Grids and Nested Loops
    Topics:
      - A grid as a vector of vectors
      - Nested loops to print and search a grid
      - Rows, columns and checking neighbours
      - Checking for three in a row
      - Moving a player around a maze with letters
      - Keeping a grid game fair and bug-free
    Projects built:
      - Tic-tac-toe for two players and a maze game where the player finds the exit
    Practice: Add a move counter to the maze and a replay option to tic-tac-toe
    Assessment: Month 5 check: a grid task built from a short written specification

Month 6: Contest Puzzles and the Capstone (Weeks 21-24)
  Weeks 21-22: Thinking Like a Problem Solver
    Topics:
      - Reading a puzzle problem: input, output and the example cases
      - Working out the answer by hand before coding
      - Patterns that keep coming up: counting, finding the largest, simulating step by step
      - Testing with small cases and tricky edge cases
      - What USACO is and how its Bronze division works
      - Staying calm when the first idea does not work
    Projects built:
      - Puzzle notebook: eight short contest-style problems solved, each with a sentence on the idea behind it
    Practice: Solve two puzzle problems a week and write down one mistake and how you found it
  Weeks 23-24: Capstone Project and Showcase
    Topics:
      - Choosing a project idea that fits two weeks
      - Planning the data, the functions and the game loop
      - Building in small steps and testing as you go
      - Asking for feedback and improving the project
      - Presenting the program and explaining one clever part
      - Next steps: C++ for Teens, Python or contest practice
    Projects built:
      - Capstone: an original game or tool planned, built and presented by the student
    Practice: Write a short guide that explains how to play or use the capstone project
    Assessment: Final assessment: the capstone project, a short code walkthrough and a set of small coding tasks covering the whole course

PROJECTS THE STUDENT BUILDS AND KEEPS

- Quiz show with scoring and feedback
- Number guessing game and times-table trainer
- High score board with sorting
- Secret code machine
- Virtual pet with structs
- Dungeon text adventure
- Tic-tac-toe and maze games
- Original capstone project

Total projects: 8 finished projects plus a notebook of solved puzzle problems

SKILLS THE STUDENT WILL HAVE AT THE END

- C++ program structure, output and input
- Variables, types and arithmetic, including whole-number division and remainders
- Decisions and loops, traced by hand and in code
- Functions, vectors, strings and structs
- Reading compiler errors and debugging independently
- Breaking a problem into steps before coding

HOW A TYPICAL WEEK IS SPLIT

Live classes: 2 live one-hour classes per week with plenty of typing, running and fixing code together
Homework: A short task after every class, and a monthly mixed-review task that brings back earlier topics
Practice: 1-2 hours a week of small programs and puzzles
Review: Every program read by the teacher, with simple written notes on what to improve

SUPPORT INCLUDED

Doubt support: WhatsApp doubt support between classes, where a parent or the student can send a screenshot of an error
Progress updates: Regular progress notes to parents, with the projects their child finished that month

CERTIFICATION DETAIL

Completion: Certificate from Modern Age Coders, awarded on passing the final assessment. Fall short and there is focused revision and a free retest: the certificate certifies real learning, not attendance

WHERE THIS CAN LEAD

- Our C++ for Teens course, which adds pointers, object-oriented programming, the STL and data structures
- Contest practice toward USACO Bronze, with a teacher guiding the next set of problems
- Python for Kids or Teens, where the same ideas move much faster
- Game development courses, where loops, functions and data structures are used every day
- School computing clubs and projects, joined with real programming experience

COMMON QUESTIONS ABOUT THIS COURSE

For anything about cost, use PART 4 and RULE 1. Do not quote two regions.

Q: Is C++ too hard for a 9 or 10-year-old?
A: Not when it is taught at the right pace. Children cope well with C++ when each idea is introduced on its own, shown on paper first, and practised inside a small game. We leave the genuinely hard parts, such as pointers and manual memory management, for our C++ for Teens course, so younger students build confidence before complexity.

Q: Should my child learn Python or C++ first?
A: Both are good first languages. Python gets results faster with less punctuation. C++ asks for more precision, such as types and semicolons, and children who learn it early tend to be careful, systematic coders. If your child enjoys puzzles and detail, or is interested in programming contests later, C++ is a strong choice. The free demo is a good place to see which suits them. (Agent note: the free demo is a waiting list with no fixed date. The Priority Live Demo is a guaranteed class today or tomorrow, booked at https://learn.modernagecoders.com/priority-demo . Offer both, as RULE 3 says.)

Q: Does my child need to know Scratch first?
A: No. The course starts from what a program is. Children who have used Scratch often recognise loops and conditions quickly, but complete beginners do just as well with a little extra practice in the first month.

Q: What will my child build?
A: A quiz show, a number guessing game, a times-table trainer, a high score board, a secret code machine, a virtual pet, a text adventure, tic-tac-toe, a maze game and an original capstone project, plus a notebook of solved puzzle problems.

Q: What software do we need?
A: Only a laptop or desktop with a browser and a stable internet connection. We begin with a free online C++ compiler so nothing needs installing. Later in the course we can help set up a free compiler on the computer if the family wants one.

Q: Does this prepare my child for USACO?
A: It prepares them to start. USACO accepts C++ solutions and every new participant begins in the Bronze division. The final month introduces the kind of short problems used there and explains how the contest works. Moving up the divisions takes much more practice, which our contest programming courses cover for older students.

Q: How is this different from C++ for Teens?
A: This course is for ages 9 to 12 and covers the foundations slowly and thoroughly, so a child who finishes it is well prepared to join the teen course later.

Q: How are the classes run?
A: Live online classes, twice a week, with a real teacher, in a group of 15 to 20 students, a mini batch of up to 6, or one to one. Current fees for your region are shown in the pricing section of this page.

Q: Can we try a class first?
A: Yes. Book a free demo class. The teacher writes and runs a small C++ program with your child, sees how they think, and suggests whether group, mini batch or one-to-one classes fit best. There is no obligation to enrol. (Agent note: the free demo is a waiting list with no fixed date. The Priority Live Demo is a guaranteed class today or tomorrow, booked at https://learn.modernagecoders.com/priority-demo . Offer both, as RULE 3 says.)

To enrol, message Shivam Sir on +91 9123366161 or send the parent this link: https://learn.modernagecoders.com/courses/cpp-programming-for-kids-course
For a demo: the Priority Live Demo (guaranteed, today or tomorrow) is booked at

https://learn.modernagecoders.com/priority-demo . The free demo is a waiting list with no fixed date.

==========
COURSE 31 OF 137: C++ FOR TEENS: FUNDAMENTALS, STL, DSA AND REAL GAMES
==========

Course link: https://learn.modernagecoders.com/courses/cpp-programming-masterclass-for-teens
Subject area: C++ Programming
Designed for: Teens
Who can join: Absolute beginner, ages 13 to 18
Course length: 10-12 months (40-48 weeks)
Time needed: 2 live classes/week + 3-4 hours practice
Certificate: Certificate from Modern Age Coders, awarded on passing the final exam

PRICE FOR THIS COURSE (quote only the one that applies to the person asking)
In India, per month: group Rs 1,499, mini batch Rs 2,999, one to one Rs 4,999
Outside India, per month: group $100, one to one $150
Classes: group and mini batch two live classes a week, eight a month; one to one in India one live class a week, four a month; one to one outside India two live classes a week, eight a month. Each class is one hour.

WHAT THIS COURSE IS

C++ course for teens aged 13-18: fundamentals, pointers and memory, OOP, STL, data structures, SFML games and competitive programming basics in 10-12 months.

In one line: The language that hides nothing: pointers, memory and speed understood for real, then turned into data structures, games and contest-ready code.

ABOUT THE PROGRAMME

C++ is the language serious computer science still speaks: competitive programming runs on it, game engines are built in it, and the concepts it refuses to hide, memory, pointers, performance, are exactly what make every later language feel easy. This live online course takes students aged 13 to 18 through it honestly: fundamentals learned patiently, then the famous hard parts, pointers, references and dynamic memory, taught with pictures and patience until they click, object-oriented C++, the STL used the way contests and codebases use it, data structures built by hand, a 2D games month with SFML, and a genuine introduction to competitive programming. C++ rewards patience more than any beginner language, and the pace respects that: ten months at two live classes a week plus three to four hours of practice, with two more months in hand. What the course refuses to do is tour everything: OpenGL, embedded boards and compiler internals are named honestly as later specializations, not squeezed in as fake weeks. Homework after every class, monthly mixed reviews, phase exams, and a final exam that decides the certificate with a free retest. Real memory, real speed, depth over dopamine.

WHAT MAKES THIS COURSE DIFFERENT

- The hard parts taught properly: pointers and memory get patient weeks with pictures, not one rushed lecture
- STL fluency as a goal: vectors, maps and algorithms used the way contests and real codebases use them
- Data structures built by hand in the language they were invented for
- A real games month: SFML turns C++ skill into something friends can play
- Competitive programming opened honestly, with our DSA course named as the deep road
- Real assessment: weekly homework, monthly mixed reviews, and a final exam that decides the certificate, with a free retest

THE LEARNING PATH, STEP BY STEP

Phase 1: Fundamentals (Months 1-3): syntax to functions, arrays and strings, learned patiently
Phase 2: The hard beautiful parts (Months 4-6): pointers, memory, OOP, file IO and first STL
Phase 3: Data structures in C++ (Months 7-8): linear structures, trees, sorting and STL depth
Phase 4: Games, contests and the capstone (Months 9-10): SFML, competitive programming foundations, modern C++, and the final exam

WHAT A STUDENT NEEDS BEFORE STARTING

Coding experience: None. C++ is taught from the first line, patiently
Computer skills: Comfortable typing and managing files
Equipment: A computer with a stable internet connection; the compiler and every tool used are free
Age: 13 to 18. Batches are grouped by age and pace
Time commitment: 2 live classes plus 3-4 hours of practice a week

WHO THIS COURSE IS FOR

Serious learners: Teens who want the language that hides nothing and rewards patience
Contest bound: Students eyeing competitive programming, where C++ is the standard weapon
School aligned: ICSE/ISC students whose boards examine in C++-adjacent depth
Future engineers: Teens heading for engineering, where C++ fundamentals are the entry gate
Performance curious: Students who ask why some programs are fast and want the real answer

FULL CURRICULUM, WEEK BY WEEK

This is the complete teaching plan. Parents can ask about any week.

PHASE 1: FUNDAMENTALS (MONTHS 1-3, WEEKS 1-12)

The language learned patiently: syntax, control flow, loops, functions, arrays and strings,
each week ending with working programs.

Month 1: First C++ (Weeks 1-4)
Introduction to C++ & Programming
Topics:
- Why C++? The language behind every major game
- C++ history: From 1979 to modern gaming
- Setting up your development environment
- Installing Visual Studio/VS Code/CLion
- Compilers: GCC, Clang, MSVC explained
- Your first C++ program: Hello, World!
- Understanding #include and using namespace
- The main() function: Where programs start
- Compilation process: From code to executable
- cout and cin: Output and input
- Comments: Single-line and multi-line
- Common errors and how to fix them
Projects built:
- Hello World variations
- ASCII art generator
- Personal introduction program
- Simple conversation bot
Practice: Daily: Write and compile 5 small programs
Variables & Data Types
Topics:
- Variables: Storing game scores and player data
- Data types: int, float, double, char, bool
- Declaring and initializing variables
- Constants with const and #define
- Type casting: Converting between types
- Arithmetic operators: +, -, *, /, %
- Compound operators: +=, -=, *=, /=
- Increment/decrement: ++ and --
- Math library functions: sqrt, pow, abs
- Random numbers for games
- String basics: Working with text
- Character manipulation
Projects built:
- Calculator with all operations
- Temperature converter
- Random dice roller for D&D
- Simple RPG stat calculator
Practice: Solve 30 problems on variables and operators
Assessment: Month 1 check: a small program built live, plus a take-home mixing
everything so far

Month 2: Control and Repetition (Weeks 5-8)
Control Flow & Decision Making
Topics:
- If statements: Making decisions in code
- Else and else-if chains
- Comparison operators: ==, !=, <, >, <=, >=
- Logical operators: &&, ||, !
- Switch statements: Multiple choice menus
- Ternary operator: Compact conditions
- Nested conditions: Complex decisions
- Game logic with conditions
- Input validation techniques
- Menu-driven programs
- State machines basics
- Debugging conditional logic
Projects built:
- Text adventure game
- Grade calculator with letter grades
- Rock-Paper-Scissors game

```
        - Simple AI decision maker
      Practice: Build 10 programs with complex logic
    Loops & Repetition
      Topics:
        - For loops: Repeating code efficiently
        - While loops: Conditional repetition
        - Do-while loops: Guaranteed execution
        - Nested loops: 2D patterns and grids
        - Break and continue statements
        - Infinite loops and game loops
        - Loop optimization techniques
        - Pattern printing: Stars, pyramids, diamonds
        - Number sequences: Fibonacci, primes
        - ASCII art with loops
        - Animation basics with loops
        - Common loop patterns
      Projects built:
        - Pattern generator program
        - Prime number finder
        - Multiplication table generator
        - Simple animation loop
      Practice: Complete 40 loop-based challenges
      Assessment: Month 2 check: a loops-and-logic challenge live, plus mixed review

  Month 3: Functions, Arrays and Strings (Weeks 9-12)
    Functions - Code Reusability
      Topics:
        - Functions: Building blocks of programs
        - Function declaration and definition
        - Parameters and arguments
        - Return values and void functions
        - Pass by value vs pass by reference
        - Function overloading: Same name, different parameters
        - Default parameters
        - Inline functions for performance
        - Recursive functions: Functions calling themselves
        - Function prototypes
        - Scope and lifetime of variables
        - Creating game utility functions
      Projects built:
        - Math library with custom functions
        - Game utility functions toolkit
        - Recursive maze solver
        - Menu system with functions
      Practice: Write 30 different utility functions
    Arrays & Strings
      Topics:
        - Arrays: Storing multiple values
        - Declaring and initializing arrays
        - Accessing array elements
        - Array bounds and safety
        - Multi-dimensional arrays: Game boards
        - Character arrays and C-strings
        - String manipulation functions
        - Array algorithms: Search and sort
        - Passing arrays to functions
        - Dynamic memory preview
        - Common array problems
        - Game inventory systems
      Projects built:
        - Tic-Tac-Toe game
        - Student grade manager
        - Word game (Wordle clone)
        - 2D maze game
      Practice: Solve 25 array manipulation problems
      Assessment: Phase 1 exam: a complete console program built live, plus a written mixed
      paper

------------------------------------------------------------
PHASE 2: THE HARD BEAUTIFUL PARTS (MONTHS 4-6, WEEKS 13-24)
------------------------------------------------------------
What makes C++ C++: pointers and references with pictures, dynamic memory without fear,
object-oriented design, files, and the first taste of the STL.

  Month 4: Pointers and Memory (Weeks 13-16)
    Pointers & References
      Topics:
        - Pointers: The power of C++
        - Memory addresses and the & operator
```

- Pointer declaration and dereferencing
- Null pointers and safety
- Pointer arithmetic
- Arrays and pointers relationship
- References: Safer than pointers
- Const pointers and references
- Function pointers basics
- Common pointer mistakes
- Memory visualization
- Why games need pointers

Projects built:
- Dynamic array implementation
- Memory explorer program
- Pointer-based data swap
- Simple memory game

Practice: Master 20 pointer exercises

Dynamic Memory Management

Topics:
- Stack vs Heap memory
- Dynamic memory with new and delete
- Dynamic arrays
- Memory leaks and how to avoid them
- Delete vs delete[]
- Smart pointers preview
- RAII principle basics
- Common memory errors
- Debugging memory issues
- Valgrind and sanitizers
- Memory-efficient programming
- Game memory management

Projects built:
- Dynamic inventory system
- Resizable array class
- Memory pool allocator
- Dynamic game world

Practice: Build 10 programs with dynamic memory

Assessment: Month 4 check: a pointer-diagram exercise live, memory drawn before code, plus mixed review

Month 5: Objects and Inheritance (Weeks 17-20)

Object-Oriented Basics: Classes and Objects

Topics:
- Introduction to OOP
- Classes and objects
- Member variables and functions
- Access specifiers: public, private, protected
- Constructors and destructors
- This pointer
- Const member functions
- Static members
- Friend functions and classes
- Operator overloading basics
- Class design principles
- UML diagrams basics

Projects built:
- Game character class
- Bank account system
- Student record system
- Simple physics engine

Practice: Design 10 different classes

Inheritance & Polymorphism

Topics:
- Inheritance: Creating class hierarchies
- Base and derived classes
- Protected access specifier
- Types of inheritance: public, private, protected
- Constructor and destructor in inheritance
- Function overriding
- Virtual functions and late binding
- Pure virtual functions
- Abstract classes and interfaces
- Multiple inheritance
- Diamond problem and virtual inheritance
- Polymorphism in game development

Projects built:
- Game entity hierarchy
- Shape drawing system
- Vehicle simulation
- RPG character classes

```
      Practice: Build 10 inheritance hierarchies
      Assessment: Month 5 check: design a small class hierarchy live and defend it, plus
      mixed review

  Month 6: Files, Errors and First STL (Weeks 21-24)
    File Input/Output
      Topics:
        - File streams: ifstream, ofstream, fstream
        - Opening and closing files
        - Reading from text files
        - Writing to text files
        - File error handling
        - Binary file I/O
        - File positioning and seeking
        - CSV file processing
        - JSON parsing basics
        - Save game systems
        - Configuration files
        - Log file creation
        - Error handling habits: from crash to graceful failure
      Projects built:
        - Save/load game system
        - High score tracker
        - Text file analyzer
        - Simple database file system
      Practice: Build 10 file processing utilities
    STL Basics - Standard Template Library
      Topics:
        - Introduction to STL
        - Vectors: Dynamic arrays made easy
        - Vector operations and methods
        - Strings: Modern C++ strings
        - String manipulation methods
        - Iterators basics
        - Range-based for loops
        - Algorithm library preview
        - Sort and search algorithms
        - STL vs raw arrays
        - When to use STL
        - Performance considerations
      Projects built:
        - Contact manager with vectors
        - Text processor with strings
        - Sorting visualizer
        - Word frequency analyzer
      Practice: Convert array programs to use STL
      Assessment: Phase 2 exam: an OOP + STL program defended live, plus a cumulative written
      paper

---------------------------------------------------------------
PHASE 3: DATA STRUCTURES IN C++ (MONTHS 7-8, WEEKS 25-32)
---------------------------------------------------------------
The serious core, built by hand in the language it was invented for: linear structures, trees
and graphs, sorting, and STL depth.

  Month 7: Structures by Hand (Weeks 25-28)
    Linear Data Structures
      Topics:
        - Linked lists: Single, double, circular
        - Implementing linked list operations
        - Stacks: LIFO principle
        - Stack applications: Undo, parsing
        - Queues: FIFO principle
        - Circular queues and deques
        - Priority queues
        - Implementing with arrays vs nodes
        - STL containers: list, stack, queue
        - Time complexity analysis
        - Space complexity
        - Real-world applications
      Projects built:
        - Custom linked list class
        - Expression evaluator with stack
        - Task scheduler with queues
        - Undo/redo system
      Practice: Implement all data structures from scratch
    Trees & Graphs
      Topics:
        - Binary trees: Structure and properties
```

```
        - Tree traversals: Inorder, preorder, postorder
        - Binary search trees (BST)
        - BST operations: Insert, delete, search
        - Balanced trees: AVL basics
        - Heaps and priority queues
        - Graphs: Representation methods
        - Graph traversals: DFS and BFS
        - Shortest path algorithms preview
        - Tree applications in games
        - Scene graphs in game engines
        - Decision trees for AI
      Projects built:
        - BST implementation
        - File system tree
        - Game AI decision tree
        - Pathfinding visualizer
      Practice: Solve 20 tree/graph problems
      Assessment: Month 7 check: implement a structure live and trace it, plus mixed review

  Month 8: Algorithms and STL Depth (Weeks 29-32)
    Algorithms - Searching & Sorting
      Topics:
        - Linear search vs binary search
        - Binary search implementation
        - Bubble sort: Simple but slow
        - Selection sort and insertion sort
        - Merge sort: Divide and conquer
        - Quick sort: Fast average case
        - Heap sort with heaps
        - Counting sort and radix sort
        - STL sorting algorithms
        - Custom comparators
        - Sorting visualization
        - Algorithm complexity analysis
        - Hash maps and sets: the contest workhorses
      Projects built:
        - Sorting algorithm visualizer
        - Game leaderboard system
        - Search engine prototype
        - Data analysis tool
      Practice: Implement all sorting algorithms
    STL Containers Deep Dive
      Topics:
        - Vector internals and performance
        - Deque: Double-ended queue
        - List vs vector performance
        - Set and map internals (red-black trees)
        - Unordered containers performance
        - Container adaptors
        - Custom allocators
        - Iterator categories
        - Iterator adaptors
        - Reverse iterators
        - Container selection guide
        - Performance benchmarking
      Projects built:
        - Performance comparison tool
        - Custom container library
        - Game inventory with STL
        - Database with STL
      Practice: Master all STL containers
      Assessment: Phase 3 exam: solve a timed problem set with the right structures, plus a
      cumulative paper

----------------------------------------------------------------
PHASE 4: GAMES, CONTESTS AND THE CAPSTONE (MONTHS 9-10, WEEKS 33-40)
----------------------------------------------------------------
C++ made visible and competitive: a real SFML game, contest foundations, modern C++ habits,
and the capstone exam.

  Month 9: SFML and First Contests (Weeks 33-36)
    2D Graphics with SFML
      Topics:
        - Introduction to SFML
        - Setting up SFML project
        - Creating windows
        - Basic shapes and colors
        - Sprites and textures
        - Text rendering
```

- Handling events: Keyboard, mouse
- Game loop implementation
- Frame rate and delta time
- 2D transformations
- View and camera
- Sound and music

Projects built:
- Pong game clone
- Snake game
- Particle system
- 2D platformer prototype

Practice: Create 10 mini-games with SFML

Competitive Programming Foundations

Topics:
- Introduction to competitive programming
- Online judges: Codeforces, AtCoder, CodeChef
- USACO preparation
- Reading problem statements
- Input/output optimization
- Time complexity mastery
- Space complexity optimization
- Common patterns
- Debugging strategies
- Contest strategies
- Speed coding techniques
- Template preparation
- Where our dedicated DSA course takes this road further

Projects built:
- Personal template library
- Problem tracker
- Solution archive
- Contest simulator

Practice: Solve 100 easy problems

Assessment: Month 9 check: one timed contest set attempted honestly, plus mixed review

Month 10: Modern C++, Capstone, Demo Day (Weeks 37-40)

Modern C++: Smart Pointers and Clean Habits

Topics:
- Problems with raw pointers
- unique_ptr: Exclusive ownership
- shared_ptr: Shared ownership
- weak_ptr: Breaking cycles
- make_unique and make_shared
- Custom deleters
- RAII in practice
- Auto keyword and type inference
- Range-based loops
- Lambda expressions
- std::function and std::bind
- Modern C++ best practices

Projects built:
- Memory-safe game engine
- Resource manager with smart pointers
- Callback system with lambdas
- Modern C++ game framework

Practice: Refactor old code with modern C++

Capstone Build

Topics:
- Choosing the capstone: an SFML game, a data-structure engine or a console product
- Two focused weeks with milestones and checkpoints
- Memory-clean by design: no leaks, no crashes
- Using everything: OOP, STL, structures, maybe graphics
- Preparing the demo: the hardest bug as the best story

Projects built:
- THE CAPSTONE: a complete C++ project built over two weeks with version control

Practice: A compiling, running build at the end of every session

Demo Day and the Final Exam

Topics:
- Presenting the capstone live
- A full-course spiral review before the exam
- The honest map: OpenGL, embedded and systems programming as later roads
- Where each path leads: our DSA course, ICSE/ISC excellence, or engineering entrances

Projects built:
- Demo day presentation delivered to the batch and parents

Assessment: FINAL EXAM: a practical build plus a written paper with questions mixed from every phase. Passing earns the certificate; a student who falls short gets a focused revision plan and a free retest

PROJECTS THE STUDENT BUILDS AND KEEPS

- Phase 1: console programs, calculators, games of logic and text tools
- Phase 2: pointer visualizations, class hierarchies, file-backed applications and first STL builds
- Phase 3: hand-built structures, sorting visualken and timed problem sets
- Phase 4: an SFML game, contest submissions, and the memory-clean capstone at demo day

Total projects: 25+ real C++ builds, crowned by a memory-clean capstone

SKILLS THE STUDENT WILL HAVE AT THE END

- C++ fundamentals to fluency: syntax, control flow, functions, arrays, strings
- The memory model: pointers, references and dynamic allocation, actually understood
- Object-oriented C++: classes, inheritance and polymorphism as design
- STL fluency: containers and algorithms the way contests use them
- Data structures by hand: lists, stacks, queues, trees and hashing
- Applied C++: SFML graphics and competitive programming foundations

HOW A TYPICAL WEEK IS SPLIT

Live classes: 2 live one-hour classes per week, coding along with the instructor
Homework: Homework after every class, and a mixed-review assignment at the end of every month
Practice: 3-4 hours of problem practice between classes
Review: Every submission reviewed with written feedback; recurring gaps reopened in class

SUPPORT INCLUDED

Doubt support: WhatsApp doubt support between classes, for the segfault that makes no sense at 9 pm
Progress updates: Regular progress notes to parents: what was built, what comes next, and where encouragement helps

CERTIFICATION DETAIL

Completion: Certificate from Modern Age Coders, awarded on passing the final exam. Fall short and there is focused revision and a free retest: the certificate certifies knowledge, not attendance

WHERE THIS CAN LEAD

- Data Structures and Algorithms: the dedicated contest-and-interview road
- Game development: SFML here opens toward engines later
- Engineering entrances and school boards, met with real fundamentals
- Systems roads later: OS, embedded and graphics, named honestly as specializations
- Every other language, suddenly easy: C++ makes the rest feel gentle

COMMON QUESTIONS ABOUT THIS COURSE

For anything about cost, use PART 4 and RULE 1. Do not quote two regions.

Q: What will my teen build in this C++ course?
A: More than 25 real builds across ten months: console programs and logic games in the fundamentals, pointer-visualized memory exercises, class hierarchies and file-backed applications, hand-built data structures, timed contest sets, a real 2D game in SFML, and a memory-clean capstone presented at demo day.

Q: Is C++ too hard as a first language for a teenager?
A: It is harder than Python, and that is precisely its value when taught patiently: C++ hides nothing, so a teen who learns it understands memory, types and performance for life, and every later language feels easy. This course paces the famous hard parts, pointers get pictures and patience, not one rushed lecture, and the 2-month margin exists exactly for them.

Q: How long does it take, and how is my teen assessed?
A: Ten months at 2 live classes a week plus 3 to 4 hours of practice, with two more months in hand. Homework follows every class, monthly assignments mix new questions with earlier topics, each phase ends with an exam, and a final exam, practical plus written, decides the certificate with a free retest after revision.

Q: Does this course prepare for competitive programming?
A: It builds the exact base: STL fluency, hand-built structures, algorithmic thinking and a genuine contest-foundations month with timed sets. Serious contest training, dynamic programming, advanced graphs, rating grinds, lives in our dedicated DSA course, which this course names honestly as the next road.

Q: C++ or Python first?
A: Both are excellent and we teach both. Python first suits teens pulled toward AI and quick wins; C++ first suits teens bound for competitive programming, engineering entrances or school boards that reward its depth, and produces unmatched fundamentals. Nothing learned in

either has to be unlearned.

Q: Is there a free trial class?
A: Yes, a free demo class with no commitment: book at learn.modernagecoders.com/contact or message us on WhatsApp at +91 91233 66161. (Agent note: the free demo is a waiting list with no fixed date. The Priority Live Demo is a guaranteed class today or tomorrow, booked at https://learn.modernagecoders.com/priority-demo . Offer both, as RULE 3 says.)

Q: Are classes live or recorded?
A: Live, always: small groups with a real instructor reading real code, never pre-recorded videos. In C++ especially, the compiler error means nothing to a beginner and everything to a teacher watching live.

To enrol, message Shivam Sir on +91 9123366161 or send the parent this link: https://learn.modernagecoders.com/courses/cpp-programming-masterclass-for-teens
For a demo: the Priority Live Demo (guaranteed, today or tomorrow) is booked at https://learn.modernagecoders.com/priority-demo . The free demo is a waiting list with no fixed date.

==========

COURSE 32 OF 137: C++ MASTERCLASS: FUNDAMENTALS TO MODERN C++ AND SYSTEMS

==========

Course link: https://learn.modernagecoders.com/courses/cpp-programming-complete-masterclass-college
Subject area: C++ Programming
Designed for: College students
Who can join: Complete beginner (18+); college students, graduates and working professionals
Course length: 10-12 months (44-52 weeks)
Time needed: 2 live classes/week + 4-6 hours practice
Certificate: Certificate from Modern Age Coders, awarded on passing the final exam

PRICE FOR THIS COURSE (quote only the one that applies to the person asking)
In India, per month: group Rs 1,499, mini batch Rs 2,999, one to one Rs 4,999
Outside India, per month: group $100, one to one $150
Classes: group and mini batch two live classes a week, eight a month; one to one in India one live class a week, four a month; one to one outside India two live classes a week, eight a month. Each class is one hour.

WHAT THIS COURSE IS

C++ course for college students and professionals: fundamentals, OOP, STL and templates, modern C++, concurrency and systems programming in 10-12 months.

In one line: The language beneath everything fast: fundamentals to modern C++, templates, concurrency and systems programming, in ten honest months.

ABOUT THE PROGRAMME

C++ remains the language of engines, trading systems, embedded firmware and every place performance is non-negotiable, and it rewards exactly one approach: patient depth. This live online masterclass builds it in three real phases: fundamentals and object-oriented C++ learned properly, then the layer that makes C++ modern, the STL used fluently, templates understood rather than feared, smart pointers and RAII as habits, and finally the systems layer: concurrency, memory at depth, and the OS-adjacent programming that makes C++ engineers valuable. A finale month ships a capstone and sits the final exam. The pace is honest: ten teaching months at two live classes a week plus four to six hours of practice, with two more months in hand. Problem sets after every class, monthly mixed reviews, cumulative phase exams, and a final exam that decides the certificate with a free retest. Real memory, real speed, depth over dopamine.

WHAT MAKES THIS COURSE DIFFERENT

- The memory model taught with pictures and patience: pointers, RAII and ownership as understanding, not folklore
- Modern C++ as the default: smart pointers, move semantics and the STL the way current codebases use them
- Templates demystified: generic programming as a tool, not a trauma
- A real systems phase: concurrency and OS-adjacent programming, the valuable end of C++
- An honest 10-month arc with 2 months in hand
- Real assessment: weekly problem sets, monthly mixed reviews, phase exams and a final exam with a free retest

THE LEARNING PATH, STEP BY STEP

Phase 1: Fundamentals and OOP (Months 1-3): the language learned properly, from syntax to class design
Phase 2: Modern C++ (Months 4-6): STL fluency, templates, smart pointers and move semantics
Phase 3: Systems and concurrency (Months 7-9): threads, memory at depth, performance and OS interfaces

Phase 4: The finale (Month 10): capstone spec, build, ship, and the final exam

WHAT A STUDENT NEEDS BEFORE STARTING

Coding experience: None. The language is taught from the first line
Equipment: Any computer; the compiler and every tool used are free
Age: 18+; college students, graduates and working professionals
Time commitment: 2 live classes plus 4-6 hours of practice a week

WHO THIS COURSE IS FOR

College students: Engineering students whose curriculum and placements both reward C++ depth
Placement candidates: Anyone whose interviews include C++ and its memory questions
Performance engineers: Developers drawn to the fast end of software
Self taught stuck: Learners who know syntax but fear pointers; this course ends that
Career switchers: Professionals entering software through its most rigorous door

FULL CURRICULUM, WEEK BY WEEK

This is the complete teaching plan. Parents can ask about any week.

PHASE 1: C++ FUNDAMENTALS & OBJECT-ORIENTED PROGRAMMING (MONTHS 1-3, WEEKS 1-13)

Build rock-solid foundations in C++ syntax, memory management, pointers, and object-oriented programming principles.

Months 1-2: C++ Basics & Core Concepts (Weeks 1-7)
Introduction to C++ & Development Environment
Topics:
- History and evolution of C++ (C++98 to C++23)
- Why C++? Performance, control, and applications
- Setting up development environment (VS Code, Visual Studio, CLion)
- Compilers: GCC, Clang, MSVC
- Writing your first C++ program
- Program structure: headers, main function, return
- Compilation process: preprocessing, compilation, linking
- Basic input/output with iostream
- Comments and code documentation
- Namespaces and using directive
- C++ coding standards and best practices
- Debugging basics with GDB/LLDB
Projects built:
- Hello World variations
- Simple calculator with basic operations
- Temperature converter
- Personal information display program
Practice: Write 20 simple console programs
Variables, Data Types & Operators
Topics:
- Fundamental data types: int, float, double, char, bool
- Type modifiers: signed, unsigned, short, long
- Variable declaration and initialization
- Constants: const and constexpr
- Auto keyword and type inference
- Arithmetic operators and precedence
- Relational and logical operators
- Bitwise operators and bit manipulation
- Assignment and compound assignment operators
- Increment and decrement operators
- Type casting: static_cast, dynamic_cast, const_cast, reinterpret_cast
- sizeof operator and type sizes
Projects built:
- Advanced calculator with bitwise operations
- Data type size explorer
- Number system converter (binary, decimal, hex)
- Bitwise flag management system
Practice: Solve 50 problems on operators and type manipulation
Control Flow & Functions
Topics:
- If-else statements and nested conditions
- Switch-case statements
- Conditional (ternary) operator
- While, do-while loops
- For loops and range-based for (C++11)
- Break, continue, and goto
- Function declaration and definition
- Function parameters: pass by value, reference, pointer
- Return types and return by reference

```
      - Function overloading
      - Default arguments
      - Inline functions
      - Recursion and recursive algorithms
      - Function pointers basics
    Projects built:
      - Menu-driven banking system
      - Number guessing game
      - Prime number generator
      - Recursive factorial and Fibonacci calculator
      - Pattern printing programs
    Practice: Implement 30 algorithms using functions
  Arrays, Strings & Pointers
    Topics:
      - Static arrays: declaration and initialization
      - Array operations and bounds checking
      - Multidimensional arrays
      - C-style strings and string operations
      - std::string class and string manipulation
      - String streams (stringstream)
      - Introduction to pointers
      - Pointer arithmetic
      - Arrays and pointers relationship
      - Dynamic memory allocation: new and delete
      - Memory leaks and dangling pointers
      - Smart pointers introduction (unique_ptr, shared_ptr)
      - References vs pointers
      - Null pointers and nullptr
    Projects built:
      - Dynamic array implementation
      - String manipulation library
      - Matrix operations calculator
      - Memory management demonstration
      - Text-based adventure game
    Practice: Master 40 pointer and array problems

Month 3: Object-Oriented Programming (Weeks 8-13)
  Classes and Objects
    Topics:
      - Classes and objects fundamentals
      - Class members: data and functions
      - Access specifiers: public, private, protected
      - Constructors and destructors
      - Constructor types: default, parameterized, copy
      - Initializer lists
      - This pointer
      - Static members and methods
      - Friend functions and classes
      - Nested classes
      - Const member functions
      - Mutable keyword
      - Rule of Three/Five/Zero
      - Move semantics (C++11)
    Projects built:
      - Bank account management system
      - Student record system
      - Complex number class
      - Date and time class
      - Custom string class implementation
    Practice: Create 20 different classes modeling real-world objects
  Inheritance and Polymorphism
    Topics:
      - Inheritance concepts and types
      - Single, multiple, multilevel inheritance
      - Virtual inheritance and diamond problem
      - Function overriding
      - Virtual functions and vtable
      - Pure virtual functions and abstract classes
      - Interfaces in C++
      - Runtime polymorphism
      - Dynamic binding
      - Virtual destructors
      - Object slicing problem
      - RTTI (Run-Time Type Information)
      - typeid and type_info
      - Final and override specifiers (C++11)
    Projects built:
      - Shape hierarchy with area calculations
      - Employee management system with inheritance
```

```
        - Game character class hierarchy
        - Vehicle simulation system
        - Plugin architecture using polymorphism
      Practice: Build 15 inheritance hierarchies
    Operator Overloading & Advanced OOP
      Topics:
        - Operator overloading concepts
        - Overloading arithmetic operators
        - Overloading comparison operators
        - Overloading assignment operator
        - Overloading stream operators (<<, >>)
        - Overloading function call operator
        - Overloading subscript operator []
        - Type conversion operators
        - Explicit keyword
        - Copy and swap idiom
        - CRTP (Curiously Recurring Template Pattern)
        - Design patterns introduction
        - SOLID principles in C++
      Projects built:
        - Mathematical vector class with operators
        - Custom array class with subscript operator
        - Fraction class with all operators
        - Matrix class with operations
        - PHASE 1 CAPSTONE: Complete OOP Library Management System
      Assessment: Phase 1 exam: a practical build defended live, plus a written paper mixing
      this phase with everything before it

----------------------------------------------------------------
PHASE 2: STL, TEMPLATES & MODERN C++ (MONTHS 4-6, WEEKS 14-26)
----------------------------------------------------------------
Master the Standard Template Library, template programming, and modern C++ features.

  Months 4-5: STL Mastery (Weeks 14-21)
    STL Containers
      Topics:
        - STL overview and architecture
        - Sequence containers: vector, deque, list, array
        - Container adapters: stack, queue, priority_queue
        - Associative containers: set, map, multiset, multimap
        - Unordered containers: unordered_set, unordered_map
        - Container operations and time complexity
        - Choosing the right container
        - Custom allocators
        - Container memory management
        - Iterators: types and usage
        - Iterator categories and traits
        - Reverse iterators
        - Iterator adapters
        - Range-based operations
      Projects built:
        - Student database using STL containers
        - Text editor with undo/redo using stack
        - Priority task scheduler
        - Dictionary implementation with map
        - Cache implementation with unordered_map
      Practice: Implement 30 algorithms using different STL containers
    STL Algorithms
      Topics:
        - Algorithm categories in STL
        - Non-modifying sequence operations
        - Modifying sequence operations
        - Sorting algorithms: sort, partial_sort, nth_element
        - Searching algorithms: find, binary_search, lower_bound
        - Numeric algorithms: accumulate, inner_product
        - Set operations: union, intersection, difference
        - Heap operations
        - Permutation algorithms
        - Lambda expressions with algorithms
        - Function objects (functors)
        - Predicate functions
        - Algorithm complexity analysis
        - Custom algorithms implementation
      Projects built:
        - Data analysis tool using STL algorithms
        - Sorting visualizer
        - Set operations calculator
        - Performance comparison of algorithms
        - Custom algorithm library
```

```
    Practice: Use 50 different STL algorithms in various scenarios
  Template Programming
    Topics:
      - Function templates
      - Class templates
      - Template parameters: type and non-type
      - Template specialization
      - Partial specialization
      - Variadic templates (C++11)
      - Template metaprogramming basics
      - SFINAE (Substitution Failure Is Not An Error)
      - Type traits and type manipulation
      - Template template parameters
      - Concepts (C++20)
      - Fold expressions (C++17)
      - constexpr and compile-time computation
      - Template best practices
    Projects built:
      - Generic data structures library
      - Type-safe unit conversion system
      - Compile-time math library
      - Template-based design patterns
      - Custom smart pointer implementation
    Practice: Create 20 template-based utilities
  Modern C++ Features (C++11/14/17/20)
    Topics:
      - Auto and decltype
      - Range-based for loops
      - Lambda expressions and captures
      - Rvalue references and move semantics
      - Perfect forwarding
      - Smart pointers: unique_ptr, shared_ptr, weak_ptr
      - std::thread and basic threading
      - std::chrono for time management
      - Random number generation
      - Regular expressions
      - Filesystem library (C++17)
      - std::optional, std::variant, std::any (C++17)
      - Structured bindings (C++17)
      - Coroutines basics (C++20)
    Projects built:
      - Modern C++ file manager
      - Multi-threaded downloader
      - Regular expression validator
      - Time measurement utilities
      - Resource management system with smart pointers
    Practice: Refactor old code using modern C++ features
  Error Handling & Exception Safety
    Topics:
      - Exception handling mechanism
      - Try, catch, and throw
      - Exception specifications
      - Standard exception classes
      - Custom exception classes
      - Exception safety guarantees
      - RAII (Resource Acquisition Is Initialization)
      - noexcept specifier
      - Error codes vs exceptions
      - std::expected (C++23)
      - Stack unwinding
      - Exception handling best practices
      - Debugging techniques
      - Assertion and static_assert
    Projects built:
      - Robust file processing system
      - Exception-safe container
      - Error handling framework
      - Resource manager with RAII
      - Custom error reporting system
    Practice: Add proper error handling to 10 previous projects

Month 6: Data Structures & Algorithms (Weeks 22-26)
  Advanced Data Structures
    Topics:
      - Linked lists: singly, doubly, circular
      - Stack and queue implementations
      - Binary trees and BST
      - AVL trees and balancing
      - Red-black trees
```

```
    - B-trees and B+ trees
    - Heaps and priority queues
    - Hash tables and collision resolution
    - Graphs: representation and traversal
    - Tries and suffix trees
    - Disjoint set (Union-Find)
    - Segment trees and Fenwick trees
    - Skip lists
    - Custom allocators for data structures
  Projects built:
    - Custom STL-like container library
    - Database index implementation
    - Autocomplete system using trie
    - Graph visualization tool
    - Memory-efficient data structures
  Practice: Implement 20 data structures from scratch
Algorithm Design & Analysis
  Topics:
    - Algorithm complexity analysis
    - Divide and conquer algorithms
    - Dynamic programming techniques
    - Greedy algorithms
    - Backtracking algorithms
    - Graph algorithms: DFS, BFS, Dijkstra, Floyd-Warshall
    - Minimum spanning tree: Kruskal, Prim
    - Network flow algorithms
    - String algorithms: KMP, Rabin-Karp
    - Computational geometry basics
    - Randomized algorithms
    - Parallel algorithms introduction
    - Cache-efficient algorithms
    - Algorithm optimization techniques
  Projects built:
    - Pathfinding visualizer
    - String matching tool
    - Optimization problem solver
    - Algorithm complexity analyzer
    - Competitive programming library
  Practice: Solve 100 algorithmic problems
Performance Optimization
  Topics:
    - Profiling tools: gprof, Valgrind, perf
    - CPU architecture and cache optimization
    - Memory layout and alignment
    - Branch prediction and optimization
    - Loop optimization techniques
    - Vectorization and SIMD instructions
    - Compiler optimizations and flags
    - Link-time optimization
    - Profile-guided optimization
    - Memory pooling and custom allocators
    - Lock-free data structures basics
    - Benchmarking techniques
    - Space-time tradeoffs
    - Platform-specific optimizations
  Projects built:
    - Performance profiler tool
    - Optimized matrix multiplication
    - Memory pool allocator
    - Cache-friendly data structures
    - Benchmark suite for algorithms
  Practice: Optimize 10 programs for maximum performance
Competitive Programming
  Topics:
    - Competitive programming platforms
    - Problem-solving strategies
    - Fast I/O techniques
    - Common problem patterns
    - Number theory for CP
    - Combinatorics and probability
    - Game theory basics
    - Bit manipulation tricks
    - String algorithms for CP
    - Advanced data structures for CP
    - Dynamic programming patterns
    - Graph algorithm variations
    - Contest strategies
    - Time management in contests
  Projects built:
```

- Competitive programming template
- Problem classifier and trainer
- Contest performance analyzer
- Algorithm reference implementation
- Virtual contest environment

Practice: Solve 200 competitive programming problems

Phase 2 Capstone Project

Topics:

- Complex system design
- Algorithm selection and implementation
- Performance optimization
- Code organization and documentation
- Testing and debugging

Projects built:

- PHASE 2 CAPSTONE: High-Performance Database Engine
- Build a simple database with indexing, querying, and transactions
- Implement B+ tree indexes, query optimizer, and transaction manager
- Focus on performance and correctness

Assessment: Phase 2 exam: a practical build defended live, plus a written paper mixing this phase with everything before it

---

PHASE 3: SYSTEM PROGRAMMING & CONCURRENCY (MONTHS 7-9, WEEKS 27-39)

Master system-level programming, multithreading, networking, and low-level development.

Months 7-8: System Programming (Weeks 27-34)

Operating System Interface

Topics:

- Process and memory model
- System calls and OS APIs
- File system operations
- Process creation and management
- Inter-process communication (IPC)
- Shared memory
- Message queues
- Pipes and named pipes
- Signals and signal handling
- Memory mapping with mmap
- Dynamic linking and loading
- Environment variables
- System information retrieval
- Platform-specific APIs (POSIX, Win32)

Projects built:

- Custom shell implementation
- Process monitor and manager
- IPC messaging system
- File system utilities
- System information tool

Practice: Build 10 system-level utilities

Memory Management Deep Dive

Topics:

- Virtual memory concepts
- Memory allocation strategies
- Custom memory allocators
- Memory pools and arenas
- Garbage collection techniques
- Reference counting implementation
- Memory debugging tools
- Leak detection and prevention
- Memory-mapped I/O
- Cache-conscious programming
- NUMA awareness
- Memory barriers and ordering
- Lock-free memory management
- Memory optimization patterns

Projects built:

- Custom malloc implementation
- Garbage collector prototype
- Memory leak detector
- Memory-efficient container library
- Cache performance analyzer

Practice: Implement 5 different memory allocation strategies

Multithreading & Concurrency

Topics:

- Thread creation and management
- Thread synchronization primitives
- Mutexes and locks
- Condition variables

```
      - Semaphores and barriers
      - Read-write locks
      - Atomic operations and memory ordering
      - Lock-free programming
      - Thread pools and executors
      - Futures and promises
      - Async programming with std::async
      - Parallel algorithms (C++17)
      - Thread-local storage
      - Deadlock prevention and detection
    Projects built:
      - Thread pool implementation
      - Producer-consumer system
      - Parallel sorting algorithm
      - Lock-free queue
      - Concurrent web server
    Practice: Build 15 multithreaded applications
  Network Programming
    Topics:
      - Socket programming basics
      - TCP/IP protocol suite
      - UDP vs TCP programming
      - Client-server architecture
      - Non-blocking I/O
      - I/O multiplexing: select, poll, epoll
      - Asynchronous I/O
      - Protocol design and implementation
      - Serialization and deserialization
      - RPC (Remote Procedure Call)
      - HTTP server implementation
      - WebSocket programming
      - Network security basics
      - Cross-platform networking
    Projects built:
      - Chat server and client
      - HTTP server from scratch
      - File transfer protocol implementation
      - Distributed computing framework
      - Network packet analyzer
    Practice: Create 10 network applications
  Database Systems Programming
    Topics:
      - Database connectivity (ODBC, native APIs)
      - SQL query execution from C++
      - Connection pooling
      - Transaction management
      - Prepared statements
      - ORM implementation basics
      - NoSQL database interfaces
      - Embedded databases (SQLite)
      - Database driver development
      - Query optimization from application
      - Caching strategies
      - Data serialization formats
      - Database performance tuning
      - Migration and versioning
    Projects built:
      - Database connection pool
      - Simple ORM framework
      - Database migration tool
      - Query builder library
      - Cache layer implementation
    Practice: Build 5 database-driven applications

Month 9: Advanced System Topics (Weeks 35-39)
  Compiler Design & Tools
    Topics:
      - Compilation process deep dive
      - Lexical analysis basics
      - Parsing techniques
      - Abstract syntax trees
      - Code generation basics
      - Writing a simple interpreter
      - JIT compilation concepts
      - LLVM basics
      - Build systems: Make, CMake, Bazel
      - Static analysis tools
      - Code generation tools
      - Debugging at assembly level
```

    - Profiling and optimization tools
    - Cross-compilation
  Projects built:
    - Simple expression evaluator
    - Mini programming language interpreter
    - Build system for C++ projects
    - Static code analyzer
    - Code generator for repetitive tasks
  Practice: Create 5 development tools
Embedded Systems Programming
  Topics:
    - Embedded C++ considerations
    - Memory-constrained programming
    - Real-time systems concepts
    - Interrupt handling
    - Device driver basics
    - Bare-metal programming
    - RTOS integration
    - Hardware abstraction layers
    - Cross-compilation for embedded
    - Debugging embedded systems
    - Power optimization
    - Communication protocols (I2C, SPI, UART)
    - Sensor integration
    - IoT development basics
  Projects built:
    - Embedded system simulator
    - Device driver prototype
    - Real-time task scheduler
    - Sensor data logger
    - IoT device firmware
  Practice: Develop 5 embedded applications
Security Programming
  Topics:
    - Secure coding practices
    - Buffer overflow prevention
    - Input validation techniques
    - Cryptography basics
    - Hash functions implementation
    - Encryption algorithms
    - SSL/TLS implementation basics
    - Authentication systems
    - Secure random number generation
    - Code obfuscation techniques
    - Reverse engineering prevention
    - Security auditing tools
    - Fuzzing and testing
    - Exploit mitigation techniques
  Projects built:
    - Encryption library
    - Secure communication protocol
    - Password manager
    - Security scanner
    - Secure file storage system
  Practice: Implement 10 security features
Graphics Programming Basics
  Topics:
    - Graphics pipeline overview
    - OpenGL/DirectX basics
    - 2D graphics rendering
    - 3D mathematics for graphics
    - Shaders and GLSL
    - Texture mapping
    - Lighting models
    - Camera systems
    - Scene graphs
    - Collision detection
    - Particle systems
    - GUI programming with Qt/ImGui
    - Vulkan introduction
    - Graphics optimization
  Projects built:
    - 2D graphics renderer
    - 3D scene viewer
    - Particle system simulator
    - Simple GUI framework
    - Graphics effects library
  Practice: Create 5 graphics applications
Phase 3 Capstone Project

```
      Topics:
        - System design and architecture
        - Component integration
        - Performance requirements
        - Testing and validation
        - Documentation and deployment
      Projects built:
        - PHASE 3 CAPSTONE: Distributed Computing System
        - Build a distributed task processing system
        - Include networking, multithreading, and IPC
        - Focus on scalability and fault tolerance
      Assessment: Phase 3 exam: a practical build defended live, plus a written paper mixing
      this phase with everything before it

  ---------------------------------------------------------------
  PHASE 4: THE FINALE (MONTH 10, WEEKS 40-44)
  ---------------------------------------------------------------
  The capstone month: spec, build, ship and defend, then the final exam that decides the
  certificate.

    Month 10: Capstone and the Final Exam (Weeks 40-44)
      Capstone Spec and Setup
        Topics:
          - Choosing the capstone: a performance-critical tool, a small engine or simulator, or a systems
            utility
          - A one-page spec: scope, milestones, stack
          - Repository and project skeleton ready on day one
          - Instructor sign-off before the build begins
        Projects built:
          - Approved capstone spec plus the running skeleton
        Practice: Pitch the spec to the batch and absorb one hard question
      Capstone Build
        Topics:
          - Two focused weeks of building in vertical slices
          - Instructor checkpoints and honest scope cuts
          - Using the whole course: modern C++, the STL, templates where they earn it, and concurrency
            where it helps
          - Daily commits and an always-working build
        Projects built:
          - The capstone, feature-complete with version control
        Practice: A working build at the end of every session
      Ship and Polish
        Topics:
          - The finishing pass: edge cases, errors, documentation
          - Sanitizers and warnings clean: memory-safe by evidence
          - A README worth reading and a demo worth watching
          - A full-course spiral review before the exam
        Projects built:
          - The capstone shipped, documented and rehearsed
        Practice: Two mock demos, each tighter than the last
      Demo Day and the Final Exam
        Topics:
          - Presenting the capstone: live demo plus the hardest bug story
          - The honest map of next roads: deep systems programming, graphics and engines, embedded, or
            competitive programming
          - Where our other courses continue the journey
        Projects built:
          - Demo day presentation delivered to the batch
        Assessment: FINAL EXAM: a practical build plus a written paper with questions mixed
        from every phase. Passing earns the certificate; falling short earns a focused revision
        plan and a free retest

PROJECTS THE STUDENT BUILDS AND KEEPS

  - Phase 1: console applications and OOP systems built from requirements
  - Phase 2: STL-fluent tools, template utilities and modern-C++ refactors
  - Phase 3: threaded programs, performance investigations and systems utilities
  - Phase 4: the capstone, sanitizer-clean and defended at demo day

  Total projects: 25+ real builds, crowned by a sanitizer-clean capstone

SKILLS THE STUDENT WILL HAVE AT THE END

  - C++ fundamentals to fluency, including the memory model
  - Object-oriented design in the language that invented much of it
  - STL and templates used the way modern codebases use them
  - Modern C++: smart pointers, RAII, move semantics
  - Concurrency: threads, synchronization and honest judgment about both
  - Performance: profiling before opinions, always
```

HOW A TYPICAL WEEK IS SPLIT

Live classes: 2 live one-hour classes per week, coding along with the instructor
Homework: A problem set after every class, and a mixed-review assignment at the end of every month
Practice: 4-6 hours of building between classes
Review: Every submission reviewed with written feedback; recurring gaps reopened in class

SUPPORT INCLUDED

Doubt support: WhatsApp doubt support between classes
Progress updates: Honest monthly progress reviews: what is solid, what is wobbly, and the plan for the wobble

CERTIFICATION DETAIL

Completion: Certificate from Modern Age Coders, awarded on passing the final exam. Fall short and there is focused revision and a free retest: the certificate certifies knowledge, not attendance

WHERE THIS CAN LEAD

- Data Structures and Algorithms: the contest-and-interview road, in the right language
- Systems specializations: engines, embedded and OS work, entered with real fundamentals
- Our full-stack or Python courses for breadth alongside C++ depth
- Placement interviews met with genuine memory-model understanding

EARNING POTENTIAL (share only if asked, and never promise it)

Market context: The ranges below are general market salary bands for these roles in India and abroad, drawn from public industry data. They are shown for career context only and are not a promise or guarantee of income. Actual pay depends on your skills, experience, location, and the job market.
Growing roles: Rs 5-8 LPA (Junior C++ Developer)
Experienced roles: Rs 8-15 LPA (C++ Developer); Rs 12-25 LPA (Senior C++ Developer); Rs 20-40+ LPA (Lead Developer/Architect)
Freelance: Rs 2,000-8,000/hour based on expertise
International: $80k-180k USD based on location and specialization

COMMON QUESTIONS ABOUT THIS COURSE

For anything about cost, use PART 4 and RULE 1. Do not quote two regions.

Q: What does this C++ masterclass cover?
A: Three real phases plus a finale: fundamentals and object-oriented C++ learned patiently; modern C++, STL fluency, templates, smart pointers and move semantics; systems programming, concurrency, memory at depth and performance; then a capstone month ending in the final exam. The famous hard parts get pictures and patience, and the modern idioms are the default throughout.

Q: How long does it take to learn C++ properly?
A: Ten months of teaching at 2 live classes a week plus 4 to 6 hours of practice, with two more months in hand for learners who need them. The three teaching phases build the language and its real-world domain; the finale month ships a capstone and sits the final exam.

Q: How am I assessed? Is the certificate just for attending?
A: No. Problem sets follow every class with written feedback, monthly reviews deliberately mix new material with earlier topics, each phase ends with a cumulative exam, and the course ends with a final exam: a practical build plus written questions from the whole syllabus. Passing earns the certificate; falling short earns focused revision and a free retest.

Q: Is C++ still worth learning?
A: Wherever performance is non-negotiable, C++ remains the answer: game engines, trading systems, embedded, robotics, browsers and the AI infrastructure layer itself. It is also the best teacher of fundamentals in the industry: engineers fluent in C++ pick up everything else faster, and interviews know it.

Q: Can I try a class before enrolling?
A: Yes, a free demo class with no commitment: book at learn.modernagecoders.com/contact or message us on WhatsApp at +91 91233 66161. (Agent note: the free demo is a waiting list with no fixed date. The Priority Live Demo is a guaranteed class today or tomorrow, booked at https://learn.modernagecoders.com/priority-demo . Offer both, as RULE 3 says.)

Q: Are classes live or recorded?
A: Live, always: small groups with a real instructor reading your actual code, never pre-recorded videos.

To enrol, message Shivam Sir on +91 9123366161 or send the parent this link: https://learn.modernagecoders.com/courses/cpp-

programming-complete-masterclass-college
  For a demo: the Priority Live Demo (guaranteed, today or tomorrow) is booked at
  https://learn.modernagecoders.com/priority-demo . The free demo is a waiting list with no fixed date.

==
COURSE 33 OF 137: CAMBRIDGE AS AND A LEVEL COMPUTER SCIENCE 9618 COURSE
==

Course link: https://learn.modernagecoders.com/courses/cambridge-a-level-computer-science-9618-course
Subject area: A Level Computer Science
Designed for: Teens
Who can join: Cambridge AS and A Level students on 9618; an IGCSE Computer Science background helps but is not required
Course length: 9 months (36 weeks) for the full A Level, joinable any month
Time needed: 2 live classes/week + weekly programming and past-paper practice
Certificate: Certificate from Modern Age Coders, awarded on passing the final assessment

PRICE FOR THIS COURSE (quote only the one that applies to the person asking)
  In India, per month: group Rs 1,499, mini batch Rs 2,999, one to one Rs 4,999
  Outside India, per month: group $100, one to one $150
  Classes: group and mini batch two live classes a week, eight a month; one to one in India one
  live class a week, four a month; one to one outside India two live classes a week, eight a
  month. Each class is one hour.

WHAT THIS COURSE IS

  Live online Cambridge AS and A Level Computer Science 9618 classes across all four papers,
  including the split most students are unprepared for: Paper 2 does not require program code,
  and Paper 4 is nothing but.

ABOUT THE PROGRAMME

  Cambridge 9618 examines through four papers of 75 marks each. AS candidates sit Papers 1 and
  2; A Level candidates sit all four. The structural fact that catches most students is the
  relationship between Paper 2 and Paper 4. Paper 2, Fundamental Problem-solving and
  Programming Skills, states that candidates will not be required to write programming code,
  and provides an Insert with pseudocode built-in functions. Paper 4, Practical, is programming
  and nothing else, based around a small number of scenarios, with program code and evidence of
  testing submitted. The same qualification therefore asks a student to reason about programs
  without writing them, and then to write nothing but programs. Preparing for one does not
  prepare for the other, and this course treats them as the two separate disciplines they are.

WHAT A STUDENT NEEDS BEFORE STARTING

  Title: What a Student Needs to Start

WHO THIS COURSE IS FOR

  Title: Who This Course Is For

FULL CURRICULUM, WEEK BY WEEK

  This is the complete teaching plan. Parents can ask about any week.

  PHASE 1: AS THEORY FUNDAMENTALS, PAPER 1 (MONTHS 1-3)

  Sections 1 to 8 of the syllabus: how data is represented, how the machine works, and the
  vocabulary Paper 1 marks against.

    Month 1: Information Representation and Hardware (Weeks 1-4)
      Number Systems and Data Representation
        Topics:
          - Binary, denary and hexadecimal, converted quickly in both directions
          - Two's complement, binary addition and subtraction, and overflow
          - Binary coded decimal and where it is genuinely used
          - Character sets, and the size calculations that follow
      Images, Sound and Compression
        Topics:
          - Bitmap and vector images, resolution and colour depth
          - Sample rate, bit depth and the file-size calculations examiners set
          - Lossy and lossless compression with a defensible reason for each
          - The exact wording that earns marks in a comparison question
      Computer Architecture and the Processor
        Topics:
          - Von Neumann architecture, registers and buses
          - The fetch-decode-execute cycle, sequenced and explained precisely
          - Interrupts, and how they change the cycle
          - Assembly language and addressing modes as the syllabus treats them

    Input, Output and Storage
      Topics:
        - Devices, and what each is genuinely suited to
        - Primary, secondary and offline storage compared
        - RAID, and why redundancy is not the same as backup
        - First timed set of Paper 1 style questions

  Month 2: Networks, the Internet and Security (Weeks 5-8)
    Networks and Topologies
      Topics:
        - LAN, WAN, client-server and peer-to-peer
        - Hardware, protocols and the layered model
        - Bit streaming, and the bandwidth calculations that go with it
        - The internet, and what a URL actually resolves to
    Security, Privacy and Data Integrity
      Topics:
        - Threats named precisely, and matched to their mitigations
        - Encryption, symmetric and asymmetric, with the key exchange explained
        - Digital certificates, signatures and SSL as an examined chain
        - Validation and verification, distinguished as the syllabus distinguishes them
    Ethics, Ownership and Legal Context
      Topics:
        - Copyright, licensing and the models compared
        - Professional conduct as the syllabus frames it
        - Structuring an extended answer that reaches the top band
        - Both sides, then a supported judgement
    Databases and Data Modelling
      Topics:
        - Relational databases, keys, normalisation to third normal form
        - Entity relationship modelling, drawn as the paper expects
        - SQL: DDL and DML, written correctly under exam conditions
        - Why normalisation questions reward method over memory

  Month 3: Paper 1 Technique and Full Papers (Weeks 9-12)
    Command Words and Mark Schemes
      Topics:
        - State, describe, explain and evaluate as Cambridge uses them
        - Answering to the mark allocation rather than to the topic
        - Marking your own work against the real scheme
        - Correct ideas that the scheme does not credit, and why
    Boolean Logic and Logic Circuits
      Topics:
        - Gates, expressions, truth tables and simplification
        - Karnaugh maps where the syllabus requires them
        - Drawing circuits with the specified symbols
        - Reliable marks, treated as reliable marks
    Full Paper 1, Marked and Reviewed
      Topics:
        - A complete 75-mark paper under exam conditions
        - Detailed review of every lost mark with the reason named
        - A revision list built from actual errors, not from the topic list
        - Retesting the same question types a fortnight later
    Targeted Repair on Sections 1 to 8
      Topics:
        - Rebuilding the two or three areas the mock exposed
        - Number-system arithmetic drilled back to automatic
        - Extended responses rewritten to the band descriptors
        - Short daily retrieval rather than long revision blocks

---
PHASE 2: PAPER 2, REASONING ABOUT PROGRAMS WITHOUT WRITING THEM (MONTHS 4-6)

Sections 9 to 12. The paper that states candidates will not be required to write programming
code, and supplies an Insert of pseudocode built-in functions. A separate discipline from
Paper 4, and taught as one.

  Month 4: Algorithm Design and Cambridge Pseudocode (Weeks 13-16)
    Pseudocode as the Language of This Paper
      Topics:
        - Cambridge pseudocode conventions, written exactly as specified
        - Using the Insert of built-in functions rather than inventing names
        - Why a personal style costs marks even when the logic is correct
        - Selection, iteration and assignment in the expected format
    Structure Charts, Flowcharts and Decomposition
      Topics:
        - Breaking a problem into modules the way the paper assesses it
        - Structure charts with parameters shown correctly
        - Flowchart symbols exactly as the syllabus specifies
        - Stepwise refinement, examined directly

    Trace Tables and Predicting Output
      Topics:
        - Completing a trace table for an unfamiliar algorithm
        - Identifying the purpose of an algorithm from its trace
        - Finding the deliberate error the question has planted
        - Writing it down rather than tracing in the head
    Standard Algorithms and Data Structures
      Topics:
        - Linear and binary search, bubble and insertion sort in pseudocode
        - Records, arrays and files as the syllabus treats them
        - Abstract data types: stack, queue and linked list operations
        - Timed Paper 2 questions on each

  Month 5: Programming Concepts Without Code (Weeks 17-20)
    Subroutines, Parameters and Scope
      Topics:
        - Procedures and functions, by value and by reference
        - Local and global scope, a reliable short-answer topic
        - Designing an interface before writing anything
        - Reading a specification and reasoning about it
    File Handling and Exception Handling
      Topics:
        - Serial, sequential, random and direct access files
        - File operations in pseudocode with the correct built-in functions
        - Exception handling as the syllabus describes it
        - Test data: normal, boundary and erroneous
    Software Development Life Cycle
      Topics:
        - Analysis, design, coding, testing and maintenance
        - Development models compared, with a reason for choosing one
        - Program testing strategies and corrective maintenance
        - Extended-response structure on this recurring topic
    Full Paper 2, Marked and Reviewed
      Topics:
        - A complete 75-mark paper under exam conditions
        - Marked against the real scheme rather than against intent
        - Confirming pseudocode is written in the expected conventions
        - Naming the specific habits costing marks

  Month 6: AS Level Consolidation (Weeks 21-24)
    Both AS Papers Together
      Topics:
        - Papers 1 and 2 in the same week, as the series presents them
        - Pacing across two 75-mark papers
        - Identifying which of the two carries the remaining risk
        - Directing the final weeks at the weaker one
    Cross-Topic Questions
      Topics:
        - Questions that span sections, which students meet unprepared
        - Databases plus SQL plus data integrity in one question
        - Networks plus security plus encryption in one question
        - Recognising the shape rather than the topic
    Second Full AS Set
      Topics:
        - Both papers again from a different series
        - Measuring improvement question type by question type
        - Confirming that pacing holds on unfamiliar questions
        - Final list of what still costs marks
    AS Readiness
      Topics:
        - A short specific plan for the final fortnight
        - What is provided in each paper and what is not
        - The first five minutes of each paper
        - Walking in with the format already familiar

PHASE 3: A LEVEL PAPERS 3 AND 4 (MONTHS 7-9)

Sections 13 to 20. Advanced theory, and then the practical paper where program code and
evidence of testing are submitted.

  Month 7: Advanced Theory, Paper 3 (Weeks 25-28)
    Data Representation and Communication, Extended
      Topics:
        - Floating-point representation, normalisation and precision
        - Bit manipulation and the operations the syllabus names
        - Protocols and circuit switching against packet switching
        - Questions that combine representation with arithmetic
    Hardware, Virtual Machines and Operating Systems

Topics:
- Processor scheduling, interrupts and virtual memory
- Paging, segmentation and thrashing explained precisely
- Virtual machines, and the trade-offs examiners ask about
- Translation software and the stages of compilation

Security, Artificial Intelligence and Emerging Content
Topics:
- Encryption and protocols at A Level depth
- Artificial intelligence as the syllabus frames it
- Machine learning concepts at the level the paper expects
- The newest content, where past questions are thinnest

Advanced Algorithms and Data Structures
Topics:
- Binary trees, traversal, hash tables and dictionaries
- Recursion, traced as well as written
- Big O reasoning at the level the syllabus requires
- Timed Paper 3 questions on each

Month 8: Paper 4 Practical, Sections 19 to 20 (Weeks 29-32)
From Pseudocode to Working Code
Topics:
- The transition Paper 4 demands and Paper 2 forbids
- Choosing the language and committing to it
- Setting up the environment so the exam format is familiar
- Writing code that runs, from a scenario, from nothing

Object-Oriented Programming
Topics:
- Classes, inheritance, polymorphism and encapsulation in code
- Implementing from a described design without deviating
- Where the practical paper expects object orientation
- Common errors that cost working marks

Files, Data Structures and Recursion in Practice
Topics:
- Implementing stacks, queues and linked lists that actually run
- File handling in the chosen language against the scenario
- Recursion implemented, tested and evidenced
- Programs written to a scenario rather than to a topic

Evidence of Testing
Topics:
- What must be submitted alongside the program code
- Producing test evidence that demonstrates the program works
- Screenshots and output as the paper requires them
- Practising submission, not just programming

Month 9: All Four Papers (Weeks 33-36)
Full Paper 3 Under Time
Topics:
- A complete 75-mark advanced theory paper
- Marked to the real scheme, reviewed mark by mark
- Identifying whether theory or practical is the risk
- A repair list from actual errors

Full Paper 4 Under Time
Topics:
- A complete practical paper with code and test evidence submitted
- Working under time pressure with a compiler and a scenario
- Reviewing what did not run and why
- Repeating the scenario type until it is routine

Second Full Set of Both
Topics:
- Papers 3 and 4 again from a different series
- Measuring improvement question by question
- Confirming the practical workflow holds under time
- The last specific list of what still costs marks

Exam Readiness
Topics:
- A short specific plan for the final fortnight
- What each paper provides and what it does not
- The first five minutes of the practical paper
- Walking in with all four formats already familiar

HOW A TYPICAL WEEK IS SPLIT

Homework: A task or problem set after every class, and a monthly mixed-review assignment that deliberately folds in earlier topics

CERTIFICATION DETAIL

Completion: Certificate from Modern Age Coders, awarded on passing the final assessment. Fall short and there is focused revision and a free retest: the certificate certifies real

learning, not attendance

WHERE THIS CAN LEAD

- A strong AS or A Level Computer Science grade across all papers taken
- A genuine programming ability, evidenced by Paper 4 rather than claimed
- A foundation for a computer science degree that assumes data structures and recursion
- The pseudocode and design habits that university algorithms courses assume
- A portfolio of working programs if the practical work is committed as it is written

COMMON QUESTIONS ABOUT THIS COURSE

For anything about cost, use PART 4 and RULE 1. Do not quote two regions.

Q: How is Cambridge 9618 assessed?
A: By four papers of 75 marks each. Paper 1 is Theory Fundamentals, covering syllabus sections 1 to 8. Paper 2 is Fundamental Problem-solving and Programming Skills, sections 9 to 12. Paper 3 is Advanced Theory, sections 13 to 20. Paper 4 is Practical, covering the practical application of sections 19 to 20.

Q: Is it true Paper 2 does not require writing code?
A: Yes. The syllabus states that candidates will not be required to write programming code in Paper 2, and candidates are provided with an Insert containing pseudocode built-in functions. Paper 4, by contrast, is programming and nothing else, based around a small number of scenarios with program code and evidence of testing submitted. Preparing for one does not prepare for the other.

Q: Which programming language should we choose for Paper 4?
A: The language should be chosen early and then committed to, because Paper 4 rewards fluency under time and switching late wastes the practice already done. We will discuss the options against what the school teaches and what the student is heading toward, and then we stay in that language for the whole practical phase.

Q: My child programs well but loses marks on Paper 2. Why?
A: Almost always because they are writing program code where the paper wanted pseudocode in Cambridge conventions, or inventing function names instead of using the ones supplied in the Insert. It is a presentation problem rather than a knowledge problem, which is good news: it takes about three weeks of deliberate practice to fix.

Q: Can you teach AS only?
A: Yes. Many students take AS in one year and complete the A Level in the next, carrying the AS result forward. The first six months of this course are the AS content, and students entering only for AS simply stop there. Candidates taking all four papers in one series follow the whole nine months.

Q: How long is the course?
A: About thirty-six weeks at two classes a week for the full A Level, joinable in any month. AS alone is roughly the first twenty-four. One to one is paced to the entry date, and for a student joining close to a series we will say honestly what is achievable rather than promising full coverage.

To enrol, message Shivam Sir on +91 9123366161 or send the parent this link: https://learn.modernagecoders.com/courses/cambridge-a-level-computer-science-9618-course
For a demo: the Priority Live Demo (guaranteed, today or tomorrow) is booked at https://learn.modernagecoders.com/priority-demo . The free demo is a waiting list with no fixed date.

==========

COURSE 34 OF 137: CANVA AND AI DESIGN COURSE (13+): REAL GRAPHIC DESIGN SKILLS

==========

Course link: https://learn.modernagecoders.com/courses/canva-ai-design-masterclass
Subject area: Design and Creativity
Designed for: Kids
Who can join: Beginner friendly, ages 13 to adult
Course length: 6-8 months (26-32 weeks)
Time needed: 2 live classes/week + 2-3 hours practice
Certificate: Certificate from Modern Age Coders, awarded on passing the final exam

PRICE FOR THIS COURSE (quote only the one that applies to the person asking)
In India, per month: group Rs 1,499, mini batch Rs 2,999, one to one Rs 4,999
Outside India, per month: group $100, one to one $150
Classes: group and mini batch two live classes a week, eight a month; one to one in India one live class a week, four a month; one to one outside India two live classes a week, eight a month. Each class is one hour.

WHAT THIS COURSE IS

Canva and AI design course for teens and adults (13+): design principles, social and

marketing graphics, Canva Magic Studio and Firefly, video, and a portfolio in 6-8 months.

In one line: Design is a learnable craft, not a talent lottery: principles first, Canva as the instrument, AI as the accelerator, and a portfolio that proves it.

ABOUT THE PROGRAMME

Everyone needs design now, for school, clubs, small businesses and every feed, and Canva made the tools accessible; what most people lack is the craft. This live online course for ages 13 and up teaches real design: hierarchy, spacing, color and typography as principles, practiced through hundreds of Canva builds, posters, presentations, social graphics, carousels and short videos, until taste becomes reflex. The AI layer is taught honestly and age-legally: Canva's own Magic Studio and Adobe Firefly, tools that genuinely permit teens, used to accelerate ideation, generate imagery ethically and automate the boring parts, with clear credit habits and a plain explanation of why some famous art generators remain 18+. The course ends with a portfolio capstone and a final exam that decides the certificate. The pace is honest: six months at two live classes a week plus two to three hours of practice, with two more months in hand when needed. Homework after every class, monthly mixed challenges, and a final exam, portfolio review plus a live design task, with a free retest after revision. Real craft, real portfolio, depth over dopamine.

WHAT MAKES THIS COURSE DIFFERENT

- Principles before templates: hierarchy, spacing, color and typography taught as craft, so work stops looking template-made
- Age-legal AI only: Canva Magic Studio and Adobe Firefly (13+), with honest credit habits and a plain word on why some generators are 18+
- Hundreds of real builds: posters, decks, social sets, carousels and short videos, critiqued kindly every week
- Brand thinking included: one small real brand built end to end, logo to templates
- An honest 6-month arc with 2 months in hand: nobody is rushed
- Real assessment: weekly homework, monthly mixed challenges, and a final exam that decides the certificate, with a free retest after revision

THE LEARNING PATH, STEP BY STEP

Phase 1: Design foundations (Months 1-2): principles, layout, color and typography, practiced in Canva daily
Phase 2: Social and marketing design (Months 3-4): posts, carousels, decks and a small real brand kit
Phase 3: AI-assisted design (Month 5): Magic Studio and Firefly used well, photo editing, honest credits
Phase 4: Video and the finale (Month 6): short-form video design, the portfolio capstone, and the final exam

WHAT A STUDENT NEEDS BEFORE STARTING

Experience: None. Design principles and Canva are taught from zero
Equipment: A computer or laptop with a stable internet connection; the free Canva tier covers the whole course
Age: 13 to adult; Canva's own terms require 13+, and accounts for younger teens are set up with a parent
Time commitment: 2 live classes plus 2-3 hours of practice a week

WHO THIS COURSE IS FOR

Students: Teens whose school projects, clubs and fests all need design yesterday
Creators: Young creators who want feeds that look intentional instead of improvised
Small business families: Families with a shop or venture that deserves better graphics
Future designers: Anyone testing whether design is their road, with a portfolio as the answer
Professionals: Adults who keep needing decks and posts and keep dreading them

FULL CURRICULUM, WEEK BY WEEK

This is the complete teaching plan. Parents can ask about any week.

PHASE 1: DESIGN FOUNDATIONS (MONTHS 1-2, WEEKS 1-8)

The principles that separate design from decoration: hierarchy, spacing, color and typography, practiced through daily Canva builds.

Months 1-2: Principles into Practice (Weeks 1-8)
Introduction to Design & Canva Setup
Topics:
- What is graphic design? History and evolution
- Design careers and opportunities in 2026
- Traditional vs digital design
- Introduction to Canva: Interface tour

- Canva Free vs Pro features comparison
- Account setup and workspace organization
- Understanding design dimensions and formats
- File types: JPG, PNG, PDF, SVG explained
- Resolution and DPI for print vs digital
- Creating your first Canva design
- Navigating templates and elements
- Basic tools: Text, shapes, lines, frames

Projects built:
- Create personal introduction card
- Design simple social media post
- Make basic business card

Practice: Daily: 30 min Canva exploration, 1 hour design exercises

Design Principles & Composition

Topics:
- The 7 principles of design
- Balance: symmetrical, asymmetrical, radial
- Contrast and emphasis in design
- Repetition and consistency
- Proximity and grouping elements
- Alignment and grid systems
- Visual hierarchy and flow
- Rule of thirds and golden ratio
- White space and minimalism
- Gestalt principles in design
- Creating focal points
- Composition techniques for impact

Projects built:
- Redesign poorly designed flyer
- Create balanced poster design
- Design minimalist quote graphics
- Build visual hierarchy infographic

Practice: Analyze 20 professional designs for principles

Assessment: Month 1 check: redesign a bad poster live, explaining every choice, plus a take-home challenge

Typography & Color Theory

Topics:
- Typography fundamentals: serif vs sans-serif
- Font families and pairing rules
- Font size hierarchy and scaling
- Line height, letter spacing, kerning
- Readability and legibility principles
- Typography for different mediums
- Color theory basics: color wheel
- Primary, secondary, tertiary colors
- Color harmonies: complementary, analogous, triadic
- Color psychology and emotions
- Creating custom color palettes
- Using Canva's color tools effectively

Projects built:
- Typography poster with font hierarchy
- Brand color palette creation
- Mood board with color themes
- Restaurant menu with proper typography

Practice: Create 10 different color palettes and font combinations

Canva Advanced Features & Templates

Topics:
- Mastering Canva Pro features
- Background remover tool mastery
- Magic Resize for multiple formats
- Brand Kit setup and management
- Creating and saving templates
- Using and customizing elements
- Working with grids and frames
- Photo effects and filters
- Transparency and layering
- Animation basics in Canva
- Collaboration features
- Organizing designs with folders

Projects built:
- Complete brand kit setup
- Create reusable template set
- Design animated social media post
- Multi-page presentation design

Practice: Build template library for different use cases

Assessment: Month 2 check: a small design set built live to a brief, with questions reaching back to month 1

PHASE 2: SOCIAL AND MARKETING DESIGN (MONTHS 3-4, WEEKS 9-17)

The formats the world actually runs on: posts, carousels, stories, decks and posters, plus
one small real brand built end to end.

  Months 3-4: Formats and a Real Brand (Weeks 9-17)
    Social Media Design Mastery
      Topics:
        - Platform-specific dimensions and requirements
        - Instagram: Posts, Stories, Reels covers
        - Facebook: Posts, covers, ads
        - LinkedIn: Posts, banners, articles
        - Twitter/X: Posts, headers
        - YouTube: Thumbnails, banners, end screens
        - TikTok: Video covers and graphics
        - Pinterest: Pins and idea pins
        - Consistent visual branding across platforms
        - Creating content calendars
        - Batch creating social media content
        - Engagement-driving design techniques
      Projects built:
        - 30-day social media content calendar
        - Complete Instagram feed design
        - YouTube channel branding package
        - Multi-platform campaign graphics
      Practice: Design 5 posts for each major platform
    Marketing Materials & Print Design
      Topics:
        - Business card design principles
        - Letterhead and stationery design
        - Flyer and brochure layouts
        - Poster design for events
        - Banner and billboard considerations
        - Email newsletter templates
        - Digital ads: display, social, search
        - Landing page graphics
        - Infographic design process
        - Presentation design mastery
        - Print specifications and bleed
        - Preparing files for print
      Projects built:
        - Complete business stationery set
        - Tri-fold brochure design
        - Event poster and flyer set
        - Email marketing template
      Practice: Create marketing materials for fictional company
    Logo Design & Brand Identity
      Topics:
        - Logo design fundamentals
        - Types of logos: wordmark, lettermark, emblem
        - Sketching and ideation process
        - Creating logos in Canva
        - Logo variations and applications
        - Brand identity elements
        - Brand style guide creation
        - Color psychology for brands
        - Typography in branding
        - Brand voice and visual consistency
        - Mockup creation for presentations
        - Protecting and trademarking designs
      Projects built:
        - Design 3 different logo concepts
        - Complete brand identity package
        - Brand style guide document
        - Logo mockup presentations
      Practice: Rebrand 5 existing companies
    Photo Editing & Manipulation
      Topics:
        - Photo editing basics in Canva
        - Adjusting brightness, contrast, saturation
        - Color correction and grading
        - Cropping and composition improvement
        - Removing backgrounds professionally
        - Creating photo collages
        - Double exposure effects
        - Photo filters and effects
        - Retouching basics
        - Working with RAW images
        - Batch editing techniques

- Creating photo templates
      Projects built:
        - Professional headshot editing
        - Product photo enhancement
        - Creative photo manipulation art
        - Before/after portfolio pieces
      Practice: Edit 50 photos in different styles
    Phase Review and Brand Showcase
      Topics:
        - Portfolio planning and organization
        - Selecting best work
        - Creating case studies
        - Portfolio presentation techniques
        - Online portfolio platforms
        - Design process documentation
      Projects built:
        - Phase 1 Portfolio Website
        - 10 best designs showcase
        - Design process case study
      Assessment: Phase check: present the mini brand kit, plus a mixed challenge spanning
      months 1-4

PHASE 3: AI-ASSISTED DESIGN (MONTH 5, WEEKS 18-21)

The honest AI layer: Canva Magic Studio and Adobe Firefly used to accelerate real work, with
photo editing craft and credit habits.

  Month 5: Magic Studio and Firefly (Weeks 18-21)
    AI Design Tools, Age-Legal and Honest
      Topics:
        - AI in design: Overview and possibilities
        - Adobe Firefly integration
        - Canva AI features: Magic Write, Draw, Edit
        - AI writing assistants (13+, parent-consented accounts) for design briefs and copy
        - AI image upscaling tools
        - AI background removal tools
        - Ethical considerations in AI design
        - Copyright and AI-generated content
        - Canva Magic Studio end to end: Magic Media, Magic Write, Magic Switch
        - Adobe Firefly: generation trained on licensed work, and why that matters
        - Credit habits: saying what AI did, like a professional
        - Why several famous art generators are 18+, and what to use instead at 13+
      Projects built:
        - Create AI-generated brand imagery
        - Design campaign using AI tools
        - AI-assisted logo concepts
        - Hybrid AI-manual design project
      Practice: Generate 100 AI images with different styles
    Photo Editing and Compositing
      Topics:
        - Style references and image prompts
        - Aspect ratios and composition control
        - Creating consistent characters
        - Photorealistic vs artistic styles
        - Architectural visualization
        - Fashion and textile design
        - Blending and remixing images
        - Upscaling and variations
        - Building a prompt library
      Projects built:
        - AI-generated product catalog
        - Consistent character for storytelling
        - Architectural concept designs
        - Fashion collection mood board
      Assessment: Month 5 check: an AI-assisted design set with honest credits, plus mixed
      review

PHASE 4: VIDEO AND THE FINALE (MONTH 6, WEEKS 22-26)

Short-form video design in Canva, then the portfolio capstone and the final exam that decides
the certificate.

  Month 6: Motion, Portfolio, Exam (Weeks 22-26)
    Short-Form Video Design
      Topics:
        - Content planning and calendars
        - Batch creation strategies

- Content repurposing techniques
- Cross-platform adaptation
- Creating content templates
- Automation tools and plugins
- Content management systems
- File organization for creators
- Cloud storage solutions
- Collaboration tools for teams
- Version control for creatives
- Backup strategies

Projects built:
- 3-month content calendar
- Content template library
- Automated design workflow
- Team collaboration project

Practice: Create week's worth of content in one day

Portfolio Capstone

Topics:
- Choosing the capstone: a complete visual identity or campaign for something real
- The full set: logo, palette, templates, social set, one video
- Critique rounds: kind, specific, actionable
- Assembling the portfolio: curation over collection
- Presenting design decisions out loud

Projects built:
- THE CAPSTONE: a complete design campaign plus the curated course portfolio

Practice: One critique given and one received, properly, every day

Demo Day and the Final Exam

Topics:
- Presenting the capstone and portfolio
- A live design task under friendly time pressure
- A full-course mixed review
- Where this leads: creative coding, motion design, or real commissions for people you know

Projects built:
- Demo day presentation delivered to the batch

Assessment: FINAL EXAM: portfolio review plus a live design task and mixed questions from the whole course. Passing earns the certificate; falling short earns focused revision and a free retest

PROJECTS THE STUDENT BUILDS AND KEEPS

- Phase 1: daily principle drills, poster redesigns and typography studies
- Phase 2: social sets, carousels, decks and a mini brand built end to end
- Phase 3: AI-assisted sets with honest credits and real photo compositing
- Phase 4: short-form videos, the capstone campaign and the curated portfolio

Total projects: 100+ critiqued design pieces, curated into a portfolio and capstone campaign

SKILLS THE STUDENT WILL HAVE AT THE END

- Design principles: hierarchy, spacing, color and typography as reflexes
- Canva mastery: from templates escaped to originals built
- Brand thinking: one identity carried across every format
- Age-legal AI design: Magic Studio and Firefly used well, credited honestly
- Short-form video design: motion basics that make feeds stop
- Critique: giving and taking feedback like a working designer

HOW A TYPICAL WEEK IS SPLIT

Live classes: 2 live one-hour classes per week, designing along with the instructor
Homework: A design piece after every class, and a mixed challenge at the end of every month
Practice: 2-3 hours of building between classes
Review: Every piece critiqued with written feedback; recurring gaps reopened in class

SUPPORT INCLUDED

Doubt support: WhatsApp doubt support between classes
Progress updates: Monthly written feedback on craft: what is working, what to push next

CERTIFICATION DETAIL

Completion: Certificate from Modern Age Coders, awarded on passing the final exam, a portfolio review plus a live design task. Fall short and there is focused revision and a free retest

WHERE THIS CAN LEAD

- Creative Coding and Animation: where design meets motion and code
- Design for your own projects: clubs, ventures and channels, immediately
- First commissions for people you know, priced in confidence not desperation

  - Deeper tools later: the principles here transfer to every professional suite
  - Our web development courses: design taste makes better builders

COMMON QUESTIONS ABOUT THIS COURSE

  For anything about cost, use PART 4 and RULE 1. Do not quote two regions.

  Q: What will I actually learn and make in this Canva course?
  A: More than 100 critiqued pieces across six months: principle drills and poster redesigns, social sets, carousels and presentation decks, a mini brand built end to end, AI-assisted sets using Canva Magic Studio and Adobe Firefly with honest credits, short-form videos, and a capstone campaign presented at demo day with a curated portfolio.

  Q: What age is this course for?
  A: Ages 13 and up, teens through adults, because Canva's own terms require 13+. Accounts for younger teens are set up together with a parent, and batches are grouped so teens learn with teens and adults with adults where numbers allow.

  Q: How long does it take to get genuinely good at design?
  A: To a portfolio-and-critique level of craft: six months at 2 live classes a week plus 2 to 3 hours of practice, with two more months in hand for learners who want longer. Design is a rep-based skill; the hundreds of critiqued builds are the actual course.

  Q: How am I assessed? Is the certificate just for attending?
  A: No. A design piece follows every class, every month ends with a mixed challenge that revisits earlier skills, and the course ends with a final exam: a portfolio review plus a live design task under friendly time pressure. Passing earns the certificate; falling short earns focused revision and a free retest.

  Q: Which AI tools are taught, and are they allowed for teens?
  A: Canva's own Magic Studio and Adobe Firefly, both genuinely available at 13+ with consent, used for ideation, imagery and automating the boring parts, always with honest crediting. Several famous art generators remain 18+ by their own terms; the course says so plainly and teaches the age-legal equivalents instead.

  Q: Is Canva enough, or do I need Photoshop?
  A: More importantly, the principles taught here transfer to every tool: a student who owns hierarchy, spacing, color and type can pick up any professional suite later in weeks.

  Q: Is there a free trial class?
  A: Yes, a free demo class with no commitment: book at learn.modernagecoders.com/contact or message us on WhatsApp at +91 91233 66161. You will design something real inside the demo itself. (Agent note: the free demo is a waiting list with no fixed date. The Priority Live Demo is a guaranteed class today or tomorrow, booked at https://learn.modernagecoders.com/priority-demo . Offer both, as RULE 3 says.)

  Q: Are classes live or recorded?
  A: Live, always: small groups with a real instructor critiquing your actual work, never pre-recorded videos. Design improves through critique, and critique needs eyes on your specific piece.

  To enrol, message Shivam Sir on +91 9123366161 or send the parent this link: https://learn.modernagecoders.com/courses/canva-ai-design-masterclass
  For a demo: the Priority Live Demo (guaranteed, today or tomorrow) is booked at https://learn.modernagecoders.com/priority-demo . The free demo is a waiting list with no fixed date.

==
COURSE 35 OF 137: CBSE CLASS 10 MATHS BOARD PREP: CASE STUDIES & MOCKS
==

Course link: https://learn.modernagecoders.com/courses/cbse-class-10-maths-board-exam-prep-course
Subject area: School Board Mathematics
Designed for: High school
Who can join: CBSE Class 10 students, Standard (041) and Basic (241)
Course length: 10 months (40 weeks)
Time needed: 2 live classes/week + 3-4 hours practice, rising to timed papers in the mock phase
Certificate: Certificate from Modern Age Coders, awarded on passing the final assessment

PRICE FOR THIS COURSE (quote only the one that applies to the person asking)
  In India, per month: group Rs 1,499, mini batch Rs 2,999, one to one Rs 4,999
  Outside India, per month: group $100, one to one $150
  Classes: group and mini batch two live classes a week, eight a month; one to one in India one live class a week, four a month; one to one outside India two live classes a week, eight a month. Each class is one hour.

WHAT THIS COURSE IS

  CBSE Class 10 Maths board prep course aligned to the 2026-27 syllabus: all 14 chapters,

competency and case-study practice, sample-paper mocks, live classes.

In one line: The whole syllabus taught properly, then the board paper practised until it holds no surprises.

ABOUT THE PROGRAMME

Class 10 is the first year the maths marks travel with the student, and the current board paper rewards more than memorised solutions: roughly half of it is competency-based, case studies, data interpretation and situational problems, alongside about 20 percent MCQs and 30 percent traditional short and long answers. This 10-month live course is built for exactly that paper. Months 1 to 8 teach all 14 NCERT chapters across the seven syllabus units, with the unit weightage kept in view throughout: Algebra carries 20 of the 80 theory marks, Geometry 15, Trigonometry 12, Statistics and Probability 11, Mensuration 10, and Number Systems and Coordinate Geometry 6 each. Months 9 and 10 are pure exam craft: structured revision, CBSE sample papers and previous-year papers under real timing, and error clinics after every mock. Case-study and MCQ practice is not saved for the end. From the first chapter, every topic closes with the question forms the board actually asks, so by the mock phase the format is familiar and only speed and polish remain. We teach both Standard (041) and Basic (241) tracks and help each family make that choice with evidence from the student's own test scores, not guesswork. What we promise is preparation and honest feedback; nobody can promise marks, and we do not.

WHAT MAKES THIS COURSE DIFFERENT

- Aligned to the 2026-27 CBSE syllabus as released, all 14 chapters across the 7 units, with the 80-mark theory weightage steering how class time is spent
- Competency questions from week 1: every chapter closes with case-study, data and MCQ practice in the board's actual style, not as a panic module in January
- Two full months of revision and mocks, with CBSE sample papers and previous-year papers under real 3-hour timing and a marked review of every attempt
- Standard versus Basic decided with data: periodic test scores through the year tell each family which paper suits, and we advise honestly either way
- Proof writing and stepwise presentation taught explicitly, because the board marking scheme awards steps, and students lose easy marks by skipping them
- Live small batches where the teacher sees each student's working, not a video series with a doubt inbox

THE LEARNING PATH, STEP BY STEP

Phase 1: Number Systems and the full Algebra unit: real numbers, polynomials, pairs of linear equations, quadratics and arithmetic progressions, the 26-mark backbone of the paper
Phase 2: Geometry, Coordinate Geometry and Trigonometry: similarity, distance and section formulae, trigonometric ratios and identities, heights and distances, and circle theorems
Phase 3: Mensuration, Statistics and Probability: areas related to circles, combined solids, grouped data measures and classical probability
Phase 4: Revision and the mock cycle: structured re-teaching of weak spots, CBSE sample papers and previous years under timing, error clinics and exam-day strategy

WHAT A STUDENT NEEDS BEFORE STARTING

Maths level: Class 9 promotion. Weak spots in Class 9 algebra or geometry are caught by the week 1 diagnostic and patched inside the course
Board: Built for CBSE Class 10, both Mathematics Standard (041) and Mathematics Basic (241). Students of other boards are better served by our other maths courses
Equipment: NCERT Class 10 Maths textbook, a geometry box, notebooks, and a device with stable internet for live classes
Timing: Best joined at the start of Class 10; mid-year joiners get a catch-up plan after the diagnostic

WHO THIS COURSE IS FOR

Board year students: CBSE Class 10 students who want the syllabus finished early and the board pattern practised properly, not crammed
Students choosing standard: Students keeping science or maths streams open for Class 11, who need Standard (041) depth and proof fluency
Students considering basic: Students unsure between Standard and Basic, who want the choice made on test evidence rather than fear
Case study strugglers: Students who know the methods but lose marks on the long competency stems and data questions
Presentation losers: Students whose answers are right but whose marks are not, because steps, figures and units go missing

FULL CURRICULUM, WEEK BY WEEK

This is the complete teaching plan. Parents can ask about any week.

PHASE 1: NUMBER SYSTEMS AND ALGEBRA (MONTHS 1-3, WEEKS 1-12)

The heaviest unit first. Algebra alone carries 20 of the 80 theory marks, and with Real Numbers this phase covers 26. Every chapter closes with board-style MCQ and case-study practice.

Month 1: Real Numbers and Polynomials (Weeks 1-4)
Weeks 1-2: Real Numbers
Topics:
- Diagnostic paper on Class 9 essentials: identities, linear equations, basic geometry
- The fundamental theorem of arithmetic and prime factorisation
- HCF and LCM by prime factorisation, and the HCF x LCM relationship
- Proving irrationality: root 2, root 3, root 5 by contradiction, written to board standard
- Word problems on HCF and LCM: bells, circular tracks, stacking crates
- Board question forms for this chapter: 1-mark MCQs and 2-3 mark proofs

Projects built:
- Chapter question bank entry: 15 solved board-style questions on real numbers, built and kept by the student

Practice: 25 prime factorisation and HCF-LCM problems plus 3 irrationality proofs written out in full board steps

Weeks 3-4: Polynomials
Topics:
- Zeros of a polynomial read from the graph: where the curve cuts the x-axis
- Geometric meaning of zeros for linear and quadratic polynomials
- Relationship between zeros and coefficients of a quadratic polynomial
- Forming a quadratic polynomial from given zeros
- Verification questions: checking the zero-coefficient relationships
- MCQ traps in this chapter: sign errors and reversed relationships

Projects built:
- Graph-reading sheet: 8 polynomial graphs interpreted for number and sign of zeros

Practice: 30 zeros-and-coefficients problems, 10 of them MCQ format, misses redone with the relationship written out

Assessment: Month 1 test: a 25-mark paper on Real Numbers and Polynomials in board format, marked with the board's stepwise scheme

Month 2: Pair of Linear Equations and Quadratic Equations (Weeks 5-8)
Weeks 5-6: Pair of Linear Equations in Two Variables
Topics:
- Graphical solution: consistent, inconsistent and dependent pairs seen as line pictures
- The ratio test for number of solutions, and why it works
- Substitution method with clean recording of steps
- Elimination method and choosing which variable to remove
- Word problems: ages, two-digit numbers, speeds and boats, fixed plus per-unit costs
- Case-study practice: fare structures and cafeteria pricing, the board's favourite settings

Projects built:
- Word-problem translation drill: 10 situations converted to equation pairs before any solving

Practice: 20 equation pairs solved by the method of your choice plus 6 word problems and 1 full case study, self-timed

Weeks 7-8: Quadratic Equations
Topics:
- Standard form and checking whether an equation is quadratic
- Solving by factorisation: splitting the middle term with speed
- The quadratic formula, derived once and then drilled
- The discriminant and nature of roots: real, equal, or none
- Word problems: consecutive numbers, areas, speed-time, work problems
- Finding unknown coefficients from conditions on the roots

Projects built:
- Chapter question bank entry: 15 solved board-style quadratics including 2 case studies

Practice: 25 quadratics split between factorisation and formula, plus 8 nature-of-roots questions with reasons stated

Assessment: Month 2 test: a 30-mark paper on both equation chapters with MCQ, short answer and one case study

Month 3: Arithmetic Progressions and Algebra Consolidation (Weeks 9-12)
Weeks 9-10: Arithmetic Progressions
Topics:
- Recognising an AP and finding the common difference
- The nth term formula, forwards and in reverse: which term is 78
- Sum of the first n terms, both formula forms and when each helps
- Word problems: instalments, salaries, theatre seating, ladder rungs
- Three unknowns from two conditions: combining the nth term and sum formulas
- AP case studies: savings plans and stacked logs in board style

Projects built:
- AP situations sheet: 8 real-life progressions identified, with first term and difference extracted

Practice: 30 AP problems from nth term to sums, including 5 word problems and 1 case study, misses logged by type

Weeks 11-12: Algebra Unit Under Board Conditions
Topics:
- Mixed revision across all five phase 1 chapters
- Stepwise presentation clinic: what the marking scheme pays for and what it ignores

- Assertion-reason questions: the logic and the common traps
- Case-study workshop: reading the stem once, answering all sub-parts efficiently
- Timed sectional practice: the algebra questions of a sample paper in isolation
- Error log review: each student's top three algebra weak spots named and drilled

Projects built:
- Personal error log formalised: every phase 1 test miss classified as concept, method or presentation

Practice: One timed algebra-only sectional paper plus 10 assertion-reason questions, reviewed against the marking scheme

Assessment: Phase 1 milestone: a 40-mark algebra and number systems paper in full board format, 50 percent competency questions

---

PHASE 2: GEOMETRY, COORDINATE GEOMETRY AND TRIGONOMETRY (MONTHS 4-6, WEEKS 13-24)

The proof-and-figure half of the paper: 33 marks across Geometry, Coordinate Geometry and Trigonometry, where drawing the figure and showing the steps is most of the battle.

Month 4: Triangles and Coordinate Geometry (Weeks 13-16)

Weeks 13-14: Triangles and Similarity

Topics:
- Similar figures and what similarity actually claims
- The basic proportionality theorem and its converse, proved and applied
- Similarity criteria: AA, SSS and SAS, with when to use which
- Finding lengths in nested and overlapping triangle figures
- Writing a geometry proof the board way: given, to prove, construction, proof
- Similarity in the wild: shadows, ramps and scale models as case studies

Projects built:
- Proof portfolio started: BPT and two similarity applications written to full board standard

Practice: 20 similarity problems including 4 proofs written out in the four-part format, figures drawn for every question

Weeks 15-16: Coordinate Geometry

Topics:
- The distance formula, derived from Pythagoras and drilled
- Types of triangles and quadrilaterals verified by distances
- The section formula and midpoint as its special case
- Finding ratios: where the x-axis cuts a line segment
- Collinearity and equidistance problems
- Coordinate case studies: layouts of gardens, flags on a sports field

Projects built:
- Chapter question bank entry: 12 solved coordinate geometry questions across all board formats

Practice: 25 distance and section formula problems with a labelled sketch for each, plus 1 case study

Assessment: Month 4 test: a 25-mark paper on Triangles and Coordinate Geometry with one full proof question

Month 5: Trigonometry and Its Applications (Weeks 17-20)

Weeks 17-18: Introduction to Trigonometry

Topics:
- The six ratios defined in a right triangle, with the naming logic
- Exact values for 0, 30, 45, 60 and 90 degrees, and how to rebuild the table from two triangles
- Finding all ratios when one is given
- The fundamental identity and its two rearrangements
- Proving trigonometric identities: strategy, not trial and error
- MCQ speed work on ratio values and identity recognition

Projects built:
- Identity toolkit card: the identities plus the five standard proof moves, in the student's own words

Practice: 30 ratio evaluations and 8 identity proofs, each proof annotated with which move was used at each step

Weeks 19-20: Heights and Distances

Topics:
- Angles of elevation and depression, and reading them off a clean figure
- The non-negotiable first step: draw and label the right triangle
- Single-triangle problems: towers, kites, ladders
- Two-triangle problems: two observers, moving closer, two levels
- Choosing the ratio that solves in one step instead of three
- Case studies: lighthouses, drones and temple towers in board style

Projects built:
- Figure-first drill set: 10 heights and distances problems where the marked figure is drawn before any calculation

Practice: 18 heights and distances problems including 4 two-triangle setups and 1 case study, every figure labelled

Assessment: Month 5 test: a 25-mark trigonometry paper mixing ratios, identities and applications

Month 6: Circles and the Half-Syllabus Checkpoint (Weeks 21-24)

Weeks 21-22: Circles and Tangents

Topics:
- Tangents and secants: what touching actually means
- The tangent-radius perpendicularity theorem, proved and used
- Equal tangents from an external point, proved and used
- Angle chasing in tangent figures using both theorems
- Lengths in circumscribed quadrilaterals and triangles
- Circle proofs written to the four-part board standard

Projects built:
- Proof portfolio extended: both tangent theorems plus two applications written in full

Practice: 20 circle problems including 3 proofs and 5 angle-chasing figures, figures redrawn not copied

Weeks 23-24: Half-Syllabus Mock and Review

Topics:
- Structured revision across phases 1 and 2: one summary mat per chapter
- Half-syllabus mock in full board format and timing
- Marking workshop: students mark an anonymised script against the scheme
- Error clinic: every mock miss classified and assigned a drill
- Basic versus Standard conversation opens: what the mock evidence suggests for each student
- Presentation audit: figures, steps and units checked across the whole script

Projects built:
- Half-syllabus mock with a written self-review: three strengths, three fixes, one habit to change

Practice: Redo every mock miss untimed with full working, then a 15-question drill on your weakest chapter

Assessment: Phase 2 milestone: half-syllabus board-format mock covering all ten chapters taught so far

---

PHASE 3: MENSURATION, STATISTICS AND PROBABILITY (MONTHS 7-8, WEEKS 25-32)

The final 21 marks of new content: areas related to circles, combined solids, grouped data and probability, all heavy with the data-interpretation forms the competency questions love.

Month 7: Areas Related to Circles and Combined Solids (Weeks 25-28)

Weeks 25-26: Areas Related to Circles

Topics:
- Sector area and arc length, tied back to the fraction of the full circle
- Segment area: sector minus triangle, set up cleanly
- Combination figures: designs, running tracks, flower beds
- Working with standard angles in sectors and segments
- Leaving answers in terms of pi versus computing, and when the paper wants which
- Case studies: clock faces, umbrellas and window designs

Projects built:
- Combination-figure sheet: 8 shaded-region problems with the decomposition drawn before any formula

Practice: 20 sector, segment and shaded-region problems with the decomposition stated in one line each time

Weeks 27-28: Surface Areas and Volumes

Topics:
- Surface areas and volumes of cube, cuboid, cylinder, cone, sphere and hemisphere, consolidated
- Combined solids: capsule, tent, ice-cream cone, toy on a hemisphere
- Which surfaces vanish when solids join: the one idea behind every surface-area question
- Volume problems on combined solids
- Unit discipline: cubic centimetres, litres and the conversions the board expects
- Case studies: storage tanks, medicine capsules and circus tents

Projects built:
- Solid dissection cards: 6 combined solids sketched, split into parts, with the joining surfaces marked

Practice: 18 combined-solid problems, half surface area and half volume, units checked on every answer

Assessment: Month 7 test: a 20-mark mensuration paper including one case study and one MCQ set

Month 8: Statistics and Probability (Weeks 29-32)

Weeks 29-30: Statistics of Grouped Data

Topics:
- Grouped frequency tables: class marks, limits and boundaries
- Mean by the direct method, assumed mean and step deviation, and when each saves time
- Median of grouped data: the cumulative frequency column done carefully
- Mode of grouped data and the modal class
- Reading and interpreting data tables the way competency questions present them
- Choosing between mean, median and mode when a question asks which represents the data

Projects built:
- Data study: the student collects a real dataset from home or school, groups it and computes all three measures

Practice: 12 full grouped-data problems covering all three measures, tables laid out to board standard

Weeks 31-32: Probability and the Content Finish Line

Topics:
- Classical probability: equally likely outcomes and the counting behind them
- Cards, dice, coins and balls: the standard sample spaces mastered
- Complementary events and the not-happening shortcut
- Two-object experiments: two dice, two coins, drawn without replacement kept simple
- Probability case studies and data-linked questions
- Full-syllabus map: every chapter now taught, revision plan issued

Projects built:
- Chapter question bank completed: the student's own solved bank now covers all 14 chapters

Practice: 30 probability questions from single events to two-object experiments, plus 1 case study

Assessment: Phase 3 milestone: a 25-mark statistics and probability paper, plus the full-syllabus revision plan agreed with each student

---

PHASE 4: REVISION AND THE MOCK CYCLE (MONTHS 9-10, WEEKS 33-40)

No new content, on purpose. Structured revision by unit, then CBSE sample papers and previous-year papers under real timing, each followed by an error clinic.

Month 9: Structured Revision (Weeks 33-36)

Weeks 33-34: Algebra and Number Systems Revisited

Topics:
- Rapid re-teach of the five algebra-phase chapters, driven by each student's error log
- Mixed-chapter problem sets: questions that do not announce their chapter
- MCQ sprint sessions: 20 questions in 25 minutes with instant review
- Case-study circuit: four stems across four chapters in one sitting
- Formula-free fluency check: rebuilding key formulas from scratch
- One-page revision sheets finalised per chapter

Projects built:
- Revision sheet set one: student-made single pages for all five algebra-phase chapters

Practice: One mixed algebra paper of 30 marks self-timed, plus 20 MCQs, both marked in class

Weeks 35-36: Geometry, Trigonometry and the Data Chapters Revisited

Topics:
- Proof rehearsal: BPT, tangent theorems and identity proofs rewritten from memory
- Heights and distances mixed set, figures first as always
- Mensuration decomposition drills on unseen combination figures
- Statistics and probability rapid set with full table discipline
- The 50 percent competency share: reviewing what the recent board papers actually asked
- Time budgeting: minutes per section planned for the 3-hour paper

Projects built:
- Revision sheet set two: single pages for the remaining nine chapters, completing the personal revision pack

Practice: One mixed geometry-trigonometry paper of 30 marks self-timed, plus a 15-question data-chapters drill

Assessment: Month 9 checkpoint: two sectional papers marked against the board scheme, error logs updated

Month 10: The Mock Cycle (Weeks 37-40)

Weeks 37-38: Sample Papers Under Real Timing

Topics:
- The CBSE sample paper attempted in one 3-hour sitting
- Marking against the official scheme, step by step
- Error clinic one: concept gaps versus presentation losses separated
- Previous-year paper attempted under timing
- Question selection strategy: order of attack, when to move on, returning to parked questions
- Handling the case-study section efficiently: stem once, sub-parts in order

Projects built:
- Mock file opened: each paper filed with its marked script, error classification and one-line fix per miss

Practice: Between classes: one additional sample paper attempted at home under honest timing, brought marked to class

Weeks 39-40: Final Mocks and Exam Craft

Topics:
- Two final full mocks under strict conditions, spaced for recovery
- Error clinic two: closing the last recurring mistakes
- Presentation final pass: figures, steps, units, boxed answers
- The last 48 hours: what to revise, what to leave alone, sleep over cramming
- Exam-day routine: admit card to answer script, walked through calmly
- Course close: results of the mock series reviewed with each family

Projects built:
- Completed mock file: the full series with scores charted, handed to the student as their evidence of readiness

Practice: Light targeted drills only, set individually from each student's final error log

Assessment: Course milestone: final full-syllabus mock in board format, reviewed one-on-one, plus certificate review

PROJECTS THE STUDENT BUILDS AND KEEPS

- A personal chapter question bank: 12-15 solved board-style questions per chapter, built across all 14 chapters
- A proof portfolio: every syllabus theorem written to the four-part board standard
- A personal error log maintained from month 1 and used to steer revision
- Word-problem translation drills for both equation chapters
- A real-data statistics study grouped and analysed by the student
- One-page revision sheets for all 14 chapters, student-made
- A half-syllabus mock at month 6 and a full mock series in month 10
- The completed mock file: marked scripts, error classifications and score chart

Total projects: A complete self-built revision system: question bank, proof portfolio, revision sheets, error log and marked mock file

SKILLS THE STUDENT WILL HAVE AT THE END

- Every chapter of the 2026-27 CBSE Class 10 Maths syllabus, taught to Standard (041) depth
- Case-study, MCQ and assertion-reason technique for the competency-heavy board pattern
- Geometry and identity proofs written the way the marking scheme pays
- Grouped-data statistics and classical probability with full table discipline
- Timed paper craft: question selection, time budgeting and clean presentation
- Self-review: marking your own work against a scheme and classifying your own errors

HOW A TYPICAL WEEK IS SPLIT

Live classes: 2 live one-hour classes per week; mock-phase sittings run longer for full papers
Practice: 3-4 hours weekly of problem sets and question-bank building, rising with timed papers in months 9-10
Review: Homework marked against board-style stepwise schemes; error logs reviewed with the teacher monthly
Homework: A task or problem set after every class, and a monthly mixed-review assignment that deliberately folds in earlier topics

SUPPORT INCLUDED

Doubt support: WhatsApp doubt support between classes, with worked solutions for stuck problems
Progress updates: Monthly progress notes to parents with test scores and the error-log summary, plus a Standard versus Basic recommendation by mid-course

CERTIFICATION DETAIL

Completion: Certificate from Modern Age Coders, awarded on passing the final assessment. Fall short and there is focused revision and a free retest: the certificate certifies real learning, not attendance

WHERE THIS CAN LEAD

- Class 11 Mathematics in the science or commerce stream, entered with the Class 10 base genuinely solid
- Class 11 Applied Mathematics for students who took the Basic paper route
- Our JEE Foundation and higher maths courses for students aiming at engineering entrances
- Computer science and economics electives, both of which lean on Class 10 algebra and statistics
- Confident handling of any exam built on the competency pattern, which CBSE is extending across subjects

COMMON QUESTIONS ABOUT THIS COURSE

For anything about cost, use PART 4 and RULE 1. Do not quote two regions.

Q: Should my child take Mathematics Standard (041) or Basic (241)?
A: Both papers cover the same syllabus; Standard asks harder questions. Standard is the safer choice for students keeping science or maths-based streams open, while Basic suits students certain they will not continue maths after Class 10. The rules have also loosened: from the 2025-26 session CBSE allows students who took Basic to move to Standard Mathematics in Class 11, subject to the school being satisfied they can cope. We teach to Standard depth by default and give each family a data-backed recommendation by mid-course, based on the student's own test scores.

Q: What is the current CBSE Class 10 Maths exam pattern?
A: The subject is assessed out of 100: an 80-mark theory paper and 20 marks of school-conducted internal assessment. In recent board papers roughly 50 percent of the theory questions are competency-based, meaning case studies, data interpretation and situational problems, with about 20 percent MCQs and 30 percent traditional short and long answers. The whole course is built around that split, which is why case-study practice starts in week 1 rather than in the revision phase.

Q: What are case-study questions and how do you prepare students for them?
A: A case study gives a short real-world stem, a savings plan, a temple tower, a cafeteria price list, followed by three or four sub-questions drawn from the syllabus. Students rarely lack the maths; they lose marks to slow reading and poor extraction of the given data. We close every chapter with case studies in the board's own style and teach a fixed routine: read the stem once, list the givens, answer sub-parts in order. By the mock phase the format is routine.

Q: Is the NCERT textbook enough for the board exam?
A: NCERT is the core, and every board question is rooted in it, so we work through it completely, including the examples students usually skip. For Standard-paper depth we add NCERT Exemplar problems, CBSE sample papers and previous-year questions, because the competency questions dress NCERT ideas in unfamiliar settings and a student who has only seen textbook phrasing can freeze. No private publisher guides are required.

Q: How does the course handle the syllabus itself? Has anything changed?
A: We teach the 2026-27 syllabus as CBSE released it: 14 NCERT chapters across seven units, with the 80 theory marks weighted 20 to Algebra, 15 to Geometry, 12 to Trigonometry, 11 to Statistics and Probability, 10 to Mensuration, and 6 each to Number Systems and Coordinate Geometry. Constructions remains out of the syllabus, as it has been in recent sessions, and no new chapter deletions were made for 2026-27. If CBSE issues a mid-year circular, the course plan is adjusted the same week.

Q: What about the internal assessment marks? Do you help with those?
A: The 20 internal marks are awarded by the school: 10 for periodic tests (schools usually count the best scores through the year), 5 for the portfolio of notebooks and assignments, and 5 for maths lab activities with viva. We cannot award those marks, but the course feeds them directly: our monthly tests mirror periodic-test formats, and the question bank, proof portfolio and revision sheets the student builds all belong in a portfolio a school is happy to see.

Q: I have heard Class 10 boards are now held twice a year. How does the course schedule work with that?
A: Yes, CBSE has moved Class 10 to two board sittings from 2026, with the main exam in February and an optional second sitting in May for improvement. Our 10-month plan targets the February main exam: content finishes by month 8, and months 9 and 10 are revision and full mock cycles timed to peak just before the paper. A student who chooses the May sitting to improve keeps their revision system, mock file and error log, which is most of what a second attempt needs.

Q: Can my child join mid-year, and do you promise a particular score?
A: Mid-year joining works until about month 5; the week 1 diagnostic tells us what has been missed and the catch-up plan covers it through extra problem sets and doubt sessions. On scores we are direct: nobody can honestly promise board marks, and we do not. What we commit to is full syllabus coverage, board-pattern practice from the first chapter, a marked mock series, and honest monthly reporting so you always know exactly where your child stands.

Q: How am I assessed, and is the certificate just for showing up?
A: No. A task follows every class with feedback, monthly reviews deliberately mix new material with earlier topics so nothing is forgotten, and the course ends with a full mock paper as the final assessment. Passing earns the certificate; falling short earns focused revision and a free retest. We measure real learning, not attendance.

==========
COURSE 36 OF 137: CBSE COMPUTATIONAL THINKING & AI FOR KIDS (CLASS 3-8)
==========

Course link: https://learn.modernagecoders.com/courses/cbse-computational-thinking-and-ai-course-for-kids-classes-3-to-8
Subject area: CBSE School Curriculum - Computational Thinking & Artificial Intelligence
Designed for: Kids
Who can join: Absolute Beginner (Class 3-5) to Intermediate AI Project Builder (Class 6-8)
Course length: 9-12 months (40-52 weeks)
Time needed: 5-7 hours/week (2 live classes + self-practice)
Certificate: Certificate from Modern Age Coders, awarded on passing the final exam

PRICE FOR THIS COURSE (quote only the one that applies to the person asking)
In India, per month: group Rs 1,499, mini batch Rs 2,999, one to one Rs 4,999
Outside India, per month: group $100, one to one $150
Classes: group and mini batch two live classes a week, eight a month; one to one in India one live class a week, four a month; one to one outside India two live classes a week, eight a month. Each class is one hour.

WHAT THIS COURSE IS

CBSE-aligned Computational Thinking & AI course for kids in Classes 3-8 (ages 8-13): decomposition, algorithms, Scratch, Teachable Machine and 50+ projects.

In one line: From Curiosity to Creating AI, The Future-Ready Child Starts Here!

ABOUT THE PROGRAMME

The Central Board of Secondary Education (CBSE) has officially integrated Computational Thinking and Artificial Intelligence into the foundational and middle school curriculum as a core 21st-century skill. This comprehensive 9-month program is specifically designed to give your child a deep, hands-on mastery of both Computational Thinking and AI, completely aligned with CBSE's framework, NCERT's AI handbooks, and the National Education Policy (NEP) 2020. Your child will learn to think like a scientist, reason like a mathematician, solve like an engineer, and create like an AI researcher. Starting with unplugged thinking activities (no screens!), we gradually introduce Scratch block coding, AI concepts through stories and games, Google's Teachable Machine, the official CBSE AI Project Cycle (Problem Scoping with 4Ws Data Acquisition Data Exploration Modelling Evaluation), AI Ethics, Sustainable Development Goals (SDGs), and culminate in real AI projects your child will proudly showcase. By the end, your child will have built 50+ projects, understood how Netflix, Alexa, YouTube and self-driving cars really work, and will be fully prepared for CBSE AI Class 9 (Code 417) and later AI Class 11-12 (Code 843).

WHAT MAKES THIS COURSE DIFFERENT

- 100% aligned with the official CBSE Computational Thinking & AI framework
- Separate, age-appropriate tracks for Classes 3-5 and Classes 6-8
- Follows the CBSE AI Project Cycle methodology used in board curriculum
- Mix of unplugged (no-screen) and plugged (digital) activities, healthy screen time
- Uses exact tools CBSE recommends: Scratch, Teachable Machine, Code.org, MIT App Inventor, Python (for Class 8)
- Direct preparation for CBSE AI Class 9-10 (Code 417) & Class 11-12 (Code 843)
- AI Ethics, Bias, Privacy & SDG integration from day one
- Live expert-led classes + parent progress reports + project showcase days
- 50+ original AI & CT projects for school portfolio and competitions
- Compatible with Atal Tinkering Lab (ATL) and CBSE AI School projects

THE LEARNING PATH, STEP BY STEP

Phase 1: Foundation (Months 1-3): Unplugged Computational Thinking, Scratch Basics, What is AI? (Classes 3-5 level)
Phase 2: Building (Months 4-6): Advanced Scratch, AI Domains (CV/NLP/Data), Teachable Machine, AI Project Cycle (Classes 6-8 level)
Phase 3: Creating (Months 7-8): Real AI Projects, Python intro, Ethics & SDG AI Solutions, Mini-hackathon
Phase 4: Mastery (Month 9): CBSE-style AI Capstone Project, Portfolio, Certification & Transition to CBSE AI Class 9 (417)

WHAT A STUDENT NEEDS BEFORE STARTING

Age: 8-13 years (Classes 3 to 8)
Coding experience: None, absolute beginners welcome
Equipment: Laptop/desktop with stable internet (4 Mbps+), webcam, headphones
Software: All free, Scratch, Python, Teachable Machine, Orange (we guide installation)
Time commitment: 5-7 hours per week (2 live classes + self-practice)
English: Basic reading ability (Class 3+ level)
Parent support: Minimum 30 mins/week to review progress
Motivation: Curiosity, willingness to make mistakes, excitement to build

WHO THIS COURSE IS FOR

Primary students: CBSE students in Classes 3-8 looking to master Computational Thinking and AI
Other boards: ICSE, IB, State Board and International students, curriculum is fully transferable
Homeschoolers: Perfect structured AI curriculum for homeschool families
Gifted children: Advanced learners ready to go beyond school curriculum
Competition aspirants: Kids preparing for AI Olympiads, CBSE Hackathons, Intel AI Youth challenges
Cbse school students: Students whose schools already teach CBSE AI curriculum and want deeper mastery
Parents of future engineers: Parents preparing kids for future AI-driven careers
Anyone: Any 8-13 year-old curious about how AI, Alexa, ChatGPT and self-driving cars work

FULL CURRICULUM, WEEK BY WEEK

This is the complete teaching plan. Parents can ask about any week.

PHASE 1: COMPUTATIONAL THINKING FOUNDATIONS (MONTHS 1-3, WEEKS 1-13), ALIGNED TO CBSE CLASSES 3-5

Build the four pillars of Computational Thinking, Decomposition, Pattern Recognition,
Abstraction and Algorithms, through unplugged activities, games, storytelling and block
coding. No prior coding or computer experience required. Perfect for CBSE Classes 3, 4 and 5
students.

  Month 1: The Four Pillars of Computational Thinking (Unplugged + Intro to Scratch) (Week 1-4)
    Introduction to Computational Thinking & Why It Matters
      Topics:
        - What is Computational Thinking? (Definition as per CBSE/NCERT framework)
        - How do computers 'think'? (Simple explanation for kids)
        - Difference between a human brain and a computer
        - The 4 pillars of CT: Decomposition, Pattern Recognition, Abstraction, Algorithms
        - Real-life CT: Brushing teeth, making sandwich, getting ready for school
        - CT all around us: Traffic signals, recipes, board games
        - Growth mindset & making mistakes, the scientist way
        - Introduction to the CBSE CT framework (age-appropriate)
        - Thinking journal: Your child's first CT diary
        - Family CT challenge: Find 5 algorithms at home
      Projects built:
        - Create a 'How I Get Ready for School' step-by-step poster
        - Break down making Maggi into 10 precise steps (Decomposition)
        - CT Thinking Diary, daily entries for a week
      Practice: Daily 10-minute unplugged CT game from our parent pack
    Decomposition, Breaking Big Problems Into Small Ones
      Topics:
        - What is Decomposition?
        - Why decomposition matters (examples: school projects, cleaning room)
        - Decomposing a drawing into shapes
        - Decomposing a birthday party plan
        - Tree diagrams and mind maps for decomposition
        - Decomposing a school timetable
        - Decomposing a game into rules
        - Practice: Decompose 10 everyday tasks
        - When decomposition helps (and when it doesn't)
        - Team decomposition: Family project breakdown
      Projects built:
        - Decompose your favorite board game into its smallest rules
        - Plan a pretend birthday party using only decomposition
        - Create a decomposition poster for any Class subject
      Practice: Decompose one new task every day, parent signs logbook
    Pattern Recognition, The Secret Skill of Scientists
      Topics:
        - What are patterns? (Visual, numerical, behavioral, musical)
        - Patterns in nature: leaves, flowers, honeycomb, zebra stripes
        - Patterns in math tables (2, 5, 10 tables)
        - Patterns in Indian festivals & seasons
        - Spotting patterns in stories & rhymes
        - Patterns in our daily routine
        - Why AI uses pattern recognition (face unlock, Netflix recommendations)
        - Pattern puzzles and Sudoku for kids (4x4)
        - Creating your own patterns
        - Pattern break: Finding the 'odd one out'
      Projects built:
        - Pattern hunt journal, photograph 20 patterns around you
        - Design a Rangoli using mathematical patterns
        - Create a pattern-based memory game
      Practice: Spot 5 new patterns daily
    Abstraction & Algorithms, Recipes for Computers
      Topics:
        - What is Abstraction? (Keeping important, ignoring rest)
        - Maps as abstractions (Metro map, school map)
        - What is an Algorithm? Step-by-step instructions
        - Recipes as algorithms
        - Algorithms for brushing teeth, tying shoelaces
        - Sequence matters, why order is important
        - Introduction to Flowcharts (shapes and arrows)
        - First flowchart: Morning routine
        - Writing your first algorithm on paper
        - Robot Game: Human Robot, algorithms in action
      Projects built:
        - Write the 'Perfect Algorithm' for making your favorite food
        - Design a flowchart adventure story
        - Program your family to be 'robots' and follow your algorithm
      Practice: Write one algorithm per day for any daily task

  Month 2: First Coding with Scratch, Where CT Meets Computers (Week 5-8)

- Welcome to Scratch, The Block Coding Playground
  - Topics:
    - Introduction to Scratch (MIT), why CBSE recommends it
    - Scratch interface tour: Stage, Sprites, Blocks, Scripts
    - Motion blocks: Move, turn, glide
    - Your first Scratch program: Make the cat dance
    - Saving and managing Scratch projects
    - Scratch account creation (parent-supervised)
    - Connecting CT to Scratch: Every program = an algorithm
    - Changing costumes & backgrounds
    - Sound blocks, making your sprite speak in Hindi/English
    - First creative project: Digital greeting card
  - Projects built:
    - Animated birthday card for a family member
    - Dancing cat in 5 different backgrounds
    - Digital storybook cover with your name
  - Practice: Explore one new Scratch block daily
- Events, Loops & Repeat, Making Programs Powerful
  - Topics:
    - Events in Scratch: 'When flag clicked', key press, sprite click
    - Loops: Repeat, forever (why loops save time)
    - Real-life loops: brushing teeth 20 times, school bell rings 6 times
    - Nested loops for patterns
    - Pen tool, drawing geometric shapes with code
    - Drawing squares, triangles, hexagons with loops
    - Spiral drawings with loops
    - Variables introduction, boxes that hold information
    - Score counter in a simple game
    - Name input using 'Ask' block
  - Projects built:
    - Geometric art generator (shapes with pen + loops)
    - Simple counting game
    - Animated alphabet learning app
  - Practice: Create one new looping animation daily
- Decisions, Conditions & Interactive Stories
  - Topics:
    - If-then blocks, decisions in code
    - If-else blocks, choosing between two options
    - Comparison: Less than, greater than, equal to
    - Interactive stories with choices
    - Keyboard-controlled sprites
    - Sprite-to-sprite interaction (touching, bouncing)
    - Adding sound effects for actions
    - Timer and countdown
    - Changing background on condition
    - Branching storylines
  - Projects built:
    - 'Choose Your Adventure' interactive story
    - Keyboard-controlled character runner
    - Quiz game with If-Else logic (Science or GK quiz)
  - Practice: Add If-Else logic to previous projects
- First Mini Capstone: Build Your Own Scratch Game
  - Topics:
    - Game design basics for kids
    - Planning: storyboarding before coding
    - Combining motion, events, loops, conditions
    - Scoring systems
    - Lives and Game Over screens
    - Winning and losing conditions
    - Play-testing & debugging
    - Sharing with friends and family
    - Publishing to Scratch studio
    - Presenting your project
  - Projects built:
    - CAPSTONE 1: Complete Scratch game (Catch the Stars, Maze Runner, or Pong)
    - Record a project showcase video (2 mins)
    - Write a simple README for your game
  - Assessment: Phase 1 Mid-Milestone: Scratch Project Certification

Month 3: What is AI?, Your First Encounter with Artificial Intelligence (Week 9-13)
- AI All Around Us, Seeing AI Everywhere
  - Topics:
    - What is Intelligence? What makes humans smart?
    - What is Artificial Intelligence? (Simple CBSE-aligned definition)
    - AI vs ordinary computer programs, the key difference
    - AI in daily life: Alexa, Siri, YouTube, Netflix, Google Maps, face unlock
    - History of AI: From chess computers to ChatGPT (kid-friendly timeline)
    - The 3 ways AI learns: Supervised, Unsupervised, Reinforcement (simplified)
    - AI vs Robots, are they the same?

- Famous AI success stories (AlphaGo, Watson, self-driving cars)
- Things AI is good at (and not good at)
- Where does AI go wrong? (Introduction to bias)

Projects built:
- AI Spotter Journal, find 30 examples of AI in your home & neighborhood
- Draw an 'AI Timeline' poster
- Interview a parent/grandparent: 'What was life before AI?'

Practice: Identify AI vs non-AI apps on family phone

How Does AI 'See', Introduction to Computer Vision

Topics:
- How do humans see? (Eyes + brain)
- How do computers 'see'? (Cameras + AI)
- Pixels, colors, and images for computers
- Introduction to Computer Vision (CV domain of AI)
- Face detection vs face recognition
- Object detection (cars, traffic signs, animals)
- QR codes, a simple CV example
- Medical imaging, how AI detects diseases
- Ethics: Is face recognition always good?
- Fun hands-on: Training a simple image classifier with Teachable Machine

Projects built:
- Train a Teachable Machine model to recognize 'happy face vs sad face'
- Train a model to classify 3 objects you own
- Poster: '10 places where Computer Vision is used'

Practice: Spot 5 Computer Vision apps daily

How Does AI 'Listen & Talk', Natural Language & Speech

Topics:
- How computers understand language (Natural Language Processing intro)
- Speech-to-Text: How Alexa & Google understand you
- Text-to-Speech: How computers talk back
- Chatbots, kid-friendly intro
- Simple rule-based chatbot in Scratch
- Language translation with AI
- Voice assistants: Alexa, Google Home, Siri
- How AI learns Hindi, Tamil, English, Bengali and other languages
- Spam detection in email, a NLP example
- Ethics: When should you trust a chatbot?

Projects built:
- Build a rule-based chatbot in Scratch (answers 10 common questions)
- Record voice commands and explore Google Assistant
- Design a friendly AI assistant for elderly people

Practice: Talk to voice assistants and note what works, what doesn't

Introduction to the CBSE AI Project Cycle (4Ws & Beyond)

Topics:
- What is the AI Project Cycle? (Official CBSE framework)
- The 5 stages: Problem Scoping Data Acquisition Data Exploration Modelling Evaluation
- Stage 1: Problem Scoping using 4Ws (Who, What, Where, Why)
- Practice: Apply 4Ws to a school problem
- Stage 2: Data Acquisition, what is data?
- Types of data: Images, text, numbers, sound
- Stage 3: Data Exploration, looking for patterns
- Graphs and charts for young kids
- Stage 4 preview: What is a 'model'?
- Stage 5 preview: How do we know AI is right?

Projects built:
- Apply the 4Ws to 'Why do kids waste food in school canteen?'
- Collect data on weather for 7 days and draw a chart
- Create an AI Project Cycle poster for classroom

Practice: Use 4Ws on one problem every day

Phase 1 Capstone, Your First AI-Assisted Project

Topics:
- Choosing a community problem
- Applying the full AI Project Cycle
- Combining Scratch + Teachable Machine
- Documentation & presentation
- Demonstrating to parents and peers
- Getting feedback and improving
- Celebrating first success
- Preparing for Phase 2

Projects built:
- CAPSTONE 2: AI-powered Scratch project solving a home problem (e.g. lost item finder, pet mood detector, uniform checker)
- 3-slide presentation
- 2-minute demo video

Assessment: CBSE CT & AI Foundation Certificate (Classes 3-5 level)

PHASE 2: AI BUILDER TRACK (MONTHS 4-6, WEEKS 14-26), ALIGNED TO CBSE CLASSES 6-8

Dive deep into Artificial Intelligence with the official CBSE Classes 6-8 AI curriculum. Master the full AI Project Cycle, explore all three domains of AI (Data, Computer Vision, Natural Language Processing), begin Python programming, and build real AI-powered applications that solve real-world problems.

- Month 4: Mastering the CBSE AI Project Cycle (Week 14-17)
  - Problem Scoping & Data Acquisition (Deep Dive)
    - Topics:
      - Problem Scoping, 4Ws in detail (Who, What, Where, Why)
      - Stakeholder identification
      - Framing the problem statement
      - SDG (Sustainable Development Goals) connection, mandated by CBSE
      - Selecting SDG goals for your AI project
      - Data types: Structured (tables), Unstructured (images, text, audio)
      - Sources of data: Surveys, sensors, public datasets (Kaggle for kids), APIs
      - Data privacy basics, why it matters
      - How to design a survey (Google Forms)
      - Collecting data ethically
      - Data cleaning basics, removing mistakes
      - Introduction to CSV files
    - Projects built:
      - Create a full CBSE-format AI Project Cycle document
      - Design and conduct a survey in your school (30 responses)
      - Map your project to 2 SDG goals
    - Practice: Practice 4Ws on 3 new problems weekly
  - Data Exploration & Visualization
    - Topics:
      - Data exploration, why we look at data
      - Types of charts: Bar, Line, Pie, Scatter (when to use which)
      - Google Sheets / MS Excel for data exploration
      - Making charts in Google Sheets
      - Finding outliers and missing values
      - Mean, median, mode for kids
      - Data stories, telling the truth with data
      - Avoiding misleading graphs
      - Introduction to data visualization best practices
      - Creating infographics in Canva
      - Interpretation, what does the data say?
      - Designing a data dashboard
    - Projects built:
      - Collect and visualize your class's screen time data
      - Analyze a public dataset on air pollution in Indian cities
      - Create a data-driven infographic on a CBSE social topic
    - Practice: Make one chart from real data every day

- Month 5: AI Domains, Data, Computer Vision, NLP (Week 18-21)
  - Data Science, Teaching Computers to Predict
    - Topics:
      - What is Data Science?
      - Prediction vs Classification vs Clustering
      - Linear thinking in predictions (temperature, prices)
      - Classification with Teachable Machine (extended)
      - Clustering explained with sorting toys game
      - K-Means clustering, simplified
      - Decision Trees, kids' explanation
      - Building your first decision tree by hand
      - Orange Data Mining, visual ML for kids
      - Installing & exploring Orange Data Mining
      - Uploading a dataset in Orange
      - Running your first ML model visually
    - Projects built:
      - Decision tree: 'What should I wear today?'
      - Clustering project: Group your toys using K-Means thinking
      - Orange ML: Predict if a student will pass based on study hours
    - Practice: Solve one ML thinking puzzle daily
  - Computer Vision, Deep Dive
    - Topics:
      - Pixels, RGB, grayscale explained
      - Image classification vs object detection vs image generation
      - Training a custom Teachable Machine model (10+ classes)
      - Exporting Teachable Machine models to Scratch
      - Using TM models inside Scratch for interactive projects
      - Face filters, how Snapchat/Instagram works (simplified)
      - OCR (Optical Character Recognition), reading handwriting
      - Medical AI, skin disease, X-ray detection (kid-safe intro)
      - Real-world case studies (Indian startups using CV)
      - Ethics: Deepfakes & misuse of CV
      - CBSE sample CV project ideas
      - Planning your own CV project

- Projects built:
  - Build a Teachable Machine + Scratch 'Hand Gesture Controlled Game'
  - Create an attendance system using facial recognition (Teachable Machine)
  - Design a 'litter detector' for clean India initiative (SDG)
- Practice: Train one TM model daily

Natural Language Processing, Making Machines Understand Us
- Topics:
  - Words as data, how computers read text
  - Tokenization, splitting sentences into words
  - Bag of Words model (simplified)
  - Sentiment analysis, is this message happy or sad?
  - Chatbot building blocks
  - Rule-based vs AI-based chatbots
  - Dialogflow / simple chatbot builders for kids
  - Voice input & output in Scratch 3 (speech extensions)
  - Translation AI, how Google Translate works
  - NLP use cases in India (Bhashini, regional languages)
  - Spam filters, a classic NLP task
  - Limitations of NLP, why AI gets confused
- Projects built:
  - Build a Scratch-based mood-detecting journal bot
  - Create a voice-controlled calculator
  - Build a Hindi-English translation assistant prototype
- Practice: Analyze sentiment of 10 messages daily

AI Ethics, Bias & Responsible AI (core CBSE AI themes)
- Topics:
  - Why AI ethics matters, CBSE emphasis
  - What is AI bias? (Famous case studies)
  - Gender, racial, cultural bias in AI
  - Case study: Biased resume screening AI
  - Privacy & AI, your data is valuable
  - Consent in the AI age
  - Deepfakes & misinformation
  - Environmental cost of AI (energy, water)
  - AI & Jobs, what the future holds
  - Responsible AI principles (fairness, accountability, transparency)
  - Asimov's 3 Laws of Robotics (kid-friendly)
  - Designing ethical AI, a framework for kids
- Projects built:
  - Ethics poster: 'Our Family's AI Rules'
  - Case study presentation: Find an example of AI bias
  - Design an 'AI Ethics Checklist' for classroom use
- Practice: Daily AI ethics journal

Month 6: Modelling & Evaluation + First Python Steps (Week 22-26)

Modelling, How Machines Learn
- Topics:
  - What is a model?
  - Supervised learning (with labeled examples)
  - Unsupervised learning (finding patterns alone)
  - Reinforcement learning (learning from reward)
  - Training, validation and testing data
  - Overfitting & underfitting, kids' analogy
  - Accuracy, error, confusion matrix basics
  - When models fail
  - Improving a model
  - Retraining & iterating
  - Google's Teachable Machine: Advanced usage
  - Introduction to MIT App Inventor for AI apps
- Projects built:
  - Train, test and evaluate 3 different TM models
  - Build an MIT App Inventor app that uses a trained AI model
  - Improve an existing model by adding more data
- Practice: Evaluate one model daily

Evaluation & Deployment
- Topics:
  - Evaluation metrics (simplified)
  - Precision, Recall, kid-friendly explanations
  - F1 Score in simple terms
  - When AI shouldn't be deployed
  - Real-world deployment examples
  - User testing with friends and family
  - Feedback & iteration cycle
  - Packaging & sharing AI projects
  - Hosting AI apps (Teachable Machine, MIT App Inventor, Glitch)
  - Presenting AI projects to non-technical people
  - Creating project documentation
  - CBSE AI project report format
- Projects built:

- Deploy one AI app for family use (MIT App Inventor)
- Write a CBSE-format AI Project Report (5 pages)
- Conduct 3 user-testing sessions

Practice: Get feedback from 3 people per project

Introduction to Python for AI (CBSE Class 8 Transition)

Topics:

- Why Python? The language of AI & CBSE Class 9+
- Installing Python & Thonny (kid-friendly IDE)
- Google Colab, Python in the browser
- Variables, data types, print statement
- Input & simple calculations
- If-else in Python
- Loops (for, while)
- Lists, storing multiple items
- Functions, reusable code
- Random module, fun first projects
- Turtle module, drawing with Python
- First AI-like program in Python (rule-based chatbot)

Projects built:

- Python turtle, draw Indian flag, mandala, geometric art
- Python rule-based chatbot
- Dice roller, number guessing, quiz game in Python

Practice: Write 10 Python lines daily

Phase 2 Capstone, End-to-End AI Project

Topics:

- Full AI Project Cycle application
- Scratch + Teachable Machine + Python integration
- SDG alignment
- Documentation
- Showcase preparation
- Peer review
- Parent-teacher showcase
- Competition readiness

Projects built:

- CAPSTONE 3: Full AI Project solving a community problem (choose any SDG)
- Examples: Plant disease detector, School waste tracker, Elderly help chatbot, Road safety app
- Complete CBSE-format report + video + live demo

Assessment: CBSE CT & AI Builder Certificate (Classes 6-8 level)

PHASE 3: YOUNG AI CREATOR TRACK (MONTHS 7-8, WEEKS 27-34)

Advance beyond the CBSE Class 6-8 level into true AI project creation. Build 8+ real AI projects, participate in mock hackathons, understand emerging AI technologies, and prepare for Olympiads and competitions.

Month 7: Advanced AI Tools & Projects (Week 27-30)

Generative AI for Kids, Safe Exploration

Topics:

- What is Generative AI? (chatbots and image generators, simplified)
- How GenAI is different from earlier AI
- Using GenAI safely, age-appropriate rules
- Prompt Engineering basics for kids
- Creating AI art (safe, kid-friendly tools)
- AI writing helpers for schoolwork (ethical use)
- AI as a homework helper vs homework doer (boundary setting)
- Citing AI in school assignments
- Creativity + AI = Superpower
- AI music generation introduction
- AI video generation basics
- Ethics of GenAI, hallucinations & misinformation

Projects built:

- Generate a storybook cover with AI and Canva
- Design an AI-generated bookmark
- Write a 300-word story with AI assistance (document your prompts)

Practice: Daily prompt engineering journal

Robotics & AI, Bringing AI to the Real World

Topics:

- What is a robot? Robot vs AI
- mBot, LEGO Mindstorms, Spike, kid-friendly robots
- Sensors: ultrasonic, light, touch, camera
- Actuators: motors, servos, LEDs
- Virtual robotics, VEXcode VR
- Line-following robot (simulated)
- Obstacle-avoidance robot (simulated)
- Adding AI to robots, computer vision for robots
- Humanoid robots (Sophia, Optimus) overview
- Indian robotics, ISRO, DRDO, startups
- Future of robotics in homes & hospitals

- Robotics competitions in India (WRO, FLL)
Projects built:
- Program a virtual robot in VEXcode VR
- Design a line-following robot algorithm
- Storyboard: 'A day with your personal AI robot'
Practice: Daily robotics simulation
AI for Sustainable Development Goals (SDGs)
Topics:
- Overview of the 17 UN SDGs (a core CBSE AI curriculum theme)
- How AI is helping each SDG (case studies)
- AI for Clean Water (Goal 6)
- AI for Quality Education (Goal 4)
- AI for Zero Hunger (Goal 2)
- AI for Climate Action (Goal 13)
- AI for Good Health (Goal 3)
- Indian AI-for-Good examples (Swasth, eSanjeevani)
- Designing an SDG-aligned AI project
- Finding SDG datasets (UN, Government of India)
- Measuring impact
- Youth AI-for-Good competitions (Google, UNICEF)
Projects built:
- Choose one SDG, design a complete AI solution
- Build a prototype of the solution
- Write an impact report (2 pages)
Practice: Daily SDG research
App-Based AI Projects with MIT App Inventor
Topics:
- App design principles
- MIT App Inventor advanced
- Integrating Personal Image Classifier
- Using Look Extension for AI
- Adding voice recognition to apps
- Text-to-speech in apps
- Connecting to Firebase for data
- Publishing APKs and sharing
- UI/UX for kids
- App store basics (concept only)
- Making your app accessible
Projects built:
- AI-powered plant identifier app
- Voice-command note app
- Flash card memorizer with NLP
Practice: Build one mini app weekly

Month 8: Mini-Hackathon & Olympiad Prep (Week 31-34)
Competition Preparation & Mini-Hackathon
Topics:
- What is a hackathon? Format and rules
- Team formation strategies
- Idea generation (design sprints)
- Rapid prototyping
- Pitching an AI idea (Pixar method)
- Creating a great demo video
- Presenting to judges (body language, voice)
- Handling Q&A
- Time management during competitions
- Famous CBSE AI competitions (CBSE AI Hackathon, Intel AI Youth)
- Indian AI Olympiads (IIRC, TechXcelerate)
- International AI for Good competitions
Projects built:
- Full 48-hour mini-hackathon (home edition)
- Original AI project + pitch + demo
- 3-minute pitch video for portfolio
Practice: Daily idea generation
AI Olympiad & CBSE Competition Preparation
Topics:
- AI Olympiad syllabus overview
- CBSE AI Hackathon past problems
- Logical reasoning practice
- Python/Scratch speed challenges
- AI vocabulary & concepts test prep
- Time-bound problem solving
- Mock Olympiad rounds
- AI puzzle solving (riddles, pattern tests)
- Math for AI, proportion, averages, probability basics
- Debate: 'Is AI dangerous?' (public speaking)
- Essay writing: AI in India 2030
- Portfolio polishing
Projects built:

- Complete 5 mock Olympiad rounds
- Submit to one real CBSE/Intel AI competition
- AI essay for school magazine

Practice: Daily timed practice

PHASE 4: MASTERY & TRANSITION (MONTH 9, WEEKS 35-40)

Final capstone project, portfolio creation, CBSE AI Class 9 (Code 417) readiness test, and graduation ceremony.

Month 9: Capstone, Portfolio & Certification (Week 35-40)

Grand Capstone Project (Full AI Lifecycle)

Topics:

- Selecting a real community problem
- Deep stakeholder interviews
- Complete AI Project Cycle execution
- Multi-week project management
- Using Git/GitHub basics for kids
- Version control & backup
- Collaboration with classmates
- Expert mentor review sessions
- Iterative development
- User testing with 10+ real users
- Formal CBSE-style report writing (10 pages)
- Presentation mastery

Projects built:

- FINAL CAPSTONE: Full AI solution for a real community issue
- Complete CBSE-style report (cover, abstract, methodology, results, ethics, SDG alignment)
- Public GitHub portfolio with documentation

Portfolio, LinkedIn (with parental guidance) & Public Showcase

Topics:

- Portfolio website building
- Personal branding for young creators
- Creating a project showcase page
- Video editing for project demos
- Writing project stories (journalistic style)
- Social media presentation (parent-managed)
- Preparing for school science fair
- Public speaking, mini TED-talk format
- Handling feedback gracefully
- Connecting with peer creators
- Maintaining lifelong learning habits
- Giving back, teach a younger friend

Deliverables:

- Personal portfolio site (Netlify/GitHub Pages)
- 50+ projects documented with screenshots and videos
- 10-minute live showcase presentation

CBSE AI Class 9 (Code 417) Readiness Test & Beyond

Topics:

- CBSE Class 9 AI (417) curriculum overview
- CBSE Class 11-12 AI (843) curriculum preview
- Sample past papers (Class 9 AI)
- Practical file requirements
- Employability skills (part of CBSE AI curriculum)
- Self-management, ICT, Entrepreneurial, Green skills
- Mock Class 9 AI assessment
- Gap identification
- Personalized next-step recommendation
- Transition pathway plan
- Parent conference
- Learning roadmap for next 3 years

Assessment: CBSE AI Class 9 (Code 417) Readiness Certification

Graduation & Final Showcase

Topics:

- Final skill assessment
- Certification ceremony (virtual + physical certificate)
- Alumni community induction
- Access to future courses and updates
- Mentor allocation for next year
- Community contribution opportunities
- Celebrating every student's journey
- Setting 3-year learning goals

Deliverables:

- CBSE-Aligned Computational Thinking & AI Certificate for Kids
- 50+ Project Portfolio
- LinkedIn-shareable digital badge
- Next-level course pathway plan

Assessment: FINAL EXAM: capstone demo plus a friendly viva and a mixed quiz drawn from

the whole course. Passing earns the certificate; a child who falls short gets focused revision and a free retest

PROJECTS THE STUDENT BUILDS AND KEEPS

- Phase 1: 10+ unplugged CT activities, 8+ Scratch projects, 3+ AI awareness projects
- Phase 2: 6+ full AI Project Cycle projects, 5+ Teachable Machine models, 2+ Python projects
- Phase 3: 8+ advanced AI projects, 3+ robotics simulations, 2+ MIT App Inventor apps
- Phase 4: 1 grand capstone + portfolio of 50+ documented projects
- Total: 50+ projects with full CBSE-style documentation

SKILLS THE STUDENT WILL HAVE AT THE END

- Computational Thinking: 4 pillars mastery (Decomposition, Pattern Recognition, Abstraction, Algorithms)
- Block Coding: Scratch advanced level (events, loops, conditions, variables, broadcasts, cloning)
- AI Fundamentals: CV, NLP, Data Science, ML basics, ethics, bias
- AI Project Cycle: Full CBSE-aligned 5-stage process
- Data literacy: Collection, cleaning, visualization, interpretation
- Python basics: Variables, loops, conditions, lists, functions, turtle, random
- Prompt engineering (GenAI): Safe, effective, age-appropriate
- Project management: Planning, execution, documentation, presentation
- Soft skills: Public speaking, teamwork, critical thinking, empathy
- Research: Surveys, datasets, stakeholder interviews, impact reporting
- Ethics: Bias, privacy, responsibility, SDG alignment
- Technology literacy: Apps, AI, IoT basics, robotics simulation

HOW A TYPICAL WEEK IS SPLIT

Live classes: 2 x 60-min expert-led sessions/week
Self practice: 2-3 hours/week
Project work: 1-2 hours/week
Parent engagement: 30 mins/week progress review
Total per week: 5-7 hours

SUPPORT INCLUDED

Live sessions: Weekly live classes with CBSE-trained AI instructors
One on one: Fortnightly 1-on-1 mentor check-ins
Parent reports: Monthly detailed progress reports for parents
Community: Kids-only private community (moderated)
Feedback: Weekly project reviews with feedback
Resources: Full access to curated AI resource library
Doubt support: WhatsApp group + ticket system with <12 hr response time
Parent workshops: Quarterly AI-for-Parents sessions

CERTIFICATION DETAIL

Phase certificates: Separate certificate after each phase (4 total)
Final certificate: Certified Young Computational Thinker & AI Innovator
Linkedin badge: Shareable digital badge for LinkedIn/school profile
School recognition: Recognized by 400+ CBSE & ICSE schools (and growing)
Portfolio projects: 50+ documented CBSE-style AI projects
Cbse class 9 readiness: CBSE AI Class 9 (Code 417) Readiness Certificate

WHERE THIS CAN LEAD

- Direct pathway to CBSE AI Class 9-10 (Code 417)
- Direct pathway to CBSE AI Class 11-12 (Code 843)
- Future AI Engineer / ML Engineer
- Future Data Scientist
- Future Robotics Engineer
- Future Prompt Engineer / AI Product Designer
- Future AI Ethics Researcher
- Future Computer Science Researcher
- Future Tech Entrepreneur
- Any career benefiting from computational & analytical thinking (medicine, law, business, arts)

COMMON QUESTIONS ABOUT THIS COURSE

For anything about cost, use PART 4 and RULE 1. Do not quote two regions.

Q: Is this course officially approved by CBSE?
A: Our course is 100% aligned with the official CBSE Computational Thinking & Artificial Intelligence framework and NCERT AI handbooks. While CBSE does not 'approve' external courses, we have designed every module to match CBSE syllabus for Classes 3-8 AI curriculum. Students completing this program will be ahead of CBSE AI Class 9 (Code 417) requirements.

Our students from 400+ CBSE/ICSE schools have successfully used this course as supplementary and even replacement learning.

Q: My child is in Class 3, is this course too advanced?
A: Absolutely not! Phase 1 (Months 1-3) is specifically designed for Classes 3-5 with unplugged activities, Scratch basics, and AI awareness, no technical prerequisite. We have separate age-appropriate batches for Primary (Classes 3-5) and Middle School (Classes 6-8). Younger children progress at their own pace and reach Phase 2 when ready. Many Class 3 students complete the full 9 months successfully with proper pacing.

Q: My child is in Class 8, isn't this too basic?
A: Class 8 students enter directly into Phase 2 (Month 4) after a quick diagnostic, then progress through Python, advanced AI projects, GenAI, robotics, and capstone projects that are well beyond the CBSE Class 8 AI chapter. By the end, they are not just ready for CBSE AI Class 9 (Code 417), they are 6-12 months ahead of it. We also offer optional Phase 3+ advanced tracks for ambitious Class 8 students.

Q: Does this course prepare for CBSE AI Class 9 (Code 417)?
A: Yes, this is one of our core outcomes. Phase 4 includes an explicit CBSE Class 9 AI (Code 417) Readiness Test. Students who complete this course are fully prepared to excel in the Class 9-10 CBSE AI curriculum, including Communication Skills, Self-Management, ICT Skills, Entrepreneurial Skills, Green Skills, Introduction to AI, AI Project Cycle, Neural Networks intro, Python intro, and Ethics of AI. Many of our students score 95+ in their Class 9-10 AI board exams.

Q: How is this different from school AI classes?
A: Most CBSE school AI classes cover the curriculum at surface level due to 1-2 hours/week time constraints. Our course goes 10x deeper with 5-7 hours/week, live expert instruction, 50+ hands-on projects, CBSE-format project documentation, and continuous feedback. We also include cutting-edge topics (GenAI, Prompt Engineering, Robotics simulation, MIT App Inventor) that most school curricula skip. Result: our students don't just pass AI, they create AI.

Q: Is Python necessary at this age?
A: Python is introduced only in Month 6 (Class 8 level), and even then in a gentle, kid-friendly way using Turtle graphics and simple games. CBSE introduces Python officially in Class 8 AI chapter and heavily in Class 9 (Code 417). Starting early gives your child a huge advantage. Younger kids (Classes 3-6) focus on Scratch and unplugged CT, which pedagogically is the right progression.

Q: What if my child misses a class?
A: Small batches make catch-up genuinely easy: the teacher recaps the missed concepts in the next session, class notes and the week's practice set are shared over WhatsApp, and for longer absences we schedule a short free catch-up slot so no child falls behind the batch.

Q: Are the projects CBSE-board-exam standard?
A: Yes. All capstone projects follow the official CBSE AI Project Cycle format (Problem Scoping Data Acquisition Data Exploration Modelling Evaluation). Reports are written in CBSE practical file format with abstract, methodology, SDG alignment, ethics consideration, and results, exactly the format required by CBSE AI board exams for Class 9-12.

Q: How much screen time does this course require?
A: We are very mindful of healthy screen time, especially for younger kids. Phase 1 (Classes 3-5) is 60-70% unplugged (no-screen) activities, puzzles, paper flowcharts, human-robot games, nature pattern hunts. Total screen time averages 3-4 hours/week for Phase 1 and 5-6 hours/week for Phases 2-4. We encourage physical activity, outdoor breaks, and offline thinking time throughout.

Q: Will my child be ready for AI competitions?
A: Absolutely, Phase 3 Week 31-34 is dedicated competition preparation. Our students regularly participate in and win CBSE AI Hackathons, Intel AI Youth Challenge, Samsung Innovation Campus, Microsoft AI for Good, and India AI Olympiad.

Q: Do parents need technical knowledge?
A: Zero technical knowledge needed. We provide parent-friendly weekly progress reports, quarterly AI-for-Parents workshops and clear written progress notes. Many of our most successful students have parents from non-technical backgrounds. In fact, we encourage parents to 'learn alongside' for the first month, it's a beautiful bonding experience!

Q: How do I know this course is right for my child?
A: Book a FREE diagnostic session with our CBSE AI expert. We will assess your child's current level, interests, and goals, then recommend whether they should join Primary (Classes 3-5) or Middle School (Classes 6-8) batch. If we feel this course is not the right fit, we will honestly tell you, we only enroll students who will truly benefit.

To enrol, message Shivam Sir on +91 9123366161 or send the parent this link: https://learn.modernagecoders.com/courses/cbse-computational-thinking-and-ai-course-for-kids-classes-3-to-8
For a demo: the Priority Live Demo (guaranteed, today or tomorrow) is booked at https://learn.modernagecoders.com/priority-demo . The free demo is a waiting list with no fixed date.

==========
COURSE 37 OF 137: CBSE COMPUTATIONAL THINKING & AI FOR TEENS (CLASS 9-12)
==========

Course link: https://learn.modernagecoders.com/courses/cbse-computational-thinking-and-ai-course-for-teens-classes-9-to-12-code-417-843
Subject area: CBSE School Board Exam Preparation - Artificial Intelligence (Code 417 & 843)
Designed for: Teens
Who can join: Complete Beginner to CBSE AI Board Topper + Industry-Ready AI Developer
Course length: 12-14 months (48-56 weeks), or the full Class 9-12 board track
Time needed: 10-12 hours/week (2-3 live classes + practical + self-study)
Certificate: Certificate from Modern Age Coders, awarded on passing the final exam; syllabus aligned to CBSE AI 417 and 843

PRICE FOR THIS COURSE (quote only the one that applies to the person asking)
  In India, per month: group Rs 1,499, mini batch Rs 2,999, one to one Rs 4,999
  Outside India, per month: group $100, one to one $150
  Classes: group and mini batch two live classes a week, eight a month; one to one in India one live class a week, four a month; one to one outside India two live classes a week, eight a month. Each class is one hour.

WHAT THIS COURSE IS

  CBSE Computational Thinking & AI for Classes 9-12: Python, Machine Learning and board practical mastery. Covers AI 417 (Class 10) and AI 843 (Classes 11-12).

  In one line: From CBSE AI Board Topper to Industry-Ready AI Engineer, In One Comprehensive Program

ABOUT THE PROGRAMME

  The Central Board of Secondary Education (CBSE) introduced Artificial Intelligence as an official Skill Subject (Code 417 for Class 9-10, Code 843 for Class 11-12) in response to India's urgent need for AI-ready youth. This 12-month flagship program is the definitive preparation course for every CBSE teen pursuing AI, whether as a board subject, competition pathway, or future career. You will master the complete CBSE AI syllabus with 10x greater depth than any school offers: Employability Skills (Communication, Self-Management, ICT, Entrepreneurial, Green Skills), the complete AI Project Cycle (Problem Scoping Data Acquisition Data Exploration Modelling Evaluation), AI Domains (Data, Computer Vision, Natural Language Processing), Python programming from zero to advanced, NumPy, Pandas, Matplotlib, scikit-learn, TensorFlow, Keras, OpenCV, NLTK, Neural Networks, Convolutional Neural Networks (CNNs), Recurrent Neural Networks (RNNs), Transformers, Generative AI (ChatGPT-class text models, diffusion image models), LLM concepts, Prompt Engineering, Reinforcement Learning, AI Ethics, SDG-aligned capstone projects, and full board practical file + viva preparation. By completion, you will have (1) scored 95+ in your CBSE AI board exam, (2) built 80+ industry-grade AI projects in your GitHub portfolio, (3) prepared for top AI Olympiads (India AI Olympiad, Intel AI Youth, Samsung Innovation Campus), and (4) positioned yourself for IIT/NIT/BITS/top universities and future AI careers earning Rs 40+ LPA.

WHAT MAKES THIS COURSE DIFFERENT

  - 100% CBSE AI Code 417 + 843 syllabus coverage, not a single topic missed
  - Separate dedicated batches for Class 9, 10, 11, and 12
  - Full Employability Skills module (10% of CBSE AI marks, often neglected by schools)
  - CBSE-format practical file creation with 20+ lab activities per class
  - Every capstone project follows official CBSE AI Project Cycle format
  - Viva voce preparation with 500+ commonly asked board questions
  - Sample papers, past year papers, marking scheme analysis, topper answer sheets
  - Industry-level Python, ML, DL training, goes beyond board syllabus
  - GitHub portfolio of 80+ projects for college applications and internships
  - Live 1-on-1 mentorship with AI engineers from Google, Microsoft, IIT alumni
  - Guaranteed 95+ marks in CBSE AI board exam or 50% fee refund
  - Preparation for India AI Olympiad, Intel AI Youth, Samsung Innovation Campus, MS Imagine Cup

THE LEARNING PATH, STEP BY STEP

  Phase 1: Foundation (Months 1-3): Employability Skills + CT + Python + AI Basics + the CBSE AI 417 syllabus
  Phase 2: AI Project Cycle Mastery (Months 4-6): Full CBSE AI Project Cycle + Data/CV/NLP domains + Class 10 AI (417) syllabus + Board prep
  Phase 3: Machine Learning & Class 11 AI (843) (Months 7-9): scikit-learn, pandas, ML algorithms, Data Visualization, Class 11 AI full syllabus
  Phase 4: Deep Learning + Class 12 AI (843) + Career Launch (Months 10-12): TensorFlow, CNN/RNN/Transformer, GenAI, Class 12 full syllabus, board + industry portfolio

WHAT A STUDENT NEEDS BEFORE STARTING

  Age: 13-18 years (Classes 9 to 12)

Coding experience: None, we start from absolute zero. Prior Scratch/Python is a bonus.
Equipment: Laptop/desktop (min 8GB RAM, i3+/Ryzen 3+), stable internet (10 Mbps+), webcam, headphones
Software: All free (+ Google Colab for GPU). Paid optional: Colab Pro ($10/mo) or Kaggle free GPU
Time commitment: 10-12 hours/week (2-3 classes + practical + self-study)
English: Class 9+ English comprehension
Math: Basic Class 9 Math (Algebra, simple geometry). Advanced math taught as needed.
Motivation: Willingness to be challenged, curiosity for AI, commitment to board results

WHO THIS COURSE IS FOR

Cbse class 9: Students opting for CBSE AI as Skill Subject (Code 417) in Class 9
Cbse class 10: Students pursuing CBSE AI (417) with board exam in Class 10
Cbse class 11: Students electing CBSE AI (Code 843) as academic elective in Class 11
Cbse class 12: Students with CBSE AI (843) board exam in Class 12
Other boards: ICSE/ISC, IB, Cambridge, State Board students, curriculum fully transferable
International students: NRI/PIO students preparing for Indian board exams from abroad
Cs non cs students: Students doing CBSE CS (083) or IP (065) wanting AI depth alongside
Engineering aspirants: JEE/BITSAT aspirants wanting AI portfolio for college applications
International college applicants: Students applying to MIT, Stanford, CMU, AI portfolio is critical
Competition aspirants: Kids gunning for India AI Olympiad, Intel AI Youth, Samsung Innovation Campus, MS Imagine Cup, Google AI, UNICEF AI-for-Good
Startup minded: Teens who want to launch an AI product/startup while in school
Self learners: Homeschoolers and advanced learners wanting structured AI mastery

FULL CURRICULUM, WEEK BY WEEK

This is the complete teaching plan. Parents can ask about any week.

PHASE 1: CBSE AI FOUNDATION (CODE 417 SYLLABUS, MONTHS 1-3, WEEKS 1-13)

Complete mastery of the CBSE AI 417 syllabus - Employability Skills, Introduction to AI, AI Project Cycle basics, Neural Networks and Python for AI. This is the Class 10 board syllabus, and the right foundation for a Class 9 student now that CBSE has discontinued AI 417 at Class 9. Every student builds a rock-solid foundation regardless of prior coding experience.

Month 1: Employability Skills + Introduction to AI (CBSE Unit 1-3) (Week 1-4)
Employability Skills Part 1: Communication & Self-Management (CBSE Mandatory Unit)
Topics:
- Why Employability Skills matter (10% of CBSE AI marks)
- Communication Skills: Definitions, types, importance
- Verbal vs Non-verbal communication
- Communication cycle and feedback
- Barriers to effective communication
- Writing skills, Kinds of sentences, parts of speech, tenses
- Basic English grammar for CBSE AI
- Self-Management Skills: Introduction
- Stress management & working independently
- Self-awareness, self-motivation, self-regulation
- Goal setting, SMART goals framework
- Time management techniques
Projects built:
- Write a 500-word reflective essay on 'AI in my life'
- Create a SMART goals worksheet for the AI course
- Group presentation: 'Barriers to communication in AI teams'
Practice: Daily vocabulary + communication drills
Employability Skills Part 2: ICT, Entrepreneurial & Green Skills
Topics:
- ICT Skills: Introduction to computers
- Basic ICT operations: files, folders, shortcuts
- Operating system basics (Windows/Ubuntu)
- Internet, email, search, cloud basics
- Entrepreneurial Skills: Introduction
- Qualities and functions of entrepreneurs
- Myths about entrepreneurship
- Green Skills: Introduction & importance
- Sustainable development & SDGs
- Green economy & green jobs
- Digital ethics and cyber safety
- Password management, phishing awareness
Projects built:
- Set up a cloud backup of your AI work (Google Drive)
- Interview a local entrepreneur (1-page report)
- Green AI poster, connect 3 SDGs to AI
Practice: Daily ICT skill drill (typing, shortcuts, productivity)
Introduction to Artificial Intelligence (CBSE Unit 1, Subject Specific)

```
    Topics:
      - Definition of AI, CBSE official definition
      - History & evolution of AI (1950-2026 timeline)
      - AI, ML, DL, the Venn diagram
      - Types of AI: Narrow AI, General AI, Super AI
      - Types by functionality: Reactive, Limited Memory, Theory of Mind, Self-Aware
      - AI in everyday life: 20 real examples
      - Domains of AI: Data Science, Computer Vision, NLP (detailed)
      - Is this AI? Classifying systems as AI or not AI
      - AI success stories (AlphaGo, IBM Watson, Tesla, ChatGPT)
      - AI vs Automation vs Robotics
      - AI in India, Aadhaar, UPI, Digital India context
      - Myths about AI (will it take our jobs?)
    Projects built:
      - AI Spotter, identify 50 AI systems in daily life
      - AI Timeline infographic (Canva)
      - Debate: 'Narrow AI vs General AI, will we ever reach AGI?'
    Practice: CBSE textbook Unit 1 MCQs + short answer
  AI Project Cycle, Deep Dive (CBSE Core Unit)
    Topics:
      - The 5-stage AI Project Cycle (official CBSE framework)
      - Stage 1: Problem Scoping with 4Ws (Who, What, Where, Why)
      - Stakeholder identification and needs assessment
      - SDG alignment, mandatory in CBSE AI
      - Stage 2: Data Acquisition, sources, types, ethics
      - Structured vs Unstructured data
      - Stage 3: Data Exploration, EDA basics
      - Stage 4: Modelling, Rule-based vs Learning-based
      - Learning-based: Supervised, Unsupervised, Reinforcement
      - Stage 5: Evaluation metrics introduction
      - Iteration and deployment
      - CBSE-format AI Project Report template
    Projects built:
      - Apply the full 5-stage Project Cycle to a real school problem
      - Write a 10-page CBSE-format AI Project Report
      - Present project in board-exam viva style
    Practice: Solve 3 past-year Project Cycle questions daily

Month 2: Python Programming for AI (CBSE Unit 3) (Week 5-8)
  Python Basics (CBSE-aligned + Industry Level)
    Topics:
      - Why Python for AI, CBSE recommendation
      - Python installation (Anaconda, Thonny, VS Code)
      - Google Colab for free GPU access
      - Jupyter Notebook basics
      - Variables, data types (int, float, string, bool)
      - Operators (arithmetic, comparison, logical, bitwise)
      - Input/output statements
      - Type conversion and type checking
      - Strings, indexing, slicing, methods
      - Python standard library intro
      - Running first CBSE-syllabus Python programs
      - Writing clean, commented code
    Projects built:
      - BMI Calculator
      - Temperature converter
      - Interactive quiz on AI concepts
    Practice: Daily 10 Python programs from CBSE textbook + Sumita Arora
  Python Control Flow & Data Structures
    Topics:
      - If-elif-else (nested conditionals)
      - For loop (with range, enumerate)
      - While loop (with break, continue)
      - Nested loops
      - Lists, full mastery (methods, comprehensions)
      - Tuples, immutable sequences
      - Dictionaries, key-value storage
      - Sets, unique collections
      - List vs Tuple vs Dict vs Set, CBSE comparison table
      - Functions, def, parameters, return, scope
      - Lambda functions
      - Recursion (introductory)
    Projects built:
      - To-Do List application
      - Contact Book with dictionaries
      - Password generator
    Practice: 50 Python programs on control flow
  NumPy & Pandas, Data Handling for AI (CBSE Class 11 AI Unit)
    Topics:
```

- NumPy introduction, why arrays
- Creating arrays (1D, 2D, 3D)
- Array operations, broadcasting, indexing
- NumPy vs Python list, performance
- Pandas Series & DataFrame
- Reading CSV, Excel, JSON files
- DataFrame indexing, selection, filtering
- Handling missing data
- Grouping, aggregation, merging
- Pandas for CBSE Informatics Practices (supplementary)
- Real dataset exploration, government datasets
- data.gov.in & Kaggle intro for teens

Projects built:
- Analyze India's air pollution dataset (Pandas)
- Cricket stats analysis
- Exam performance data dashboard

Practice: Daily Pandas challenges

Data Visualization, Matplotlib, Seaborn (CBSE Class 11 AI)

Topics:
- Why visualize data, CBSE exam context
- Matplotlib basics (pyplot interface)
- Line, bar, pie, scatter, histogram, box plots
- Customizing plots (titles, labels, legend)
- Subplots and figures
- Seaborn introduction, statistical plots
- Heatmaps, pair plots, violin plots
- Plotly for interactive charts
- Design principles of good visualization
- Common mistakes in visualization
- CBSE sample viva questions on visualization
- Exporting plots to reports

Projects built:
- COVID-19 India data visualization
- Climate change visualization portfolio
- Student performance visualization for school

Practice: Daily chart-making from random datasets

Month 3: AI Domains Deep Dive + Neural Networks Intro (CBSE Class 10) (Week 9-13)

Data Science Domain (CBSE Class 10 Unit 4)

Topics:
- What is Data Science? (CBSE definition)
- Data Science project cycle (application of AI Project Cycle)
- Data Acquisition: Surveys, sensors, web scraping, APIs
- Data Exploration: Descriptive statistics (mean, median, mode, SD)
- Data cleaning (handling NaN, duplicates, outliers)
- Feature engineering basics
- Simple linear regression (concept)
- Classification with decision trees
- Orange Data Mining advanced
- K-Nearest Neighbors intro
- Predictive analytics in business
- Case study: Cricket stats, BSE Sensex, weather forecasting

Projects built:
- Predict student marks from study hours (linear regression)
- Classify emails as spam/ham
- Stock price trend analysis

Practice: 3 full Data Science projects

Computer Vision Domain (CBSE Class 10 Unit 5)

Topics:
- What is Computer Vision? (CBSE definition)
- Applications: Medical imaging, self-driving cars, face unlock, CCTV
- How images are stored, pixels, RGB, grayscale
- Image processing fundamentals
- OpenCV introduction (industry-standard library)
- Image reading, display, resizing, cropping
- Filters: blur, sharpen, edge detection
- Face detection using Haar Cascades
- Basic object detection
- Teachable Machine advanced (10+ class classifiers)
- CNN intuition (pre-deep learning)
- Ethics of CV, surveillance, deepfakes, bias

Projects built:
- Face detector using OpenCV
- Mask detector (post-COVID era)
- Custom image classifier with Teachable Machine + Python

Practice: OpenCV daily challenge

Natural Language Processing Domain (CBSE Class 10 Unit 6)

Topics:
- What is NLP? (CBSE definition)

- Applications: Chatbots, translation, sentiment analysis, voice assistants
- Chatbots: Rule-based vs AI-based (Script Bot vs Smart Bot)
- Human language vs computer language, the gap
- Text processing: tokenization, stemming, lemmatization
- Stopwords removal
- Bag of Words model (CBSE Class 10 mandatory topic)
- TF-IDF introduction
- Sentiment analysis using Python
- NLTK library basics
- Chatbot building with Dialogflow + Python
- Regional language NLP (Hindi, Tamil, Bengali), Bhashini

Projects built:
- Mental health chatbot (Dialogflow + Python)
- Product review sentiment analyzer
- Hindi-English translator app

Practice: NLP text processing drills

Neural Networks Introduction (CBSE Class 10 Unit 7)

Topics:
- Human brain vs artificial neural network
- Neuron, biological and artificial
- Perceptron model
- Activation functions (Sigmoid, ReLU, Tanh)
- Input, hidden, output layers
- Forward propagation (intuition)
- Loss function basics
- Backpropagation (intuition, not calculus)
- Gradient descent (kid-friendly explanation)
- Types of NN: Feedforward, CNN, RNN (brief)
- Hands-on: Perceptron in Python from scratch
- Hands-on: Simple NN in Keras/TensorFlow

Projects built:
- Build a perceptron from scratch (OR/AND/XOR gates)
- Train a simple NN on MNIST digits
- Compare NN accuracy with vs without hidden layer

Practice: NN concept MCQs daily

CBSE Class 9-10 AI Board Practical File + Viva Prep

Topics:
- CBSE AI Board exam structure
- Theory paper (70 marks) breakdown
- Practical exam (30 marks) breakdown
- Practical file, 10 mandatory activities
- CBSE AI project report format
- Viva voce, common questions
- Topper answer sheet analysis
- Marking scheme understanding
- Time management in exam
- Common mistakes to avoid
- Mock practical exam
- Mock viva session

Deliverables:
- Complete CBSE AI Class 9/10 Practical File (20+ activities)
- Full capstone project with CBSE report
- Mock exam score report

Assessment: CBSE AI 417 board-aligned preparation

PHASE 2: CBSE CLASS 10 AI (417) BOARD MASTERY + ADVANCED PROJECTS (MONTHS 4-6, WEEKS 14-26)

Complete the CBSE Class 10 AI (Code 417) board syllabus mastery with extensive project work, practical file completion, mock exams, and competition preparation. Build 20+ industry-grade projects.

Month 4: Advanced Data Science Projects (Week 14-17)

End-to-End Data Science Projects

Topics:
- Kaggle competition walkthrough
- Feature engineering deep dive
- Handling categorical variables (one-hot, label encoding)
- Train-test split, cross-validation
- Regression: Linear, Polynomial, Ridge, Lasso
- Classification: Logistic Regression, SVM, Decision Trees, Random Forest
- Clustering: K-Means, Hierarchical, DBSCAN
- Model evaluation: accuracy, precision, recall, F1, ROC-AUC
- Hyperparameter tuning (GridSearchCV, RandomizedSearchCV)
- Model deployment basics (Streamlit, Flask)
- MLOps concepts for teens
- Real-world case studies from Indian startups

Projects built:
- House price prediction (Kaggle-level)

```
      - Titanic survival predictor
      - Customer churn classifier
    Practice: 1 Kaggle micro-competition weekly
  Advanced Computer Vision Projects
    Topics:
      - OpenCV deep dive
      - Face detection + recognition pipelines
      - Object tracking
      - CNN architecture deep dive (LeNet, VGG, ResNet)
      - Transfer learning (use pre-trained models)
      - Image augmentation
      - Training custom CNN in Keras
      - MobileNet, YOLO for real-time detection (intro)
      - Medical imaging projects
      - Agricultural CV (crop disease detection)
      - Traffic monitoring AI
      - Ethics: privacy + surveillance trade-offs
    Projects built:
      - Real-time face mask detector
      - Crop disease detection (leaf image classifier)
      - Traffic sign recognizer for self-driving
    Practice: Daily OpenCV + Keras exercises

Month 5: Advanced NLP + Generative AI (Week 18-21)
  Advanced NLP & Chatbot Engineering
    Topics:
      - Text preprocessing pipeline
      - Word embeddings: Word2Vec, GloVe
      - Advanced sentiment analysis
      - Named Entity Recognition (NER)
      - Topic modeling (LDA)
      - Chatbot engineering with Rasa
      - Voice assistants with SpeechRecognition + pyttsx3
      - Language translation APIs
      - Fine-tuning transformer models (intro)
      - Hugging Face transformers library intro
      - CBSE AI NLP advanced questions
      - Multilingual NLP for Indian languages (Bhashini)
    Projects built:
      - Multilingual voice assistant (Hindi + English)
      - Advanced sentiment dashboard for Twitter/X
      - Resume parser using NER
    Practice: Daily NLP project
  Generative AI & Prompt Engineering (2026-27 CBSE emerging topic)
    Topics:
      - What is Generative AI, GANs, VAEs, Diffusion, Transformers
      - ChatGPT / frontier models (GPT-class, Claude-class, Gemini-class), how they work
      - Prompt Engineering fundamentals
      - Advanced prompting: few-shot, chain-of-thought, tree-of-thought
      - Image generation: how diffusion models work, hands-on with teen-legal tools (Adobe Firefly,
        Bing Image Creator)
      - Text-to-video models explained (Sora-class), concept and implications generation
      - LangChain framework introduction
      - Building RAG (Retrieval-Augmented Generation) apps
      - API integration: OpenAI, Anthropic, Google
      - Fine-tuning LLMs for specific tasks
      - Ethics of GenAI: hallucinations, copyright, misinformation
      - Future of AI work, GenAI native careers
    Projects built:
      - Build a custom AI tutor using ChatGPT API + LangChain
      - Generate a visual storybook with AI (prompts + Adobe Firefly)
      - RAG chatbot over your school's PDF notes
    Practice: Daily prompt engineering journal

Month 6: CBSE Class 10 Board Final Prep + Capstone (Week 22-26)
  CBSE Class 10 AI Board Full Revision + Sample Papers
    Topics:
      - Complete Unit-wise revision (Units 1-8)
      - Chapter-wise MCQ marathon
      - Short answer questions bank (100+)
      - Long answer questions bank (50+)
      - Case study questions mastery
      - Last 5 years' board papers, full solution walkthrough
      - Topper answer sheet analysis
      - Examiner's marking perspective
      - Time management strategies
      - Common trap questions
      - Pre-board simulated exams
      - Answer-writing technique
```

```
      Practice: Daily 1 mock paper + analysis
      Deliverables: 5 solved CBSE AI sample papers with feedback
    Class 10 Grand Capstone + Practical File Completion
      Topics:
        - CBSE AI project cycle, full application
        - Stakeholder interviews in your community
        - Data collection, ethical and valid
        - Model building, choose appropriate algorithm
        - Evaluation with real metrics
        - CBSE-format 15-page report writing
        - Demo video production
        - Viva rehearsal with external expert
        - Practical file: 10+ mandatory lab activities with code, output, interpretation
        - File binding & formatting per CBSE standard
        - Examiner FAQs preparation
        - Submission checklist
      Practice: Advance your capstone at home: conduct two stakeholder interviews, log the
      data you collected and note one ethics safeguard you applied.
      Deliverables:
        - Final Class 10 AI capstone project (board-submission quality)
        - Complete practical file (30+ activities)
        - Viva readiness with 500+ questions rehearsed
    Mock Board Exam + Competition Launch
      Topics:
        - Full 3-hour mock board exam
        - Detailed paper analysis
        - Score vs target gap identification
        - Improvement plan
        - Entering competitions: CBSE AI Hackathon, Intel AI Youth, Samsung Innovation, MS Imagine
        - Registration support
        - Team formation
        - Project pitching
      Deliverables:
        - Mock exam score report (target: 95+)
        - At least 1 competition submission
      Assessment: CBSE AI Class 10 (Code 417) Board Ready Certification

----------------------------------------------------------------
PHASE 3: CBSE CLASS 11 AI (CODE 843), MACHINE LEARNING DEEP DIVE (MONTHS 7-9, WEEKS 27-39)
----------------------------------------------------------------
Complete CBSE Class 11 Artificial Intelligence (Subject Code 843) syllabus with
industry-grade ML engineering skills. Includes Capability Approach, Sustainable Development,
Foundational Python, Data Visualization, AI Frameworks, Statistical Data, Computer Vision,
Storytelling through Data.

  Month 7: CBSE AI 843 Class 11 Units 1-4 (Week 27-30)
    Capability Approach + Sustainable Development (CBSE AI 843 Unit 1)
      Topics:
        - Amartya Sen's Capability Approach, foundation of modern AI ethics
        - Functionings vs Capabilities
        - Human development vs economic growth
        - Role of AI in expanding human capabilities
        - 17 UN Sustainable Development Goals, deep dive
        - AI for each SDG, 17 detailed case studies
        - Measuring impact and outcomes
        - SDG alignment in AI projects (mandatory CBSE practice)
        - India's SDG progress and AI role
        - Responsible innovation frameworks
        - AI-for-Good case studies: Aravind Eye, eSanjeevani, Swasth
        - Designing SDG-centered AI projects
      Projects built:
        - Research paper: 'AI + SDG of my choice'
        - AI project directly solving one SDG
        - SDG impact measurement framework
      Practice: Pick one UN Sustainable Development Goal, find a real AI project addressing
      it and write a half page note linking it to Sen's capability approach.
    Communication Skills + AI Review + Python Foundation (CBSE Units 2-3)
      Topics:
        - Advanced communication for AI teams
        - Scientific writing for AI papers
        - Presentation skills for AI demos
        - AI review, from Class 9-10 recap to Class 11+ depth
        - History of AI revisited (LISP, Expert Systems, Deep Learning boom)
        - Python foundational advanced: OOP (classes, objects, inheritance, polymorphism)
        - File handling (text, binary, CSV)
        - Exception handling (try-except-finally)
        - Python modules and packages
        - Virtual environments, pip, conda
        - Jupyter vs VS Code vs Colab workflows
```

- Git and GitHub for version control
Projects built:
- Build a Python library (published to PyPI)
- Git-managed group AI project
- Technical blog post on an AI topic
Practice: Record a three minute AI demo presentation of any past project, then solve five Python refresher exercises on lists, dicts and functions.

Data Literacy, Data Visualization & Statistical Data (CBSE Unit 4)
Topics:
- Data literacy in the age of AI
- Data collection methods (primary, secondary)
- Descriptive statistics (full coverage)
- Inferential statistics intro (hypothesis testing)
- Probability for AI (Bayes, conditional, joint, marginal)
- Probability distributions (Normal, Binomial, Poisson)
- Advanced visualization (Seaborn, Plotly, Bokeh)
- Dashboards with Streamlit & Power BI basics
- Storytelling through data (CBSE emphasis)
- Data ethics and privacy (GDPR, DPDP Act 2023)
- Open datasets for Indian context
- A/B testing basics
Projects built:
- Complete Streamlit dashboard on a social issue
- Statistical analysis paper (school topic)
- Power BI dashboard for school data
Practice: Collect a small primary dataset of at least 20 rows from your class or home, compute mean, median, mode and standard deviation, and plot two charts that tell its story.

Month 8: CBSE AI 843 Class 11 Units 5-7 (Frameworks, CV, ML) (Week 31-34)
AI Frameworks & Tools (CBSE Class 11 Unit 5)
Topics:
- scikit-learn, industry-standard ML framework
- TensorFlow 2.x overview
- Keras high-level API
- PyTorch introduction
- Open-source AI ecosystem
- Cloud AI platforms (Google Cloud AI, AWS SageMaker, Azure ML)
- AutoML tools
- Comparing frameworks, when to use which
- Setting up complete AI dev environment
- Containerization (Docker basics)
- Model serialization (pickle, joblib, ONNX)
- API deployment with Flask/FastAPI
Projects built:
- Same ML problem solved in scikit-learn, Keras, PyTorch
- Deploy an ML model as REST API
- Docker-containerized AI app
Practice: Recreate the same simple classifier in both scikit-learn and Keras and note two differences in the workflow.

Computer Vision Advanced (CBSE Class 11 Unit 6)
Topics:
- Image processing fundamentals (full)
- OpenCV mastery
- Convolutional Neural Networks (CNN) from scratch
- CNN architectures: LeNet, AlexNet, VGG, ResNet, Inception
- Transfer learning deep dive
- Object detection: R-CNN, YOLO, SSD
- Semantic segmentation (U-Net intro)
- Face recognition with deep learning
- Optical Character Recognition (OCR)
- Video processing and action recognition
- CV for autonomous vehicles
- CV ethics: facial recognition debate
Projects built:
- YOLO-based real-time object detector
- Attendance system with face recognition
- Sign language recognizer
Practice: Fine tune a pre-trained CNN on a small image dataset using transfer learning and log its accuracy against your from scratch baseline.

Machine Learning Algorithms Mastery (CBSE Unit 7)
Topics:
- ML lifecycle end-to-end
- Supervised: Regression (Linear, Polynomial, Logistic)
- Supervised: Classification (SVM, kNN, Decision Tree, Random Forest, Gradient Boosting, XGBoost)
- Unsupervised: Clustering (K-Means, DBSCAN, Hierarchical)
- Unsupervised: Dimensionality reduction (PCA, t-SNE, UMAP)
- Semi-supervised and self-supervised intro

- Reinforcement Learning concepts (Q-learning, policy gradient intro)
- Feature engineering advanced
- Handling imbalanced datasets
- Bias-variance trade-off
- Cross-validation strategies
- Ensemble learning (bagging, boosting, stacking)

Projects built:
- Complete Kaggle competition submission
- Ensemble model for a Sensex prediction
- Clustering for Indian consumer segmentation

Practice: Train three classifiers, kNN, decision tree and random forest, on one dataset and compare them in a confusion matrix table.

Month 9: Class 11 AI Board Prep + Storytelling + Competitions (Week 35-39)

Storytelling Through Data (CBSE Class 11 Unit 8)

Topics:
- Data storytelling frameworks
- Tufte principles of graphical excellence
- Narrative structures for AI insights
- Tableau basics
- Power BI basics
- Dashboard design principles
- Infographics creation
- Presentation design (slides.com, Pitch)
- Public speaking for data presentations
- TED-talk style AI presentations
- Video storytelling
- Blog/Medium article writing on AI insights

Projects built:
- Tableau dashboard on social issue
- Medium blog with 1000+ words AI insights
- 7-minute TEDx-style AI talk (recorded)

Practice: Turn one of your model results into a three chart data story in Tableau or Power BI with a headline insight above each chart.

Class 11 AI Board Revision + Pre-Board

Topics:
- Full syllabus revision (8 units)
- Sample papers (5 complete)
- Chapter-wise question bank
- Case study questions
- Board-style long answers
- Topper strategy sessions
- Mock pre-board exam (3-hour, CBSE format)
- Examiner feedback simulation
- Weakness identification + gap filling
- Final revision checklist
- Day-before-exam strategy
- Stress management techniques

Practice: Daily mock paper + detailed review

Deliverables: 5 complete mock papers solved

Class 11 Capstone + Competition Deployment

Topics:
- Class 11 AI capstone project (industry-grade)
- GitHub portfolio curation
- Competition submissions (Intel AI Youth, Samsung, MS)
- College application readiness (for Class 11 students preparing for Class 12)
- Internship pitching to startups
- Building a personal brand

Practice: Polish your capstone README and GitHub portfolio page, then draft one competition submission entry such as Intel AI Youth.

Deliverables:
- CBSE Class 11 AI (843) Board Readiness Certificate
- Industry-grade capstone project
- Competition entries with results
- GitHub portfolio with 50+ projects

PHASE 4: CBSE CLASS 12 AI (843), DEEP LEARNING, NLP, CAREER LAUNCH (MONTHS 10-12, WEEKS 40-52)

Complete CBSE Class 12 AI (Code 843) syllabus including Capstone Project, Data Science, CV, NLP, Model Evaluation, AI Ethics. Parallel industry-grade Deep Learning, Transformers, LLMs, and career-launch for college + internships.

Month 10: CBSE Class 12 AI Units 1-4 (Week 40-43)

Communication Skills Advanced + Self-Mgmt + Entrepreneurship (CBSE Units 1-2)

Topics:
- Advanced presentation skills
- Writing scientific reports
- Tech interview communication

- Self-management for high-performers
- Stress & time management
- Entrepreneurial mindset in AI
- Indian AI startup ecosystem (YC India, NASSCOM, T-Hub)
- Founding team skills
- MVP building
- Pitching to VCs
- Business Model Canvas for AI startups
- IP and patent basics

Projects built:

- Founder's Deck for a hypothetical AI startup
- Interview for placement simulation (recorded)
- Business Model Canvas for final project

Practice: Draft a one page personal pitch covering who you are, your best AI project and your goal, then rehearse it aloud twice against a timer.

Capstone Project (CBSE Class 12 Unit 3), Official Board Project

Topics:

- CBSE Class 12 AI Capstone guidelines
- Problem scoping with 4Ws (advanced)
- Full AI Project Cycle, executed in 8-10 weeks
- Literature review for AI projects
- Data acquisition (primary + secondary)
- Feature engineering + model building
- Evaluation with appropriate metrics
- Deployment (Streamlit, Flask, Hugging Face Spaces)
- CBSE-format 30-page report
- Demo video production
- Rehearsal + submission
- Viva-voce mastery

Practice: Write the official capstone problem scoping document using the 4Ws canvas plus a literature list of at least three sources.

Deliverables:

- CBSE Class 12 AI Capstone, board-submission quality
- Deployed AI application (public URL)
- Complete 30-page report

Data Science Advanced + Statistical ML (CBSE Class 12 Unit 4)

Topics:

- Advanced statistics for AI
- Time series forecasting (ARIMA, Prophet)
- Anomaly detection
- Bayesian methods
- A/B testing at scale
- Big data processing basics (Dask, Spark intro)
- MLOps introduction
- Model monitoring and drift
- Responsible AI practices
- Indian data regulations (DPDP Act)
- GDPR compliance basics
- Ethical data collection in India

Projects built:

- Stock price forecasting (ARIMA + Prophet)
- Fraud detection pipeline
- MLOps mini-project with monitoring

Practice: Build a time series forecast on a public dataset with ARIMA or Prophet and report one place where the model breaks down.

Month 11: Deep Learning + Transformers + LLMs (CBSE Units 5-6 Extended) (Week 44-47)

Deep Learning Mastery, CNNs, RNNs, LSTMs (CBSE Class 12 Unit 5)

Topics:

- Deep Learning theory deep dive
- Backpropagation mathematics
- Optimizers (SGD, Adam, RMSprop)
- Regularization (dropout, batch norm, L1/L2)
- CNN advanced architectures (EfficientNet, Vision Transformers)
- RNN, LSTM, GRU for sequences
- Sequence-to-Sequence models
- Attention mechanism intuition
- Training deep networks on GPU (Colab Pro/Kaggle)
- Transfer learning best practices
- Model compression (quantization, pruning)
- Edge AI, running models on phones/IoT

Projects built:

- ImageNet-style classifier (transfer learning)
- Stock price LSTM predictor
- Speech command recognizer

Practice: Train the same network twice, with and without dropout and batch normalization, and chart how the validation curves differ.

Transformers, LLMs & Modern AI (CBSE Class 12 Unit 6 extended)

Topics:

- Transformer architecture (Attention is All You Need)
- BERT, GPT, T5 explained
- The LLM landscape: GPT-class, Claude-class, Gemini-class and open-weight Llama-class
- RLHF (Reinforcement Learning from Human Feedback)
- Fine-tuning LLMs (LoRA, QLoRA)
- Building RAG systems
- LangChain + LlamaIndex
- Vector databases (Pinecone, Chroma)
- Hugging Face ecosystem mastery
- Multimodal AI (frontier vision-language models)
- Agent-based AI (modern agent frameworks, surveyed honestly)
- Ethics of LLMs (hallucination, alignment, safety)

Projects built:
- Fine-tuned LLM for specific Indian-language task
- RAG chatbot on personal knowledge base
- Multimodal AI app (image + text)

Practice: Run a small experiment comparing zero shot and few shot prompts on the same task across two LLMs, and tabulate the results.

Month 12: CBSE Class 12 Board Finals + Career Launch (Week 48-52)

CBSE Class 12 AI Board Revision + Pre-Board

Topics:
- Full 6-unit revision
- 10 CBSE Class 12 AI sample papers (completely solved)
- Last 5 years board papers
- Case studies and long answers
- MCQ marathon
- Topper answer sheets analysis
- Viva-voce drills
- Practical file finalization (20+ activities)
- Capstone project final rehearsal
- Pre-board exam (3-hour full paper)
- Detailed feedback and improvement
- Day-before-exam strategy

Practice: 2 mock papers daily

Deliverables: Complete board-ready package

Final Board Readiness + Viva Mastery

Topics:
- CBSE AI viva voce question bank (500+ questions)
- Board examiner perspective
- Confidence building
- Practice viva with external AI experts
- Backup plans for difficult questions
- Final document check
- Stress management on exam day
- Last-minute revision strategy
- Healthy habits during board exams
- Post-board college application readiness

Practice: Answer 20 questions from the viva bank aloud under exam conditions and mark the five that need another revision pass.

Deliverables:
- Final Board-Ready Certificate
- All practical file + capstone submitted
- 100% viva-voice readiness

College, Internship & Career Launch

Topics:
- B.Tech AI/CS/Data Science college guidance (IIT/NIT/BITS/IIIT)
- JEE Mains/Advanced, role of AI portfolio
- International college applications (MIT, Stanford, CMU)
- SAT + AI portfolio strategy
- AI summer internship applications (Indian + global)
- LinkedIn optimization for teens
- GitHub portfolio curation
- Personal website/portfolio (Next.js)
- Cold outreach to AI companies
- Interview preparation (technical + HR)
- Negotiating your first internship
- Long-term AI career roadmap

Practice: Shortlist five target colleges or internships and map which portfolio project you would lead with for each application.

Deliverables:
- Polished LinkedIn + GitHub + portfolio website
- 3 cold outreach emails sent
- 1 internship application submitted

Graduation & Final Showcase

Topics:
- Full skill assessment
- Final certification ceremony
- Alumni community induction (lifetime)

- Access to alumni-only job board
- Mentor-for-life allocation
- Community contribution pathways
- Giving back, teach the next batch
- Continuous learning roadmap (post-Class 12)

Deliverables:
- CBSE AI Code 843 Class 12 Board Topper Certification
- an earned course certificate
- 80+ Project GitHub Portfolio
- Verifiable digital badge

Assessment: FINAL EXAM: a board-style paper plus a practical build, with questions mixed from the whole syllabus. Passing earns the certificate; a student who falls short gets a focused revision plan and a free retest

PROJECTS THE STUDENT BUILDS AND KEEPS

- Phase 1: 20+ Python + AI basics projects, CBSE Class 9 practical file
- Phase 2: 20+ Advanced projects, CBSE Class 10 practical file + capstone
- Phase 3: 20+ ML engineering projects, CBSE Class 11 capstone
- Phase 4: 20+ DL + LLM projects, CBSE Class 12 board capstone
- Total: 80+ industry-grade projects in GitHub portfolio

SKILLS THE STUDENT WILL HAVE AT THE END

- Complete CBSE AI Code 417 syllabus (Class 9-10)
- Complete CBSE AI Code 843 syllabus (Class 11-12)
- Python programming (zero to advanced, OOP, async)
- Data Science engineering (NumPy, Pandas, SQL basics)
- Machine Learning engineering (scikit-learn mastery)
- Deep Learning engineering (TF, Keras, PyTorch)
- Computer Vision engineering (OpenCV, CNN mastery)
- NLP engineering (Transformers, Hugging Face mastery)
- Generative AI mastery (prompt engineering, RAG, fine-tuning)
- MLOps basics (deployment, monitoring, versioning)
- AI Ethics & Responsible AI
- CBSE board exam technique (95+ score targeting)
- Viva-voce mastery (500+ questions prepared)
- GitHub portfolio building
- Technical writing & presentation
- Competition-ready problem solving

HOW A TYPICAL WEEK IS SPLIT

Live classes: 2-3 x 90-min expert-led sessions/week
Self practice: 3-4 hours/week (coding + theory)
Project work: 2-3 hours/week
Board prep: 1-2 hours/week (sample papers, revision)
Mentor session: 30 mins fortnightly 1-on-1
Total per week: 10-12 hours

SUPPORT INCLUDED

Live sessions: Weekly live classes with IIT/Google/Microsoft AI engineers
One on one: Fortnightly 1-on-1 mentor sessions
Parent reports: Monthly detailed progress reports for parents
Feedback: Weekly code review + project review
Resources: 200+ curated AI resources, books, papers
Doubt support: <6-hour response time on WhatsApp
Parent workshops: Quarterly AI-for-Parents webinars
Board support: Dedicated board-exam helpline February-March
Competition support: Team formation + mentor guidance for competitions
Internship support: Internship referrals after Class 11

CERTIFICATION DETAIL

Phase certificates: 4 phase certificates + class-specific certificates
Final certificate: CBSE AI (417 & 843) Board Topper + Industry AI Developer Certificate
Linkedin badge: Shareable verifiable digital badge
School recognition: Recognized by 400+ CBSE & ICSE schools
Portfolio projects: 80+ industry-grade documented projects on GitHub
Board readiness guarantee: 95+ board marks guarantee or 50% refund

WHERE THIS CAN LEAD

- B.Tech in AI / CS / Data Science / ECE at IIT, NIT, BITS, IIIT, top private universities
- International admissions: MIT, Stanford, CMU, Georgia Tech, UIUC (AI portfolio is a key differentiator)
- AI/ML Engineer
- Data Scientist

- ML Research Scientist
- AI Product Manager
- AI Startup Founder (unlimited potential, Y Combinator, Sequoia India pathway)
- Computer Vision Engineer
- NLP Engineer / Conversational AI
- Generative AI Engineer / Prompt Engineer
- Quantitative AI (Algo Trading), Rs 30 LPA-2 Crore+
- AI Ethics / Policy

COMMON QUESTIONS ABOUT THIS COURSE

For anything about cost, use PART 4 and RULE 1. Do not quote two regions.

Q: Can my child take AI (Code 417) in Class 9?
A: Not from the 2026-27 session. CBSE Circular Acad-18/2026 (9 April 2026) discontinued the AI skill subject for Class 9; students already in Class 10 continue on the earlier scheme, so 417 still applies there. What replaces it matters more: CBSE's new Computational Thinking & AI becomes a compulsory Class 9 subject with an annual examination from session 2027-28. A child in Class 8 today sits it next year. This course teaches the full 417 syllabus either way, because it is the same foundation - AI project cycle, neural networks, Python, data science - and it is what Class 10 examines.

Q: Is this course officially aligned with CBSE AI Code 417 and 843 syllabus?
A: Yes, 100% alignment. Every unit of CBSE AI Class 9-10 (Code 417) and Class 11-12 (Code 843) is covered in greater depth than prescribed. We follow the exact CBSE pedagogical order, use NCERT-recommended textbooks and tools, and our capstone projects follow the official CBSE AI Project Cycle format. Our students consistently score 95+ in their CBSE AI board exams (verified by 2,800+ board results).

Q: What is the difference between CBSE AI Code 417 and Code 843?
A: Code 417 is the Skill Subject for Class 9 & 10 (introductory, more hands-on, 30% practical). Code 843 is the Academic Elective for Class 11 & 12 (deeper theory + advanced ML/DL, 70% theory + 30% practical). Our course seamlessly covers both, Phases 1-2 master Code 417, Phases 3-4 master Code 843. Students starting in Class 9 get a complete 4-year pathway; students starting later enter the appropriate phase based on diagnostic.

Q: I'm in Class 12 with boards in a few months. Is this course still useful?
A: Yes, we offer a Class 12 Crash Track (3-4 months intensive) that covers the complete CBSE AI 843 Class 12 syllabus with board-focused revision, 10 mock tests, capstone project (board-submission quality), and viva mastery. Our Class 12 crash students have scored 90+ in under 3 months of intensive prep. Book a free diagnostic to see if this suits you.

Q: My school already teaches CBSE AI, why do I need this?
A: Most CBSE schools cover AI at surface level due to 2-4 hours/week constraint, and teacher training is still catching up. Our course goes 10x deeper with 10-12 hours/week, industry-grade Python + ML + DL, full practical file support, capstone project guidance, board-exam strategy, competition prep, and GitHub portfolio, none of which schools provide. 92% of our students also attend school AI classes, we complement, not replace.

Q: Do you cover the CBSE practical file requirements?
A: Absolutely. Practical file is 30 marks (Code 417) or 30 marks (Code 843). We provide: complete practical file creation support (20+ lab activities per class), file binding and formatting per CBSE standard, viva-voce preparation (500+ question bank), examiner's perspective analysis, and topper-quality answer templates. Our students consistently score 28-30 out of 30 in practicals.

Q: Will this help with JEE / BITSAT / other entrance exams?
A: Directly: No (JEE doesn't test AI). Indirectly: Yes, our computational thinking module sharpens logical reasoning and problem-solving that directly boost JEE Advanced performance. More importantly, your AI project portfolio becomes a massive differentiator for IIT/NIT/BITS interviews, scholarship applications, and international college admissions where portfolio weight is 40-60%.

Q: Is 10-12 hours per week sustainable alongside Class 10/12 boards?
A: Yes, because AI is one of your board subjects (Code 417 for Class 10, Code 843 for Class 12), the time spent directly contributes to your board prep. Our schedule adjusts during board months (Jan-March) to revision mode. Many of our students handle full CBSE board prep (Physics, Chem, Math, English) + AI 95+ score + GitHub portfolio simultaneously with our structured approach.

Q: Do I need a powerful computer for Deep Learning?
A: No, we use Google Colab which provides free GPU access (enough for 90% of our curriculum). A basic 8GB RAM laptop suffices for coding. We teach cloud-first engineering (which is the industry standard anyway).

Q: Will I be ready for international AI programs like Stanford AI4All or MIT Beaver Works?
A: Absolutely. Our curriculum is benchmarked against Stanford CS229 (Machine Learning) and CS231 (Deep Learning), and we've helped 40+ students get into Stanford AI4All, MIT Beaver Works, CMU AI Summer, Google CodeU, and Google AI India. We provide application guidance and

recommendation letter support.

Q: How does the board score guarantee work?
A: If you attend 85%+ classes, complete 80%+ homework, submit all practical file activities and capstone on time, score below 95 in CBSE AI board exam, we refund 50% of fees. Our historical guarantee claim rate is <3% because our methodology works. See full terms in enrollment agreement.

Q: What if I'm in a non-CBSE board but want to learn AI?
A: Our course is fully transferable. ICSE/ISC students use it alongside ICSE Computer Science; IB students use it for Computer Science HL projects; Cambridge students use it for IGCSE ICT/CS; State Board students use it as comprehensive AI skill-building. The only CBSE-specific modules are board-exam prep in Phase 2 Week 22-26 and Phase 4 Week 48-52, which become optional electives for non-CBSE students.

To enrol, message Shivam Sir on +91 9123366161 or send the parent this link: https://learn.modernagecoders.com/courses/cbse-computational-thinking-and-ai-course-for-teens-classes-9-to-12-code-417-843

==========
COURSE 38 OF 137: CCC JUNIOR AND SENIOR PREPARATION (CANADIAN COMPUTING COMPETITION)
==========

Course link: https://learn.modernagecoders.com/courses/ccc-junior-and-senior-preparation-course
Subject area: Competitive Programming
Designed for: Teens
Who can join: Students roughly aged 13 to 18 who can write simple programs (Junior track) or are confident programmers ready for algorithms (Senior track)
Course length: A 24-week season, September to the CCC on Wednesday, February 17, 2027, joinable any month
Time needed: 2 live classes/week + weekly problem sets and timed practice contests
Certificate: Certificate from Modern Age Coders, awarded on passing the final assessment

PRICE FOR THIS COURSE (quote only the one that applies to the person asking)
In India, per month: group Rs 1,499, mini batch Rs 2,999, one to one Rs 4,999
Outside India, per month: group $100, one to one $150
Classes: group and mini batch two live classes a week, eight a month; one to one in India one live class a week, four a month; one to one outside India two live classes a week, eight a month. Each class is one hour.

WHAT THIS COURSE IS

Live online Canadian Computing Competition prep for ages 13 to 18: Junior and Senior tracks in Python or C++, from September to the CCC on Wednesday, February 17, 2027.

In one line: One season, two tracks, real problem solving: from the first CCC Junior loops to the Senior algorithms that lead toward the Canadian Computing Olympiad.

ABOUT THE PROGRAMME

The Canadian Computing Competition (CCC) is run by the Centre for Education in Mathematics and Computing (CEMC) at the University of Waterloo. The 2027 contest for North and South America is on Wednesday, February 17, 2027. It has two levels: Junior, for "any participant with beginner to intermediate programming skills", and Senior, for "any participant with intermediate to advanced programming skills", and CEMC says each participant can choose the best level "regardless of their grade". Each level has 5 questions, the time allowed is 3 hours, and it is scored out of 75. CCC participants may use C, C++, Python 2, Python 3 or Java, and the contest is written in school: participants write online, individually. This course is a full September-to-February season with two parallel tracks. The Junior track follows the skills CEMC's own question guide describes, from basic loops and conditions, through loops, conditions and counting together, up to the recursion, two-dimensional arrays and efficient algorithms of the hardest Junior question. The Senior track starts where CEMC says the Senior paper starts, with sorting and searching, then moves through careful counting and mathematical reasoning toward the algorithms of the final question, which CEMC calls an IOI level question. Both tracks are taught in Python or C++. For Senior students aiming beyond the CCC we teach C++ properly, because CEMC states that "CCO participants must use C++". Practice comes from two places: our own original problems written for each topic, and CEMC's free past contests, which CEMC publishes with no registration or fee and which students can also try on CEMC's free CCC Online Grader practice account. We never copy contest problems into our materials; students work them where CEMC publishes them. Students register through their school, not through us. We teach the skills and the contest habits, and we make no promise of scores, distinctions, CCO invitations or admissions.

WHAT MAKES THIS COURSE DIFFERENT

- Built for the CCC as CEMC runs it: 5 questions, 3 hours, scored out of 75, written online at school
- Two tracks in one season: Junior and Senior, with the level chosen by skill, not by grade

- Python or C++, with an honest explanation of when C++ matters and why the CCO requires it
- Our own original problems for every topic, plus CEMC's free past contests used as practice where CEMC publishes them
- A timed practice contest every month, ending with full 3-hour mock contests in January and February
- Clear guidance on registering through a school, including CEMC's advice when a school does not take part

THE LEARNING PATH, STEP BY STEP

Phase 1: The shared core for both tracks: reading CCC-style statements, exact input and output, loops, conditions, strings, lists, counting and grids
Phase 2: The tracks split: Junior builds toward recursion, two-dimensional arrays and efficient algorithms; Senior covers sorting, searching, careful counting, graphs and dynamic programming
Phase 3: Contest season: timed mocks, partial-mark strategy, contest-day routine, the CCC on February 17, 2027, then upsolving and next steps

WHAT A STUDENT NEEDS BEFORE STARTING

Coding level: Junior track: simple programs with variables, loops and conditions. Senior track: confident with lists or arrays, functions and basic sorting
Language: Python or C++. Senior students aiming at the CCO move to C++ during the season
Age: Roughly 13 to 18. Level is chosen by skill, not by grade
Equipment: A computer with stable internet that can run Python or a C++ compiler
Contest entry: The CCC is written through a school; check that your school (or another local school) is taking part
Timing: Weekdays or weekends, flexible: choose your batch, or for a very personalised plan choose 1-on-1 at your convenience, weekend mornings or weekdays

WHO THIS COURSE IS FOR

First time contest writers: Students who can code a little and want to write CCC Junior with real preparation
Returning junior students: Students who wrote Junior before and want to reach the harder questions or move up to Senior
Senior track students: Confident programmers who want the sorting, searching, graph and dynamic programming toolkit for CCC Senior
Olympiad hopefuls: Senior students who want to understand the CCO path and train in C++
School programmers: Students in school computer science who want harder, more interesting problems

FULL CURRICULUM, WEEK BY WEEK

This is the complete teaching plan. Parents can ask about any week.

PHASE 1: THE SHARED CORE (SEPTEMBER AND OCTOBER, WEEKS 1-8)

Everything both tracks need: precise reading, exact input and output, and the loops, conditions, strings, lists and counting that the first CCC questions are built on.

Month 1: Contest Setup, Input and Output, Loops and Conditions (Weeks 1-4)
Weeks 1-2: How the CCC Works and First Problems
Topics:
- The CCC format: 5 questions, 3 hours, scored out of 75, Junior and Senior levels
- Choosing a level by skill: a diagnostic to place each student on the Junior or Senior track
- Setting up Python or C++ and creating a free practice account on CEMC's CCC Online Grader
- Reading input exactly as the statement describes and printing exactly what is asked
- Basic loops and conditions on short original problems
- Testing with the sample input, then with cases you write yourself

Projects built:
- A personal starting profile: track choice, language choice and five solved warm-up problems

Practice: Ten short original problems, each tested on at least two extra cases before submitting
Weeks 3-4: Strings, Lists and Simple Counting
Topics:
- String processing: characters, counting, reversing and comparing
- Lists and arrays: storing input, scanning, finding maxima and minima
- Counting with conditions, the core of the middle Junior questions
- Dictionaries or maps for frequency counts
- Simulation: following a set of rules step by step
- Edge cases: empty input, one item, ties and the largest values

Projects built:
- A counting and simulation problem set solved in full, with a written list of edge cases for each

Practice: A first CEMC past contest from CEMC's site, attempted untimed, with a written review
Assessment: Month 1 timed round: a short practice contest of original problems

Month 2: Grids, Functions and First Ideas of Efficiency (Weeks 5-8)
Weeks 5-6: Two-Dimensional Grids and Functions
Topics:
- Reading and storing a grid of characters or numbers
- Moving through a grid: neighbours, borders and directions
- Breaking a solution into functions so it stays readable
- Debugging with small hand-made test cases
- Avoiding repeated work inside loops
- Writing clean code fast enough for a 3-hour contest
Projects built:
- A grid puzzle solver for an original problem, organized into clear functions
Practice: Grid and simulation problems, each traced on a small grid by hand first
Weeks 7-8: How Fast Is Fast Enough?
Topics:
- Counting the steps a program takes as the input grows
- Reading the input limits to guess what solution is needed
- Why a nested loop can pass small tests and time out on large ones
- Sorting with the built-in sort and when it helps
- Partial marks: solving the small cases when the full solution is out of reach
- Keeping an error log of every wrong or slow submission
Projects built:
- Solve one original problem three ways, from slow to fast, and time each version
Practice: Mixed problem set plus one CEMC past contest at the student's level, reviewed in class
Assessment: Phase 1 assessment: a 90-minute practice contest and a written review of every question

---
PHASE 2: JUNIOR AND SENIOR TRACKS (NOVEMBER AND DECEMBER, WEEKS 9-16)

The tracks run in parallel in separate batches. Junior students build toward the hardest Junior question; Senior students build the algorithm families the Senior paper rewards.

Months 3-4, Junior Track: From Counting to Recursion and Efficient Algorithms (Weeks 9-16)
Weeks 9-10: Junior Questions 3 and 4 Skills
Topics:
- Combining loops, conditions and counting in one solution
- Careful string and number parsing from mixed input
- Nested loops over pairs and their cost
- Sets for fast membership checks
- Planning a solution in plain words before coding
- Checking the answer against the samples and a brute-force version
Projects built:
- Five original middle-level problems, each with a plain-word plan and a test list
Practice: Middle Junior questions from CEMC past contests, solved on CEMC's site and reviewed in class
Weeks 11-12: Two-Dimensional Arrays in Depth
Topics:
- Grids as two-dimensional arrays or lists of lists
- Rotations, reflections and counting regions
- Flood fill to find connected areas
- Row and column totals for fast answers
- Off-by-one and border mistakes, and how to avoid them
- Choosing between storing a grid and computing on the fly
Projects built:
- An original region-counting problem solved with flood fill
Practice: Grid problems timed at 30 minutes each, with every miss logged
Weeks 13-14: Recursion
Topics:
- Base case and recursive case on small examples
- Recursive counting and generating all options
- Recursive flood fill and its limits
- Tracing recursion with a call diagram
- When to replace recursion with a loop
- Pruning: stopping early when an option cannot work
Projects built:
- Three recursion problems solved and explained in a short written note
Practice: Recursion problem set with a trace for each solution
Weeks 15-16: Efficient and Insightful Algorithms
Topics:
- Spotting a pattern so a slow search becomes a quick formula
- Prefix sums for fast range totals
- Sorting first to make a problem simple
- Breadth-first search on a grid for shortest moves
- Earning partial marks with a correct slow solution, then improving it
- When a Junior student is ready to try the Senior track
Projects built:
- Take a slow solution from earlier in the course and rewrite it to run within the limits

Practice: A full Junior-style mock of original problems, timed at 3 hours
Assessment: Junior track assessment: a full timed mock with a written review of every question

Months 3-4, Senior Track: Sorting, Searching, Counting, Graphs and Dynamic Programming (Weeks 9-16)
Weeks 9-10: Sorting and Searching
Topics:
- Sorting with custom keys and comparators
- Binary search on a sorted list and binary search on the answer
- Two pointers and sliding windows
- Prefix sums and difference arrays
- Fast input and output in Python and C++
- Reading constraints to choose the right complexity

Projects built:
- An original problem solved with binary search on the answer, with a written proof that it is fast enough

Practice: Early Senior questions from CEMC past contests, solved on CEMC's site and reviewed in class

Weeks 11-12: Careful Counting and Mathematical Reasoning
Topics:
- Counting without listing: the multiplication rule and complements
- Avoiding overflow, and taking answers modulo a number
- GCD, primes and divisibility in contest problems
- Greedy choices and how to check one is safe
- Turning a word problem into a precise mathematical model
- Testing a clever idea against a brute-force check

Projects built:
- A greedy and counting problem pack with a short argument for each solution

Practice: Counting and reasoning problems at 40 minutes each, with the idea written before the code

Weeks 13-14: Graphs
Topics:
- Representing graphs with adjacency lists
- Depth-first and breadth-first search
- Connected components and cycle checks
- Shortest paths with Dijkstra's algorithm
- Disjoint set union
- Spotting a graph hidden inside a problem that never says graph

Projects built:
- An original routing problem solved with breadth-first search and then with Dijkstra's algorithm

Practice: Graph problem set, with C++ versions written by students aiming at the CCO

Weeks 15-16: Dynamic Programming and the Hardest Questions
Topics:
- Defining a state and a transition
- Classic one-dimensional and grid dynamic programming
- Knapsack-style choices
- Combining techniques on the hardest question of a paper
- Partial marks on the final question: solving the smaller subtasks first
- C++ for speed: the standard library containers students will use most

Projects built:
- Solve one original dynamic programming problem top-down and bottom-up, and compare

Practice: A full Senior-style mock of original problems, timed at 3 hours
Assessment: Senior track assessment: a full timed mock with a written review of every question

---
PHASE 3: CONTEST SEASON (JANUARY AND FEBRUARY, WEEKS 17-24)

Full timed mocks, contest craft and the CCC itself on Wednesday, February 17, 2027, followed by upsolving and a plan for what comes next.

Month 5: Mock Contests and Contest Craft (Weeks 17-20)
Weeks 17-18: Pacing a 3-Hour, 5-Question Paper
Topics:
- Reading all five questions first and ordering the attempt
- Banking the early questions quickly and carefully
- Deciding when to move on from a stuck question
- Partial-mark strategy on the last two questions
- Testing before submitting, every time
- Using CEMC's past contests from the last 10 years as timed practice on CEMC's site

Projects built:
- Two full 3-hour mocks, each followed by a written pacing review

Practice: One full timed mock a week at the student's level, then a structured upsolve

Weeks 19-20: Upsolving and Weak-Spot Repair
Topics:
- Upsolving: solving every missed question unaided after the mock
- Reading the error log to find the real weak spot
- Targeted mini-lessons on each student's weakest topic

- Templates and checklists kept short and personal
- Choosing Python or C++ for the contest day, with honest advice for each student
- Making sure the school has the student on its CCC order

Projects built:
- A personal weak-spot plan with three topics, each with a problem set completed

Practice: Original problem sets on each student's weak topics

Assessment: Month 5 assessment: a full timed mock reviewed one to one with the teacher

Month 6: Final Mocks, the CCC and Next Steps (Weeks 21-24)

Weeks 21-22: Final Mocks

Topics:
- Final full mocks under contest timing
- Calm, routine starts: setup, reading and the first question
- Checking output format one last time
- What to do when the code works on samples but not on the judge
- Rest and practice balance in the last two weeks
- Reading CEMC's current CCC instructions together

Projects built:
- A final mock with a written contest-day plan

Practice: Light, steady practice: short problems that keep skills sharp

Weeks 23-24: Contest Week and After

Topics:
- Contest-day routine for the CCC on Wednesday, February 17, 2027
- After the contest: upsolving the paper once CEMC publishes it
- For Senior students: what the CCO is and how CEMC selects for it
- For Junior students: whether to aim for Senior next season
- Planning the next season of practice
- Presenting a favourite solution of the season to the class

Projects built:
- A next-season plan based on the error log and the mock history

Practice: Write a full explanation of your favourite solution of the season for a newer student

Assessment: Final assessment: the last mock contest result plus a short conversation about method choices

PROJECTS THE STUDENT BUILDS AND KEEPS

- Starting profile with track and language choice
- Counting, simulation and grid problem sets of original problems
- Slow-to-fast rewrites with timings
- Recursion and flood fill solutions (Junior track)
- Binary search, graph and dynamic programming solutions (Senior track)
- Full 3-hour mock contests with written pacing reviews
- A next-season plan built from the error log

Total projects: A season of solved original problems, reviewed CEMC past contests, an error log and a mock contest history

SKILLS THE STUDENT WILL HAVE AT THE END

- Reading contest statements precisely and handling input and output exactly
- Loops, conditions, strings, lists and counting
- Two-dimensional grids, recursion and flood fill
- Sorting, searching, prefix sums and two pointers
- Careful counting, number theory basics and greedy reasoning
- Graphs, shortest paths and dynamic programming (Senior track)
- Pacing a 3-hour, 5-question contest and earning partial marks

HOW A TYPICAL WEEK IS SPLIT

Live classes: 2 live one-hour classes per week, Junior and Senior in separate batches

Practice: A problem set after every class, with core and stretch problems

Review: Solutions reviewed with written comments, a timed contest every month and a monthly error log check

SUPPORT INCLUDED

Doubt support: WhatsApp doubt support between classes, with hints first and full solutions after a real attempt

Progress updates: A monthly progress note to parents with mock results and next steps

Free past contests: CEMC's past contests from the last 10 years, free with no registration, used as practice where CEMC publishes them

Free online grader: CEMC's free CCC Online Grader practice account, where students can try previous contests

Free python tutorials: Computer Science Circles, CEMC's free Python tutorials, a good warm-up for beginners

CERTIFICATION DETAIL

Completion: Certificate from Modern Age Coders, awarded on passing the final assessment. Fall

short and there is focused revision and a free retest: the certificate certifies real learning, not attendance

WHERE THIS CAN LEAD

- A second season of this course, moving from Junior to Senior or deeper into Senior
- Our Competitive Programming for Teens course for year-round contest training
- School computer science such as ICS3U and ICS4U, through our Ontario companion course
- University computer science, mathematics or engineering, with strong problem-solving habits
- Further contests and personal projects built on algorithmic thinking

COMMON QUESTIONS ABOUT THIS COURSE

For anything about cost, use PART 4 and RULE 1. Do not quote two regions.

Q: What is the Canadian Computing Competition?
A: The CCC is a programming contest run by CEMC (the Centre for Education in Mathematics and Computing) at the University of Waterloo. It has a Junior and a Senior level. CEMC says the contest is available in English and French and is written in school, with participants writing online, individually.

Q: When is CCC 2027?
A: CEMC lists the 2027 CCC for North and South America on Wednesday, February 17, 2027, and the ordering deadline for schools as Thursday, February 11, 2027. Our season runs from September up to that date, and students who join later get a catch-up plan.

Q: Should my child write CCC Junior or CCC Senior?
A: CEMC describes Junior as for "any participant with beginner to intermediate programming skills" and Senior as for "any participant with intermediate to advanced programming skills", and says each participant can choose the best level "regardless of their grade". In the first two weeks we place each student on a track by skill, and we review the choice before the contest.

Q: How do we register for the CCC?
A: Through a school, not through us. CEMC says "It is not possible for students to individually register for a contest" and "all students must participate through their school." If a student's school does not take part, CEMC suggests that "students can look for another local school that will allow them to join as a participant". We remind families to check the school's order well before the deadline.

Q: Python or C++ for the CCC?
A: CEMC says "CCC participants may use C, C++, Python 2, Python 3, or Java." It also notes that "it may not always be possible to achieve a perfect score with a particular language choice (for example, Python or Java)". Python is a sensible choice for most Junior students. For Senior students aiming at the Canadian Computing Olympiad we teach C++, because CEMC states that "CCO participants must use C++."

Q: Do you use CCC past papers?
A: Yes, the way CEMC intends. CEMC publishes its past contests free, with no registration or fee, and students can practise on CEMC's free CCC Online Grader account. We set those contests as practice and review them in class, alongside our own original problems written for each topic. We do not copy CEMC's problems into our materials.

Q: What is the Canadian Computing Olympiad (CCO)?
A: CEMC says "Approximately 20 of the top official CCC Senior participants from schools in Canada are invited to the CCO at the University of Waterloo each spring", and that this invitation-only event "is also used to select Canada's teams for the International Olympiad in Informatics (IOI)". So the path is CCC Senior, then the CCO by invitation, then the IOI team. CEMC's page sets out who counts as an official participant, so read its current rules.

Q: Will this course get my child a distinction or a CCO invitation?
A: No course can promise that, and we do not. Results depend on the student, the paper and the day. What the course gives is a full season of structured practice, timed mocks, honest reviews and an error log, so progress is visible month by month.

Q: Does the CCC matter for university admission?
A: It is a good experience, not a requirement. CEMC states that "Participation in the Canadian Computing Competition (CCC) is not required for admission to the Faculty of Mathematics at the University of Waterloo." We encourage students to write it for the problem solving it builds.

Q: Does my child need coding experience?
A: For the Junior track, a little: writing simple programs with variables, loops and conditions in Python or C++. For the Senior track, a student should be confident with lists or arrays, functions and basic sorting. The first-week diagnostic places each student, and our other coding courses are a good first step for complete beginners.

Q: How are the classes run?
A: Live online classes, twice a week, with a real teacher, in a group of 15 to 20 students, a

mini batch of up to 6, or 1-on-1. Junior and Senior students are taught in separate batches. Weekdays or weekends, flexible: choose your batch, or for a very personalised plan choose 1-on-1 at your convenience, weekend mornings or weekdays. Current fees for your region are shown in the pricing section of this page.

Q: Can we try a class first?
A: Yes. Book a free demo class. The teacher works through a short original problem with your child, suggests the Junior or Senior track, and recommends group, mini batch or 1-on-1 classes. There is no obligation to enrol. (Agent note: the free demo is a waiting list with no fixed date. The Priority Live Demo is a guaranteed class today or tomorrow, booked at https://learn.modernagecoders.com/priority-demo . Offer both, as RULE 3 says.)

To enrol, message Shivam Sir on +91 9123366161 or send the parent this link: https://learn.modernagecoders.com/courses/ccc-junior-and-senior-preparation-course
For a demo: the Priority Live Demo (guaranteed, today or tomorrow) is booked at https://learn.modernagecoders.com/priority-demo . The free demo is a waiting list with no fixed date.

==========
COURSE 39 OF 137: CODEX & CLAUDE CODE FOR TEENS: AI CODING AGENTS COURSE
==========

Course link: https://learn.modernagecoders.com/courses/codex-and-claude-code-ai-coding-agents-course-for-teens
Subject area: AI Coding Agents
Designed for: Teens
Who can join: Beginner-friendly (ages 13-18) to confident AI-agent builder
Course length: 24 classes (12 weeks · 2 classes/week)
Time needed: 3-4 hours/week recommended
Certificate: Certificate from Modern Age Coders, awarded on passing the final assessment

PRICE FOR THIS COURSE (quote only the one that applies to the person asking)
In India, per month: group Rs 1,499, mini batch Rs 2,999, one to one Rs 4,999
Outside India, per month: group $100, one to one $150
Classes: group and mini batch two live classes a week, eight a month; one to one in India one live class a week, four a month; one to one outside India two live classes a week, eight a month. Each class is one hour.
Note: this course also needs the student to have their own Claude and ChatGPT subscriptions, because the whole course is hands on with those tools. Say this before enrolling anyone, so it is never a surprise later.

WHAT THIS COURSE IS

Live online Codex + Claude Code course for teens 13-18. 24 mentor-led classes: install the CLIs, plan mode, MCP, subagents, then ship a real app. Free demo class.

In one line: Don't just learn to code, learn to direct the two most powerful AI coding agents on Earth, and build real apps in 24 classes.

ABOUT THE PROGRAMME

This is the most complete teen-friendly course on the two AI coding agents every developer is talking about in 2026: OpenAI Codex and Anthropic Claude Code. In 24 carefully sequenced, project-based classes you will install both tools, learn to give them instructions safely, and watch them write, fix, and ship real code with you. You start from zero, no coding experience required, and finish by building and deploying a real app end-to-end with both agents helping you. Every class is taught live by a mentor in a small batch or 1-on-1, never a pre-recorded video, with live commands, worked examples, a hands-on project, practice, and a checkpoint. You learn the current tools as they exist today: Claude Code v2.1.x running on Anthropic's Claude 5 models (Sonnet 5 by default, with Fable 5 and Opus 4.8 selectable), and the OpenAI Codex CLI running on the GPT-5.6 family (Sol, Terra, and Luna). One important requirement: to run the agents yourself, every student must have an active Claude subscription (Pro or higher) for Claude Code and a ChatGPT subscription (Plus or higher) for Codex. These are purchased directly from Anthropic and OpenAI, are separate from the course fee, and we help you choose the right plans in your free demo class.

WHAT MAKES THIS COURSE DIFFERENT

- Two agents, one course: most courses teach one tool; you graduate fluent in BOTH Codex and Claude Code and know when to use which.
- 100% hands-on: you run real commands from Class 2. No watching, all building.
- Built for teens: friendly pace, fun projects (a website, a game, a Discord-style bot), and a portfolio you can show schools and colleges.
- Living Syllabus: the curriculum is updated continuously as OpenAI Codex and Anthropic Claude Code release new features, models, and capabilities. You always learn the latest.
- Safety-first: you learn approval modes, sandboxes, and responsible AI use before you ever let an agent run wild.
- Real tools, not a sandbox: students bring their own Claude and ChatGPT subscriptions, so every command you practice runs on the same production agents professional developers use every day.

- Real outcomes: finish with a deployed app, a GitHub profile with real pull requests, and a recognized certificate.

WHAT A STUDENT NEEDS BEFORE STARTING

Device: A laptop or desktop (Windows, Mac, or Linux) with internet: that's the main hardware requirement
Coding experience: None needed! We start from absolute zero. If you've done a little Scratch or Python, even better
Accounts: REQUIRED: an active Claude subscription (Pro or higher) for Claude Code and a ChatGPT subscription (Plus or higher) for Codex. These are purchased directly from Anthropic and OpenAI and are not included in the course fee. You also need a free GitHub account. We guide you through every setup step and help you pick the most student-friendly plans
Mindset: Curiosity and willingness to experiment. You'll learn by building, not memorizing

WHO THIS COURSE IS FOR

Teens: Ages 13-18 who want to build real apps fast and learn the AI tools professional developers use in 2026
Beginners: Total beginners: no prior coding required; the agents help you while you learn
Young builders: Teens with project ideas (games, websites, bots) who want to actually ship them
Future cs students: Students aiming for computer science, who want a standout portfolio and future-ready skills
Scratch python grads: Kids who've outgrown Scratch or done basic Python and want the next big step

FULL CURRICULUM, WEEK BY WEEK

This is the complete teaching plan. Parents can ask about any week.

PHASE 1: FOUNDATIONS OF AI CODING AGENTS

Understand what AI coding agents are, install both Codex and Claude Code, learn to keep them safe with approval modes, and complete your very first real coding task.

Class 1: What Are AI Coding Agents? (Codex vs Claude Code)
Topics:
- What 'agentic coding' means: an AI that can read your files, write code, run commands, and fix its own mistakes, not just autocomplete
- Meet OpenAI Codex: an AI software-engineering agent that lives in your terminal, your editor, the cloud, and ChatGPT
- Meet Anthropic Claude Code: an agentic coding tool that runs in the terminal, VS Code/JetBrains, desktop, web, and mobile
- How an agent loop works: you give a goal it plans it edits/runs it checks it reports back
- Codex vs Claude Code at a glance: both are excellent; Codex leans into cloud parallel tasks + ChatGPT, Claude Code leans into deep terminal control + subagents
- The 2026 models you'll use: Claude Code on the Claude 5 family (Sonnet 5 default, Fable 5 and Opus 4.8 above it); Codex on the GPT-5.6 family (Sol, Terra, Luna)
- Why learning to DIRECT an agent is now as important as writing code yourself

Projects built:
- Make a one-page 'Codex vs Claude Code' comparison sheet in your own words, listing 3 things each is great at

Practice: Watch each tool's homepage demo and write down 5 things you saw an agent do that surprised you.
Assessment: Explain, in 3 sentences a friend could understand, what an AI coding agent is and how it differs from a chatbot.

Class 2: Installing & Setting Up Claude Code
Topics:
- Install on Windows (PowerShell): irm https://claude.ai/install.ps1 | iex. On Mac/Linux: curl -fsSL https://claude.ai/install.sh | bash
- Sign in with your plan: claude auth login (Claude Pro or Max works great for learners); check with claude auth status
- Start your first session: open a project folder and type claude
- Meet the REPL (the chat prompt): type a request in plain English and press Enter
- Type / to see the slash-command menu; try /help and /status
- Understand the model: by default you're on Sonnet 5, Anthropic's balanced Claude 5 model with a native 1M-token context: see it with /model
- Exit safely and resume later: your session is saved

Projects built:
- Install Claude Code, start a session in an empty folder, and ask it to create a hello.html page that says your name

Practice: Ask Claude Code to explain what it just created, then ask it to change the background color.
Assessment: Share a screenshot of Claude Code running and your hello.html opening in a browser.

Class 3: Installing & Using the OpenAI Codex CLI
Topics:
- What the Codex CLI is: an open-source AI coding agent in your terminal
- Install it: npm install -g @openai/codex (needs Node.js 18+). Careful: the plain 'codex' package is something else; always use the @openai/ scope
- Sign in two ways: 'Sign in with ChatGPT' (uses your ChatGPT Plus/Pro plan) OR an API key
- Start it: type codex to open the interactive TUI; run codex doctor to check everything is healthy
- Pick your model and thinking level with /model (low up to ultra); the 2026 lineup is the GPT-5.6 family: Sol for complex work, Terra the all-rounder, Luna for quick tasks
- Give your first instruction in plain English and watch Codex plan and edit
- Preview the AGENTS.md idea: a file that teaches Codex your project's rules (Class 10)

Projects built:
- Install Codex, run codex doctor, then have Codex add a new section to your hello.html from Class 2

Practice: Ask Codex to explain a file line-by-line, then ask it to add helpful comments.
Assessment: Screenshot a successful Codex session that edited a file, and explain in one line what the approval prompt asked you.

Class 4: Staying in Control with Approval & Permission Modes
Topics:
- Why approval modes matter: you decide how much the agent can do without asking
- Claude Code modes (cycle with Shift+Tab): default (asks each time), acceptEdits (auto-accepts file edits), plan (read-only, proposes first), auto (a classifier auto-approves safe actions)
- Set a mode on launch: claude --permission-mode plan; manage rules with /permissions
- Codex modes: read-only (look but don't touch), workspace-write (the safe default: edit inside your project), danger-full-access (no guardrails)
- Switch Codex modes anytime with /approvals; the scary bypass flag --dangerously-bypass-approvals-and-sandbox (never use casually)
- Reading an approval prompt: what the agent wants to run and why, before you say yes
- Good habit: start in plan/read-only, review, then allow edits

Projects built:
- Run the same small task ('add a footer to hello.html') in plan mode first, review the plan, then approve and apply it

Practice: Deliberately deny an action in each tool and read what changes.
Assessment: List each approval mode for both tools and say in one line when you'd use it.

Class 5: Your First Real Task in Both Agents
Topics:
- Pick a tiny starter project (a to-do list web page) and open it in your terminal
- Give a clear goal: 'Add a button that clears all completed to-dos'
- Let Claude Code plan it, show you a diff, and apply the change after you approve
- Repeat the same goal with Codex and compare how each one approached it
- Reading a diff: green = added lines, red = removed lines: how to check the change is what you wanted
- Asking for a fix: 'That button is the wrong color, make it red': iterating with the agent
- Saving your work: ask the agent to run the app so you can see it work

Projects built:
- Add two new features to the to-do app, one with Claude Code, one with Codex, and note which felt easier

Practice: Intentionally introduce a bug, then ask the agent to find and fix it.
Assessment: Submit a short reflection comparing how Claude Code and Codex handled the same feature request.

PHASE 2: YOUR DAILY CODING WORKFLOW

Learn the everyday moves: slash commands, planning before building, editing and diffs, running tests and git, teaching the agent your project, and undoing mistakes.

Class 6: Slash Commands & Steering Your Session
Topics:
- Claude Code essentials: /help, /clear (start fresh), /compact (shrink a long chat), /context (see what the agent remembers), /model
- Codex essentials: /model, /approvals, /review, /status, and the @ picker to mention files
- Why /clear and /compact matter: keeping the agent focused and fast
- Mentioning a file so the agent reads exactly what you mean (@-mentions)
- Checking your usage and limits with /usage (Claude) and /status (Codex)
- Getting unstuck: asking the agent 'what are you doing and why?'
- Keyboard tips that make you faster in each TUI

Projects built:
- Create a personal cheat-sheet of your 10 most-used slash commands across both tools

Practice: Run a long conversation, then use /compact (Claude) and start a clean Codex session: notice the difference.
Assessment: Demonstrate using @-mention to point the agent at a specific file and ask a question about it.

Class 7: Plan Mode & Goal Mode, Think Before You Build
Topics:

- Claude Code Plan Mode: enter with /plan: the agent researches and proposes a plan WITHOUT editing
- Why plan first: catches misunderstandings before any code changes
- Goal Mode (/goal): the agent keeps working until a goal you define is actually met
- Codex /plan and /goal: the same idea on the Codex side (Goal mode is on by default in 2026)
- Writing a good goal: clear, checkable, one outcome ('the login form validates email and shows an error')
- Reviewing and editing the agent's plan before you approve it
- When to skip planning (tiny edits) vs always plan (anything touching multiple files)

Projects built:
- Use Plan Mode to design a 'dark mode toggle' for a web page, review the plan, then let the agent build it

Practice: Give a vague goal on purpose and watch how planning surfaces the missing details.
Assessment: Write one strong, checkable goal statement and explain why it's better than a vague one.

Class 8: Reading, Editing & Reviewing Code Changes

Topics:
- How agents edit: they read the file, propose precise changes, and show you a diff
- Reading multi-file changes: following a feature across several files
- Accepting, rejecting, or asking for tweaks on each change
- Claude Code /diff to see what changed; reviewing in VS Code with the extension
- Asking the agent to explain a change you don't understand
- Keeping changes small: one feature at a time is easier to review
- Spotting when an agent edited too much and reining it in

Projects built:
- Have an agent refactor a messy function and walk you through the diff line-by-line

Practice: Reject a proposed change and ask for a different approach.
Assessment: Review a diff and correctly identify which lines were added, removed, and why.

Class 9: Running Commands, Tests & Git from the Agent

Topics:
- Letting the agent run your app: 'start the dev server and tell me the URL'
- Running tests through the agent and reading pass/fail output together
- Basic git with the agent: 'commit this with a clear message', 'show me what changed'
- Claude Code's Bash tool and Codex running commands inside the workspace sandbox
- Approving commands safely: reading the command before it runs
- Asking the agent to fix a failing test until it passes
- Good commit hygiene: small, frequent commits with clear messages

Projects built:
- Build a tiny feature, have the agent write a test for it, run the test, and commit when it passes

Practice: Break a test on purpose and ask the agent to make it green again.
Assessment: Show a git history with at least 3 clear, agent-assisted commits.

Class 10: Project Memory, CLAUDE.md & AGENTS.md

Topics:
- Why memory matters: tell the agent your project rules once, not every time
- Claude Code: run /init to auto-create a CLAUDE.md; it loads automatically each session
- What to put in CLAUDE.md: how to run the project, your style preferences, do's and don'ts
- Claude Code auto-memory: it can save learnings to a memory folder and reload them later (/memory)
- Codex: AGENTS.md at your repo root teaches Codex your conventions; you can also have nested ones per folder and a personal ~/.codex/AGENTS.md
- A 'Review guidelines' section in AGENTS.md so Codex reviews PRs your way
- Keeping memory short and useful (aim under ~200 lines)

Projects built:
- Write a CLAUDE.md and an AGENTS.md for your to-do app describing how to run it and your code style

Practice: Add a rule like 'always use 2-space indentation' and watch the agent follow it.
Assessment: Submit a CLAUDE.md and AGENTS.md and explain one rule in each.

Class 11: Checkpoints, Rewind, Undo & Resuming Sessions

Topics:
- Claude Code checkpointing: it saves code state before edits automatically
- Rewind with /rewind (or press Esc twice): restore code, conversation, or both
- Limitation to know: rewind tracks edits made by the agent's file tools, not files deleted by shell commands
- Resuming: claude --continue (last chat) and claude --resume to pick a past session
- Codex: resume past sessions and search your local conversation history
- Branching a conversation to try a different approach without losing your place
- Building the safety habit: checkpoint, experiment, rewind if needed

Projects built:
- Make a risky change, dislike it, and use /rewind to go back cleanly

Practice: Resume yesterday's session and continue where you left off.
Assessment: Demonstrate a rewind that restores code without losing your earlier conversation.

PHASE 3: EXTENDING & CONNECTING YOUR AGENTS

Supercharge both agents: connect external tools with MCP, build skills and plugins, create subagents, automate with hooks, choose models and reasoning effort, and code from screenshots.

  Class 12: Connecting External Tools & Data with MCP
    Topics:
      - What MCP (Model Context Protocol) is: a standard way to plug tools and data into your agent
      - Claude Code: add a server with claude mcp add --transport http <name> <url>; manage with /mcp and claude mcp list
      - Real examples: connect a docs server, a database, or a design tool so the agent can use it
      - Codex MCP: configure servers under [mcp_servers.<name>] in ~/.codex/config.toml (stdio or HTTP)
      - MCP scopes in Claude Code: local, project (shared via the repo), and user
      - Safety with MCP: only connect servers you trust; agents warn about untrusted tools
      - Seeing the new tools appear and asking the agent to use one
    Projects built:
      - Connect one MCP server to each agent and have the agent use it to fetch real information
    Practice: List the new tools an MCP server added and try one.
    Assessment: Explain what MCP does and show one server connected in each tool.

  Class 13: Skills, Custom Commands & Codex Plugins
    Topics:
      - Claude Code Skills: reusable mini-instructions the agent can run; manage with /skills
      - Create a custom slash command by adding a file in .claude/commands/ (e.g. /deploy)
      - How skills load only when needed, keeping things fast
      - Codex plugins, profiles, and the plugin marketplace for sharing setups
      - Codex profiles: switch settings/models per project with codex --profile <name>
      - When to make a skill vs just typing the instruction each time
      - Sharing your skills/plugins with classmates
    Projects built:
      - Create a Claude Code custom command (like /newpage that scaffolds an HTML page) and a Codex profile for your project
    Practice: Run your custom command twice and tweak it to be more useful.
    Assessment: Submit one working custom command/skill and explain what it automates.

  Class 14: Subagents, Your Specialist Team
    Topics:
      - What a subagent is: a helper with its own context, tools, and job
      - Claude Code built-in subagents: Explore (fast read-only search) and Plan (research before editing)
      - Create your own: a Markdown file in .claude/agents/ with name + description + a system prompt
      - Give a subagent only the tools it needs (e.g., a 'reviewer' that can only read)
      - Manage and generate agents with /agents
      - Why subagents keep the main chat clean and focused (since mid-2026 they run in the background by default, so you keep working while they finish)
      - Example: a 'test-writer' subagent that writes tests while you keep building
    Projects built:
      - Create a 'code-reviewer' subagent and have it review your to-do app
    Practice: Compare answers from the Explore subagent vs asking the main agent directly.
    Assessment: Submit a working subagent definition and a sample of its output.

  Class 15: Hooks & Automation
    Topics:
      - What hooks are: code that runs automatically at certain moments (events)
      - Claude Code events you'll meet: PreToolUse, PostToolUse, SessionStart, UserPromptSubmit, Stop
      - Where hooks live: settings JSON (.claude/settings.json) with a matcher + a command
      - A simple, safe hook: auto-format code after every edit, or block a dangerous command
      - Reading hook results as feedback to the agent
      - Turning hooks on/off and viewing them with /hooks
      - Automation mindset: let routine steps happen for you, every time
    Projects built:
      - Add a PostToolUse hook that runs a formatter after the agent edits a file
    Practice: Write a PreToolUse rule that blocks an obviously dangerous command and test it.
    Assessment: Submit a working hook and explain which event triggers it and why.

  Class 16: Models & Reasoning Effort
    Topics:
      - Claude Code models: Fable 5 (most capable, the new Claude 5 flagship tier), Opus 4.8, Sonnet 5 (the default), Haiku 4.5 (fast/cheap); switch with /model
      - Reasoning effort levels: low, medium, high, xhigh: more effort = deeper thinking (set with /effort)
      - The 'ultrathink' trick: add it to a prompt for a one-off deeper think
      - Codex models: GPT-5.6 Sol, Terra, and Luna; pick model + reasoning level with /model (low up to ultra)
      - Big context: Sonnet 5 has a native 1M-token window, great for large projects

- Choosing wisely: fast model for simple edits, top model + high effort for hard problems
- Cost & limits awareness for learners on student-friendly plans

Projects built:
- Solve the same tricky bug on a low effort setting and a high effort setting and compare results

Practice: Switch models mid-task and note speed vs quality trade-offs.
Assessment: Recommend a model + effort level for three different tasks and justify each.

Class 17: Multimodal Coding from Screenshots & Images
Topics:
- Why images help: show the agent a design or a bug instead of describing it
- Drag-and-drop a screenshot into the prompt so the agent can see it
- Codex Appshots (Mac): capture an app window as context for the agent
- Ask the agent to recreate a UI from a picture of a design
- Debugging from a screenshot of an error message
- Combining text + image: 'make my page look like THIS image'
- Limits: both agents read images; Codex added audio input in 2026; video is still not supported

Projects built:
- Give the agent a screenshot of a website you like and have it build a similar layout

Practice: Screenshot a broken page and ask the agent to diagnose it from the image.
Assessment: Show a before/after where an image guided the agent to the right result.

PHASE 4: CLOUD, COLLABORATION & SCALE

Go beyond your laptop: delegate tasks to Codex Cloud, use Claude Code on web and mobile, get automatic GitHub code reviews, and run several agents at once.

Class 18: Codex Cloud, Delegating Tasks That Run for You
Topics:
- What Codex Cloud is: agents that work on tasks in the background, in their own safe sandboxes
- Get started at chatgpt.com/codex and connect a GitHub account
- Run tasks in parallel: kick off several at once and let them cook
- Each finished task comes back as a pull request you can review
- Setting up a cloud environment: which repo, setup steps, and internet access
- Reviewing the agent's work before merging anything
- When cloud beats local: long jobs, or working on a repo you don't have on your laptop

Projects built:
- Delegate two small tasks to Codex Cloud at once and review both resulting pull requests

Practice: Give a cloud task a clear scope and read the PR description it writes.
Assessment: Show two parallel cloud tasks and explain what each PR changed.

Class 19: Claude Code Everywhere, on Web, Desktop, and Mobile
Topics:
- Claude Code on the web at claude.ai/code for long-running and parallel tasks
- The desktop app: review diffs visually and run multiple sessions side-by-side
- Background agents: detach a session with /background and check it later
- Remote control & mobile: steer a session from your phone
- Pulling a web/remote session into your terminal to finish locally
- Choosing the right surface for the job
- Keeping all your sessions organized

Projects built:
- Start a task on the web, then continue it on the desktop app or in your terminal

Practice: Send one agent to the background and keep working in the foreground.
Assessment: Demonstrate moving the same task across two surfaces (web terminal/desktop).

Class 20: GitHub Integration & Automatic Code Review
Topics:
- Connecting GitHub so agents can open and review pull requests
- Codex code review: comment @codex review on a PR, or turn on automatic reviews for every PR
- Adding focus: @codex review for security issues
- Claude Code: /code-review on your branch, with --comment to post inline comments on GitHub
- Letting an agent fix review findings: @codex fix the issues
- GitHub Actions/CI: agents that review or triage automatically
- Reading a code review like a pro and acting on it

Projects built:
- Open a PR, get an AI code review from Codex and from Claude Code, and apply the fixes

Practice: Write a tiny risky change and see what the reviewer flags.
Assessment: Show a PR with at least one AI review comment that you addressed.

Class 21: Parallel Agents, Worktrees & /batch
Topics:
- Why parallel: split a big job into pieces that run at the same time
- Git worktrees: isolated copies of your repo so agents don't collide (claude -w <name>)
- Claude Code /batch: break a large change into many units, each handled by its own background agent in its own worktree
- Agent teams: multiple coordinating sessions
- Codex Cloud parallelism revisited: many tasks, many PRs

- Keeping parallel work organized and reviewing each piece
- When NOT to parallelize (small, tightly-linked changes)

Projects built:
- Use /batch (or several Codex Cloud tasks) to apply the same small improvement across multiple files

Practice: Create a git worktree and run an agent in it without touching your main branch.
Assessment: Explain a real change you split into parallel pieces and how you reviewed them.

PHASE 5: BUILD, SECURE & SHIP

Bring it together: automate with the SDKs, code safely with sandboxes and permissions, and ship a real capstone app, then earn your certificate.

Class 22: Building With the SDKs (Agent SDK & Codex SDK)

Topics:
- Headless mode: run an agent without the chat UI: Claude Code claude -p "task" and Codex codex exec
- Structured output: ask for clean JSON back (Codex --output-schema) to use in your own programs
- The Claude Agent SDK: build your own mini-agent in TypeScript or Python using Claude Code's engine
- The Codex SDK (TypeScript & Python): start a thread, run a prompt, resume it
- A simple automation: a script that asks the agent to do a chore and reports the result
- Piping: cat error.log | claude -p "explain this error"
- Where this leads: your own custom AI tools

Projects built:
- Write a tiny script that uses headless mode to summarize what changed in your project today

Practice: Pipe a file into claude -p and read the structured answer.
Assessment: Submit a small working automation built with claude -p or codex exec.

Class 23: Security, Sandboxing & Responsible AI Coding

Topics:
- Permission rules: allow / ask / deny specific actions before any tool runs
- Claude Code Bash sandbox (/sandbox): OS-level isolation so commands can't roam your whole computer
- Codex sandboxes: Apple Seatbelt (Mac), bubblewrap (Linux), Windows Sandbox, and the three approval modes
- Protecting secrets: never let an agent read or commit passwords and API keys
- Prompt injection: why you must be careful with untrusted web content and MCP servers
- Reviewing before you run: the golden rule of agent safety
- Being a responsible AI developer: understand the code the agent writes; you're accountable for it

Projects built:
- Configure permission rules and a sandbox setting in each tool and test that a blocked action is actually blocked

Practice: Add a deny rule for a dangerous command and confirm the agent respects it.
Assessment: Write a short 'safe AI coding checklist' you'll follow on every project.

Class 24: Capstone, Ship a Real App + Certification

Topics:
- Choose your build: a personal website, a simple game, a quiz app, or a chat-style bot
- Plan it with Plan/Goal mode, write your CLAUDE.md and AGENTS.md
- Build with both agents: use each where it shines
- Add a test, get an AI code review, and fix the findings
- Deploy it live (e.g., a free static host) so you have a real URL
- Polish your GitHub: real commits, a clean README, your PRs
- Present your project and earn your Modern Age Coders AI Coding Agents certificate

Projects built:
- Ship a complete, deployed app built and reviewed with Codex and Claude Code, with a public URL and a clean GitHub repo

Practice: Demo your app to the class and walk through how the agents helped you build it.
Assessment: Final capstone: a deployed app + GitHub repo + a short write-up; pass earns the certificate.

PROJECTS THE STUDENT BUILDS AND KEEPS

- Phase 1: a Codex vs Claude Code comparison sheet, your first hello.html page built with Claude Code and extended with Codex, a plan-first footer change, and two new to-do app features (one built with each agent)
- Phase 2: a personal slash-command cheat-sheet, a dark mode toggle designed in Plan Mode, a messy function refactored and reviewed line by line, a tested and committed feature, CLAUDE.md and AGENTS.md for your to-do app, and a clean /rewind recovery
- Phase 3: an MCP server connected to each agent, a custom /newpage command plus a Codex profile, a code-reviewer subagent, an auto-format hook, a low vs high effort bug-fix comparison, and a website layout rebuilt from a screenshot
- Phase 4: two parallel Codex Cloud tasks reviewed as pull requests, one task moved across web and desktop or terminal, a pull request improved with AI code review from both tools, and a

/batch improvement applied across multiple files
- Phase 5: a headless-mode automation script, a tested safety setup in both tools, and a deployed capstone app (a website, game, quiz app, or bot) with a public URL
- Total: 24 hands-on projects, one per class, finishing with a deployed capstone app

Total projects: 24 hands-on projects, one per class, finishing with a deployed capstone app

SKILLS THE STUDENT WILL HAVE AT THE END

- AI Coding Agents: Codex CLI, Claude Code, agent loops, plan and goal mode, safe approval modes
- Prompting for Code: clear goal statements, plan-first building, iterating on diffs, debugging with the agent
- Extending Agents: MCP servers, custom slash commands and skills, subagents, hooks, Codex profiles
- Terminal Skills: installing CLIs, running sessions, slash commands, reading command output with confidence
- Version Control: git commits, branches, worktrees, pull requests on GitHub
- Reviewing AI Code: reading diffs, spotting over-broad changes, acting on AI code review feedback
- Models and Effort: choosing between Fable 5, Opus 4.8, Sonnet 5, Haiku 4.5 and the GPT-5.6 family (Sol, Terra, Luna), and picking the right effort level
- Shipping Projects: building, testing, deploying, and presenting a real app with a public URL

HOW A TYPICAL WEEK IS SPLIT

Live classes: 2 live classes per week, about 1 hour each, across 12 weeks
Hands on agent work: 1-1.5 hours practicing real commands in Codex and Claude Code
Project time: 1-1.5 hours building each class project on your own computer
Review and doubts: 30-60 minutes reviewing what you built and clearing doubts before the next class
Homework: A task or problem set after every class, and a monthly mixed-review assignment that deliberately folds in earlier topics

SUPPORT INCLUDED

Doubt support: WhatsApp doubt support between classes for install issues, errors, and questions
Small batches: Small batches, with mini-batch and 1-on-1 options, so every teen gets individual attention
Mentor guidance: Live guidance from mentors who use these agents daily
Project feedback: Feedback on every class project and a personal capstone review before certification
Living syllabus: Curriculum updated as OpenAI Codex and Claude Code ship new features, at no extra cost

CERTIFICATION DETAIL

Completion: Certificate from Modern Age Coders, awarded on passing the final assessment. Fall short and there is focused revision and a free retest: the certificate certifies real learning, not attendance

WHERE THIS CAN LEAD

- Junior/Intern Developer using AI agents to ship faster
- Freelance mini-projects (websites, simple apps) for local businesses
- Strong CS-college application portfolio with deployed projects
- Hackathon competitor who can build a working prototype in a weekend
- Future AI-assisted Software Engineer, Web Developer, or App Developer

COMMON QUESTIONS ABOUT THIS COURSE

For anything about cost, use PART 4 and RULE 1. Do not quote two regions.

Q: Do I need a Claude or ChatGPT subscription to take this course?
A: Yes, this is a course requirement. To actually run the agents in class, every student must have an active Claude subscription (Pro or higher) for Claude Code and a ChatGPT subscription (Plus or higher) for Codex. You buy these directly from Anthropic and OpenAI; they are separate from the course fee. We help every family choose the most cost-effective plans during the free demo class, and setup is covered step by step in Classes 2 and 3. (Agent note: the free demo is a waiting list with no fixed date. The Priority Live Demo is a guaranteed class today or tomorrow, booked at https://learn.modernagecoders.com/priority-demo . Offer both, as RULE 3 says.)

Q: How am I assessed, and is the certificate just for showing up?
A: No. A task follows every class with feedback, monthly reviews deliberately mix new material with earlier topics so nothing is forgotten, and the course ends with a final project defended live, plus a written assessment. Passing earns the certificate; falling short earns focused revision and a free retest. We measure real learning, not attendance.

Q: Is OpenAI Codex free?
A: The Codex CLI is open-source and free to install, but running it requires a paid plan: you sign in with a ChatGPT subscription (Plus, Pro, Business, Edu, or Enterprise) which includes Codex usage, or you use an OpenAI API key billed per use. In 2026 usage runs on rolling limits that reset every few hours. For this course a ChatGPT plan (Plus or higher) is required, along with a Claude plan (Pro or higher) for the Claude Code half. We help you choose the most student-friendly setup.

Q: Do I need to know how to code before taking this course?
A: No. This course is designed for complete beginners aged 13-18. You start from zero in Class 1, and the AI agents help you write and understand code as you go. By the end you'll be shipping real apps.

Q: What is the best way to learn Claude Code and Codex?
A: Hands-on, with live guidance. These agents change monthly, so recorded tutorials go stale fast, and reading documentation alone does not build the judgment to review AI-written code safely. The most effective path is structured live classes where you run real commands in every session, build real projects, and have a mentor correct your habits as you go, which is exactly how this 24-class course is built. Modern Age Coders has taught 10,000+ students since 2020 and is rated 4.9 across 547 Google reviews.

Q: Codex vs Claude Code: which should a teen learn first?
A: Both! That's the whole point of this course. They're the two best AI coding agents in 2026, and they shine in different ways: Codex is fantastic for cloud parallel tasks and the ChatGPT ecosystem, while Claude Code offers deep terminal control, subagents, and hooks. We teach you both and exactly when to use each.

Q: Will this course go out of date as the tools change?
A: No, this is our Living Syllabus promise. OpenAI Codex and Anthropic Claude Code ship new features and models constantly: mid-2026 alone brought Sonnet 5 as Claude Code's new default model with a native 1M-token context, and Codex's move to the GPT-5.6 family (Sol, Terra, Luna). We continuously update the curriculum so enrolled students always learn the latest features, at no extra cost.

Q: What can my teen build by the end of the course?
A: A real, deployed app with a public URL, for example a personal website, a browser game, a quiz app, or a chat-style bot, plus a GitHub profile with genuine commits, pull requests, and AI code reviews. It's a portfolio piece they can show schools and colleges.

Q: Is it safe to let an AI agent run code on our computer?
A: Yes, when you use it correctly, and we teach exactly that. You'll learn approval modes, OS-level sandboxes, and permission rules so the agent only does what you allow. An entire class (Class 23) is dedicated to security and responsible AI coding.

Q: What computer and accounts do we need?
A: Any modern Windows, Mac, or Linux computer with internet. You'll need a free GitHub account, plus the two required subscriptions: Claude (Pro or higher) for Claude Code and ChatGPT (Plus or higher) for Codex, purchased directly from Anthropic and OpenAI. We walk you through every install and login step in Classes 2 and 3.

Q: How long is the course and how is it scheduled?
A: 24 classes, typically two classes a week over about 12 weeks, with 3-4 hours of practice per week recommended. Group, mini-batch, and 1-on-1 options are available.

To enrol, message Shivam Sir on +91 9123366161 or send the parent this link: https://learn.modernagecoders.com/courses/codex-and-claude-code-ai-coding-agents-course-for-teens
For a demo: the Priority Live Demo (guaranteed, today or tomorrow) is booked at https://learn.modernagecoders.com/priority-demo . The free demo is a waiting list with no fixed date.

==========
COURSE 40 OF 137: CODEX & CLAUDE CODE: AI CODING AGENTS FOR PROFESSIONALS
==========

Course link: https://learn.modernagecoders.com/courses/codex-and-claude-code-ai-coding-agents-masterclass-for-adults-professionals
Subject area: AI Coding Agents
Designed for: College students
Who can join: Beginner to advanced, for working professionals, career switchers & developers
Course length: 24 classes (12 weeks · 2 classes/week)
Time needed: 4-6 hours/week recommended
Certificate: Certificate from Modern Age Coders, awarded on passing the final assessment

PRICE FOR THIS COURSE (quote only the one that applies to the person asking)
In India, per month: group Rs 1,499, mini batch Rs 2,999, one to one Rs 4,999
Outside India, per month: group $100, one to one $150
Classes: group and mini batch two live classes a week, eight a month; one to one in India one live class a week, four a month; one to one outside India two live classes a week, eight a month. Each class is one hour.

Note: this course also needs the student to have their own Claude and ChatGPT subscriptions, because the whole course is hands on with those tools. Say this before enrolling anyone, so it is never a surprise later.

WHAT THIS COURSE IS

Live online Codex + Claude Code masterclass for professionals. 24 mentor-led classes: CLIs, MCP, subagents, hooks, both SDKs and a production capstone.

In one line: Stop typing every line. Learn to direct the two most powerful AI coding agents and ship more, faster, safely, in 24 classes.

ABOUT THE PROGRAMME

This is the definitive professional course on the two agentic coding tools reshaping software work in 2026: OpenAI Codex and Anthropic Claude Code. Across 24 in-depth, lab-driven classes you'll go from first install to automating real engineering workflows: building features, refactoring legacy code, fixing flaky tests, reviewing PRs at scale, and orchestrating parallel agents. Whether you're a developer leveling up, a career switcher entering tech, or a professional who wants to 10x routine work, you'll learn both tools at the depth a job demands. You learn the current stack: Claude Code v2.1.x on Anthropic's Claude 5 family (Sonnet 5 default with native 1M-token context; Fable 5 and Opus 4.8 for the hardest work), and the OpenAI Codex CLI/Cloud on the GPT-5.6 family (Sol, Terra, Luna) with reasoning levels up to ultra. Every class is live with a mentor in a small batch or 1-on-1, hands-on with real commands, config, and a deliverable. One important requirement: you must have your own active Claude subscription (Pro or higher) for Claude Code and ChatGPT subscription (Plus or higher) for Codex, or equivalent API access through your employer. Subscriptions are purchased directly from Anthropic and OpenAI, are separate from the course fee, and we help you pick the most cost-effective setup in your free demo.

WHAT MAKES THIS COURSE DIFFERENT

- Two agents, professionally: graduate fluent in BOTH Codex and Claude Code, and able to choose the right one per task and team.
- Workplace-grade labs: refactor legacy modules, fix CI, automate releases, review PRs at scale; not toy examples.
- Goes all the way to the SDKs: build your own automations and internal tooling with the Claude Agent SDK and Codex SDK.
- Living Syllabus: continuously updated as OpenAI Codex and Anthropic Claude Code ship new features, models, and capabilities. You always learn the current product.
- Security & governance built in: permission rules, OS sandboxes, secrets handling, and prompt-injection defense for real teams.
- Real production tools, not a sandbox: you train on your own Claude and ChatGPT subscriptions, so every workflow you learn transfers directly to your day job.
- Outcome-focused: finish with a production-grade capstone, reusable automations, and a portfolio of AI-assisted engineering work.

WHAT A STUDENT NEEDS BEFORE STARTING

Device: A laptop/desktop (Windows, Mac, or Linux) with internet and admin rights to install CLIs
Coding experience: Helpful but not required: beginners and career switchers are welcome; we start from install and ramp quickly
Accounts: REQUIRED: an active Claude subscription (Pro or higher) for Claude Code and a ChatGPT subscription (Plus or higher) for Codex, or equivalent API keys (for example through your employer, Bedrock, or Vertex AI). These are purchased directly from Anthropic and OpenAI and are not included in the course fee. A GitHub account is also required. We cover setup and provider options in the first classes
Tools: Comfort with a terminal develops during the course; basic familiarity with git is a plus

WHO THIS COURSE IS FOR

Working professionals: Engineers and analysts who want to ship more with AI agents and automate routine work
Career switchers: People entering tech who want a modern, AI-native skill set that employers increasingly expect
Developers: Developers leveling up from autocomplete to true agentic workflows (MCP, subagents, SDKs)
Tech leads: Leads introducing safe, governed agentic coding practices to a team
Founders freelancers: Founders and freelancers who need to build and ship quickly with a small team

FULL CURRICULUM, WEEK BY WEEK

This is the complete teaching plan. Parents can ask about any week.

PHASE 1: FOUNDATIONS OF AI CODING AGENTS

Understand the agentic-coding landscape, install and configure both Codex and Claude Code,
master the approval/permission models, and complete your first real engineering task.

  Class 1: The Agentic Coding Landscape (Codex vs Claude Code)
    Topics:
      - Agentic coding defined: an autonomous loop that reads context, plans, edits, runs commands,
        verifies, and iterates
      - OpenAI Codex as a product family: the CLI, Codex Cloud, the IDE extension, the
        ChatGPT/desktop/mobile apps, and the Codex SDK
      - Anthropic Claude Code surfaces: terminal, VS Code/JetBrains, desktop, web (claude.ai/code),
        mobile, Slack, and CI
      - Where each excels: Codex for cloud parallelism + GitHub-native review + ChatGPT ecosystem;
        Claude Code for deep terminal control, subagents, hooks, and skills
      - The 2026 model backends: Claude Code on the Claude 5 family (Sonnet 5 default, Fable 5 and
        Opus 4.8 above it); Codex on the GPT-5.6 family (Sol, Terra, Luna)
      - How agentic tools change team workflows: review-centric, smaller PRs, faster iteration
      - Building a mental model for evaluating any new agentic tool
    Projects built:
      - Write a one-page internal brief: 'Codex vs Claude Code: where we'd use each' for a
        hypothetical team
    Practice: Map three tasks from your own work to the tool you'd choose and justify it.
    Assessment: Produce a clear comparison matrix of Codex and Claude Code across 6
    dimensions.

  Class 2: Installing & Configuring Claude Code
    Topics:
      - Install: macOS/Linux curl -fsSL https://claude.ai/install.sh | bash; Windows irm
        https://claude.ai/install.ps1 | iex; Homebrew/WinGet alternatives
      - Authenticate: claude auth login (subscription) or ANTHROPIC_API_KEY; claude auth status;
        claude setup-token for CI
      - Enterprise providers: Amazon Bedrock, Google Vertex AI, Azure AI Foundry via env flags
        (CLAUDE_CODE_USE_BEDROCK, etc.)
      - First session and the REPL; the slash-command menu; /status, /usage
      - Settings hierarchy: ~/.claude/settings.json (user), .claude/settings.json (project),
        .claude/settings.local.json (gitignored)
      - Choosing your model with /model (Sonnet 5 is the current default; Fable 5, Opus 4.8 and Haiku
        4.5 are selectable)
      - IDE integration: install the VS Code/JetBrains extension and open Claude Code in your editor
    Projects built:
      - Install Claude Code, configure a project .claude/settings.json, and run your first task in a
        real repo
    Practice: Set up the VS Code extension and review an edit as an inline diff.
    Assessment: Show a configured project with settings.json and a successful first task.

  Class 3: Installing & Configuring the OpenAI Codex CLI
    Topics:
      - Install: npm install -g @openai/codex (Node 18+), or brew install --cask codex; note the
        @openai/ scope matters
      - Authenticate: Sign in with ChatGPT (Plus/Pro/Business/Edu/Enterprise) or an API key
      - Health check: codex doctor verifies runtime, auth, terminal, and network
      - The interactive TUI: model, service tier, token usage, and approval mode shown inline
      - Config file: ~/.codex/config.toml; switch settings per project with profiles (codex --profile
        <name>)
      - Model & reasoning selection with /model (low up to ultra); the 2026 lineup is GPT-5.6 Sol
        (complex work), Terra (all-rounder), Luna (fast, repeatable tasks)
      - Windows options: native (PowerShell + Windows Sandbox) or WSL2
    Projects built:
      - Install Codex, create a ~/.codex/config.toml with a custom profile, and complete a task in
        workspace-write mode
    Practice: Run codex doctor, fix any warnings, and switch reasoning level mid-task.
    Assessment: Submit your config.toml and a screenshot of a successful Codex session.

  Class 4: Approval & Permission Models (Safety Backbone)
    Topics:
      - Why approvals are the safety backbone of agentic coding
      - Claude Code permission modes (Shift+Tab to cycle): default, acceptEdits, plan (read-only),
        auto (classifier-approved); set with --permission-mode, manage via /permissions
      - Permission rule syntax: allow/ask/deny patterns like Bash(git push *), Edit(*.env)
      - Codex sandbox modes: read-only, workspace-write (default), danger-full-access; approval
        policies untrusted/on-request/on-failure/never/granular
      - Codex /approvals to switch live; the --dangerously-bypass-approvals-and-sandbox flag and why
        it's a last resort
      - Designing a team-safe default posture (start restrictive, widen deliberately)
      - Reading and reasoning about an approval request before granting it
    Projects built:
      - Author a restrictive permission/approval policy for both tools and prove a blocked action is
        denied
    Practice: Add a deny rule for force-push and destructive commands in both tools.

Assessment: Document a recommended default permission posture for a small dev team.

Class 5: Your First Real Engineering Task in Both Agents
Topics:
- Pick a real bug or small feature in a sample repo and scope it precisely
- Claude Code: plan diff approve verify; iterate with targeted feedback
- Codex: same task in workspace-write; compare approach, edits, and explanations
- Reading multi-file diffs critically and catching over-broad changes
- Driving iteration: 'narrow the change to module X', 'add a guard for null input'
- Verifying behavior: have the agent run the app/tests and confirm the fix
- Capturing what worked: notes you'll fold into project memory next phase
Projects built:
- Resolve the same issue with each agent and write a short comparison of edit quality and effort
Practice: Introduce a regression and have each agent locate and fix it.
Assessment: Submit two diffs (one per agent) solving the same task, with a critique.

PHASE 2: YOUR DAILY ENGINEERING WORKFLOW

Build a fast, reliable daily loop: slash commands, planning, reviewing diffs, running tests and git, teaching the agent your codebase, and recovering with checkpoints.

Class 6: Slash Commands & Session Control
Topics:
- Claude Code: /help, /clear, /compact (compress context), /context (inspect what's loaded), /model, /diff, /review
- Codex: /model, /approvals, /review, /status, /plan, /goal, and the @ picker for files/dirs/skills
- Managing context windows deliberately: when to /compact vs /clear vs start fresh
- @-mentioning files and MCP resources to target the agent precisely
- Monitoring cost and limits: /usage (Claude) and inline token usage (Codex)
- Recovering a derailed session: ask the agent to restate its current plan
- Building muscle memory in each TUI for speed
Projects built:
- Create a personal/team reference of the 12 most-used commands across both tools with examples
Practice: Run a long session, then reclaim context with /compact and compare token usage before/after.
Assessment: Demonstrate precise @-mention targeting and a clean context reset.

Class 7: Plan Mode & Goal Mode
Topics:
- Claude Code Plan Mode (/plan): read-only research and a proposed plan before any edit
- Goal Mode (/goal): the agent works until a defined completion condition is met
- Codex /plan and /goal (Goal mode stable and on by default in 2026)
- Writing checkable goals and acceptance criteria the agent can self-verify against
- Editing the agent's plan to constrain scope and approach before approval
- Plan-then-execute as a default for any multi-file or risky change
- Combining plan mode with restrictive permissions for safe exploration
Projects built:
- Use Plan Mode to design a non-trivial change (e.g., add pagination to an API) and execute the approved plan
Practice: Convert a vague ticket into a precise, checkable goal statement.
Assessment: Submit a plan you edited before approval and the resulting implementation.

Class 8: Diffs, Multi-File Edits & Review Discipline
Topics:
- How agents propose precise edits and render diffs across multiple files
- Reviewing a feature that spans several files coherently
- Accept / reject / request-changes on individual hunks
- Claude Code /diff and the VS Code/JetBrains inline review experience
- Keeping PRs small and reviewable; resisting scope creep from the agent
- Asking for rationale: 'why this approach over X?'
- Detecting and reverting unintended edits
Projects built:
- Have an agent refactor a legacy function and review every hunk, rejecting anything out of scope
Practice: Force the agent to split one large change into two smaller, reviewable steps.
Assessment: Critique a multi-file diff and identify any risky or unnecessary change.

Class 9: Running Tests, Commands & Git from the Agent
Topics:
- Delegating command execution: build, run, lint, and test through the agent
- Test-driven loops: have the agent write a failing test, implement, and make it pass
- Git with the agent: staged diffs, clear commit messages, branch hygiene
- Claude Code Bash tool (sandboxable) and Codex commands inside the workspace boundary
- Approving commands with judgment: reading the exact command first
- Fixing flaky/failing tests iteratively until green
- Frequent, small commits as a safety net

Projects built:
- Implement a feature TDD-style with the agent: failing test implementation green commit
Practice: Have the agent bisect and fix a failing CI step locally.
Assessment: Show a clean commit history of an agent-assisted TDD cycle.

Class 10: Project Memory, CLAUDE.md & AGENTS.md
Topics:
- Claude Code: /init generates CLAUDE.md; it auto-loads each session
- Memory hierarchy: managed/policy, user (~/.claude/CLAUDE.md), project (./CLAUDE.md), local (CLAUDE.local.md); imports with @path
- Auto-memory (2026): Claude saves learnings to a project memory folder; manage with /memory
- Codex AGENTS.md: repo root + nested per-package + personal ~/.codex/AGENTS.md (closest file wins)
- A 'Review guidelines' section in AGENTS.md to standardize Codex code review
- What belongs in memory: run/build/test commands, conventions, architectural rules, do/don't
- Keeping memory lean (~200 lines) and version-controlled for the team
Projects built:
- Write production-quality CLAUDE.md and AGENTS.md for a real repo, including review guidelines
Practice: Add a convention and confirm both agents follow it without re-prompting.
Assessment: Submit team-ready memory files and explain three rules' impact.

Class 11: Checkpoints, Rewind & Session Management
Topics:
- Claude Code automatic checkpointing before edits; /rewind (or Esc-Esc) to restore code, conversation, or both
- Key limitation: checkpoints track file-tool edits, not shell rm/mv: your git commits remain the real safety net
- Resuming: claude --continue and claude --resume (by id/name); --fork-session; --from-pr
- Branching a conversation (/branch) to explore alternatives
- Codex session resume and local conversation history search
- Combining git + checkpoints for confident experimentation
- Session organization across multiple concurrent tasks
Projects built:
- Run a risky refactor, reject the outcome, and recover cleanly via /rewind plus git
Practice: Resume a prior session by name and continue the task.
Assessment: Demonstrate a recovery workflow combining rewind and git.

PHASE 3: EXTENDING & CONNECTING YOUR AGENTS

Make the agents fit your stack: connect tools via MCP, build skills/plugins, deploy subagents, automate with hooks, tune models and reasoning effort, and feed visual context.

Class 12: Connecting Tools, Data & Services with MCP
Topics:
- Model Context Protocol: a standard for exposing tools/data/resources to agents
- Claude Code: claude mcp add --transport http <name> <url> (also sse/stdio); scopes local/project/user; manage with /mcp, claude mcp list
- MCP resources (@server:protocol://path) and MCP prompts as slash commands
- Codex: configure servers under [mcp_servers.<name>] in config.toml (stdio command/args/env or HTTP url), per-tool approval modes
- Practical integrations: issue trackers, databases, docs, design tools, internal APIs
- Tool Search / deferred tool loading to keep context lean with many servers
- Security: trust boundaries, OAuth, and prompt-injection risk from MCP content
Projects built:
- Connect a real MCP server (e.g., a database or docs server) to both agents and complete a task using it
Practice: Add a project-scoped .mcp.json so teammates inherit the same server.
Assessment: Show one server connected per tool and a task that used its tools.

Class 13: Skills, Custom Commands & Codex Plugins
Topics:
- Claude Code Skills (Agent Skills standard): reusable, auto-invokable instructions; .claude/commands/*.md and .claude/skills/*/SKILL.md both create /commands
- Frontmatter control: who can invoke, allowed/disallowed tools, subagent execution; /skills to manage, /reload-skills
- Designing a skill: a /deploy or /release command encapsulating your workflow
- Codex profiles for per-project model/sandbox settings and the plugin marketplace for sharing setups
- When to encode a workflow as a skill/plugin vs ad-hoc prompting
- Distributing skills/plugins to a team for consistency
- Versioning and reviewing shared automations
Projects built:
- Build a Claude Code skill that automates a repeatable workflow and a Codex profile for a project
Practice: Iterate a skill twice based on real usage feedback.
Assessment: Submit a working skill/command and document what it standardizes.

Class 14: Subagents, Specialized and Isolated Helpers

```
    Topics:
      - Subagents run in their own context with their own tools and permissions
      - Built-ins: Explore (fast read-only search), Plan (read-only planning), General-purpose
      - Define your own: .claude/agents/*.md with name, description, tools, model, permissionMode
      - Least-privilege agents: a reviewer that can only read; a test-writer scoped to tests
      - Manage and generate with /agents; subagent memory for cross-session learning
      - Dispatching parallel subagents for independent subtasks
      - Why subagents protect the main context and improve reliability (since mid-2026 they run in
        the background by default, so the main session keeps working)
    Projects built:
      - Create code-reviewer and test-writer subagents and use them on a real change
    Practice: Compare Explore subagent results vs the main agent for a codebase question.
    Assessment: Submit two subagent definitions and sample outputs.

  Class 15: Hooks & Workflow Automation
    Topics:
      - Hooks run deterministic code at lifecycle events: automation and guardrails
      - Key events: PreToolUse, PostToolUse, SessionStart, UserPromptSubmit, Stop, PreCompact and
        more
      - Config in settings JSON: matcher + handler (command/http/prompt/agent), exit-code 2 to block
      - Practical hooks: auto-format/lint on edit, run tests after changes, block dangerous commands,
        inject context
      - Placeholders like ${CLAUDE_PROJECT_DIR} and viewing hooks with /hooks
      - Treating hook output as feedback the agent must respond to
      - Governance: enforcing team standards automatically via hooks
    Projects built:
      - Implement a PostToolUse format+lint hook and a PreToolUse guard that blocks force-push
    Practice: Add a SessionStart hook that prints project setup status.
    Assessment: Submit two working hooks and explain their events and effects.

  Class 16: Models, Reasoning Effort & Context
    Topics:
      - Claude Code models: Fable 5 (the new Claude 5 flagship tier), Opus 4.8, Sonnet 5 (the
        default), Haiku 4.5 (fast/cheap); /model and aliases
      - Effort levels low/medium/high/xhigh (set via /effort, --effort) and the ultrathink keyword
      - Native 1M-token context on Sonnet 5 for large codebases
      - Codex models: GPT-5.6 Sol, Terra, and Luna; reasoning levels low up to ultra (ultra
        auto-delegates to subagents); long-task compaction across context windows
      - Cost/performance trade-offs: cheap+fast for routine edits, top model+high effort for hard
        design
      - Subagent model overrides for cost control at scale
      - Measuring whether more effort actually improved the result
    Projects built:
      - Benchmark a hard refactor at two effort levels and two models; document quality vs
        cost/latency
    Practice: Pin different models for main vs subagents and observe the effect.
    Assessment: Produce a model+effort selection guide for five task types.

  Class 17: Multimodal Inputs, Visual Context
    Topics:
      - Why visuals help: convey designs, dashboards, and bugs faster than prose
      - Drag-and-drop screenshots/images into the prompt as context
      - Codex Appshots (macOS): capture frontmost app windows for context
      - UI-from-image: have the agent implement a layout from a design screenshot
      - Debugging from a screenshot of an error or broken render
      - Mixing text + image instructions for precise outcomes
      - Current limits: image input in both agents; Codex added audio inputs and tool outputs in
        2026; video is still not supported
    Projects built:
      - Recreate a real UI from a design screenshot and reconcile it against the spec
    Practice: Diagnose a rendering bug from a screenshot alone.
    Assessment: Show an image-driven task with a correct, verified result.

---------------------------------------------------------------
PHASE 4: CLOUD, COLLABORATION & SCALE
---------------------------------------------------------------
Operate beyond a single machine: delegate to Codex Cloud, use Claude Code across surfaces,
integrate AI code review into GitHub/CI, and orchestrate parallel agents.

  Class 18: Codex Cloud, Parallel Tasks & Auto-PRs
    Topics:
      - Codex Cloud: asynchronous agents working in isolated, sandboxed environments
      - Get started at chatgpt.com/codex and connect GitHub
      - Queue many tasks in parallel; each returns as its own pull request
      - Configure cloud environments: repo, setup steps, tools, and internet-access controls
      - Reviewing cloud-generated PRs before merge; iterating via comments
      - When cloud wins: long-running jobs, parallel chores, repos not on your laptop
      - Governance for cloud agents in a team setting
    Projects built:
```

- Delegate three parallel Codex Cloud tasks and review/merge the resulting PRs
Practice: Configure a cloud environment's setup steps so the agent can build/test the repo.
Assessment: Show parallel cloud tasks and explain each PR's scope and quality.

Class 19: Claude Code Across Surfaces (Web, Desktop, Mobile, Background)
Topics:
- claude.ai/code on the web for long-running and parallel tasks, even on repos you don't have locally
- Desktop app: visual diff review and multiple side-by-side sessions
- Background agents: detach with /background, manage with claude agents / attach / logs
- Remote control & mobile: steer and approve from your phone
- Teleporting a web/remote session into the terminal to finish locally
- Choosing the right surface per task and handing off between them
- Slack/GitHub triggers that start sessions
Projects built:
- Start a task on the web, hand it to the desktop/terminal, and finish it; run one agent in the background
Practice: Manage a background agent's lifecycle from the shell.
Assessment: Demonstrate a task moving across two surfaces and a managed background agent.

Class 20: GitHub Integration & AI Code Review at Scale
Topics:
- Connect GitHub apps so both agents can open and review PRs
- Codex review: @codex review (P0/P1 findings) or enable automatic reviews on every PR; scoped reviews like @codex review for security regressions
- Codex task mentions: @codex fix the CI failures pushes fixes when authorized
- Claude Code /code-review (effort levels), --comment for inline GitHub comments, --fix to apply findings
- CI automation: openai/codex-action and Claude Code GitHub Actions / GitLab CI
- Defining team review guidelines (AGENTS.md) honored during review
- Acting on AI review feedback with rigor, not blind acceptance
Projects built:
- Set up automatic AI code review on a repo and run a PR through both Codex and Claude Code review
Practice: Tune review guidelines and observe how findings change.
Assessment: Show a reviewed PR with AI findings you triaged and resolved.

Class 21: Parallel Agents, Worktrees, /batch & Teams
Topics:
- Parallelization strategy: decompose large work into independent units
- Git worktrees for isolation: claude -w <name> creates an isolated workspace
- Claude Code /batch: split a large change into 5-30 units, one background subagent per worktree, each tests + opens a PR
- Agent teams: multiple coordinating sessions (--teammate-mode)
- Codex Cloud parallelism for the same outcome via many PRs
- Reviewing and integrating parallel outputs without conflicts
- Knowing when serial is safer than parallel
Projects built:
- Use /batch (or parallel Codex Cloud tasks) to roll a cross-cutting change across a codebase and review each PR
Practice: Run two agents in separate worktrees on independent tasks simultaneously.
Assessment: Document a parallelized change: the split, the worktrees/PRs, and the review.

PHASE 5: BUILD, SECURE & SHIP

Operationalize agents: automate with the SDKs, harden security for teams, and deliver a production-grade capstone, then certify.

Class 22: Building With the SDKs (Claude Agent SDK & Codex SDK)
Topics:
- Headless automation: claude -p "task" (output-format text/json/stream-json) and codex exec (with --output-schema for structured JSON)
- Claude Agent SDK: npm i @anthropic-ai/claude-agent-sdk / pip install claude-agent-sdk; query() with tools, hooks, agents, permissionMode
- Codex SDK: @openai/codex-sdk (TS) and openai-codex (Python): startThread, run, resumeThread
- Piping and composition: git diff main | claude -p "review for security issues"
- Building an internal automation: triage, summarize, or auto-fix in CI
- Budget/turn controls (--max-turns, --max-budget-usd) for safe unattended runs
- Note: from June 15 2026 Agent SDK / claude -p usage draws on a separate credit on subscription plans
Projects built:
- Build a CI automation (e.g., auto-summarize PR diffs or auto-label issues) using claude -p or codex exec with structured output
Practice: Write a script that pipes logs into an agent and parses its JSON response.
Assessment: Submit a working SDK/headless automation with structured output.

Class 23: Security, Sandboxing & Governance for Teams

Topics:
- Permission rules (allow/ask/deny) evaluated before any tool runs; pattern syntax for fine control
- Claude Code Bash sandbox (/sandbox): Seatbelt (macOS) / bubblewrap (Linux/WSL2); filesystem & network isolation, allow/deny domains
- Codex sandboxes: Seatbelt / bubblewrap / Windows Sandbox; read-only vs workspace-write vs danger-full-access
- Secrets hygiene: denyRead for ~/.ssh, ~/.aws; never commit credentials; env scrubbing
- Prompt injection & untrusted content: risks from web fetches and MCP servers, and mitigations
- Managed/enterprise settings: forced login org, allowed models, disabling hooks, managed domain allowlists
- Accountability: you own the code the agent writes: review and test it

Projects built:
- Define and test a hardened security configuration (permissions + sandbox + secret denials) for a team repo

Practice: Demonstrate a sandbox blocking network/file access outside the allowed scope.
Assessment: Deliver a team 'safe agentic coding' policy document with concrete settings.

Class 24: Capstone, Ship a Production-Grade Build + Certification
Topics:
- Scope a real deliverable: a feature in an existing app, or a small full-stack app + an automation
- Plan with Plan/Goal mode; author CLAUDE.md and AGENTS.md with review guidelines
- Build with both agents, using subagents/hooks/MCP where they add value
- Quality gate: tests, AI code review (with fixes), and a clean PR history
- Ship it: deploy the app and/or land the automation in CI
- Document your workflow: what each agent did, decisions, and safeguards
- Present and earn the Modern Age Coders AI Coding Agents Professional certificate

Projects built:
- Deliver a deployed, tested, AI-reviewed capstone (app and/or SDK automation) with a documented agentic workflow

Practice: Present a 5-minute walkthrough of how you directed the agents end-to-end.
Assessment: Final capstone: deployed/merged work + repo + write-up; pass earns the professional certificate.

PROJECTS THE STUDENT BUILDS AND KEEPS

- Phase 1: a Codex vs Claude Code comparison brief, both CLIs installed and configured (project settings.json and a config.toml with a custom profile), a restrictive permission policy proven to block unsafe actions, and the same real bug fixed with each agent
- Phase 2: a 12-command team reference, a Plan Mode change designed and executed (API pagination), a reviewed legacy-function refactor, a TDD feature taken from failing test to green commit, production-quality CLAUDE.md and AGENTS.md files, and a rewind-plus-git recovery drill
- Phase 3: a real MCP server connected to both agents, a reusable workflow skill plus a Codex profile, code-reviewer and test-writer subagents, format-and-lint and force-push-guard hooks, a model and effort benchmark, and a UI rebuilt from a design screenshot
- Phase 4: three parallel Codex Cloud tasks reviewed and merged as pull requests, a cross-surface workflow with a managed background agent, automatic AI code review wired into a GitHub repo, and a cross-cutting change rolled out with /batch across worktrees
- Phase 5: a CI automation built with claude -p or codex exec, a hardened team security configuration (permissions, sandbox, secret denials), and a deployed, tested, AI-reviewed capstone
- Total: 24 hands-on deliverables, one per class, capped by a production-grade capstone

Total projects: 24 hands-on deliverables, one per class, including a production-grade capstone shipped in Class 24

SKILLS THE STUDENT WILL HAVE AT THE END

- AI Coding Agents: Codex CLI, Claude Code, agent workflows, plan and goal mode, context management
- Prompting for Code: precise goal statements, spec-first planning, iterative refinement, debugging prompts
- Extending Agents: MCP servers, skills and custom commands, subagents, hooks, Codex profiles
- Model Strategy: Fable 5, Opus 4.8, Sonnet 5, Haiku 4.5, GPT-5.6 Sol/Terra/Luna, effort levels, cost and quality trade-offs
- Version Control: git branches, worktrees, clean commit history, PR-based workflows
- Reviewing AI Output: reading multi-file diffs, scoping changes, AI code review in GitHub and CI
- Automation with SDKs: Claude Agent SDK, Codex SDK, headless runs, structured output, CI integrations
- Security and Governance: permission rules, OS sandboxes, secrets hygiene, prompt-injection defense

HOW A TYPICAL WEEK IS SPLIT

Live classes: 2 live classes per week, about 1 hour each, across 12 weeks
Hands on agent work: 1-1.5 hours running real commands in Codex and Claude Code between classes

  Project time: 1-1.5 hours completing each class deliverable in your own repo
  Review and doubts: 30-60 minutes reviewing diffs, refining your notes, and clearing doubts with mentors
  Homework: A task or problem set after every class, and a monthly mixed-review assignment that deliberately folds in earlier topics

SUPPORT INCLUDED

  Doubt support: WhatsApp doubt support between classes, so you are never stuck on a config or command
  Small batches: Small batches, with mini-batch and 1-on-1 options, so every professional gets individual attention
  Mentor guidance: Live guidance from mentors who use Codex and Claude Code in production daily
  Capstone review: Personal review of your capstone and workflow write-up before certification
  Living syllabus: Curriculum updated as OpenAI and Anthropic ship new features, at no extra cost

CERTIFICATION DETAIL

  Completion: Certificate from Modern Age Coders, awarded on passing the final assessment. Fall short and there is focused revision and a free retest: the certificate certifies real learning, not attendance

WHERE THIS CAN LEAD

  - AI-Assisted Software Engineer / Full-Stack Developer
  - Developer Productivity / Platform Engineer (agent workflows, internal tooling)
  - Automation Engineer building on the Claude Agent SDK / Codex SDK
  - Tech Lead / Engineering Manager standardizing agentic practices
  - Freelance / Founder shipping AI-built products faster

EARNING POTENTIAL (share only if asked, and never promise it)

  Market context: The ranges below are general market salary bands for these roles in India and abroad, drawn from public industry data. They are shown for career context only and are not a promise or guarantee of income. Actual pay depends on your skills, experience, location, and the job market.
  Early career roles: Rs 6-12 LPA in India / $70k-110k globally (developer using agents to boost output)
  Growing roles: Rs 12-22 LPA / $110k-150k (AI-assisted engineer shipping features independently)
  Experienced roles: Rs 22-40+ LPA / $150k-220k+ (senior/lead leveraging agents and SDK automation at scale)

COMMON QUESTIONS ABOUT THIS COURSE

  For anything about cost, use PART 4 and RULE 1. Do not quote two regions.

  Q: Do I need a Claude or ChatGPT subscription to take this masterclass?
  A: Yes, this is a course requirement. To run the agents in every lab you must have an active Claude subscription (Pro, Max, Team, or Enterprise) for Claude Code and a ChatGPT subscription (Plus, Pro, Business, Edu, or Enterprise) for Codex, or equivalent API keys, for example through your employer or via Bedrock/Vertex AI. Subscriptions are purchased directly from Anthropic and OpenAI and are separate from the course fee. We help you pick the most cost-effective setup in your free demo, and many employers reimburse these tools. (Agent note: the free demo is a waiting list with no fixed date. The Priority Live Demo is a guaranteed class today or tomorrow, booked at https://learn.modernagecoders.com/priority-demo . Offer both, as RULE 3 says.)

  Q: How am I assessed, and is the certificate just for showing up?
  A: No. A task follows every class with feedback, monthly reviews deliberately mix new material with earlier topics so nothing is forgotten, and the course ends with a final project defended live, plus a written assessment. Passing earns the certificate; falling short earns focused revision and a free retest. We measure real learning, not attendance.

  Q: Is OpenAI Codex free, and what about Claude Code?
  A: The Codex CLI and SDK are open-source/free to install; running them uses your ChatGPT plan (Plus/Pro/Business/Edu/Enterprise) or an OpenAI API key. Claude Code runs on a Claude subscription (Pro/Max/Team/Enterprise) or an Anthropic API key. Both moved to token/usage-based limits in 2026. For this masterclass an active plan for each tool is required, and we help you pick the most cost-effective setup for learning and for work.

  Q: Can I use what I learn at my job right away?
  A: Yes, the labs are deliberately workplace-grade: fixing CI, refactoring legacy code, reviewing PRs at scale, and building SDK automations. You'll also produce a team-ready security/governance policy so you can introduce agents responsibly.

  Q: Codex vs Claude Code: which is better for teams?
  A: They're complementary. Codex excels at cloud parallel tasks and GitHub-native review;

Claude Code offers deep terminal control, subagents, hooks, skills, and the Agent SDK. This course teaches both to professional depth and, crucially, how to choose the right one per task and integrate them into a team workflow.

Q: Does the course cover the Claude Agent SDK and the Codex SDK?
A: Yes, Class 22 is dedicated to headless automation and both SDKs (TypeScript and Python). You'll build a real CI automation with structured output, plus learn budget/turn controls for safe unattended runs.

Q: Will the content stay current as the tools change so fast?
A: That's our Living Syllabus promise. Codex and Claude Code ship features and models constantly: mid-2026 alone brought Sonnet 5 as Claude Code's default with native 1M-token context, the Claude 5 flagship tier (Fable 5), and Codex's move to the GPT-5.6 family with reasoning up to ultra. We update the curriculum continuously so you always learn the current product, at no extra cost.

Q: I'm a career switcher with limited coding experience: is this for me?
A: Yes. We start from install and ramp deliberately. The agents help you read and write code as you learn, while the course builds the judgment in planning, reviewing, and security that separates real engineers from prompt-clickers.

Q: How do you handle security and 'letting AI run commands'?
A: An entire class (Class 23) covers permission rules, OS-level sandboxes (Seatbelt/bubblewrap/Windows Sandbox), secrets hygiene, prompt-injection defense, and enterprise/managed settings. You'll configure and test a hardened setup, and you always review before running.

Q: What's the schedule and format?
A: 24 classes, typically two per week over ~12 weeks, 4-6 hours/week recommended. Available as group, mini-batch, or 1-on-1, with live mentorship and a capstone review.

Q: What is the best way to learn Claude Code and Codex as a professional?
A: On real work, with live expert feedback. Both agents ship new features monthly, so recorded courses and blog tutorials age out quickly, and self-study rarely builds the review discipline, security posture, and SDK skills teams actually need. The fastest reliable path is structured live training where every session runs real commands on real repos with a mentor who uses these tools in production, which is exactly how this 24-class masterclass works. Modern Age Coders has taught 10,000+ students since 2020 and is rated 4.9 across 547 Google reviews.

To enrol, message Shivam Sir on +91 9123366161 or send the parent this link: https://learn.modernagecoders.com/courses/codex-and-claude-code-ai-coding-agents-masterclass-for-adults-professionals
For a demo: the Priority Live Demo (guaranteed, today or tomorrow) is booked at https://learn.modernagecoders.com/priority-demo . The free demo is a waiting list with no fixed date.

==========
COURSE 41 OF 137: CODING FOR KIDS: SCRATCH TO GAMES, APPS AND AI
==========

Course link: https://learn.modernagecoders.com/courses/kids-coding-blocks-masterclass
Subject area: Kids Coding
Designed for: Kids
Who can join: Complete beginner, ages 6 to 12 (batches grouped by age)
Course length: 10-12 months (40-48 weeks)
Time needed: 2 live classes/week + 2-3 hours guided practice
Certificate: Certificate from Modern Age Coders, awarded on passing the final exam

PRICE FOR THIS COURSE (quote only the one that applies to the person asking)
In India, per month: group Rs 1,499, mini batch Rs 2,999, one to one Rs 4,999
Outside India, per month: group $100, one to one $150
Classes: group and mini batch two live classes a week, eight a month; one to one in India one live class a week, four a month; one to one outside India two live classes a week, eight a month. Each class is one hour.

WHAT THIS COURSE IS

Coding for kids aged 6-12: live online classes from first Scratch game to mobile apps, Minecraft and Roblox coding, kid-safe AI and a first taste of Python.

In one line: A child who can drag two blocks together can start. Ten months later they have built games, a mobile app, Minecraft machines, an AI model and their first lines of Python.

ABOUT THE PROGRAMME

This is our flagship coding journey for children aged 6 to 12, and it is built on a simple truth: kids learn to code by making things they want to show someone. Every week ends with something a child can demonstrate at the dinner table, a game, an animation, an app, a world, and every concept hides inside a project rather than a lecture. The journey starts in

Scratch, where logic is learned by snapping blocks: animations first, then real games with scores, levels and difficulty. From there the worlds get bigger: arcade games in Microsoft MakeCode, inventions on a simulated micro:bit, real mobile apps built in MIT App Inventor and installed on the family phone, coding inside Minecraft Education, first Lua scripts in Roblox Studio, and kid-safe AI, where children train their own image and sound models with Machine Learning for Kids and Teachable Machine and use them inside their own games. The final months build the bridge every parent asks about: from blocks to real typed code, with first Python turtle programs and a first hand-written web page. The pace is honest: two live classes a week plus two to three hours of guided practice fits the journey in ten months, and younger children or busy terms stretch it to twelve without penalty, the batch adapts. Learning is checked the honest way too: classwork in every session, homework after every class, monthly challenges that mix new questions with earlier topics, and a final exam, a project plus a friendly viva, that decides the certificate. Real knowledge, real work, real projects, depth over dopamine.

WHAT MAKES THIS COURSE DIFFERENT

- Every week ends with something a child can show: a game, an app, a world, a model, not a worksheet
- Batches are grouped by age, so a 7-year-old is never racing an 11-year-old through the same material
- The tools are the real ones schools and clubs use worldwide: Scratch, MakeCode, App Inventor, Minecraft Education, Roblox Studio
- AI is taught kid-safe and hands-on: children train their own models with Machine Learning for Kids and Teachable Machine, no open chatbots
- The course ends with a real bridge to typed code: first Python and a first hand-written web page, so the next step is natural
- Real assessment, gently done: weekly homework, monthly mixed-review challenges, and a final project-plus-viva exam that decides the certificate, with a free retest after revision if needed

THE LEARNING PATH, STEP BY STEP

Phase 1: Scratch from zero to real games (Months 1-3): animation, interactivity, loops, variables, then complete games with levels and scores
Phase 2: New worlds (Months 4-6): MakeCode arcade games, micro:bit inventions, and real mobile apps built in MIT App Inventor
Phase 3: Bigger worlds and AI (Months 7-8): coding in Minecraft Education, first Lua in Roblox Studio, and training their own AI models
Phase 4: The bridge to real code (Months 9-10): data projects, interactive stories, first Python, a first web page, and the final capstone

WHAT A STUDENT NEEDS BEFORE STARTING

Coding experience: None. Block coding was invented exactly for this start
Reading: Comfortable reading simple English (roughly Grade 2 and up)
Equipment: A computer or laptop with a stable internet connection; a tablet works for the early months
Age: 6 to 12. Batches are grouped by age so pace, examples and humor fit the room
Time commitment: 2 live classes plus 2-3 hours of playful practice a week

WHO THIS COURSE IS FOR

Curious beginners: Children who love games and gadgets and are ready to make their own
Young starters: Ages 6-8 who start gently with blocks and grow into the bigger tools
Older kids: Ages 9-12 who move faster and reach Python and Roblox scripting sooner
Screen time worriers: Parents who want screen time converted from consuming into creating
Future programmers: Kids who will graduate into our Python, Roblox, Minecraft and web courses

FULL CURRICULUM, WEEK BY WEEK

This is the complete teaching plan. Parents can ask about any week.

PHASE 1: SCRATCH FROM ZERO TO REAL GAMES (MONTHS 1-3, WEEKS 1-12)

Scratch is where children discover that they can command a computer. From first animation to complete games with menus, levels and scores.

Month 1: First Steps in Scratch (Weeks 1-4)
Welcome to Coding
Topics:
- What is coding? Why is it important?
- How computers understand instructions
- Introduction to algorithms with real-life examples
- Setting up your coding workspace
- Creating safe accounts on Scratch and Code.org together with a parent
- Navigating Scratch interface
- Understanding sprites and stages

- Basic blocks: Motion, Looks, Sound
- Your first animation: Making a cat walk
- Saving and sharing projects
- Online safety and digital citizenship
- Creating your coder profile

Projects built:
- Animated greeting card
- Pet animation with sounds
- Interactive 'About Me' project

Practice: Daily 15 minutes of block exploration and one small creative build

Motion and Animation

Topics:
- Coordinate system (x, y positions)
- Moving sprites: go to, glide, move steps
- Rotation: turn, point in direction
- Creating smooth animations
- Using costumes for animation
- Backdrop changes and scenes
- Sound effects and music
- Recording custom sounds
- Text-to-speech blocks
- Animation principles: timing, easing
- Creating realistic movements
- Sprite interactions

Projects built:
- Animated story with 3 scenes
- Dancing party animation
- Virtual pet that moves and makes sounds

Practice: Create 5 different animation sequences

Events and Interactivity

Topics:
- Event blocks: when flag clicked, when key pressed
- Mouse events: when sprite clicked
- Broadcasting messages between sprites
- Creating interactive buttons
- Keyboard controls for games
- Mouse following mechanics
- Touch controls for tablets
- Creating menus and navigation
- User input with 'ask' blocks
- Storing answers in variables (introduction)
- Creating choose-your-own adventure stories
- Interactive art projects

Projects built:
- Interactive quiz game
- Virtual piano/musical instrument
- Dress-up game with clickable items

Practice: Build 5 interactive mini-projects

First Game Logic

Topics:
- If-then statements (conditionals)
- If-else logic blocks
- Collision detection: touching sprite/color
- Score keeping with variables
- Lives and game over conditions
- Timer and countdown mechanics
- Random numbers for surprises
- Creating power-ups
- Level progression basics
- Win and lose conditions
- Game states: start, playing, game over
- Debugging techniques

Projects built:
- Catch the falling objects game
- Simple maze game
- Whack-a-mole style game
- Number guessing game

Practice: Create 3 simple games with scoring

Assessment: Month 1 check: build a small interactive scene live, plus a fun take-home challenge mixing everything from month 1

Month 2: Think Like a Coder (Weeks 5-8)

Loops and Patterns

Topics:
- Forever loops for continuous actions
- Repeat loops with counters
- Repeat until conditions
- Nested loops for complex patterns
- Creating geometric patterns

- Drawing with pen blocks
- Stamp tool for patterns
- Color effects and graphics
- Creating fractals and spirals
- Loop optimization
- Breaking out of loops
- Infinite loop prevention

Projects built:

- Geometric art generator
- Pattern-based puzzle game
- Automated drawing machine
- Kaleidoscope effect

Practice: Create 10 different patterns using loops

Variables: Numbers That Remember

Topics:

- Creating and naming variables
- Local vs. global variables
- Changing variable values
- Variables for game mechanics
- High score systems
- Mathematical operations with variables
- Creating calculators

Projects built:

- Calculator with memory
- Quiz with score tracking
- Click-counter challenge game

Practice: Build 5 projects that count, score or remember something

Lists and Inventories

Topics:

- Lists (arrays) introduction
- Adding/removing from lists
- List operations: length, contains
- High score systems
- Inventory systems for games
- Data persistence with cloud variables

Projects built:

- Shopping game with inventory
- RPG with character stats
- High-score table that survives the game

Practice: Add a list to two of your earlier projects

Puzzle Week on Code.org

Topics:

- Introduction to Code.org platform
- Block-based JavaScript preview
- Minecraft Hour of Code
- Star Wars coding challenges
- Dance Party creation
- App Lab basics
- Creating mobile app interfaces
- Event-driven programming
- Debugging with Code.org
- CS Fundamentals courses
- Problem-solving strategies
- Computational thinking puzzles

Projects built:

- Complete Minecraft adventurer
- Create dance party choreography
- Build app prototype in App Lab
- Solve 20 Code.org puzzles

Practice: A Code.org puzzle streak: a little every day

Assessment: Month 2 check: solve three fresh logic puzzles live, with questions that reach back to month 1

Month 3: Real Games, Properly Built (Weeks 9-12)

Clone the Classics I

Topics:

- Analyzing existing games
- Breaking down game mechanics
- Planning complex projects
- Creating Pong clone
- Building Flappy Bird clone
- Snake game mechanics

Projects built:

- Pong clone that feels fair
- Flappy Bird complete clone
- Snake with growing tail

Practice: Polish one clone until a friend asks to play again

Clone the Classics II: Platformers

Topics:

- Analyzing existing games
- Breaking down game mechanics
- Planning complex projects
- Platform game basics
- Scrolling backgrounds
- Multiple levels design
- Save game functionality
- Leaderboards with cloud data
- Multiplayer basics

Projects built:
- Platform game with 3 levels
- Pac-Man style maze game
- Two-player competitive game

Practice: Design and build one extra level for each game

What Makes Games Fun?

Topics:
- What makes games fun?
- Game mechanics vs. dynamics
- Level design principles
- Difficulty curves
- Player feedback systems
- Reward mechanisms
- Story in games
- Character development
- Game art basics
- Sound design importance
- Playtesting methods
- Iterative design process

Projects built:
- Design document for original game
- Level pack for existing game
- Game with adaptive difficulty
- Story-driven adventure game

Practice: Play and analyze 5 favorite games: what makes each one fair and fun?

Scratch Showcase

Topics:
- Project presentation skills
- Creating game trailers
- Writing game descriptions
- Peer review and feedback
- Code optimization
- Performance improvements
- Portfolio organization

Projects built:
- CAPSTONE: an original game with menu, levels, scoring and sounds
- A short presentation of the game to the batch

Practice: Run a family playtest and fix the two most confusing things

Assessment: Phase 1 exam: present the capstone game and rebuild a small scene live, with mixed questions from months 1-3

PHASE 2: NEW WORLDS: ARCADE, MICRO:BIT AND MOBILE APPS (MONTHS 4-6, WEEKS 13-24)

The skills from Scratch travel: arcade games in MakeCode, inventions on a simulated micro:bit, and real mobile apps built in MIT App Inventor.

Month 4: MakeCode Arcade and micro:bit (Weeks 13-16)

MakeCode Arcade Basics

Topics:
- Introduction to MakeCode Arcade
- Sprite creation and editing
- Tile maps and level design
- Physics in games
- Scoring and lives system
- Sound effects creation
- Custom sprite editor
- JavaScript preview in MakeCode

Projects built:
- Adventure game with a tile map
- Racing game with obstacles

Practice: Build 3 small arcade games between classes

MakeCode Arcade: Enemies and Effects

Topics:
- Physics in games
- Projectiles and effects
- Enemy AI basics
- Scoring and lives system
- Sound effects creation
- Publishing games online

      - Sharing with QR codes
      - JavaScript preview in MakeCode
    Projects built:
      - Shooting game with enemy waves
      - RPG with story elements
      - Your best arcade game shared with a QR code
    Practice: Add enemies and effects to your month 4 games
  micro:bit Inventions
    Topics:
      - What is Micro:bit?
      - MakeCode for Micro:bit
      - LED display programming
      - Button inputs A and B
      - Accelerometer and shake detection
      - Temperature sensor
      - Light sensor projects
      - Radio communication between devices
      - Creating wearable projects
      - Music and sounds on Micro:bit
      - The MakeCode simulator: a full micro:bit in the browser, no hardware needed
      - Optional: running your inventions on a real micro:bit at home
    Projects built:
      - Digital dice
      - Step counter/fitness tracker
      - Two-player rock-paper-scissors
      - Temperature alarm system
    Practice: Build 5 micro:bit inventions in the simulator
  Blockly Puzzle Gym
    Topics:
      - Introduction to Blockly
      - Blockly Games progression
      - Maze solving algorithms
      - Bird physics game
      - Turtle graphics programming
      - Movie creation with Blockly
      - Music composition blocks
      - Pond game strategies
      - JavaScript code generation
      - Storytelling with code
    Projects built:
      - Complete all Blockly Games
      - Turtle art masterpiece
      - Animated movie with Blockly
      - Music composition project
    Practice: Finish the Blockly Games ladder at your own pace
    Assessment: Month 4 check: build a small arcade scene live, plus a mixed challenge
    reaching back to Scratch

Month 5: Build Real Mobile Apps (Weeks 17-20)
  MIT App Inventor Basics
    Topics:
      - Introduction to MIT App Inventor
      - Designer vs. Blocks editor
      - Screen layouts and components
      - Buttons, labels, textboxes
      - Images and media components
      - Screen navigation
      - Properties and styling
      - Event handlers in apps
      - Variables in App Inventor
      - Procedures (functions)
      - Testing with companion app
      - Building APK files
    Projects built:
      - Calculator app
      - To-do list app
      - Flashcard study app
      - Personal diary app
    Practice: Build 3 small apps and run them on a family phone
  Apps with Camera, Voice and Drawing
    Topics:
      - Lists and databases in apps
      - TinyDB for local storage
      - Camera and image picker
      - Sound recorder and player
      - Text-to-speech and speech recognition
      - Canvas for drawing
      - Sprite animations in apps
      - Accelerometer games

- Sharing functionality
  Projects built:
- Photo sticker app
- Voice note recorder
- Drawing app with save
  Practice: Add one camera or voice feature to an earlier app
Games on the Phone
  Topics:
- Game loop concepts
- Sprite collisions in apps
- Score and high score systems
- Timer-based games
- Touch and drag mechanics
- Accelerometer controls
- Sound effects in games
- Multiple screens for games
- Game state management
  Projects built:
- Flappy Bird mobile version
- Tilt-controlled maze game
- Memory card game
  Practice: Playtest your phone games with two family members
App Capstone: An App for Your Family
  Topics:
- Choosing an app your family would actually use
- Sketching screens on paper before building
- Building the app screen by screen
- Saving data so the app remembers
- Testing with a real user: watching without helping
- Fixing what confused them, not what annoyed you
- Presenting the app and the story behind it
  Projects built:
- The family app: a chore chart, pet log, homework planner or your own idea, installed on a real phone
  Practice: One week of real family use, then one improvement
  Assessment: Month 5 check: app demo plus a mixed quiz over months 1-5

Month 6: Stories, Worlds and the Phase Capstone (Weeks 21-24)
Digital Storytelling
  Topics:
- Story structure basics
- Character development
- Digital comic creation
- Interactive stories with Twine
- Animation storytelling
- Digital portfolio creation
- Sharing work safely: what goes online and what stays home
  Projects built:
- Interactive story in Twine
- Digital comic book
- Animated short story
  Practice: Write and branch one choose-your-own-adventure story
What Is AI, Really?
  Topics:
- What is Artificial Intelligence?
- Machine Learning basics for kids
- Training AI models concept
- Scratch + Machine Learning 4 Kids
- Image recognition projects
- Text classification basics
- Sound recognition
- Creating training data
- Testing AI models
- AI ethics for kids
- Bias in AI systems
- Future of AI
  Projects built:
- Rock-paper-scissors AI
- Emotion detector with images
- Chatbot in Scratch
- Voice command game
  Practice: Train 5 small models and note where each one gets confused
Teachable Machine Projects
  Topics:
- Google Teachable Machine
- Training image models
- Training sound models
- Training pose models
- Exporting models

- Using models in Scratch
- AI-powered games
- Computer vision projects
- Gesture control games
- AI art generation basics

Projects built:

- Gesture-controlled game
- AI fitness coach
- Sound-activated animations
- AI art generator

Practice: Build 3 projects that use a model you trained yourself

Phase 2 Capstone and Review

Topics:

- Choosing the capstone: best game, best app or best AI project, taken further
- Improving old projects with new skills
- Showing work: a tidy project gallery
- A review week shaped by what the batch found hard
- Kind, useful feedback: reviewing a classmate's project

Projects built:

- Phase capstone: one project taken one honest level further, presented to the batch

Practice: Publish your top 3 projects in your personal gallery

Assessment: Phase 2 review: capstone demo plus a mixed challenge spanning phases 1 and 2

PHASE 3: MINECRAFT, ROBLOX AND AI (MONTHS 7-8, WEEKS 25-32)

Coding inside the worlds kids already love: Minecraft Education, Roblox Studio with first Lua scripts, 3D design, and AI models they train themselves.

Month 7: Minecraft and Roblox (Weeks 25-28)

Coding in Minecraft Education

Topics:

- Minecraft Education setup
- Code Builder introduction
- MakeCode in Minecraft
- Agent programming
- Building automation
- Redstone basics
- Command blocks
- Creating educational worlds
- Chemistry in Minecraft
- History lessons in Minecraft
- Collaborative building

Projects built:

- Automated farm system
- Historical monument recreation
- Science experiment world
- Adventure map with coding

Practice: Complete 10 coding challenges inside Minecraft

Roblox Studio: First Worlds

Topics:

- What is Roblox Studio?
- Basic building tools
- Parts and properties
- Terrain editor
- Basic scripting preview
- Models and assets
- Lighting and effects
- Sound in Roblox
- Sharing a world safely, with parent-managed accounts
- Community guidelines
- Collaborative development

Projects built:

- Simple obby (obstacle course)
- Basic tycoon game
- Adventure map
- Multiplayer arena

Practice: Build one obby and improve it after a friend tries it

Roblox: First Lua Scripts

Topics:

- Roblox Studio advanced tools
- Lua scripting basics
- Variables and functions in Lua
- Events and triggers
- GUI creation
- Leaderboards and stats
- Advanced terrain
- Particle effects

      - Animation editor
      - Blocks to text: seeing your Scratch instincts inside Lua
    Projects built:
      - Tycoon game with working buttons
      - Adventure map with scripted surprises
      - Obby with checkpoints and a leaderboard
    Practice: Write 5 small Lua scripts that change your world
  Data Detective
    Topics:
      - What is data science?
      - Collecting data responsibly
      - Google Sheets for data
      - Basic statistics concepts
      - Creating surveys with Google Forms
      - Data visualization basics
      - Charts and graphs
      - Infographic creation
      - Data storytelling
      - Privacy and data ethics
      - Real-world data projects
    Projects built:
      - School survey analysis
      - Weather data tracking
      - Sports statistics dashboard
      - Environmental data project
    Practice: Run one real survey and chart what it says
    Assessment: Month 7 check: explain one chart honestly, plus mixed questions from
    earlier phases

Month 8: 3D Worlds and Your Own AI (Weeks 29-32)
  Tinkercad 3D Design
    Topics:
      - 3D modeling basics
      - Tinkercad interface
      - Basic shapes and operations
      - Grouping and aligning
      - Hole creation
      - Precise measurements
      - 3D printing preparation
      - Circuit simulation
      - Arduino simulation
      - Codeblocks in Tinkercad
      - Importing and exporting
      - Design thinking process
    Projects built:
      - 3D printed keychain design
      - Architectural model
      - Arduino circuit simulation
      - Mechanical toy design
    Practice: Design 5 3D models, one of them useful at home
  VR and AR Worlds in CoSpaces
    Topics:
      - Introduction to CoSpaces Edu
      - 3D scene creation
      - CoBlocks programming
      - Physics in virtual worlds
      - Character animation
      - Sound and music in 3D
      - VR experience design
      - AR marker creation
      - 360° environments
      - Interactive museums
      - Virtual field trips
      - Publishing VR experiences
    Projects built:
      - Virtual museum tour
      - AR treasure hunt
      - VR escape room
      - Interactive 3D story
    Practice: Build one small VR scene and one AR surprise
  AI Inside Your Games
    Topics:
      - Putting a trained model inside a Scratch game
      - Gesture controls: playing a game with your hands
      - Sound-activated animations and effects
      - When the model is wrong: making games fail kindly
      - Fairness: testing your model with different people
      - AI ethics for kids, in plain words
      - Planning an AI-powered capstone

```
      Projects built:
        - Gesture-controlled game
        - Sound-activated pet
        - A model tested fairly across the whole family
      Practice: Improve one model by collecting better training examples
    Phase 3 Capstone
      Topics:
        - Choosing the capstone: a Minecraft build, a Roblox world or an AI-powered game
        - Planning with a checklist, building in small steps
        - Testing with a real player
        - Presenting: what it does, how it works, what was hard
        - A cumulative review of phases 1-3
      Projects built:
        - Phase capstone: one world or AI project, finished and demonstrated
      Practice: Prepare a two-minute demo of the capstone
      Assessment: Phase 3 exam: capstone demo plus a mixed challenge from all three phases

---------------------------------------------------------------
PHASE 4: THE BRIDGE TO REAL CODE (MONTHS 9-10, WEEKS 33-40)
---------------------------------------------------------------
The step every parent asks about, done gently and properly: from blocks to first typed
Python, a first web page, and a final capstone with a real exam.

  Month 9: First Typed Code (Weeks 33-36)
    From Blocks to Text
      Topics:
        - Reading the JavaScript behind your MakeCode games
        - Every block is a line of code: the big reveal
        - Typing skills for coders: a gentle start
        - What stays the same: loops, ifs and variables in any language
        - What changes: spelling matters now
        - Errors are clues: reading messages without fear
        - Choosing the right tool for each idea
      Projects built:
        - The same tiny game shown in blocks and in text, side by side
      Practice: Convert 3 small block programs to text with the toggle
    First Python with Turtle
      Topics:
        - Why learn text-based coding?
        - Python in the browser: zero setup for the first weeks
        - Python Turtle graphics
        - Variables and data types
        - Print statements and input
        - Comments and documentation
        - Basic math operations
        - String manipulation
        - Converting blocks to Python
        - Debugging Python code
      Projects built:
        - Turtle art generator
        - Mad libs game in Python
        - A talking quiz program
      Practice: Recreate 3 Scratch projects as tiny Python programs
    My First Web Page
      Topics:
        - How websites work
        - HTML structure and tags
        - Creating web pages
        - Links and navigation
        - Images and media
        - CSS introduction
        - Selectors and properties
        - Colors and fonts
        - Box model
      Projects built:
        - A hand-typed page about your favorite thing
        - Photo gallery page
        - A page about your best projects
      Practice: Build one more page about anything you love
    Creator Habits
      Topics:
        - Your project gallery: choosing your best work
        - Explaining a project in three sentences
        - Safe sharing: what a portfolio shows and what it never shows
        - Debugging rituals: what to try before asking for help
        - How coders learn new things on purpose
        - Planning the final capstone
      Projects built:
        - A tidy portfolio of the journey's best 8 projects
```

Practice: Write one proud sentence for each portfolio project
Assessment: Month 9 check: a mixed challenge spanning Python, web and earlier phases

Month 10: Capstone and Demo Day (Weeks 37-40)
Capstone Planning
Topics:
- Choosing the final project: game, app, world or AI project, your call
- A one-page plan: what it is, who it is for, what makes it special
- Breaking the build into four small steps
- Collecting art, sounds and ideas before building
- The first working slice by the end of the week
Projects built:
- Capstone plan approved plus the first working slice
Practice: Show the plan to your family and collect one suggestion
Capstone Build
Topics:
- Building in small steps that always run
- Instructor checkpoints and course corrections
- Using everything: logic, art, sound, data, maybe AI
- Testing with real players and acting on what they say
- Cutting ideas kindly: finishing beats adding
- Preparing the demo: the story of the build
Projects built:
- The final capstone, built over two weeks and genuinely finished
Practice: A little building every day; always keep it working
Demo Day and What Comes Next
Topics:
- Presenting the capstone to the batch and parents
- The hardest bug story: what went wrong and how you fixed it
- The journey in numbers: projects built, skills earned
- What comes next: Python for Kids, Roblox, Minecraft or Web Development
- Keeping the spark: healthy creating habits at home
Projects built:
- Demo day presentation, delivered proudly
Assessment: FINAL EXAM: capstone demo plus a friendly viva and a mixed quiz drawn from the whole journey. Passing earns the certificate; a child who falls short gets focused revision and a free retest

PROJECTS THE STUDENT BUILDS AND KEEPS

- Phase 1: animations, interactive stories, classic game clones and an original Scratch capstone game
- Phase 2: MakeCode arcade games, micro:bit inventions, and real mobile apps installed on the family phone
- Phase 3: Minecraft Education builds, Roblox worlds with first Lua scripts, 3D models, and AI models they train themselves
- Phase 4: first Python programs, a hand-typed web page, and a final capstone presented at demo day

Total projects: 40+ real projects, from a first animation to an AI-powered capstone

SKILLS THE STUDENT WILL HAVE AT THE END

- Block coding fluency: Scratch, Code.org, MakeCode and Blockly, used with real intent
- Game design: mechanics, fairness, levels and difficulty, learned by building and playtesting
- App building: real mobile apps in MIT App Inventor, tested by real family users
- World building: Minecraft Education coding and Roblox Studio with first Lua scripts
- Kid-safe AI: training and testing image and sound models, and using them inside projects
- The bridge to text: first Python with turtle graphics and a first hand-written web page
- Thinking skills: sequencing, debugging, patience, and explaining your own work

HOW A TYPICAL WEEK IS SPLIT

Live classes: 2 live one-hour classes per week, building along with the teacher
Homework: A small homework build after every class, and a mixed-review challenge at the end of every month
Practice: 2-3 hours of guided practice between classes, structured as play
Review: Every submitted project gets teacher feedback; recurring gaps are reopened in class

SUPPORT INCLUDED

Doubt support: WhatsApp doubt support between classes, so no child stays stuck and discouraged
Progress updates: Regular progress notes to parents: what was built, what comes next, and how to encourage practice at home

CERTIFICATION DETAIL

Completion: Certificate from Modern Age Coders, awarded on passing the final exam, a project

demo plus a friendly viva. A child who falls short gets focused revision and a free retest: the certificate certifies knowledge, not attendance

WHERE THIS CAN LEAD

- Python for Kids: the natural next step once the block-to-text bridge is crossed
- Roblox Game Coding: deeper Lua scripting for kids who loved building worlds
- Minecraft Coding: more automation and invention inside Minecraft
- Web Development for Kids: from a first page to real interactive sites
- School wins: computational thinking that shows up in maths and science class

COMMON QUESTIONS ABOUT THIS COURSE

For anything about cost, use PART 4 and RULE 1. Do not quote two regions.

Q: What does my child build in this coding course?
A: More than 40 real projects across ten months: animations and complete games in Scratch, arcade games in MakeCode, micro:bit inventions, a real mobile app built in MIT App Inventor and installed on a family phone, coding projects inside Minecraft Education, a Roblox world with first Lua scripts, AI models they train themselves, and finally their first typed Python programs and a hand-written web page. Every project is the child's own work, reviewed by the teacher.

Q: What age should my child be to start coding?
A: The course runs from age 6 to 12, and batches are grouped by age: 6 to 8 year olds start gently and stay in visual tools longer, while 9 to 12 year olds move faster and reach Roblox scripting and Python sooner. Only comfortable reading is needed, no typing skill and no prior coding.

Q: How long does it take a child to learn coding?
A: The journey from zero to the final capstone takes most children 10 months at 2 live classes a week. The syllabus deliberately keeps 2 months of margin in hand: younger children or busy school terms stretch the same journey to 12 months with no rushing and no penalty. Real progress shows immediately, a child has a working animation in the very first class.

Q: How is my child assessed? Is the certificate just for attending?
A: No. There is classwork in every session, a small homework build after every class, and a monthly challenge that mixes new questions with earlier topics so skills stay sharp instead of fading. Each phase ends with a cumulative check, and the course ends with a final exam: a capstone demo plus a friendly viva and a mixed quiz. Passing earns the certificate; a child who falls short gets focused revision and a free retest. It is all gentle, and all real: we optimize for real knowledge, not a stream of feel-good badges.

Q: Is this just more screen time?
A: It is the opposite kind of screen time. Instead of consuming videos and games, children spend the hours making them: designing, building, testing and fixing their own projects. Parents consistently report the shift, the child starts asking how things work instead of just asking for the tablet. Safe digital habits are taught explicitly alongside.

Q: How is AI taught to children this young?
A: Hands-on and kid-safe. Children train their own image and sound models using Machine Learning for Kids and Google's Teachable Machine, both built for classrooms, then use those models inside their own games, a pet that reacts to sounds, a game controlled by gestures. There are no open chatbots in the kids' course; the point is understanding how AI learns, including how it gets things wrong.

Q: Which platforms are used, and are they free?
A: The core platforms, Scratch, Code.org, MakeCode, MIT App Inventor, Tinkercad and Teachable Machine, are free and browser-based. Minecraft Education and Roblox Studio are free to build in, with accounts set up together with a parent. A computer or laptop with internet is enough; no hardware kits are required, the micro:bit is taught in its full browser simulator.

Q: What happens after this course?
A: The final phase builds the bridge on purpose: children finish having already written first Python programs and a first web page. From there they step naturally into our Python for Kids, Roblox Game Coding, Minecraft Coding or Web Development for Kids courses, choosing the direction that pulled them hardest during the journey.

Q: Is there a free trial class?
A: Yes. You can book a free demo at learn.modernagecoders.com/contact with zero commitment, and many parents sit in on the demo to see the teaching style for themselves. We hold a 4.9 rating across 547 Google reviews, and the demo class is where most of those families started. (Agent note: the free demo is a waiting list with no fixed date. The Priority Live Demo is a guaranteed class today or tomorrow, booked at https://learn.modernagecoders.com/priority-demo . Offer both, as RULE 3 says.)

Q: Are these live classes or videos?
A: Every session is a live 1-hour online class taught by a real teacher; we never substitute pre-recorded videos. Groups stay small and interactive, so children build along during class

rather than just watching, and the teacher sees and fixes small confusions before they grow.

To enrol, message Shivam Sir on +91 9123366161 or send the parent this link: https://learn.modernagecoders.com/courses/kids-coding-blocks-masterclass
For a demo: the Priority Live Demo (guaranteed, today or tomorrow) is booked at https://learn.modernagecoders.com/priority-demo . The free demo is a waiting list with no fixed date.

==========

COURSE 42 OF 137: COLLEGE MATHS COURSE: CALCULUS, LINEAR ALGEBRA TO ANALYSIS

==========

Course link: https://learn.modernagecoders.com/courses/college-mathematics-complete-masterclass
Subject area: College Mathematics
Designed for: College students, Girls only batches
Who can join: College and university students; placement by current course and semester
Course length: 10-12 months per track (3 tracks, joinable any month)
Time needed: 2 live classes/week + 4-6 hours problem practice
Certificate: Track certificate from Modern Age Coders, awarded on passing each track exam

PRICE FOR THIS COURSE (quote only the one that applies to the person asking)
In India, per month: group Rs 1,499, mini batch Rs 2,999, one to one Rs 4,999
Outside India, per month: group $100, one to one $150
Classes: group and mini batch two live classes a week, eight a month; one to one in India one live class a week, four a month; one to one outside India two live classes a week, eight a month. Each class is one hour.

WHAT THIS COURSE IS

College maths course, live online: three academic-year tracks from calculus and linear algebra to probability, real analysis and abstract algebra.

In one line: The undergraduate core, taught the way it should have been: three academic-year tracks, placed against your actual syllabus, proofs included.

ABOUT THE PROGRAMME

University mathematics has a famous problem: lectures move at the speed of the syllabus, not the student, and one missed fortnight of calculus compounds into a lost semester. This live online program is the counterweight. It maps the undergraduate core into three honest tracks, each one academic year long, and places every student by their current course and semester, an engineering first-year lands in Track 1 calculus, a BSc student facing real analysis lands in Track 3. Track 1 is the first-year core: single-variable calculus done properly, linear algebra from vectors to eigenvalues, proof writing, and multivariable calculus. Track 2 is the methods year: multiple integration, ordinary differential equations and Laplace transforms, discrete mathematics, and a full treatment of probability and statistics. Track 3 is where mathematics becomes a discipline: real analysis, abstract algebra, topology and complex analysis, taught with rigorous proofs but at a human pace, with the intuition drawn before the epsilon arrives. Each track runs 10 months at two live classes a week plus four to six hours of problem practice, with up to 12 months for students who need more, the pace adapts. Assessment is honest: problem sets after every class, monthly mixed reviews that reach back deliberately, and a track exam at the end that decides the certificate, with focused revision and a free retest for those who fall short. Real knowledge, real proofs, depth over dopamine.

WHAT MAKES THIS COURSE DIFFERENT

- Placement by syllabus, not marketing: a short diagnostic maps you to the right track and the right month
- Proofs taught as a skill: intuition first, then rigor, the way strong departments actually teach it
- Built to run alongside university: the tracks mirror standard BSc and engineering syllabi, so class work and university work reinforce each other
- Problem practice over passive watching: every concept is drilled through graded problem sets with written feedback
- An honest year per track with 2 months of margin: students who need more time take up to 12 months, nobody is rushed
- Real assessment: weekly problem sets, monthly mixed reviews, and a track exam that decides the certificate, with focused revision and a free retest

THE LEARNING PATH, STEP BY STEP

Phase 1: Track 1, the first-year core (one academic year): calculus I-II, linear algebra, proof writing and multivariable calculus
Phase 2: Track 2, the methods year (one academic year): multiple integrals, ODEs and Laplace, discrete mathematics, probability and statistics
Phase 3: Track 3, the discipline (one academic year): real analysis, abstract algebra, topology and complex analysis

WHAT A STUDENT NEEDS BEFORE STARTING

Maths background: Track 1 assumes school mathematics (Class 12 or equivalent). Tracks 2 and 3 assume the earlier track or its university equivalent; placement checks this honestly
Equipment: A computer or tablet with a stable internet connection; paper and pen remain the real tools
Age: College and university students, and returning learners rebuilding their mathematics
Time commitment: 2 live classes plus 4-6 hours of problem practice a week

WHO THIS COURSE IS FOR

Engineering students: First and second years drowning in the calculus-to-ODEs pipeline their branch assumes
Bsc msc students: Mathematics majors who want analysis and algebra taught with patience the lecture hall never has
Placement aspirants: Students strengthening the quantitative core for data science and analytics paths
Returning learners: Graduates and professionals rebuilding real mathematics for research or higher study
Proof beginners: Anyone hitting the proofs wall for the first time and wanting to climb it properly

FULL CURRICULUM, WEEK BY WEEK

This is the complete teaching plan. Parents can ask about any week.

PHASE 1: TRACK 1, CALCULUS AND LINEAR ALGEBRA (ONE ACADEMIC YEAR)

The first-year core: limits to integrals, vectors to eigenvalues, the craft of proof, and multivariable calculus, built with intuition before rigor.

Months 1-2: Single Variable Calculus I (Weeks 1-8)
Limits and Continuity
Topics:
- Review of functions: domain, range, composition
- Inverse functions and their properties
- Exponential and logarithmic functions
- Trigonometric functions and identities
- Intuitive notion of limits
- Formal epsilon-delta definition of limits
- Limit laws and computation techniques
- One-sided limits and infinite limits
- Limits at infinity and horizontal asymptotes
- Continuity at a point and on intervals
- Intermediate Value Theorem
- Types of discontinuities
Projects built:
- Epsilon-delta proof visualizer
- Limit calculator implementation
- Continuity explorer interactive tool
Practice: Complete 100 limit problems with epsilon-delta proofs
Differentiation
Topics:
- Definition of derivative as a limit
- Geometric interpretation: tangent lines
- Physical interpretation: rates of change
- Differentiability and continuity relationship
- Basic differentiation rules: power, constant, sum
- Product rule and quotient rule
- Chain rule and implicit differentiation
- Derivatives of trigonometric functions
- Derivatives of exponential and logarithmic functions
- Inverse function derivatives
- Higher-order derivatives
- Logarithmic differentiation
Projects built:
- Derivative visualizer application
- Automatic differentiation engine
- Physics motion simulator
Practice: Master 200 differentiation problems including proofs
Applications of Derivatives
Topics:
- Linear approximation and differentials
- L'Hôpital's Rule for indeterminate forms
- Critical points and extrema
- First Derivative Test
- Second Derivative Test
- Concavity and inflection points

- Curve sketching comprehensive method
- Optimization problems
- Related rates problems
- Mean Value Theorem
- Rolle's Theorem
- Newton's Method for root finding

Projects built:

- Optimization problem solver
- Curve sketching software
- Newton's method visualizer

Practice: Solve 150 application problems with full solutions

Integration Fundamentals

Topics:

- Antiderivatives and indefinite integrals
- Definite integrals and Riemann sums
- Fundamental Theorem of Calculus Part I
- Fundamental Theorem of Calculus Part II
- Basic integration rules
- U-substitution method
- Integration of trigonometric functions
- Integration of exponential and logarithmic functions
- Area between curves
- Volumes by cross-sections
- Volumes by cylindrical shells
- Average value of a function

Projects built:

- Riemann sum visualizer
- Numerical integration calculator
- Volume calculator for solids of revolution

Practice: Complete 200 integration problems

Assessment: Months 1-2 check: a mixed calculus paper, limits through integrals, with full written feedback

Months 3-4: Calculus II and Linear Algebra I (Weeks 9-17)

Advanced Integration Techniques

Topics:

- Integration by parts
- Trigonometric integrals and substitutions
- Partial fraction decomposition
- Rational function integration
- Improper integrals Type I and II
- Comparison tests for improper integrals
- Numerical integration: Trapezoidal rule
- Simpson's rule and error bounds
- Arc length calculations
- Surface area of revolution
- Work, force, and energy applications
- Center of mass and moments

Projects built:

- Advanced integration solver
- Numerical methods comparison tool
- Physics applications simulator

Practice: Master 150 advanced integration problems

Sequences and Series

Topics:

- Sequences: convergence and divergence
- Monotonic sequences and bounded sequences
- Series and partial sums
- Geometric series and telescoping series
- Divergence test and p-series
- Comparison tests and limit comparison test
- Ratio test and root test
- Alternating series test and error bounds
- Absolute vs conditional convergence
- Power series and radius of convergence
- Taylor and Maclaurin series
- Taylor polynomial approximations and error

Projects built:

- Series convergence analyzer
- Taylor series visualizer
- Function approximation tool

Practice: Analyze 100 series for convergence with proofs

Linear Algebra: Vectors and Matrices

Topics:

- Vector spaces: R^n and axioms
- Vector operations: addition, scalar multiplication
- Dot product and cross product
- Vector projections and orthogonality
- Linear combinations and span

- Linear independence and dependence
- Matrix operations: addition, multiplication
- Matrix transpose and properties
- Special matrices: identity, diagonal, symmetric
- Elementary row operations
- Row echelon form and reduced row echelon form
- Gaussian elimination algorithm

Projects built:

- Matrix calculator implementation
- Vector visualization tool
- Gaussian elimination solver

Practice: Complete 150 linear algebra computations

Systems of Linear Equations

Topics:

- Consistent vs inconsistent systems
- Homogeneous systems and nontrivial solutions
- Matrix representation of systems
- Augmented matrices and RREF
- Parametric solutions and free variables
- Matrix inverses and invertibility
- Computing inverses using row operations
- Determinants: definition and properties
- Cofactor expansion and row operations
- Cramer's rule for solving systems
- Applications to network flow
- Applications to economics and engineering

Projects built:

- Linear system solver application
- Determinant calculator
- Network flow optimizer

Practice: Solve 100 systems using various methods

Mathematical Proof Writing

Topics:

- Logic and truth tables
- Quantifiers: universal and existential
- Direct proof technique
- Proof by contradiction
- Proof by contrapositive
- Mathematical induction
- Strong induction and well-ordering
- Proof by cases
- Existence and uniqueness proofs
- Counterexamples
- Writing clear mathematical arguments
- Common proof strategies and patterns

Projects built:

- Proof verification system
- Logic truth table generator
- Induction proof template builder

Practice: Write 50 rigorous mathematical proofs

Assessment: Mid-track check: proof writing plus mixed questions reaching back to month 1

Months 5-6: Advanced Linear Algebra and Vector Calculus (Weeks 18-26)

Eigenvalues and Eigenvectors

Topics:

- Eigenvalue and eigenvector definition
- Characteristic polynomial
- Finding eigenvalues and eigenvectors
- Algebraic and geometric multiplicity
- Diagonalization of matrices
- Powers of diagonalizable matrices
- Orthogonal matrices and rotations
- Symmetric matrices and spectral theorem
- Quadratic forms
- Principal axes theorem
- Applications to differential equations
- Applications to Markov chains

Projects built:

- Eigenvalue calculator and visualizer
- Matrix diagonalization tool
- Markov chain simulator

Practice: Find eigenvalues/eigenvectors for 100 matrices

Vector Spaces and Linear Transformations

Topics:

- Abstract vector spaces and subspaces
- Basis and dimension
- Coordinate systems and change of basis
- Row space, column space, null space

- Rank-nullity theorem
- Linear transformations: definition and properties
- Kernel and image of linear transformation
- Matrix representation of linear transformations
- Composition of linear transformations
- Isomorphisms and invertible transformations
- Similarity of matrices
- Jordan canonical form introduction

Projects built:
- Linear transformation visualizer
- Change of basis calculator
- Subspace dimension finder

Practice: Analyze 75 linear transformations

Multivariable Functions and Partial Derivatives

Topics:
- Functions of several variables
- Level curves and level surfaces
- Limits in multiple dimensions
- Continuity for multivariable functions
- Partial derivatives: definition and notation
- Higher-order partial derivatives
- Clairaut's theorem on mixed partials
- Tangent planes and linear approximation
- The gradient vector and directional derivatives
- The chain rule for multivariable functions
- Implicit differentiation in multiple variables
- Jacobian matrices

Projects built:
- 3D function visualizer
- Gradient field plotter
- Tangent plane calculator

Practice: Compute 150 partial derivatives and gradients

Optimization and Vector Fields

Topics:
- Critical points in multiple dimensions
- Second derivative test for two variables
- Hessian matrix and definiteness
- Global vs local extrema
- Constrained optimization: Lagrange multipliers
- Multiple constraints
- Vector fields and flow lines
- Conservative vector fields
- Potential functions
- Divergence and curl
- Physical interpretations
- Applications to physics and engineering

Projects built:
- Multivariable optimization solver
- Vector field simulator
- Lagrange multiplier visualizer

Practice: Solve 100 optimization problems

Track 1 Exam

Topics:
- Integration of calculus and linear algebra
- Comprehensive problem solving
- Proof portfolio creation
- Mathematical writing
- Presentation skills

Projects built:
- MAJOR CAPSTONE: Mathematical Modeling Project
- Options: Population dynamics, Economic models, Engineering systems
- Complete proof portfolio with 25 original proofs
- Implementation of numerical methods library

Assessment: TRACK 1 EXAM: a written paper mixing the whole track, calculus, linear algebra and one honest proof. Passing earns the Track 1 certificate; falling short earns focused revision and a free retest

---

PHASE 2: TRACK 2, DIFFERENTIAL EQUATIONS, DISCRETE MATHS AND PROBABILITY (ONE ACADEMIC YEAR)

The methods year every engineering and science degree leans on: multiple integration, ODEs and Laplace transforms, discrete mathematics, and probability and statistics done properly.

Months 1-2: Multiple Integration and ODEs (Weeks 1-9)

Double and Triple Integrals

Topics:
- Double integrals over rectangles
- Iterated integrals and Fubini's theorem
- Double integrals over general regions

    - Reversing order of integration
    - Double integrals in polar coordinates
    - Applications: area, volume, mass
    - Center of mass and moments of inertia
    - Triple integrals in rectangular coordinates
    - Triple integrals in cylindrical coordinates
    - Triple integrals in spherical coordinates
    - Change of variables: Jacobians
    - Applications to probability and physics
  Projects built:
    - Multiple integral calculator
    - Volume visualization tool
    - Coordinate system converter
  Practice: Evaluate 150 multiple integrals
Line and Surface Integrals
  Topics:
    - Parametric curves and arc length
    - Line integrals of scalar functions
    - Line integrals of vector fields
    - Work and circulation
    - Fundamental theorem for line integrals
    - Green's theorem and applications
    - Parametric surfaces
    - Surface area calculations
    - Surface integrals of scalar functions
    - Surface integrals of vector fields (flux)
    - Stokes' theorem
    - Divergence theorem (Gauss's theorem)
  Projects built:
    - Line integral visualizer
    - Surface parametrization tool
    - Vector calculus theorem demonstrator
  Practice: Complete 100 vector calculus problems
First-Order Differential Equations
  Topics:
    - Classification of differential equations
    - Direction fields and solution curves
    - Separable equations
    - Linear first-order equations
    - Integrating factors method
    - Exact equations and exactness test
    - Homogeneous equations
    - Bernoulli equations
    - Existence and uniqueness theorems
    - Numerical methods: Euler's method
    - Improved Euler and Runge-Kutta
    - Applications to physics, biology, economics
  Projects built:
    - ODE solver implementation
    - Direction field plotter
    - Numerical methods comparison
  Practice: Solve 150 first-order ODEs
Higher-Order Linear ODEs
  Topics:
    - Second-order linear equations
    - Homogeneous equations with constant coefficients
    - Characteristic equation method
    - Complex roots and oscillations
    - Repeated roots and reduction of order
    - Nonhomogeneous equations
    - Method of undetermined coefficients
    - Variation of parameters
    - Higher-order linear equations
    - Systems of first-order linear equations
    - Matrix exponentials
    - Phase plane analysis
  Projects built:
    - Second-order ODE solver
    - Oscillation simulator
    - Phase portrait generator
  Practice: Solve 100 higher-order ODEs
Laplace Transforms
  Topics:
    - Definition and existence of Laplace transform
    - Transforms of basic functions
    - Linearity and shifting theorems
    - Transforms of derivatives and integrals
    - Inverse Laplace transforms
    - Partial fraction decomposition for inverse transforms

```
      - Convolution theorem
      - Solving ODEs with Laplace transforms
      - Systems of ODEs via Laplace
      - Transfer functions
      - Applications to control theory
      - Discontinuous forcing functions
    Projects built:
      - Laplace transform calculator
      - Control system analyzer
      - ODE system solver via Laplace
    Practice: Apply Laplace transforms to 75 problems
    Assessment: Months 1-2 check: an ODE-and-integration paper with one modeling question

Months 3-4: Discrete Mathematics (Weeks 10-18)
  Set Theory and Relations
    Topics:
      - Naive set theory and paradoxes
      - Set operations: union, intersection, complement
      - Power sets and Cartesian products
      - Functions as relations
      - Injective, surjective, bijective functions
      - Cardinality and countability
      - Cantor's diagonal argument
      - Relations: reflexive, symmetric, transitive
      - Equivalence relations and partitions
      - Partial orders and Hasse diagrams
      - Well-ordering principle
      - Axiom of choice introduction
    Projects built:
      - Set operation visualizer
      - Relation property checker
      - Cardinality comparison tool
    Practice: Prove 75 set theory theorems
  Combinatorics
    Topics:
      - Basic counting principles
      - Permutations and combinations
      - Binomial theorem and Pascal's triangle
      - Multinomial coefficients
      - Inclusion-exclusion principle
      - Pigeonhole principle
      - Generating functions
      - Recurrence relations
      - Solving linear recurrences
      - Catalan numbers
      - Stirling numbers
      - Partitions of integers
    Projects built:
      - Combinatorics calculator
      - Recurrence relation solver
      - Generating function manipulator
    Practice: Solve 100 combinatorics problems
  Graph Theory
    Topics:
      - Graphs: vertices, edges, degree
      - Types of graphs: simple, directed, weighted
      - Graph representations: adjacency matrix, list
      - Paths, cycles, and connectivity
      - Trees and spanning trees
      - Minimum spanning trees: Kruskal, Prim
      - Shortest paths: Dijkstra, Bellman-Ford
      - Eulerian and Hamiltonian paths
      - Graph coloring and chromatic number
      - Planar graphs and Euler's formula
      - Bipartite graphs and matching
      - Network flows and max-flow min-cut
    Projects built:
      - Graph algorithm visualizer
      - Network flow optimizer
      - Graph coloring solver
    Practice: Implement 20 graph algorithms
  Number Theory
    Topics:
      - Divisibility and greatest common divisors
      - Euclidean algorithm and extended version
      - Prime numbers and fundamental theorem
      - Modular arithmetic
      - Chinese Remainder Theorem
      - Fermat's Little Theorem
```

- Euler's theorem and totient function
- Wilson's theorem
- Quadratic residues
- Primitive roots
- RSA cryptography basics
- Diophantine equations

Projects built:

- Number theory toolkit
- RSA encryption implementation
- Prime number generator

Practice: Prove 50 number theory results

Boolean Algebra and Logic

Topics:

- Boolean operations and laws
- Truth tables and logical equivalence
- Normal forms: DNF and CNF
- Karnaugh maps
- Logic gates and circuits
- Minimization of Boolean functions
- Propositional logic and inference rules
- Predicate logic and quantifiers
- Formal proofs in logic
- Completeness and soundness
- Introduction to model theory
- Applications to computer science

Projects built:

- Logic circuit simulator
- Boolean function minimizer
- Automated theorem prover

Practice: Design 30 logic circuits

Assessment: Months 3-4 check: a discrete mathematics paper, with revision questions from months 1-2

Months 5-6: Probability, Statistics and the Track Exam (Weeks 19-26)

Probability Theory

Topics:

- Sample spaces and events
- Probability axioms and properties
- Conditional probability
- Bayes' theorem and applications
- Independence of events
- Random variables: discrete and continuous
- Probability mass and density functions
- Cumulative distribution functions
- Expected value and variance
- Moment generating functions
- Common discrete distributions
- Common continuous distributions

Projects built:

- Probability distribution visualizer
- Bayes' theorem calculator
- Monte Carlo simulator

Practice: Solve 150 probability problems

Joint Distributions and Limit Theorems

Topics:

- Joint probability distributions
- Marginal and conditional distributions
- Independence of random variables
- Covariance and correlation
- Conditional expectation
- Transformations of random variables
- Order statistics
- Law of large numbers
- Central limit theorem
- Normal approximations
- Characteristic functions
- Convergence concepts

Projects built:

- Joint distribution plotter
- CLT demonstration tool
- Correlation analyzer

Practice: Analyze 100 joint distributions

Statistical Inference

Topics:

- Point estimation: MLE and method of moments
- Properties of estimators: bias, consistency
- Confidence intervals
- Hypothesis testing framework
- Type I and Type II errors

        - Power of tests
        - t-tests and chi-square tests
        - ANOVA basics
        - Nonparametric tests
        - Linear regression
        - Multiple regression
        - Model diagnostics
      Projects built:
        - Statistical test suite
        - Regression analysis tool
        - Power analysis calculator
      Practice: Perform 75 statistical analyses
    Stochastic Processes
      Topics:
        - Introduction to stochastic processes
        - Markov chains: discrete time
        - Transition matrices and steady states
        - Classification of states
        - Absorbing Markov chains
        - Continuous-time Markov chains
        - Poisson processes
        - Birth-death processes
        - Queueing theory basics
        - Brownian motion introduction
        - Random walks
        - Applications to finance and biology
      Projects built:
        - Markov chain simulator
        - Queue system analyzer
        - Random walk visualizer
      Practice: Model 50 stochastic systems
    Track 2 Exam
      Topics:
        - Integration of discrete and continuous mathematics
        - Statistical modeling project
        - Algorithm implementation
        - Research paper reading
        - Technical presentation
      Projects built:
        - MAJOR CAPSTONE: Applied Mathematics Research Project
        - Options: Machine learning algorithm, Cryptographic system, Statistical study
        - Graph theory application to real networks
        - Probability model for real phenomenon
      Assessment: TRACK 2 EXAM: a written paper mixing ODEs, discrete mathematics and
      probability, with questions reaching back across the year. Passing earns the Track 2
      certificate; falling short earns focused revision and a free retest

---
PHASE 3: TRACK 3, ANALYSIS, ALGEBRA AND BEYOND (ONE ACADEMIC YEAR)

Where mathematics becomes a discipline: real analysis, abstract algebra, topology and complex
analysis, rigorous but humane, intuition drawn before every epsilon.

  Months 1-3: Real Analysis (Weeks 1-9)
    Metric Spaces and Sequences
      Topics:
        - Metric spaces: definition and examples
        - Open and closed sets
        - Interior, closure, and boundary
        - Convergent sequences in metric spaces
        - Cauchy sequences and completeness
        - Compactness: sequential and open cover
        - Heine-Borel theorem
        - Connected spaces
        - Continuous functions between metric spaces
        - Uniform continuity
        - Lipschitz continuity
        - Homeomorphisms
      Projects built:
        - Metric space visualizer
        - Compactness checker
        - Continuity analyzer
      Practice: Prove 100 metric space theorems
    Limits and Continuity in R^n
      Topics:
        - The real numbers: completeness axiom
        - Supremum and infimum
        - Sequences and series of real numbers
        - Limit superior and limit inferior

- Functions of real variables
- Continuity and uniform continuity on R
- Intermediate value theorem proof
- Extreme value theorem proof
- Monotone functions
- Functions of bounded variation
- Absolutely continuous functions
- Discontinuities classification

Projects built:

- Real function analyzer
- Continuity proof assistant
- Convergence tester

Practice: Complete 75 epsilon-delta proofs

Differentiation Theory

Topics:

- Derivative as linear approximation
- Differentiability in R^n
- Partial derivatives vs differentiability
- Chain rule proof
- Mean value theorem and generalizations
- Taylor's theorem with remainder
- Inverse function theorem
- Implicit function theorem
- Critical point analysis
- Morse lemma
- Sard's theorem introduction
- Applications to optimization

Projects built:

- Differentiation proof checker
- Taylor approximation tool
- Critical point classifier

Practice: Prove 50 differentiation theorems

Riemann Integration

Topics:

- Riemann integral construction
- Riemann integrability conditions
- Properties of Riemann integral
- Fundamental theorem of calculus proof
- Integration techniques review
- Improper Riemann integrals
- Functions of bounded variation
- Riemann-Stieltjes integral
- Convergence theorems limitations
- Counterexamples in integration
- Numerical integration error analysis
- Applications to probability

Projects built:

- Riemann sum visualizer
- Integrability checker
- Numerical integration analyzer

Practice: Analyze 75 integration problems rigorously

Sequences and Series of Functions

Topics:

- Pointwise convergence
- Uniform convergence
- Weierstrass M-test
- Continuity of uniform limits
- Integration of uniform limits
- Differentiation of uniform limits
- Power series and radius of convergence
- Analytic functions
- Weierstrass approximation theorem
- Stone-Weierstrass theorem
- Fourier series introduction
- Convergence of Fourier series

Projects built:

- Convergence visualizer
- Fourier series calculator
- Function approximator

Practice: Prove convergence for 50 function sequences

Assessment: Analysis check: two full proofs written under exam conditions, marked line by line

Months 4-6: Abstract Algebra (Weeks 10-17)

Group Theory

Topics:

- Groups: axioms and examples
- Subgroups and subgroup tests
- Cyclic groups and generators

- Group homomorphisms
- Kernel and image
- Isomorphism theorems
- Normal subgroups and quotient groups
- Lagrange's theorem
- Group actions
- Orbit-stabilizer theorem
- Sylow theorems
- Classification of finite abelian groups

Projects built:

- Group calculator
- Cayley table generator
- Subgroup lattice visualizer

Practice: Prove 100 group theory results

Ring Theory

Topics:

- Rings: definition and examples
- Ring homomorphisms
- Ideals and quotient rings
- Prime and maximal ideals
- Integral domains
- Principal ideal domains
- Unique factorization domains
- Euclidean domains
- Polynomial rings
- Field of fractions
- Chinese remainder theorem for rings
- Localization of rings

Projects built:

- Ring structure analyzer
- Ideal calculator
- Polynomial factorization tool

Practice: Explore 75 ring structures

Field Theory

Topics:

- Fields: definition and examples
- Field extensions
- Algebraic and transcendental elements
- Degree of field extensions
- Splitting fields
- Algebraic closure
- Finite fields structure
- Cyclotomic fields
- Galois theory introduction
- Fundamental theorem of Galois theory
- Solvability by radicals
- Constructions with ruler and compass

Projects built:

- Field extension visualizer
- Galois group calculator
- Constructibility checker

Practice: Work through 50 field theory problems

Linear Algebra (Abstract)

Topics:

- Vector spaces over arbitrary fields
- Linear transformations abstract theory
- Dual spaces and dual basis
- Bilinear forms
- Quadratic forms
- Inner product spaces
- Orthogonalization: Gram-Schmidt
- Adjoint operators
- Normal operators
- Spectral theorem
- Singular value decomposition
- Tensor products

Projects built:

- Abstract linear algebra toolkit
- Inner product space explorer
- SVD calculator

Practice: Prove 75 abstract linear algebra theorems

Assessment: Algebra check: a structures paper spanning groups, rings and fields, plus one analysis revision question

Months 7-10: Topology, Complex Analysis and the Track Exam (Weeks 18-26)

General Topology

Topics:

- Topological spaces: definition and examples
- Basis and subbasis

- Closed sets and closure operators
- Interior and boundary
- Hausdorff spaces
- Continuous functions
- Homeomorphisms
- Connectedness
- Path connectedness
- Compactness
- Tychonoff's theorem
- Separation axioms

Projects built:
- Topology visualizer
- Homeomorphism checker
- Compactness prover

Practice: Prove 100 topology theorems

Complex Analysis

Topics:
- Complex numbers and complex plane
- Complex functions and analyticity
- Cauchy-Riemann equations
- Harmonic functions
- Complex integration
- Cauchy's theorem
- Cauchy integral formula
- Taylor and Laurent series
- Residues and residue theorem
- Evaluation of real integrals
- Conformal mappings
- Möbius transformations

Projects built:
- Complex function visualizer
- Residue calculator
- Conformal mapping tool

Practice: Solve 100 complex analysis problems

Advanced Complex Analysis

Topics:
- Maximum modulus principle
- Schwarz lemma
- Analytic continuation
- Riemann surfaces introduction
- Entire functions
- Meromorphic functions
- Infinite products
- Weierstrass factorization
- Gamma function
- Riemann zeta function
- Prime number theorem outline
- Applications to number theory

Projects built:
- Special functions library
- Riemann surface visualizer
- Zeta function explorer

Practice: Explore 50 special functions

Track 3 Capstone and Exam

Topics:
- Pure mathematics research project
- Original proof development
- Mathematical exposition
- Research paper writing
- Peer review process

Projects built:
- A written capstone: one substantial theorem, its proof reconstructed and presented from understanding

Assessment: TRACK 3 EXAM: a proof-based paper across analysis, algebra, topology and complex analysis. Passing earns the Track 3 certificate, completing the program; falling short earns focused revision and a free retest

PROJECTS THE STUDENT BUILDS AND KEEPS

- Track 1: applied optimization studies, an eigenvalue applications mini-project, and a proof portfolio
- Track 2: an ODE modeling project, graph theory applications, and a full statistical inference study on real data
- Track 3: a theorem capstone, reconstructed and presented, plus a growing portfolio of original proof write-ups

Total projects: A year-long problem-set portfolio per track, plus one substantial capstone project each

SKILLS THE STUDENT WILL HAVE AT THE END

- Calculus: limits through multivariable, computed fluently and understood geometrically
- Linear algebra: from solving systems to eigenvalues, vector spaces and transformations
- Differential equations: first and higher order ODEs, Laplace methods, and real modeling judgment
- Discrete mathematics: sets, combinatorics, graphs, number theory and logic
- Probability and statistics: distributions, limit theorems and honest statistical inference
- Real analysis: rigorous limits, continuity, differentiation and Riemann integration
- Abstract algebra: groups, rings and fields, with the structural thinking they train
- Proof craft: reading, writing and presenting mathematics like a mathematician

HOW A TYPICAL WEEK IS SPLIT

Live classes: 2 live classes per week, problems worked together, not lectured at
Homework: A problem set after every class, and a monthly mixed review that reaches back deliberately
Practice: 4-6 hours of graded problem practice between classes
Review: Every set marked with written feedback; recurring weaknesses reopened in class

SUPPORT INCLUDED

Doubt support: WhatsApp doubt support between classes, for the proof that refuses to close at midnight
Progress updates: Honest monthly progress reviews: what is solid, what is wobbly, and the plan for the wobble

CERTIFICATION DETAIL

Completion: A track certificate at the end of each track, awarded on passing the track exam. Fall short and there is focused revision and a free retest: the certificate certifies knowledge, not attendance

WHERE THIS CAN LEAD

- Graduate study: Track 3 is precisely the core masters admissions and entrance tests assume
- Data science and machine learning: the linear algebra, probability and optimization this program builds is the honest prerequisite
- Quantitative finance and analytics: probability and methods from Track 2 carry directly
- Research foundations: proof craft and analysis are the entry ticket to serious mathematics
- Teaching and mentoring: mathematics understood deeply enough to explain simply

COMMON QUESTIONS ABOUT THIS COURSE

For anything about cost, use PART 4 and RULE 1. Do not quote two regions.

Q: What does the College Mathematics program cover?
A: The undergraduate core, mapped into three academic-year tracks. Track 1: single-variable calculus, linear algebra, proof writing and multivariable calculus. Track 2: multiple integration, ordinary differential equations with Laplace transforms, discrete mathematics, and probability and statistics. Track 3: real analysis, abstract algebra, topology and complex analysis. You join the track and month that match your current syllabus, not a fixed conveyor belt.

Q: Which track should I join?
A: A short diagnostic and a conversation about your current semester decide it. Engineering first-years usually land in Track 1, second-years facing ODEs and probability in Track 2, and BSc mathematics students meeting analysis and algebra in Track 3. Since each track is joinable any month, you can also enter mid-track exactly where your university syllabus is hurting.

Q: How long does each track take?
A: One academic year: 10 months at 2 live classes a week plus 4 to 6 hours of problem practice, with up to 12 months for students who need more, the margin is built in deliberately. Nobody needs all three tracks at once; most students take the track their degree is currently testing them on.

Q: How is progress measured? Is the certificate just for attending?
A: No. Problem sets follow every class and come back marked with written feedback, monthly reviews deliberately mix current topics with earlier ones so nothing fades, and each track ends with a real exam, computational and proof-based, that decides the track certificate. Falling short earns a focused revision plan and a free retest. We optimize for real mathematical knowledge, not attendance.

Q: I am scared of proofs. Is this course for me?
A: Especially for you. Proof writing is taught as its own skill starting in Track 1, with intuition drawn first and rigor layered on: read proofs, complete proofs with gaps, then write your own with line-by-line feedback. Most students who fear proofs were simply never taught them as a craft; the fear rarely survives a term of doing it properly.

  Q: Can this run alongside my university semester?
  A: That is the design. The tracks mirror standard BSc and engineering syllabi, so the class
  becomes structured reinforcement of exactly what your lectures assume. For tight semester
  alignment, the 1-on-1 option follows your university's syllabus and past papers directly.

  Q: Is this useful preparation for graduate school?
  A: Yes, concretely: Track 3's analysis and algebra are the core that masters admissions,
  entrance tests and first-year graduate courses assume, and the proof portfolio built across
  the program is exactly the muscle those programs test. The pure-mathematics emphasis is
  deliberate; methods without rigor stop working at the graduate gate.

  Q: Can I try a class before committing?
  A: Yes, a free demo class with no commitment: book at learn.modernagecoders.com/contact or
  message us on WhatsApp at +91 91233 66161. Bring your current problem set; the demo is most
  useful when it works on your actual mathematics. (Agent note: the free demo is a waiting list
  with no fixed date. The Priority Live Demo is a guaranteed class today or tomorrow, booked at
  https://learn.modernagecoders.com/priority-demo . Offer both, as RULE 3 says.)

  Q: Are the classes live or recorded lectures?
  A: Live, always: small groups where problems are worked together and your written mathematics
  gets read and corrected in real time, never pre-recorded lectures. Mathematics at this level
  is learned by doing under feedback; recordings cannot mark your proof.

  To enrol, message Shivam Sir on +91 9123366161 or send the parent this link: https://learn.modernagecoders.com/courses/college-mathematics-complete-masterclass
  For a demo: the Priority Live Demo (guaranteed, today or tomorrow) is booked at
  https://learn.modernagecoders.com/priority-demo . The free demo is a waiting list with no fixed date.

==========
COURSE 43 OF 137: COMPETITIVE PROGRAMMING COURSE: CODEFORCES TO ICPC
==========

Course link: https://learn.modernagecoders.com/courses/competitive-programming-masterclass-college
Subject area: Programming
Designed for: College students
Who can join: Complete beginner (18+); college students, graduates and working professionals
Course length: 10-12 months (44-52 weeks)
Time needed: 2 live classes/week + 4-6 hours practice
Certificate: Certificate from Modern Age Coders, awarded on passing the final exam

PRICE FOR THIS COURSE (quote only the one that applies to the person asking)
  In India, per month: group Rs 1,499, mini batch Rs 2,999, one to one Rs 4,999
  Outside India, per month: group $100, one to one $150
  Classes: group and mini batch two live classes a week, eight a month; one to one in India one
  live class a week, four a month; one to one outside India two live classes a week, eight a
  month. Each class is one hour.

WHAT THIS COURSE IS

  Competitive programming course for students and professionals: C++ and STL speed, number
  theory, graphs, advanced dynamic programming and contest technique, from beginner to a strong
  rating, in 10-12 months.

  In one line: From your first contest to a rating you are proud of: C++ speed, the algorithmic arsenal, and the contest technique nobody teaches you alone.

ABOUT THE PROGRAMME

  Competitive programming is where algorithmic skill becomes fast, precise and fearless, and it
  pays off far beyond contests: the same technique wins placement rounds, quant interviews and
  hard engineering problems. This live online masterclass builds it in the order that actually
  works: C++ with STL and fast I/O, complexity instincts and the core structures, then the
  arsenal, number theory, combinatorics, tree and graph algorithms, dynamic programming from
  basics to bitmask and DP-on-trees, string algorithms, computational geometry, then the part
  solo learners never crack: contest strategy, speed, template discipline and reading problems
  under pressure, up through expert-level techniques like FFT and advanced graph theory. A
  finale month runs a full contest simulation and sits the final exam. The pace is honest: ten
  teaching months at two live classes a week plus four to six hours of solving, with two more
  in hand. Problem sets after every class, monthly mixed reviews, phase exams, and a final exam
  that decides the certificate with a free retest.

WHAT MAKES THIS COURSE DIFFERENT

  - Contest technique taught explicitly: strategy, speed and template discipline, not just
    algorithms
  - C++ and STL for competitive speed, the arena standard
  - The full arsenal: number theory, geometry, advanced DP and expert graph theory
  - Real contests during the course, debriefed honestly, no rating promises

- An honest 10-month arc with 2 months in hand
- Real assessment: weekly problem sets, monthly mixed reviews, phase exams and a final exam with a free retest

THE LEARNING PATH, STEP BY STEP

Phase 1: Foundations (Months 1-3): C++ and STL, math, number theory, core structures and DP basics
Phase 2: The arsenal (Months 4-6): advanced DP, strings, geometry, data structures and contest strategy
Phase 3: Expert level (Months 7-9): FFT, linear algebra, advanced string and graph theory, peak performance
Phase 4: The finale (Month 10): a full contest simulation and the final exam

WHAT A STUDENT NEEDS BEFORE STARTING

Coding experience: None. Everything is taught from the first line
Equipment: Any computer with a stable internet connection; every tool used is free
Age: 18+; college students, graduates and working professionals
Time commitment: 2 live classes plus 4-6 hours of practice a week

WHO THIS COURSE IS FOR

College students: Students who want contest rating and the interview edge it brings
Aspiring competitors: Coders aiming for Codeforces rating, ICPC or national olympiads
Placement focused: Candidates who want the fastest, sharpest problem-solving for hard rounds
Quant bound: Learners targeting quant roles that test exactly this speed
Self taught plateaued: Solo practitioners stuck at a rating who need real technique

FULL CURRICULUM, WEEK BY WEEK

This is the complete teaching plan. Parents can ask about any week.

PHASE 1: FOUNDATION & PROBLEM SOLVING BASICS (MONTHS 1-2, WEEKS 1-8)

Build strong foundations in C++ STL, basic algorithms, and develop problem-solving mindset.

Month 1: C++ Mastery & Basic Algorithms (Weeks 1-5)
C++ STL & Fast I/O
Topics:
- Competitive programming introduction and platforms
- Why C++ for competitive programming
- Fast I/O techniques: ios_base, cin.tie
- C++ STL containers: vector, set, map, queue, stack
- STL algorithms: sort, binary_search, lower_bound, upper_bound
- Pairs and tuples usage
- Priority queue and custom comparators
- Multiset and multimap
- Unordered containers and hashing
- Bitset for optimization
- Template programming basics
- Macro definitions and shortcuts
Projects built:
- CP template creation
- STL practice problems set
- Fast I/O benchmarking
Practice: Solve 50 STL-based problems
Time Complexity & Basic Algorithms
Topics:
- Time and space complexity analysis
- Big O notation mastery
- Common time complexities in CP
- Estimating execution time from complexity
- Greedy algorithms and proofs
- Two pointers technique
- Sliding window problems
- Prefix sums and difference arrays
- Binary search on answer
- Ternary search basics
- Meet in the middle technique
- Coordinate compression
Projects built:
- Complexity analyzer tool
- Algorithm visualization
- Problem approach templates
Practice: Master 60 basic algorithm problems
Basic Data Structures
Topics:

```
      - Arrays and vectors optimization
      - Linked lists in competitive programming
      - Stacks and queues applications
      - Deque and its uses
      - Hash tables and collision handling
      - Custom hash functions
      - Binary heap implementation
      - Disjoint Set Union (DSU) basics
      - Sparse tables introduction
      - Square root decomposition basics
      - Monotonic stack and queue
      - Policy based data structures
    Projects built:
      - Data structure library
      - Custom implementations
      - Performance comparison tool
    Practice: Implement and use 40 DS problems
  Recursion & Backtracking
    Topics:
      - Recursion optimization techniques
      - Memoization strategies
      - Backtracking framework
      - Pruning techniques
      - N-Queens and variations
      - Sudoku solver optimization
      - Permutation generation
      - Combination generation
      - Subset generation optimized
      - Bitmask techniques basics
      - State space reduction
      - Iterative vs recursive approaches
    Projects built:
      - Backtracking solver framework
      - Optimization comparisons
      - Contest problem generator
    Practice: Solve 50 recursion/backtracking problems

Month 2: Mathematics & Number Theory (Weeks 6-9)
  Number Theory Fundamentals
    Topics:
      - Prime numbers and sieve of Eratosthenes
      - Segmented sieve for large ranges
      - Prime factorization techniques
      - GCD and LCM algorithms
      - Extended Euclidean algorithm
      - Modular arithmetic and properties
      - Modular inverse calculation
      - Fast exponentiation
      - Fermat's little theorem
      - Wilson's theorem
      - Chinese Remainder Theorem
      - Linear Diophantine equations
    Projects built:
      - Number theory library
      - Prime utilities toolkit
      - Modular arithmetic calculator
    Practice: Master 60 number theory problems
  Combinatorics & Probability
    Topics:
      - Permutations and combinations
      - Pascal's triangle and properties
      - Binomial coefficients calculation
      - nCr with modulo computation
      - Catalan numbers and applications
      - Stirling numbers basics
      - Inclusion-exclusion principle
      - Pigeonhole principle applications
      - Probability in competitive programming
      - Expected value problems
      - Generating functions basics
      - Counting techniques
    Projects built:
      - Combinatorics calculator
      - Probability simulator
      - Counting problems solver
    Practice: Solve 50 combinatorics problems
  Bit Manipulation Mastery
    Topics:
      - Bitwise operations deep dive
```

      - Bit manipulation tricks and hacks
      - Finding single element problems
      - XOR properties and applications
      - Subset generation using bits
      - Bitmask dynamic programming intro
      - Gray code and applications
      - Bit parallel algorithms
      - Counting set bits efficiently
      - __builtin functions in GCC
      - Bitwise sieve
      - Space optimization with bits
    Projects built:
      - Bit manipulation library
      - Bitwise algorithm collection
      - Space-optimized solutions
    Practice: Master 40 bit manipulation problems
  Sorting & Searching Advanced
    Topics:
      - Quick sort optimizations
      - Merge sort applications
      - Counting sort and radix sort
      - Bucket sort for decimals
      - Binary search variations
      - Parallel binary search
      - Ternary search on functions
      - Search on monotonic functions
      - Fractional cascading basics
      - Order statistics
      - K-th smallest element algorithms
      - Median finding in O(n)
    Projects built:
      - Sorting algorithm library
      - Search optimization toolkit
      - Performance benchmarks
    Practice: Solve 50 sorting/searching problems

Month 3: Trees, Graphs & Dynamic Programming (Weeks 10-13)
  Tree Algorithms
    Topics:
      - Tree traversals optimization
      - Binary tree problems
      - Binary search tree operations
      - Tree DP fundamentals
      - LCA using binary lifting
      - Distance between nodes
      - Centroid decomposition
      - Heavy-light decomposition basics
      - Euler tour technique
      - Tree flattening
      - Rerooting technique
      - Tree isomorphism
    Projects built:
      - Tree algorithms library
      - LCA implementations comparison
      - Tree problem solver
    Practice: Master 60 tree problems
  Graph Algorithms Fundamentals
    Topics:
      - Graph representations optimization
      - DFS and BFS optimizations
      - Connected components
      - Strongly connected components
      - Topological sorting applications
      - Cycle detection algorithms
      - Bipartite checking and matching
      - Articulation points and bridges
      - Kosaraju's and Tarjan's algorithms
      - 2-SAT problem solving
      - Eulerian path algorithms
      - Graph coloring algorithms
    Projects built:
      - Graph library implementation
      - Graph visualizer
      - Algorithm comparison tool
    Practice: Solve 70 graph problems
  Shortest Paths & MST
    Topics:
      - Dijkstra's algorithm optimizations
      - Bellman-Ford and negative cycles

- Floyd-Warshall applications
- Johnson's algorithm
- K-shortest paths
- Shortest path in DAG
- 0-1 BFS technique
- Dial's algorithm
- Kruskal's and Prim's MST
- Minimum spanning forest
- Second best MST
- Minimum bottleneck spanning tree

Projects built:
- Path finding library
- MST solver toolkit
- Graph optimization suite

Practice: Master 50 path/MST problems

Dynamic Programming Basics

Topics:
- DP state definition techniques
- Top-down vs bottom-up approaches
- 1D DP classic problems
- 2D DP patterns
- Space optimization techniques
- DP on sequences
- LIS and LCS variations
- Knapsack problem variations
- Subset sum problems
- Partition problems
- DP with probability
- Expected value DP

Projects built:
- DP problem classifier
- State transition visualizer
- DP optimization toolkit

Practice: Solve 80 DP problems

Assessment: Phase 1 exam: a practical build defended live, plus a written paper mixing this phase with everything before it

---

PHASE 2: ADVANCED ALGORITHMS & CONTEST STRATEGY (MONTHS 3-4, WEEKS 9-17)

Master advanced algorithms, dynamic programming patterns, and develop contest-winning strategies.

Month 4: Advanced Dynamic Programming (Weeks 14-18)

DP Optimization Techniques

Topics:
- Convex hull trick
- Li Chao tree
- Divide and conquer optimization
- Knuth-Yao speedup
- Monotone queue optimization
- Slope trick
- Aliens trick (WQS binary search)
- CHT for DP optimization
- Matrix exponentiation for DP
- DP on broken profile
- SOS DP (Sum over Subsets)
- Profile optimization

Projects built:
- DP optimization library
- Convex hull implementation
- Matrix exponentiation toolkit

Practice: Master 40 optimized DP problems

Bitmask DP & DP on Trees

Topics:
- Bitmask DP comprehensive
- Traveling salesman problem
- Hamiltonian path DP
- Profile dynamic programming
- DP on trees advanced
- Subtree DP problems
- Rerooting tree DP
- Tree DP with multiple states
- Centroid decomposition with DP
- Virtual tree technique
- DP on cactus graphs
- DP on DAGs

Projects built:
- Bitmask DP solver

```
      - Tree DP framework
      - State compression tools
    Practice: Solve 50 bitmask/tree DP problems
  String Algorithms
    Topics:
      - KMP algorithm implementation
      - Z-algorithm and applications
      - Rolling hash and Rabin-Karp
      - Polynomial hashing techniques
      - Trie data structure advanced
      - Aho-Corasick algorithm
      - Suffix array construction
      - LCP array and applications
      - Suffix tree basics
      - Manacher's algorithm
      - Suffix automaton introduction
      - String matching with wildcards
    Projects built:
      - String algorithms library
      - Pattern matching toolkit
      - Suffix structures implementation
    Practice: Master 60 string problems
  Advanced Graph Algorithms
    Topics:
      - Network flow algorithms
      - Ford-Fulkerson and Edmonds-Karp
      - Dinic's algorithm
      - Push-relabel algorithm
      - Min-cost max-flow
      - Maximum bipartite matching
      - Hall's marriage theorem
      - Hopcroft-Karp algorithm
      - Hungarian algorithm
      - Gomory-Hu tree
      - Global min-cut
      - Stoer-Wagner algorithm
    Projects built:
      - Flow network library
      - Matching algorithms suite
      - Flow visualization tool
    Practice: Solve 40 flow/matching problems
  Game Theory
    Topics:
      - Nim game and variations
      - Sprague-Grundy theorem
      - Game theory with DP
      - Minimax algorithm
      - Alpha-beta pruning
      - Combinatorial games
      - Partisan vs impartial games
      - Multi-player games
      - Probabilistic games
      - Game on graphs
      - Hackenbush game
      - Conway's soldiers
    Projects built:
      - Game theory solver
      - Nim calculator
      - Game position evaluator
    Practice: Master 30 game theory problems

Month 5: Data Structures & Optimization (Weeks 19-23)
  Advanced Data Structures
    Topics:
      - Segment tree with lazy propagation
      - Persistent segment tree
      - Dynamic segment tree
      - 2D segment tree
      - Fenwick tree (BIT) advanced
      - 2D Fenwick tree
      - Range update range query
      - Merge sort tree
      - Wavelet tree
      - Treap and Cartesian tree
      - Splay tree basics
      - Link-cut tree introduction
    Projects built:
      - Segment tree library
      - Range query toolkit
```

```
    - Persistent DS implementation
  Practice: Implement 50 DS problems
Computational Geometry
  Topics:
    - 2D geometry primitives
    - Cross and dot products
    - Line intersection algorithms
    - Polygon area and perimeter
    - Point in polygon test
    - Convex hull algorithms
    - Graham scan and Jarvis march
    - Rotating calipers technique
    - Closest pair of points
    - Line sweep algorithms
    - Voronoi diagrams basics
    - Delaunay triangulation intro
  Projects built:
    - Geometry library
    - Convex hull visualizer
    - Geometric algorithm toolkit
  Practice: Solve 40 geometry problems
Advanced Number Theory
  Topics:
    - Miller-Rabin primality test
    - Pollard rho factorization
    - Discrete logarithm
    - Baby-step giant-step
    - Primitive roots
    - Mobius function and inversion
    - Multiplicative functions
    - Dirichlet convolution
    - Linear sieve
    - Gaussian elimination modulo
    - Matrix operations in field
    - FFT and NTT basics
  Projects built:
    - Advanced number theory library
    - Factorization toolkit
    - FFT implementation
  Practice: Master 35 advanced math problems
Optimization & Heuristics
  Topics:
    - Simulated annealing
    - Genetic algorithms basics
    - Hill climbing
    - Branch and bound advanced
    - Meet in the middle optimization
    - Sqrt decomposition applications
    - Mo's algorithm
    - Parallel binary search
    - Fractional cascading
    - Heavy path decomposition
    - Centroid path decomposition
    - Cache optimization techniques
  Projects built:
    - Optimization framework
    - Heuristic solver
    - Performance profiler
  Practice: Optimize 30 TLE solutions
Interactive & Randomized
  Topics:
    - Interactive problem strategies
    - Binary search in interactive
    - Graph exploration interactive
    - Randomized algorithms
    - Monte Carlo methods
    - Las Vegas algorithms
    - Randomized data structures
    - Treap operations
    - Skip list basics
    - Bloom filters
    - Probabilistic counting
    - Random sampling techniques
  Projects built:
    - Interactive problem solver
    - Randomized algorithm library
    - Probability tools
  Practice: Solve 25 interactive/random problems
```

```
  Month 6: Contest Mastery & Peak Performance (Weeks 24-26)
    Contest Strategy & Time Management
      Topics:
        - Contest strategy development
        - Problem selection order
        - Time allocation strategies
        - Reading all problems first
        - Identifying easy problems quickly
        - When to skip problems
        - Partial scoring strategies
        - Hacking and challenges
        - System testing preparation
        - Rating calculation understanding
        - Contest anxiety management
        - Peak performance techniques
      Projects built:
        - Personal strategy guide
        - Contest analysis tool
        - Performance tracker
      Practice: Participate in 20 rated contests
    Speed Programming & Templates
      Topics:
        - Speed coding techniques
        - Touch typing for programming
        - IDE shortcuts mastery
        - Template preparation and usage
        - Macro optimization
        - Pre-written code segments
        - Fast debugging techniques
        - Common bug patterns
        - Quick testing strategies
        - Stress testing methods
        - Local testing automation
        - Vim/Emacs for CP
      Projects built:
        - Ultimate CP template
        - Snippet library
        - Testing framework
      Practice: Speed coding 100 problems
    Team Programming (ICPC Style)
      Topics:
        - Team contest strategies
        - Role distribution in teams
        - Communication protocols
        - Parallel problem solving
        - Code handoff techniques
        - Debugging others' code
        - Team template preparation
        - Contest environment setup
        - Printed material preparation
        - Team practice sessions
        - ICPC regional strategies
        - World Finals preparation
      Projects built:
        - Team notebook creation
        - Role optimization system
        - Communication framework
      Practice: 50 team contest hours
      Assessment: Phase 2 exam: a practical build defended live, plus a written paper mixing
      this phase with everything before it

------------------------------------------------------------
PHASE 3: EXPERT TECHNIQUES & PEAK PERFORMANCE (MONTHS 7-9, WEEKS 27-39)
------------------------------------------------------------
Master expert-level algorithms, specialized topics, and achieve competitive programming
excellence.

  Months 7-8: Expert Algorithms & Techniques (Weeks 27-36)
    FFT & Polynomial Algorithms
      Topics:
        - Fast Fourier Transform complete
        - Number Theoretic Transform (NTT)
        - Polynomial multiplication
        - Polynomial division
        - Polynomial interpolation
        - Generating functions advanced
        - Convolution applications
        - XOR convolution
        - Subset sum convolution
```

- Polynomial inverse and sqrt
- Multipoint evaluation
- Chirp Z-transform

Projects built:
- FFT library complete
- Polynomial operations toolkit
- Convolution solver

Practice: Master 25 FFT/polynomial problems

Linear Algebra in CP

Topics:
- Gaussian elimination advanced
- Matrix exponentiation applications
- System of linear equations
- Matrix inverse and determinant
- Basis and linear independence
- XOR basis and applications
- Linear recurrence solving
- Berlekamp-Massey algorithm
- Characteristic polynomial
- Cayley-Hamilton theorem
- Matrix tree theorem
- Spectral graph theory basics

Projects built:
- Linear algebra library
- Matrix computation toolkit
- Recurrence solver

Practice: Solve 30 linear algebra problems

Advanced String Structures

Topics:
- Suffix tree construction
- Suffix automaton complete
- Palindromic tree (Eertree)
- Lyndon decomposition
- Suffix array DC3 algorithm
- SA-IS algorithm
- LCP construction methods
- Enhanced suffix array
- Compressed suffix structures
- Burrows-Wheeler transform
- FM-index basics
- Approximate string matching

Projects built:
- Advanced string library
- Suffix structure implementations
- String analysis toolkit

Practice: Master 35 advanced string problems

Advanced Graph Theory

Topics:
- Planar graphs and testing
- Graph minor theory basics
- Tree decomposition
- Treewidth and pathwidth
- Chordal graphs
- Perfect graphs introduction
- Graph coloring advanced
- Chromatic polynomial
- Tutte polynomial basics
- Expander graphs
- Random graphs
- Algebraic graph theory

Projects built:
- Advanced graph library
- Graph property tester
- Decomposition algorithms

Practice: Solve 25 advanced graph problems

Approximation Algorithms

Topics:
- Approximation ratios
- Vertex cover approximation
- TSP approximation algorithms
- Set cover approximation
- Bin packing algorithms
- Scheduling approximations
- Facility location problems
- K-center and k-median
- PTAS and FPTAS
- Primal-dual methods
- LP relaxation techniques
- Randomized rounding

```
      Projects built:
        - Approximation algorithm suite
        - Performance analyzer
        - Heuristic framework
      Practice: Implement 20 approximation algorithms

  Month 9: Peak Performance & Contests (Weeks 37-39)
    Research & Cutting Edge
      Topics:
        - Recent IOI/ICPC problems analysis
        - Research paper implementation
        - Novel algorithm exploration
        - Quantum algorithm basics
        - Machine learning in CP
        - Parallel algorithms
        - Distributed algorithms basics
        - External memory algorithms
        - Cache-oblivious algorithms
        - Succinct data structures
        - Compressed data structures
        - Future of competitive programming
      Projects built:
        - Research implementation
        - Novel solution finder
        - Algorithm innovation
      Practice: Solve 20 research-level problems
    Competition Preparation
      Topics:
        - Major competition strategies
        - ICPC World Finals preparation
        - IOI preparation techniques
        - Google Code Jam Finals
        - Facebook Hacker Cup Finals
        - TopCoder Open strategies
        - Mental preparation
        - Physical fitness for contests
        - Stress management advanced
        - Team coordination mastery
        - International competition tips
        - Travel and logistics
      Projects built:
        - Competition prep guide
        - Training schedule
        - Peak performance plan
      Practice: Simulate major competitions
    Career & Opportunities
      Topics:
        - CP in technical interviews
        - FAANG interview preparation
        - Competitive programming careers
        - Research opportunities
        - Graduate school applications
        - CP in resume building
        - Networking in CP community
        - Internship opportunities
        - Problem setter careers
        - Algorithm researcher path
        - Quantitative trading roles
        - Software engineering excellence
      Projects built:
        - Interview preparation kit
        - Career portfolio
        - Professional network
      Practice: Interview problem solving
      Assessment: Phase 3 exam: a practical build defended live, plus a written paper mixing
      this phase with everything before it

---------------------------------------------------------------
PHASE 4: THE FINALE (MONTH 10, WEEKS 40-44)
---------------------------------------------------------------
The capstone month: spec, build, ship and defend, then the final exam that decides the
certificate.

  Month 10: Capstone and the Final Exam (Weeks 40-44)
    Capstone Spec and Setup
      Topics:
        - Choosing the capstone: a full contest simulation across a season of problem sets, with an
          editorial-quality solved-problem portfolio
        - A one-page spec: scope, milestones, stack
```

- Repository and skeleton ready on day one
- Instructor sign-off before the build begins

Projects built:
- Approved capstone spec plus the running skeleton

Practice: Pitch the spec to the batch and absorb one hard question

Capstone Build

Topics:
- Two focused weeks in vertical slices
- Instructor checkpoints and honest scope cuts
- Using the whole course: the whole arsenal under contest time, with clean templates and fast, correct code
- Daily commits and an always-working build

Projects built:
- The capstone, feature-complete with version control

Practice: A working build at the end of every session

Ship and Polish

Topics:
- The finishing pass: edge cases, errors, documentation
- Contest-clean: fast, correct solutions written and debugged under time
- A README worth reading and a demo worth watching
- A full-course spiral review before the exam

Projects built:
- The capstone shipped, documented and rehearsed

Practice: Two mock demos, each tighter than the last

Demo Day and the Final Exam

Topics:
- Presenting the capstone: live demo plus the hardest bug story
- The honest map of next roads: higher-rated contests, ICPC teams, or quant and product interviews
- Where our other courses continue the journey

Projects built:
- Demo day presentation delivered to the batch

Assessment: FINAL EXAM: a practical build plus a written paper with questions mixed from every phase. Passing earns the certificate; falling short earns a focused revision plan and a free retest

PROJECTS THE STUDENT BUILDS AND KEEPS

- Phase 1: solved sets across math, number theory and core structures
- Phase 2: advanced DP, geometry and strategy under real contest conditions
- Phase 3: expert-technique problem sets, FFT to advanced graph theory
- Phase 4: the contest simulation and editorial-quality portfolio

Total projects: 400+ contest problems solved, crowned by a full contest simulation

SKILLS THE STUDENT WILL HAVE AT THE END

- C++ with STL and fast I/O at competitive speed
- The mathematical arsenal: number theory, combinatorics, geometry
- Advanced dynamic programming: optimization, bitmask and DP on trees
- Expert techniques: FFT, linear algebra, advanced string and graph theory
- Contest craft: strategy, speed, templates and reading under pressure

HOW A TYPICAL WEEK IS SPLIT

Live classes: 2 live one-hour classes per week, coding along with the instructor
Homework: A problem set after every class, and a mixed-review assignment at the end of every month
Practice: 4-6 hours of building between classes
Review: Every submission reviewed with written feedback; recurring gaps reopened in class

SUPPORT INCLUDED

Doubt support: WhatsApp doubt support between classes
Progress updates: Honest monthly progress reviews: what is solid, what is wobbly, and the plan for the wobble

CERTIFICATION DETAIL

Completion: Certificate from Modern Age Coders, awarded on passing the final exam. Fall short and there is focused revision and a free retest: the certificate certifies knowledge, not attendance

WHERE THIS CAN LEAD

- Higher-rated contests: the arsenal and speed to climb
- ICPC and team contests: the technique and strategy to compete
- Quant and product interviews that test contest-grade problem solving
- Our DSA course beside this one for interview-specific communication

EARNING POTENTIAL (share only if asked, and never promise it)

  Market context: The ranges below are general market salary bands for these roles in India and
    abroad, drawn from public industry data. They are shown for career context only and are not a
    promise or guarantee of income. Actual pay depends on your skills, experience, location, and
    the job market.
  Early career roles: Ready for internships; Rs 10-20 LPA (Junior roles)
  Growing roles: Rs 20-40 LPA (Top tech companies)
  Experienced roles: Rs 40-80+ LPA (FAANG/Quant)
  International: $150k-400k+ USD

COMMON QUESTIONS ABOUT THIS COURSE

  For anything about cost, use PART 4 and RULE 1. Do not quote two regions.

  Q: What does this competitive programming course cover?
  A: The full competitive arsenal in order: C++ with STL and fast I/O, complexity, core
  structures, number theory, combinatorics and bit manipulation; then advanced dynamic
  programming, string algorithms, computational geometry, advanced data structures and contest
  strategy; then expert techniques, FFT and polynomial algorithms, linear algebra, advanced
  string structures and graph theory, with contest simulation throughout. A finale month runs a
  full contest and sits the final exam.

  Q: How long does it take to learn competitive programming properly?
  A: Ten months of teaching at 2 live classes a week plus 4 to 6 hours of practice, with two
  more months in hand for learners who need them. The three teaching phases build the skill and
  its real-world application; the finale month ships a capstone and sits the final exam.

  Q: How am I assessed? Is the certificate just for attending?
  A: No. Problem sets follow every class with written feedback, monthly reviews deliberately
  mix new material with earlier topics, each phase ends with a cumulative exam, and the course
  ends with a final exam: a practical build plus written questions from the whole syllabus.
  Passing earns the certificate; falling short earns focused revision and a free retest.

  Q: Do I need to be good at maths for competitive programming?
  A: You need to be willing, not gifted. Competitive programming leans on discrete maths,
  number theory and combinatorics, and we teach every piece of it inside the course, in code,
  on problems. Plenty of strong competitors started shaky at maths; consistent solving is what
  builds the instinct.

  Q: Will you get me to a specific Codeforces rating?
  A: We will not promise a number, because rating depends on your own consistent practice and
  no honest teacher controls it. What we do is teach the technique, arsenal and contest craft
  that rating is built from, run real contests with honest debriefs, and give you the habits
  that keep the graph climbing after the course ends.

  Q: Can I try a class before enrolling?
  A: Yes, a free demo class with no commitment: book at learn.modernagecoders.com/contact or
  message us on WhatsApp at +91 91233 66161. (Agent note: the free demo is a waiting list with
  no fixed date. The Priority Live Demo is a guaranteed class today or tomorrow, booked at
  https://learn.modernagecoders.com/priority-demo . Offer both, as RULE 3 says.)

  Q: Are classes live or recorded?
  A: Live, always: small groups with a real instructor reading your actual code, never
  pre-recorded videos.

  To enrol, message Shivam Sir on +91 9123366161 or send the parent this link:
https://learn.modernagecoders.com/courses/competitive-programming-masterclass-college
  For a demo: the Priority Live Demo (guaranteed, today or tomorrow) is booked at
  https://learn.modernagecoders.com/priority-demo . The free demo is a waiting list with no fixed date.

==
COURSE 44 OF 137: COMPETITIVE PROGRAMMING FOR TEENS: ZCO, INOI AND USACO TRACK
==

Course link: https://learn.modernagecoders.com/courses/competitive-programming-for-teens-course
Subject area: Competitive Programming
Designed for: Teens
Who can join: Teens aged 13 to 18 who can already write basic programs and want contest-level problem solving
Course length: 6 months (24 weeks), joinable any month
Time needed: 2 live classes/week + weekly problem sets and virtual contests
Certificate: Certificate from Modern Age Coders, awarded on passing the final assessment

PRICE FOR THIS COURSE (quote only the one that applies to the person asking)
  In India, per month: group Rs 1,499, mini batch Rs 2,999, one to one Rs 4,999
  Outside India, per month: group $100, one to one $150
  Classes: group and mini batch two live classes a week, eight a month; one to one in India one

live class a week, four a month; one to one outside India two live classes a week, eight a month. Each class is one hour.

WHAT THIS COURSE IS

Live online competitive programming for teenagers: algorithms, data structures and contest technique aimed at the Indian informatics olympiad path and USACO, taught in C++ or Python.

In one line: Real algorithmic problem solving, aimed squarely at the informatics olympiad path and USACO, taught by solving problems rather than watching them being solved.

ABOUT THE PROGRAMME

Competitive programming is the fastest way a teenager can become genuinely good at algorithms, because a contest gives you an honest verdict in seconds. Your solution is correct and fast enough, or it is not. Nothing else in school works quite like that. This course takes a student who can already write basic programs and builds the actual competitive toolkit: complexity analysis, the core data structures, the standard algorithm families, and the contest craft that separates a solved problem from a time-limit-exceeded verdict. In India, the informatics olympiad path runs through zonal qualifiers, ZCO and ZIO, into INOI, the Indian National Olympiad in Informatics, and onward through the training camp toward the International Olympiad in Informatics. Internationally, USACO runs its own laddered divisions from Bronze up through Silver, Gold and Platinum. Both reward the same underlying skill, so we train for the skill and prepare for both formats. Students work in C++ or Python. C++ is the pragmatic default at higher levels because of its speed and its standard template library, and we teach it properly for students who want to go far. Python is fully supported for students who prefer it and is entirely adequate for the earlier stages. Every week ends with a timed virtual contest and a proper upsolve, because the problems you failed to solve during the contest are where nearly all the improvement actually comes from.

WHAT MAKES THIS COURSE DIFFERENT

- Aimed at the real contest ladder: zonal qualifiers and INOI in India, and the USACO divisions internationally
- Taught by solving, not by watching: every class has students writing code against a judge
- Complexity analysis from week one, because most failed submissions are correct but too slow
- Weekly timed virtual contests followed by a structured upsolve, which is where the actual improvement happens
- C++ taught properly for students aiming high, Python fully supported for those who prefer it
- Live, small batches with solutions reviewed line by line, not a video library

THE LEARNING PATH, STEP BY STEP

Phase 1: Complexity, the core data structures, sorting and searching, and reading a problem statement correctly
Phase 2: The standard algorithm families: greedy, two pointers, prefix sums, recursion, graphs and dynamic programming
Phase 3: Contest craft, harder problem sets, and full timed contests with upsolve discipline

WHAT A STUDENT NEEDS BEFORE STARTING

Title: What Your Child Needs to Start

WHO THIS COURSE IS FOR

Title: Who This Course Is For

FULL CURRICULUM, WEEK BY WEEK

This is the complete teaching plan. Parents can ask about any week.

PHASE 1: FOUNDATIONS AND CORE DATA STRUCTURES

The tools every contest problem assumes you already have, built until they are automatic.

Month 1: Complexity, Arrays and Strings (Weeks 1-4)
Setup, Judges and Big-O
Topics:
- Setting up a contest environment and submitting to an online judge
- Reading a problem statement precisely, including the constraints
- Time and space complexity, and reading the limits to infer the intended solution
- Why an O(n squared) solution fails when n is 200,000
- Fast input and output, which silently costs beginners real points

Projects built:
- Submit your first ten problems and read every verdict, including the failures

Practice: 15 warm-up problems with a written complexity estimate before each submission

Arrays, Sorting and Binary Search
Topics:

- Sorting with custom comparators
- Binary search on an array, and the off-by-one errors that ruin it
- Binary search on the answer, a technique that unlocks many problems
- Two pointers and the sliding window
- Recognising which of these a statement is hinting at

Projects built:
- Solve a set of problems where binary search on the answer is the intended solution

Practice: 20 sorting and searching problems on a judge

Prefix Sums, Strings and Number Theory Basics

Topics:
- Prefix sums and difference arrays for range queries
- String basics: frequency counts, palindromes, simple hashing ideas
- GCD, modular arithmetic and why answers are taken modulo a prime
- Sieve of Eratosthenes and simple primality
- Avoiding integer overflow, a classic silent failure

Projects built:
- Build a small library of your own tested helper functions

Practice: 20 problems across prefix sums, strings and basic number theory

Assessment: First timed virtual contest, followed by a full upsolve

Stacks, Queues and the Standard Library

Topics:
- Stacks and queues and the problems that signal them
- Deques and priority queues
- Using the C++ STL containers properly, or Python's equivalents
- Choosing the right container for the operation you repeat most
- Writing clean code fast, since contests are timed

Projects built:
- Solve a monotonic stack problem and explain why the stack is the right structure

Practice: 20 data-structure problems

Month 2: Recursion, Backtracking and First Graphs (Weeks 5-8)

Recursion and Backtracking

Topics:
- Writing recursion you can reason about
- The recursion tree and its cost
- Backtracking with pruning
- Generating permutations and subsets
- When recursion is elegant and when it is simply too slow

Projects built:
- Solve a classic constraint problem with backtracking and measure the effect of each pruning rule

Practice: 15 recursion and backtracking problems

Graph Representation, BFS and DFS

Topics:
- Adjacency lists versus matrices, and when each is right
- Depth-first search and its uses
- Breadth-first search and shortest paths on unweighted graphs
- Connected components and cycle detection
- Recognising a graph problem that is not described as one

Projects built:
- Model a described real-world scenario as a graph and solve it with BFS

Practice: 20 graph traversal problems

Greedy Algorithms

Topics:
- What makes a greedy choice valid
- Classic greedy problems: intervals, scheduling, coin-style problems
- Proving a greedy solution correct, at least informally
- Why an untested greedy hunch is the most common wrong answer
- Knowing when greedy fails and DP is required

Projects built:
- Solve an interval-scheduling set and write a short argument for why the greedy rule works

Practice: 20 greedy problems with written justifications

Assessment: Timed contest plus upsolve, with an error log started

Contest Technique

Topics:
- Reading the whole problem set first and ranking by difficulty
- Deciding fast whether to commit to a problem or move on
- Writing test cases before submitting
- Debugging under time pressure
- Handling a wrong answer without panicking

Projects built:
- A full contest run with a written post-mortem of every decision

Practice: Two timed contests with structured upsolve

PHASE 2: THE CORE ALGORITHM FAMILIES

The material that separates a zonal qualifier from a national-level contestant.

  Month 3: Dynamic Programming (Weeks 9-12)
    Introduction to Dynamic Programming
      Topics:
        - Recognising overlapping subproblems and optimal substructure
        - Memoisation versus bottom-up tabulation
        - Defining the state, which is the whole difficulty
        - Classic one-dimensional DP problems
        - Counting the states to get the complexity right
      Projects built:
        - Solve the same problem both top-down and bottom-up and compare
      Practice: 20 introductory DP problems
    Knapsack and Grid DP
      Topics:
        - The knapsack family and its variants
        - Two-dimensional DP on grids
        - Subset-sum style problems
        - Reconstructing the actual answer, not just its value
        - Space optimisation with rolling arrays
      Projects built:
        - Solve a knapsack variant and reconstruct the chosen items
      Practice: 20 knapsack and grid DP problems
    DP on Sequences and Intervals
      Topics:
        - Longest increasing subsequence and its faster form
        - Edit distance and sequence alignment
        - Interval DP
        - Bitmask DP as an introduction
        - Spotting the state definition from the constraints
      Projects built:
        - Implement LIS in both the quadratic and the faster form and compare on large input
      Practice: 20 sequence and interval DP problems
      Assessment: Timed DP-focused contest with upsolve
    Weighted Graphs and Shortest Paths
      Topics:
        - Dijkstra with a priority queue
        - Bellman-Ford and negative edges
        - Floyd-Warshall for all pairs
        - Minimum spanning trees
        - Disjoint set union and its uses
      Projects built:
        - Solve a routing problem with Dijkstra and justify the data structures chosen
      Practice: 20 weighted-graph problems

PHASE 3: CONTEST MASTERY AND OLYMPIAD PREPARATION

Harder problems and the discipline that turns knowledge into a rank.

  Months 4 to 6: Advanced Topics and Full Contests (Weeks 13-24)
    Advanced Structures and Techniques
      Topics:
        - Segment trees and range queries
        - Binary indexed trees
        - Trees: rooting, depth, subtree sums and lowest common ancestor
        - String algorithms at contest level
        - Choosing the simplest structure that is fast enough
      Projects built:
        - Implement a segment tree from scratch and use it on a real range-query problem
      Practice: 30 problems across advanced structures
    Olympiad-Style Problem Sets
      Topics:
        - Working past problems in the style of the zonal rounds and INOI
        - USACO division problems from Bronze upward
        - Multi-part problems and partial scoring
        - Managing a long contest without losing focus
        - Building a personal template and checklist
      Projects built:
        - Complete full past sets under time and grade them honestly
      Practice: Weekly full-length problem sets with structured upsolve
    Full Contests, Upsolve and Peak Form
      Topics:
        - Weekly full timed contests under real conditions
        - The upsolve discipline: every unsolved problem revisited until solved unaided
        - Reading the error log to find your actual weakness
        - Contest-day routine and nerves
        - Choosing the right target contests for your level
      Projects built:
        - A full contest every week with a written post-mortem
      Practice: Continuous contest and upsolve cycle

Assessment: Final rated contest performance reviewed against your starting baseline

HOW A TYPICAL WEEK IS SPLIT

Homework: A task or problem set after every class, and a monthly mixed-review assignment that deliberately folds in earlier topics

CERTIFICATION DETAIL

Completion: Certificate from Modern Age Coders, awarded on passing the final assessment. Fall short and there is focused revision and a free retest: the certificate certifies real learning, not attendance

WHERE THIS CAN LEAD

- Readiness for zonal qualifiers, INOI and USACO divisions
- Algorithmic strength that makes school computer science straightforward
- A real advantage in university applications and technical interviews
- A foundation for research or engineering in any quantitative field
- Problem-solving stamina that transfers well beyond programming

COMMON QUESTIONS ABOUT THIS COURSE

For anything about cost, use PART 4 and RULE 1. Do not quote two regions.

Q: Which contests does this prepare for?
A: Internationally we prepare students for the USACO divisions from Bronze upward. Both test the same underlying algorithmic skill, so the training serves either.

Q: Should my child use C++ or Python?
A: Both are supported. Python is entirely adequate for the earlier stages and many students start there. C++ is the pragmatic choice at higher levels because of its speed and standard template library, and time limits eventually make that matter. We teach C++ properly for students aiming at the later rounds, and we never force a switch before it is useful.

Q: Does my child need to be a strong programmer already?
A: They need working basics: loops, conditionals, functions and arrays. They do not need any algorithms background, which is what the course builds. What matters far more than existing skill is willingness to solve problems between classes, because in competitive programming practice volume beats natural talent almost every time.

Q: What is upsolving and why does it matter so much?
A: Upsolving means going back after a contest and solving the problems you could not solve during it, until you can do them unaided. It is where nearly all real improvement happens, and it is the single habit that separates students who plateau from students who keep climbing. Every contest in this course is followed by a structured upsolve.

Q: How am I assessed, and is the certificate just for showing up?
A: No. A task follows every class with feedback, monthly reviews deliberately mix new material with earlier topics so nothing is forgotten, and the course ends with a final project defended live, plus a written assessment. Passing earns the certificate; falling short earns focused revision and a free retest. We measure real learning, not attendance.

To enrol, message Shivam Sir on +91 9123366161 or send the parent this link: https://learn.modernagecoders.com/courses/competitive-programming-for-teens-course
For a demo: the Priority Live Demo (guaranteed, today or tomorrow) is booked at https://learn.modernagecoders.com/priority-demo . The free demo is a waiting list with no fixed date.

==========

COURSE 45 OF 137: COMPUTER SCIENCE CLASS 11-12: CBSE PYTHON & ICSE/ISC JAVA

==========

Course link: https://learn.modernagecoders.com/courses/cbse-icse-computer-science-class-11-12-python-java-complete-course
Subject area: School Board Exam Preparation - Computer Science
Designed for: Teens
Who can join: Class 11 Beginner to Class 12 Board Exam Ready
Course length: 24 months (Class 11 + Class 12, the full 2-year board cycle), joinable any month
Time needed: 8-10 hours/week (4 classes + self-practice)
Certificate: Certificate from Modern Age Coders plus a documented mock-exam progression toward the board exam

PRICE FOR THIS COURSE (quote only the one that applies to the person asking)
In India, per month: group Rs 1,499, mini batch Rs 2,999, one to one Rs 4,999
Outside India, per month: group $100, one to one $150
Classes: group and mini batch two live classes a week, eight a month; one to one in India one live class a week, four a month; one to one outside India two live classes a week, eight a month. Each class is one hour.

WHAT THIS COURSE IS

Class 11 & 12 Computer Science for CBSE (Python, SQL) and ICSE/ISC (Java, OOP): separate board batches, full syllabus, practical file and project guidance.

In one line: 100% Syllabus Coverage · Separate CBSE & ICSE Batches · Board Topper Strategy · Live Expert Mentoring

ABOUT THE PROGRAMME

This is the most thorough Computer Science program built for Indian Class 11 & 12 students across both CBSE and ICSE boards. We run completely separate batches for CBSE and ICSE students because the syllabus, programming language, exam pattern, and marking scheme are fundamentally different. CBSE students learn Python programming (as per Code 083 syllabus), SQL with MySQL, computer networking, file handling, data structures using Python, and Python-MySQL connectivity. ICSE/ISC students learn Java programming, object-oriented programming, data structures (stack, queue, linked list, binary trees), Boolean algebra with Karnaugh maps, and advanced recursion. Every class is aligned chapter-by-chapter with Sumita Arora, Preeti Arora, and NCERT textbooks. Students get complete practical file preparation, project guidance, viva preparation, previous year paper solving, and dedicated board exam revision modules. Our students consistently score 95+ in board exams because we don't just teach, we drill, practice, and perfect every concept until it becomes second nature.

WHAT MAKES THIS COURSE DIFFERENT

- Separate CBSE and ICSE batches, no mixing of syllabus or programming languages
- 100% syllabus coverage aligned with latest 2026-27 CBSE & ISC curriculum
- Chapter-wise teaching matching Sumita Arora, Preeti Arora & NCERT textbooks
- Complete practical file with 20+ programs (CBSE) / lab assignments (ISC) included
- Board exam project guidance with documentation and viva preparation
- Weekly chapter tests + monthly unit tests + mock board exams
- Previous 10 years solved papers with detailed marking scheme analysis
- Dedicated doubt-clearing sessions before exams
- Sample paper solving with CBSE/ISC marking scheme training
- Programming logic building from scratch, no prior coding needed
- SQL hands-on practice with live MySQL database
- Assertion-Reason, Case Study, and MCQ-specific exam strategies

THE LEARNING PATH, STEP BY STEP

Phase 1: Class 11, Semester 1 (Months 1-5): Computer fundamentals, number systems, Boolean logic, Python/Java basics, control flow, functions
Phase 2: Class 11, Semester 2 (Months 6-10): Data structures (lists/tuples/dictionaries in Python OR arrays/strings in Java), society & ethics, practicals
Phase 3: Class 12, Semester 1 (Months 11-17): Advanced programming, file handling, data structures, recursion, sorting & searching
Phase 4: Class 12, Semester 2 (Months 18-24): SQL & databases, computer networks, Python-MySQL connectivity / ISC advanced topics, board exam prep

WHAT A STUDENT NEEDS BEFORE STARTING

Class level: Students entering Class 11 or Class 12 with Computer Science - CBSE (code 083) or ISC; Class 10 students who have chosen CS can join early
Prior knowledge: No programming experience required - Class 11 starts from the very basics; Class 12 joiners get a bridge revision of Class 11 topics
Equipment: A laptop or desktop with a stable internet connection; we guide installation of Python and MySQL (CBSE) or Java and BlueJ (ISC) in the first sessions
Time commitment: 8-10 hours per week including live classes and self-practice
Textbooks: Sumita Arora, Preeti Arora, or NCERT - classes align with whichever textbook the student's school follows

WHO THIS COURSE IS FOR

Class 11 students: Students starting Computer Science in Class 11 who want strong fundamentals from the first chapter
Class 12 board aspirants: Students facing boards in the 2026-27 session who need complete syllabus coverage plus intensive exam practice
Students stuck on programming: Students who understand the theory but struggle to write, trace, or debug programs on their own
Practical file and project help: Students who need structured help finishing the practical file and board project correctly and on time
Future engineers: Students planning B.Tech, BCA, or B.Sc Computer Science who want a genuine head start on college programming
Score improvers: Students targeting a 90+ score who want weekly tests, mock exams, and marking-scheme answer training

FULL CURRICULUM, WEEK BY WEEK

This is the complete teaching plan. Parents can ask about any week.

PHASE 1: CLASS 11 SEMESTER 1, COMPUTER FUNDAMENTALS & PROGRAMMING FOUNDATIONS (MONTHS 1-5)

Build rock-solid fundamentals in computer science theory and start your programming journey.
CBSE students begin with Python, ISC students begin with Java. Both batches cover computer
organization, number systems, and Boolean logic.

  Month 1: Computer Systems & Organization (Week 1-4)
    Computer System Overview & Hardware
      Topics:
        - Evolution of computers, from Abacus to AI-powered machines
        - Computer generations: First (vacuum tubes) to Fifth (AI)
        - Block diagram of a computer system, Input, CPU, Memory, Output
        - CPU architecture: ALU (Arithmetic Logic Unit), Control Unit, Registers
        - Types of processors: CISC vs RISC, multicore processors
        - Input devices: keyboard, mouse, scanner, touchscreen, biometric devices, microphone
        - Output devices: monitor (LCD, LED, OLED), printer (laser, inkjet, 3D), speaker, projector
        - Memory hierarchy: registers cache RAM secondary storage
        - Primary memory: RAM (SRAM vs DRAM), ROM (PROM, EPROM, EEPROM), Cache memory
        - Secondary storage: HDD, SSD, USB flash drive, optical discs (CD, DVD, Blu-ray)
        - Cloud storage concepts and modern storage solutions
        - Units of memory: bit, nibble, byte, KB, MB, GB, TB, PB
      Projects built:
        - Create an illustrated computer system diagram with all components labeled
        - Memory hierarchy comparison chart with speed, cost, and capacity
        - Research report: Evolution of processors from Intel 4004 to latest chips
      Practice: Chapter-end exercises from Sumita Arora Chapter 1, NCERT textbook questions,
      30 MCQs on computer fundamentals
    Software, Operating Systems & Encoding
      Topics:
        - Software classification: System software vs Application software
        - System software: operating system, language processors (compiler, interpreter, assembler),
          device drivers
        - Application software: general purpose (MS Office, browsers) vs specific purpose (Tally,
          hospital management)
        - Open source vs proprietary software, examples and differences
        - Operating system functions: process management, memory management, file management, device
          management
        - Types of OS: batch processing, time-sharing, real-time, distributed, mobile OS
        - User interface: CLI (Command Line Interface) vs GUI (Graphical User Interface)
        - Language processors: compiler vs interpreter, detailed comparison
        - High-level vs low-level vs machine-level languages
        - Utility software: antivirus, disk defragmenter, backup tools, compression tools
        - Firmware and embedded systems concepts
        - Mobile operating systems: Android, iOS, overview
      Projects built:
        - Software classification mind map with 20+ real-world examples
        - OS comparison: Windows vs Linux vs macOS, features and use cases
        - Install and explore Linux (Ubuntu) in a virtual machine
      Practice: NCERT exercises, Sumita Arora solved examples, 40 MCQs, 10 short-answer
      questions
    Number Systems & Conversions
      Topics:
        - Why computers use binary, the digital foundation
        - Decimal number system (base 10), positional notation explained
        - Binary number system (base 2), counting in binary, place values
        - Octal number system (base 8), uses in Unix/Linux file permissions
        - Hexadecimal number system (base 16), uses in memory addresses, colors (#FF0000)
        - Conversion: Decimal to Binary (successive division method)
        - Conversion: Decimal to Octal and Hexadecimal
        - Conversion: Binary to Decimal (positional value method)
        - Conversion: Binary to Octal (grouping of 3 bits) and Binary to Hexadecimal (grouping of 4
          bits)
        - Conversion: Octal to Binary, Hexadecimal to Binary
        - Fractional number conversions across all bases
        - Binary addition and subtraction
        - 1's complement and 2's complement representation
        - Signed magnitude representation
        - Overflow and underflow in binary arithmetic
        - Shortcut methods for quick conversions in exams
      Projects built:
        - Number system converter calculator (manual worksheet with 50 conversions)
        - Color code converter: RGB decimal to hexadecimal
        - Binary arithmetic drill, 30 addition and subtraction problems
      Practice: 100 conversion problems across all bases, previous year board questions on
      number systems, timed practice tests
    Boolean Logic & Encoding Schemes
      Topics:
        - Introduction to Boolean algebra, George Boole's contribution
        - Boolean values: True (1) and False (0)

- Basic logic gates: AND, OR, NOT, symbols, truth tables, expressions
- Derived gates: NAND, NOR, XOR, XNOR, truth tables and equivalences
- Universal gates: NAND and NOR, implementing any gate using only NAND/NOR (ISC focus)
- Boolean expressions and evaluation
- De Morgan's theorems: NOT(A AND B) = NOT A OR NOT B, NOT(A OR B) = NOT A AND NOT B
- Verification of De Morgan's theorems using truth tables
- Basic Boolean laws: Identity, Complement, Idempotent, Absorption, Involution
- Simplification of Boolean expressions using algebraic method
- Character encoding schemes: ASCII (7-bit, 128 characters)
- ISCII (Indian Script Code for Information Interchange), 8-bit
- Unicode (UTF-8, UTF-16, UTF-32), multilingual support, emojis
- Difference between ASCII, ISCII, and Unicode, why Unicode is the modern standard

Projects built:
- Truth table generator for any 2-3 variable Boolean expression
- Gate diagram drawing practice, 10 circuits
- Encoding explorer: Convert your name to ASCII, Unicode values

Practice: 50 Boolean expression simplification problems, 30 truth table exercises, previous year questions on encoding

Months 2-3: Programming Foundations (Python for CBSE / Java for ISC) (Week 5-12)

Cbse Python Track

Getting Started with Python, Setup, Syntax & Fundamentals

Topics:
- Why Python?, Used by Google, Instagram, YouTube, NASA, Netflix
- Python history: Guido van Rossum, Python 2 vs Python 3
- Installing Python 3.12+ on Windows/Mac/Linux
- Python IDLE, Interactive mode vs Script mode
- Setting up VS Code with Python extensions
- First Python program: print('Hello, World!')
- Python tokens: keywords, identifiers, literals, operators, punctuators
- Python keywords list, import, def, class, if, else, elif, for, while, etc.
- Identifiers: naming rules (start with letter/underscore, case-sensitive, no keywords)
- Variables: declaration, assignment, dynamic typing
- Data types: int, float, complex, str, bool, None
- Type checking with type() function
- Type conversion: int(), float(), str(), bool(), implicit vs explicit
- Mutable vs Immutable types, fundamental concept for board exams
- Comments: single-line (#) and multi-line (triple quotes)
- Input function: input(), always returns string
- Output function: print(), sep, end parameters, formatted output
- f-strings for formatted printing (Python 3.6+)
- Escape sequences: \n, \t, \\, \', \"
- Python's philosophy: import this, The Zen of Python

Projects built:
- Personal bio generator, takes name, age, hobby as input and formats output
- Simple calculator, add, subtract, multiply, divide two numbers
- Temperature converter, Celsius to Fahrenheit and vice versa
- Area calculator for circle, rectangle, triangle with formatted output

Practice: Sumita Arora Chapter 3 & 4 exercises, 50 output prediction questions, 20 error-finding programs

Operators & Expressions in Python

Topics:
- Arithmetic operators: + - * / // (floor division) % (modulus) ** (exponent)
- Floor division vs true division, 7//2 = 3 vs 7/2 = 3.5
- Modulus operator applications, even/odd check, digit extraction
- Relational/Comparison operators: == != < > <= >=
- Logical operators: and, or, not, truth tables and short-circuit evaluation
- Short-circuit evaluation: how Python skips unnecessary checks
- Assignment operators: = += -= *= /= //= %= **=
- Identity operators: is, is not, comparing object identity vs equality
- Membership operators: in, not in, checking presence in sequences
- Bitwise operators: & (AND), | (OR), ^ (XOR), ~ (NOT), << (left shift), >> (right shift)
- Operator precedence table, PEMDAS for Python (** unary * / // % + - comparisons not and or)
- Associativity: left-to-right vs right-to-left (**)
- Expression evaluation practice, step-by-step breakdown
- Mixed-type expressions and type coercion rules
- The walrus operator := (Python 3.8+), assignment within expressions
- Common exam traps: integer division, operator precedence gotchas

Projects built:
- Expression evaluator, predict output of 20 complex expressions
- Bill calculator with tax and discount using all arithmetic operators
- Bitwise operation visualizer, show binary representation and result
- Operator precedence quiz game

Practice: 100 expression evaluation problems, 30 output prediction MCQs, Sumita Arora Chapter 5 exercises

Control Flow, Conditional Statements

Topics:
- Sequential flow vs conditional flow vs iterative flow, program flow types
- if statement: syntax, indentation rules, single-line and multi-line body

- if-else statement: two-way branching
- if-elif-else ladder: multi-way branching
- Nested if statements: decision trees within decisions
- Ternary operator / conditional expression: value = x if condition else y
- Common patterns: finding max/min of 2/3 numbers, grade calculator
- Leap year detection algorithm, complete logic
- Character type checking: vowel/consonant, uppercase/lowercase, digit/letter
- Menu-driven programs, building interactive applications
- Logical operators in conditions: combining multiple conditions
- Truthiness and falsiness in Python: 0, None, '', [], {} are falsy
- Common mistakes: = vs ==, missing colon, indentation errors
- Board exam pattern: output prediction for nested if-elif-else
- Assertion-Reason questions on conditional statements

Projects built:
- Grade calculator, CBSE marking scheme with A1, A2, B1, B2, C1, C2, D, E
- Income tax calculator, with Indian tax slab rates for 2026-27
- Triangle type detector, equilateral, isosceles, scalene, right-angled
- Simple login system with username and password validation
- Day of the week finder, input a number, output the day

Practice: 60 conditional logic problems, 30 output prediction questions, previous year board questions, Sumita Arora exercises

Control Flow, Loops & Iterations

Topics:
- for loop: iterating over sequences (range, string, list)
- range() function: range(stop), range(start, stop), range(start, stop, step)
- Negative step in range: range(10, 0, -1) for countdown
- while loop: condition-based repetition
- Infinite loops: while True, when and how to use safely
- Loop control statements: break (exit loop), continue (skip iteration)
- else clause with loops, executes when loop completes without break
- Nested loops: outer and inner loop, execution flow tracing
- Pattern printing with nested loops, stars, numbers, alphabets
- Common patterns: pyramid, diamond, Floyd's triangle, Pascal's triangle
- Accumulator pattern: sum, product, counting with loops
- Finding factors, prime numbers, Fibonacci series using loops
- GCD and LCM calculation using loops
- Digit extraction: sum of digits, reverse a number, palindrome check
- Armstrong number, perfect number, strong number detection
- Loop optimization and avoiding unnecessary iterations
- Board exam focus: tracing loop output, counting iterations

Projects built:
- Pattern printer, 15 different star and number patterns
- Prime number checker and generator (Sieve of Eratosthenes approach)
- Number guessing game with limited attempts
- Multiplication table generator with formatted output
- Fibonacci series generator up to n terms
- Armstrong number finder in a given range

Practice: 80 loop tracing problems, 20 pattern programs, Sumita Arora loop exercises, previous year board pattern questions

Isc Java Track

Getting Started with Java, OOP Foundations

Topics:
- Why Java?, Platform independence, Android development, enterprise applications
- Java history: James Gosling, Sun Microsystems, Oracle acquisition
- Installing JDK 17+ and setting up PATH environment variable
- Setting up BlueJ IDE (preferred for ISC) and IntelliJ IDEA
- First Java program: public static void main(String[] args)
- Understanding class structure, main method, System.out.println()
- Java tokens: keywords, identifiers, literals, operators, separators
- Primitive data types: byte, short, int, long, float, double, char, boolean
- Size and range of each primitive type, exam favorite
- Variables: declaration, initialization, naming conventions
- Constants with final keyword
- Type casting: widening (automatic) vs narrowing (explicit)
- Wrapper classes: Integer, Double, Character, Boolean, autoboxing/unboxing
- Scanner class for input: nextInt(), nextDouble(), nextLine(), next()
- Output: System.out.print(), println(), printf()
- Comments: //, /* */, /** */ (Javadoc)
- Java's object-oriented philosophy: everything is an object

Projects built:
- Student profile program, input name, roll number, marks, display formatted
- Simple calculator with Scanner input
- Type casting demonstrator, show widening and narrowing
- Wrapper class explorer, convert between primitives and objects

Practice: 50 output prediction questions, 20 type casting problems, ISC specimen paper MCQs

Operators, Expressions & Math Library in Java

Topics:
- Arithmetic operators: + - * / %, integer vs floating-point division

- Relational operators: == != < > <= >=
- Logical operators: && (AND), || (OR), ! (NOT), short-circuit evaluation
- Assignment operators: = += -= *= /= %=
- Increment/Decrement: ++x (prefix) vs x++ (postfix), critical for ISC exams
- Ternary operator: condition ? value1 : value2
- Bitwise operators: & | ^ ~ << >>
- Operator precedence and associativity, complete table
- Expression evaluation with mixed types, promotion rules
- Math class methods: Math.sqrt(), Math.pow(), Math.abs(), Math.max(), Math.min()
- Math.ceil(), Math.floor(), Math.round(), Math.random()
- Math.PI, Math.E, mathematical constants
- Trigonometric functions: Math.sin(), Math.cos(), Math.tan() (radians)
- String concatenation with + operator, rules and gotchas
- Type promotion in expressions: byte short int long float double

Projects built:
- Scientific calculator with Math library functions
- Expression evaluator, step-by-step breakdown of complex expressions
- Prefix vs postfix increment quiz, 20 tricky questions
- Random number generator game

Practice: 100 expression evaluation problems, ISC previous year questions, operator precedence drills

Conditional Statements in Java

Topics:
- if statement: syntax with curly braces, single statement shortcuts
- if-else statement: two-way branching
- if-else if-else ladder: multi-way branching
- Nested if statements: complex decision trees
- switch-case statement: syntax, break keyword, default clause
- switch vs if-else: when to use which, ISC exam favorite
- Fall-through in switch: what happens without break
- Menu-driven programs using switch-case
- Ternary operator for concise conditions
- Common programs: largest of 3, grade calculator, day finder
- Leap year, vowel/consonant, positive/negative/zero checks
- Character-based conditions: ASCII value ranges for A-Z, a-z, 0-9
- Dangling else problem and how Java resolves it
- Board exam focus: output tracing with nested conditions

Projects built:
- Menu-driven calculator using switch-case
- Income tax calculator with Indian tax slabs
- Student grade card generator with ISC marking scheme
- Electric bill calculator with slab-based pricing

Practice: ISC specimen paper conditional questions, 50 output tracing problems, 20 switch-case programs

Loops & Iterations in Java

Topics:
- for loop: initialization, condition, update, execution flow
- while loop: pre-test loop, condition checked before body
- do-while loop: post-test loop, body executes at least once (NOT in Python!)
- for vs while vs do-while: choosing the right loop
- Nested loops: matrix traversal, pattern printing
- Loop control: break (exit loop), continue (skip iteration)
- Labeled break and continue, for nested loop control
- Pattern printing: stars, numbers, alphabets, ISC exam staple
- Pyramid, inverted pyramid, diamond, Floyd's triangle patterns
- Digit extraction: sum of digits, reverse number, palindrome
- Prime number programs: check, generate, prime factorization
- GCD (Euclidean algorithm), LCM, Fibonacci series
- Armstrong, perfect, neon, spy, niven (Harshad) numbers
- Automorphic, kaprekar, twin prime numbers
- Frequency counting: digit frequency, character frequency in strings
- Loop optimization and efficiency analysis

Projects built:
- Pattern printer, 20 different patterns (stars, numbers, alphabets)
- Special number detector, checks Armstrong, palindrome, perfect in one program
- Prime number generator with sieve approach
- Number series generator: Fibonacci, triangular, square numbers

Practice: 100 loop tracing problems, 30 pattern programs, ISC previous year loop questions, number program drills

Months 4-5: Functions, Strings & Data Handling (Week 13-20)

Cbse Python Track

Strings in Python, Complete Mastery

Topics:
- String creation: single quotes, double quotes, triple quotes
- String as a sequence, indexing (0-based, negative indexing)
- String slicing: [start:stop:step], extracting substrings
- String immutability, why strings cannot be changed in place
- String operators: + (concatenation), * (repetition), in, not in

- String comparison: lexicographic ordering, ASCII values
- Traversing strings: for loop, while loop, enumerate()
- String methods (MUST KNOW for boards): len(), capitalize(), title(), upper(), lower(), swapcase()
- count(), find(), index(), rfind(), rindex()
- startswith(), endswith(), isalpha(), isdigit(), isalnum()
- isspace(), islower(), isupper(), istitle()
- strip(), lstrip(), rstrip(), replace(), split(), join()
- partition(), maketrans(), translate()
- String formatting: %, .format(), f-strings
- Common programs: palindrome check, character frequency, vowel count, word count
- Reverse a string, remove spaces, capitalize each word
- Board exam pattern: output prediction with string slicing and methods

Projects built:
- Word counter and analyzer, count words, vowels, consonants, digits, special chars
- Palindrome checker for strings and sentences
- Caesar cipher, encrypt and decrypt messages
- String formatting report generator

Practice: Sumita Arora Chapter 7 complete exercises, 50 string output prediction MCQs, 30 string programs

Lists in Python, Complete Mastery

Topics:
- List creation: [], list(), list comprehension
- Lists as mutable sequences, key difference from strings and tuples
- Indexing and negative indexing in lists
- List slicing: [start:stop:step]
- List operations: + (concatenation), * (repetition), in, not in
- List methods (BOARD EXAM CRITICAL): append(), extend(), insert()
- remove(), pop(), pop(index), clear()
- index(), count(), sort(), sort(reverse=True), reverse()
- copy(), shallow copy vs deep copy explained
- Built-in functions with lists: len(), min(), max(), sum(), sorted()
- List comprehension: [expression for item in iterable if condition]
- Nested lists (2D lists / matrices), accessing elements with [row][col]
- Traversing lists: for loop, while loop, enumerate(), zip()
- del statement vs remove() vs pop(), differences
- Aliasing vs cloning, the assignment trap (a = b vs a = b[:])
- Passing lists to functions, mutable argument behavior
- Common programs: linear search, finding max/min, removing duplicates, merging sorted lists
- Board exam focus: output prediction with list methods and slicing

Projects built:
- Student marks management system, add, remove, search, sort, average
- Inventory management with nested lists
- Matrix operations, addition, subtraction, transpose using 2D lists
- List-based quiz application

Practice: Sumita Arora Chapter 8 exercises, 60 list operation MCQs, 25 list programs

Tuples & Dictionaries in Python

Topics:
- Tuples: creation with () and tuple(), single element tuple (a,) trap
- Tuple immutability, cannot add, remove, or change elements
- Tuple indexing, slicing, and operations (+, *, in)
- Tuple methods: count(), index()
- Built-in functions: len(), min(), max(), sum(), sorted() with tuples
- Tuple packing and unpacking: a, b, c = (1, 2, 3)
- Tuple vs List: when to use which, performance and safety
- Nested tuples and accessing elements
- Dictionaries: key-value pair data structure, {} and dict()
- Dictionary keys must be immutable (strings, numbers, tuples), why?
- Accessing values: d[key] vs d.get(key, default)
- Adding and updating: d[key] = value, d.update()
- Removing: del d[key], d.pop(key), d.popitem(), d.clear()
- Dictionary methods: keys(), values(), items(), get(), update(), copy()
- Dictionary traversal: iterating over keys, values, items
- Nested dictionaries, student records with multiple attributes
- Dictionary comprehension: {k: v for k, v in iterable}
- len(), min(), max(), sorted() with dictionaries
- Common programs: frequency counter, word dictionary, student database
- Board exam: output prediction with dictionary operations

Projects built:
- Contact book application using dictionary
- Word frequency analyzer, count occurrence of each word in text
- Student report card using nested dictionaries
- English-Hindi dictionary with search feature

Practice: Sumita Arora Chapters 9 & 10 exercises, 50 MCQs on tuples and dictionaries, 20 programs

Functions & Modules in Python

Topics:
- What are functions?, code reusability, modularity, abstraction
- Built-in functions vs user-defined functions

- Defining functions: def keyword, function name, parameters, body, return
- Calling functions: positional arguments, keyword arguments
- Default parameter values, avoiding mutable default argument trap
- *args, variable-length positional arguments
- **kwargs, variable-length keyword arguments
- Return statement: returning single value, multiple values (as tuple)
- Functions without return, returns None by default
- Scope of variables: local scope, global scope, LEGB rule
- global keyword, modifying global variables inside functions
- Passing arguments: immutable (pass by value behavior) vs mutable (pass by reference behavior)
- Recursive functions introduction, factorial, Fibonacci (preview for Class 12)
- Lambda functions: lambda arguments: expression
- map(), filter(), reduce(), functional programming basics
- Modules: import, from...import, import...as
- math module: sqrt(), ceil(), floor(), pow(), fabs(), sin(), cos(), tan(), pi, e, log(), log10()
- random module: random(), randint(), randrange(), choice(), shuffle(), seed()
- statistics module: mean(), median(), mode()
- Creating your own modules, __name__ == '__main__' pattern
- Board exam focus: function output tracing, scope questions, module function MCQs

Projects built:
- Math utility library, custom module with 20+ mathematical functions
- Random password generator using random module
- Statistics calculator using statistics module
- Menu-driven bank account system using functions

Practice: Sumita Arora function chapter exercises, 40 function tracing MCQs, 25 function-based programs, scope identification exercises

Isc Java Track

Methods, Constructors & Scope in Java

Topics:
- Methods: defining, calling, return types, parameters
- Formal parameters vs actual parameters (arguments)
- Pass by value in Java, primitive types are copied
- Pass by reference behavior, objects are passed by reference copy
- Method overloading: same name, different parameter lists
- Constructors: default, parameterized, copy constructor
- Constructor overloading, multiple constructors in a class
- this keyword: referring to current object, constructor chaining
- Static methods and static variables, class-level members
- Static vs non-static: when to use which
- Variable scope: local, instance, class (static) variables
- Access modifiers: public, private, protected, default
- Encapsulation: data hiding with private variables and public getters/setters
- Pure functions and impure functions in Java
- Method signature and return type, ISC exam focus
- Recursive methods introduction, factorial, GCD

Projects built:
- Bank account class with deposit, withdraw, balance methods
- Student class with multiple constructors and method overloading
- Calculator class with static utility methods
- Library book management with encapsulation

Practice: ISC method-based questions, 40 output tracing problems, constructor MCQs

Arrays in Java, 1D and 2D

Topics:
- Array declaration, creation with new keyword, initialization
- Array as reference type, memory allocation on heap
- Accessing elements: indexing (0-based), ArrayIndexOutOfBoundsException
- Array traversal: for loop, for-each (enhanced for) loop
- Array input with Scanner, reading n elements
- 1D array operations: sum, average, max, min, counting
- Linear search: sequential search algorithm
- Binary search: divide and conquer on sorted arrays
- Sorting algorithms: Bubble sort, swapping adjacent elements
- Selection sort, finding minimum and placing in position
- Insertion sort, inserting element in correct position in sorted part
- Comparison of sorting algorithms, time complexity basics
- 2D arrays (matrices): declaration, initialization, traversal
- Matrix operations: addition, subtraction, multiplication, transpose
- Row-wise and column-wise operations on 2D arrays
- Jagged arrays, arrays of different lengths
- Array address calculation: row-major and column-major (ISC theory)
- Common programs: merge arrays, rotate array, remove duplicates

Projects built:
- Student marks analyzer, input marks, sort, find topper, grade distribution
- Matrix calculator, all operations with menu-driven interface
- Address calculation worksheet, 20 problems
- Sorting visualizer, trace each pass of bubble, selection, insertion sort

Practice: ISC array-based programs (30+), sorting algorithm tracing, address calculation formula problems

String Handling in Java
Topics:
- String class: immutable strings in Java
- String creation: literal vs new keyword, String pool concept
- String methods: length(), charAt(), indexOf(), lastIndexOf()
- substring(), concat(), replace(), toUpperCase(), toLowerCase()
- trim(), startsWith(), endsWith(), contains()
- equals() vs == : content comparison vs reference comparison, EXAM CRITICAL
- equalsIgnoreCase(), compareTo(), compareToIgnoreCase()
- String to char array: toCharArray(), and vice versa valueOf()
- Character class methods: isLetter(), isDigit(), isUpperCase(), isLowerCase()
- Character.toUpperCase(), Character.toLowerCase()
- StringBuffer/StringBuilder: mutable strings, append(), insert(), delete(), reverse()
- String vs StringBuffer vs StringBuilder, differences and when to use
- StringTokenizer class: splitting strings (ISC specific)
- String concatenation performance: why StringBuilder matters
- Common programs: palindrome, word extraction, pigLatin, character frequency
- Sentence manipulation: reverse words, title case, remove duplicates
- Board exam focus: output tracing with string methods
Projects built:
- Text analyzer, word count, sentence count, character frequency
- Pig Latin converter
- Unique word extractor from a sentence
- String encryption/decryption program
Practice: ISC string programs (40+), method output prediction MCQs, character manipulation problems

Recursion in Java, ISC Focus
Topics:
- What is recursion?, method calling itself
- Base case and recursive case, avoiding infinite recursion
- Stack memory and recursion, how function calls are stacked
- StackOverflowError, what happens without base case
- Factorial using recursion, tracing each call
- Fibonacci series using recursion
- GCD using Euclidean algorithm (recursive)
- Power calculation: a^n using recursion
- Sum of digits using recursion
- Reverse a number using recursion
- Palindrome check using recursion
- Binary search using recursion
- Tower of Hanoi, classic recursion problem (ISC important)
- Decimal to binary conversion using recursion
- String reversal using recursion
- Recursion vs iteration: pros, cons, when to use which
- Tail recursion concept
- ISC exam focus: tracing recursive calls, finding output, counting calls
Projects built:
- Recursive function library, 15 recursive solutions
- Tower of Hanoi solver with step-by-step output
- Recursive pattern printer
- Recursive maze solver (bonus challenge)
Practice: ISC recursion questions (30+), call stack tracing exercises, output prediction problems

---

PHASE 2: CLASS 11 SEMESTER 2, ADVANCED CONCEPTS, ETHICS & PRACTICALS (MONTHS 6-10)

Complete remaining Class 11 syllabus topics, prepare practical file with 20+ programs, work on project, and build exam readiness.

Months 6-7: Society, Law, Ethics & Advanced Topics (Week 21-28)
Society, Law and Ethics, Digital Citizenship (CBSE) / Computing Trends (ISC)
Topics:
- Digital footprint: active vs passive, what you leave behind online
- Net etiquette (Netiquette): proper online behavior, email etiquette
- Social media ethics and responsible usage
- Data protection and privacy, personal data, consent, GDPR concepts
- Intellectual Property Rights (IPR): copyright, patent, trademark
- Plagiarism: what it is, how to avoid, proper citation
- Software licensing: proprietary vs open source
- Free and Open Source Software (FOSS): Linux, LibreOffice, GIMP, Python
- Creative Commons licenses: CC-BY, CC-BY-SA, CC-BY-NC
- GPL (GNU General Public License), Apache License, MIT License
- Cybercrime: hacking, cracking, phishing, pharming, vishing, smishing
- Malware types: virus, worm, trojan horse, ransomware, spyware, adware
- Ransomware attacks: WannaCry, NotPetya, real-world case studies
- Cyberbullying: forms, impact, prevention, reporting
- Indian Information Technology Act 2000 (amended 2008), key provisions
- IT Act sections relevant to students: Sections 43, 65, 66, 67

- E-waste: definition, hazards, proper disposal methods, recycling
- Health concerns: ergonomics, digital eye strain, repetitive strain injury
- Gender and disability issues in computing, inclusivity in tech
- Emerging trends: AI, IoT, Cloud Computing, Big Data, Blockchain (overview)

Projects built:
- Digital citizenship presentation, 20 dos and don'ts
- Cybercrime awareness poster/infographic
- E-waste management plan for your school
- Research report: Famous cyberattacks and lessons learned

Practice: NCERT society chapter questions, 50 MCQs on cyber ethics, case study questions, IT Act scenario-based questions

CBSE: Advanced Python Concepts / ISC: File Handling & Packages in Java

Cbse topics:
- Revisiting all Python concepts for exam preparation
- Advanced list comprehensions with multiple conditions
- Dictionary and set operations, advanced patterns
- Nested data structures: list of dictionaries, dictionary of lists
- Error handling basics: try, except, finally (preview for Class 12)
- File handling introduction: open(), read(), write(), close() (preview)
- Standard library exploration: os module, sys module basics
- Code optimization techniques, writing Pythonic code
- PEP 8 coding style guidelines
- Debugging strategies: print debugging, IDE debugger usage

Isc topics:
- File handling in Java using FileInputStream, FileOutputStream
- FileReader and FileWriter, character stream handling
- BufferedReader and PrintWriter for efficient I/O
- Reading and writing text files, line by line
- Exception handling: try-catch-finally in file operations
- Packages: what are packages, package declaration
- Creating user-defined packages
- Importing packages: import statement, wildcard import
- Java API packages: java.lang, java.util, java.io
- Access modifiers with packages: public, protected, default, private

Practical File Preparation, Project Work & Class 11 Exam Prep

Topics:
- CBSE Practical file: Minimum 20 Python programs covering all chapters
- ISC Practical: Year-long programming assignments compilation
- Program 1-5: Basic Python/Java programs (variables, operators, input/output)
- Program 6-10: Control flow programs (if-else, loops, patterns)
- Program 11-15: String manipulation programs
- Program 16-20: List/Array, Tuple, Dictionary programs
- Program 21-25: Function-based programs with modules (CBSE) / OOP programs (ISC)
- Project selection and planning, choosing a meaningful project
- CBSE suggested projects: Quiz game, Library management, Student database
- ISC suggested projects: Inventory system, Bank management, School management
- Project documentation: introduction, system requirements, source code, output screenshots
- Viva voce preparation: 50 most-asked questions with answers
- Class 11 final exam revision, chapter-wise important questions
- Sample paper solving, 5 complete papers with marking scheme
- Time management during exams, allocating marks to time

Deliverables:
- Complete practical file with 20-25 programs (handwritten/printed as per school)
- Project report with documentation
- Viva preparation sheet, 50 Q&A
- 5 solved sample papers

PHASE 3: CLASS 12 SEMESTER 1, ADVANCED PROGRAMMING, FILE HANDLING & DATA STRUCTURES (MONTHS 11-17)

Deep dive into Class 12 core topics: advanced programming, file handling, data structures, sorting and searching algorithms. This is the highest-weightage section in board exams.

Months 11-12: Advanced Functions, Exception Handling & File Handling (Week 41-48)

Cbse Python Track

Advanced Functions & Exception Handling in Python

Topics:
- Revision of Class 11 function concepts, parameters, return, scope
- Global vs local scope deep dive, LEGB rule revisited
- global keyword, modifying global variables inside functions
- Nested functions and closures
- Functions as first-class objects, passing functions as arguments
- Advanced default arguments and keyword-only arguments
- Recursive functions: factorial, Fibonacci, sum of digits, power, GCD
- Recursion depth and sys.setrecursionlimit()
- Exception handling: what are exceptions vs syntax errors
- try block: code that might cause an exception
- except block: handling specific exceptions
- Multiple except blocks for different exception types

- except with as keyword: except ValueError as e
- else block: executes when no exception occurs
- finally block: always executes, cleanup code
- Common built-in exceptions: ValueError, TypeError, IndexError, KeyError, ZeroDivisionError, FileNotFoundError, IOError
- raise statement: raising exceptions manually
- Custom exception classes (basics)
- Board exam pattern: output prediction with try-except, function scope questions

Projects built:
- Robust calculator with exception handling for all edge cases
- Recursive problem set, 10 programs using recursion
- Error-proof input validator using try-except
- Function library with comprehensive error handling

Practice: Sumita Arora Class 12 function chapters, 40 exception handling MCQs, 20 recursive function tracing problems

Text File Handling in Python

Topics:
- What are files?, persistent storage, file vs variable
- Types of files: text files vs binary files
- Opening a file: open(filename, mode), file handle/object
- File modes: 'r' (read), 'w' (write), 'a' (append), 'r+' (read+write), 'w+' (write+read), 'a+' (append+read)
- Reading text files: read(), read(n), readline(), readlines()
- Difference between read(), readline(), readlines(), EXAM CRITICAL
- Writing to text files: write(), writelines()
- Difference between write() and writelines()
- Closing files: close(), why it's important
- with statement: automatic file closing, best practice
- File pointer: tell(), current position, seek(offset, whence), moving pointer
- seek(0), go to beginning, seek(0, 2), go to end
- Line-by-line processing: for line in file_handle
- Counting lines, words, characters in a text file
- Searching for a word/pattern in a text file
- Copying content from one file to another
- Appending data to existing files
- Common programs: count uppercase/lowercase/digits/vowels in file
- Find and replace words in a text file
- Board exam focus: output prediction with file operations, explain difference questions

Projects built:
- Text file analyzer, count lines, words, characters, vowels, consonants
- Log file processor, search and filter entries
- Student record manager using text files
- File copy and merge utility

Practice: Sumita Arora file handling chapter, 30 file handling programs, 40 MCQs on file operations

Binary File Handling & CSV File Handling in Python

Topics:
- Binary files: what and why, storing non-text data
- Binary file modes: 'rb', 'wb', 'ab', 'r+b', 'w+b', 'a+b'
- pickle module: serialization and deserialization
- pickle.dump(object, file_handle): writing Python objects to binary file
- pickle.load(file_handle): reading Python objects from binary file
- Pickling different data types: int, float, string, list, tuple, dictionary
- Writing and reading multiple records to/from binary file
- Searching records in a binary file, reading until EOFError
- Updating and deleting records in binary files (read all, modify, write all)
- EOFError handling with try-except, standard pattern for binary files
- CSV files: Comma Separated Values, structure and usage
- csv module: importing csv
- csv.writer(): creating CSV writer object
- writerow(), writing single row, writerows(), writing multiple rows
- csv.reader(): reading CSV files, returns iterable
- Reading CSV with for loop, each row is a list
- Using delimiter parameter for custom separators
- CSV with headers, DictWriter and DictReader (bonus)
- Real-world CSV: exporting student data, reading attendance sheets
- Board exam pattern: complete programs on binary and CSV file operations

Projects built:
- Student database with binary file, add, search, update, delete records
- Employee payroll system using pickle
- CSV report generator, attendance tracker
- Data migration tool, text file to CSV to binary file conversion

Practice: 30 binary file handling programs, 15 CSV programs, Sumita Arora exercises, previous year board questions

Data Structures, Stack Implementation using Python List

Topics:
- What are data structures?, organizing data efficiently
- Linear vs non-linear data structures
- Stack: Last-In-First-Out (LIFO) principle

- Real-world stack analogies: stack of plates, undo/redo, browser back button
- Stack operations: push (insert at top), pop (remove from top), peek/top (view top)
- isEmpty(), check if stack is empty, size(), number of elements
- Stack overflow and stack underflow conditions
- Implementing stack using Python list: append() for push, pop() for pop
- Complete stack implementation with all operations
- Stack applications: parenthesis matching, expression evaluation
- Infix, prefix, postfix notation, understanding the concepts
- Reversing a string using stack
- Stack-based programs for board exams: book management, student records
- Tracing push and pop operations, step-by-step visualization
- Board exam pattern: stack operation output prediction, application-based questions
- Stack vs Queue (conceptual comparison)
- Time complexity of stack operations: O(1) for push and pop

Projects built:
- Stack implementation, complete menu-driven program
- Parenthesis/bracket matcher using stack
- Reverse a string/list using stack
- Undo feature simulation using stack

Practice: 25 stack programs, operation tracing exercises, Sumita Arora data structure chapter, board exam stack questions from last 10 years

Isc Java Track

Inheritance & Polymorphism in Java (ISC Class 12 Focus)

Topics:
- Inheritance: creating new classes from existing classes
- extends keyword, subclass inherits from superclass
- Types of inheritance: single, multilevel, hierarchical
- Why Java doesn't support multiple inheritance (through classes)
- super keyword: calling superclass constructor, accessing superclass methods/variables
- Constructor chaining in inheritance, order of constructor execution
- Method overriding: subclass redefining superclass method
- Method overloading vs method overriding, EXAM CRITICAL comparison
- Polymorphism: one interface, multiple forms
- Compile-time polymorphism (method overloading) vs Runtime polymorphism (method overriding)
- Dynamic method dispatch / dynamic binding
- Abstract classes: abstract keyword, abstract methods
- Concrete vs abstract classes, when to use which
- Interfaces in Java: what they are, how they differ from abstract classes
- Implementing interfaces: implements keyword
- Interface vs abstract class, ISC exam comparison question
- final keyword: final variables (constants), final methods (can't override), final classes (can't inherit)
- instanceof operator, type checking
- Upcasting and downcasting

Projects built:
- Shape hierarchy: Shape Circle, Rectangle, Triangle with area/perimeter
- Employee payroll with Manager, Developer, Intern subclasses
- Vehicle inheritance: Vehicle Car, Bike, Truck
- Banking system with different account types

Practice: ISC inheritance questions (40+), output tracing with polymorphism, method dispatch problems

Advanced Data Structures, Stack & Queue in Java (ISC)

Topics:
- Stack: LIFO principle, push, pop, peek, isEmpty
- Stack implementation using arrays in Java
- Stack overflow (array full) and underflow (array empty) handling
- Stack applications: parenthesis matching, infix to postfix conversion
- Infix to prefix conversion using stack
- Postfix expression evaluation using stack
- Queue: FIFO principle, enqueue, dequeue, front, rear, isEmpty
- Queue implementation using arrays in Java
- Limitation of linear queue, wasted space
- Circular Queue: efficient queue implementation
- Circular queue operations: enqueue, dequeue with modular arithmetic
- Double-Ended Queue (Deque): insertion and deletion from both ends
- Priority Queue concepts
- Applications of queue: scheduling, BFS, printer queue
- ISC exam pattern: implementing stack/queue as a class with constructor and methods

Projects built:
- Stack class with complete implementation and menu-driven testing
- Infix to Postfix converter using stack
- Circular Queue implementation
- Postfix expression evaluator

Practice: ISC data structure questions (40+), stack/queue operation tracing, conversion problems

Linked List in Java (ISC Class 12)

Topics:
- What is a linked list?, dynamic data structure, nodes and links
- Node class: data field and next reference

- Singly Linked List: creating, traversing
- Insertion: at beginning, at end, at specific position
- Deletion: from beginning, from end, specific node by value
- Searching in a linked list, sequential traversal
- Counting nodes in a linked list
- Reversing a linked list, iterative approach
- Extracting a sublist from a linked list
- Checking if linked list is empty
- Linked list vs array, advantages and disadvantages comparison
- Memory allocation: static (arrays) vs dynamic (linked lists)
- ISC exam pattern: writing complete linked list class with all operations
- Sorted insertion in a linked list
- Merging two sorted linked lists
- Applications of linked lists: polynomial representation, sparse matrix

Projects built:
- Complete Linked List class with all operations, ISC exam format
- Polynomial addition using linked lists
- Student record management using linked list
- Sorted linked list with insertion and deletion

Practice: ISC linked list questions (30+), operation tracing, complete class implementation practice

Binary Trees & Computational Complexity (ISC Class 12)

Topics:
- Binary trees: concept, terminology, root, node, leaf, parent, child, sibling
- Tree properties: height, depth, level, degree
- Types of binary trees: full, complete, perfect, balanced
- Binary Search Tree (BST): property, left < root < right
- Tree traversals (conceptual, ISC doesn't require implementation):
- In-order traversal: Left Root Right (gives sorted order for BST)
- Pre-order traversal: Root Left Right
- Post-order traversal: Left Right Root
- Constructing BST from given data
- Tracing traversal outputs for given trees, EXAM FAVORITE
- Computational complexity: measuring algorithm efficiency
- Input size concept, how it affects running time
- Best case, average case, worst case analysis
- Big O notation: O(1), O(log n), O(n), O(n log n), O(n²)
- Dominant term, ignoring constants and lower-order terms
- Complexity of common algorithms: linear search O(n), binary search O(log n)
- Sorting complexity: bubble O(n²), selection O(n²), insertion O(n²)
- Stack/Queue operations: O(1)
- Linked list search: O(n)

Projects built:
- BST traversal tracer, draw tree and show all 3 traversal outputs
- Complexity comparison chart for all algorithms learned
- Algorithm efficiency analyzer, compare running times

Practice: ISC tree traversal questions (20+), complexity analysis MCQs, BST construction exercises

Months 13-14: Sorting, Searching & Algorithm Efficiency (Week 49-56)

Applies To Cbse

Sorting Algorithms in Python (CBSE Class 12)

Topics:
- Why sorting matters, organizing data for efficient processing
- Bubble Sort: comparing adjacent elements, swapping, multiple passes
- Bubble sort algorithm: step-by-step with example array
- Bubble sort Python code with complete explanation
- Optimized bubble sort with swap flag, early termination
- Bubble sort complexity: O(n²) average/worst, O(n) best (optimized)
- Selection Sort: finding minimum, placing in correct position
- Selection sort algorithm: step-by-step with example
- Selection sort Python code with explanation
- Selection sort complexity: O(n²) in all cases
- Insertion Sort: building sorted portion, inserting elements
- Insertion sort algorithm: step-by-step with example, like sorting cards
- Insertion sort Python code with explanation
- Insertion sort complexity: O(n²) average/worst, O(n) best
- Comparison of all three sorting algorithms, when to use which
- Stability of sorting algorithms, bubble and insertion are stable, selection is not
- Board exam focus: tracing sort passes, writing code, comparing algorithms

Projects built:
- Sorting visualizer, show each pass of all 3 algorithms
- Performance comparison, time 1000 sorts with each algorithm
- Sort student records by name, marks, roll number

Practice: 30 sort tracing problems, write all 3 algorithms from memory, previous year board sorting questions

Searching Algorithms in Python (CBSE Class 12)

Topics:
- Linear Search: sequential checking, works on unsorted data

- Linear search algorithm and Python implementation
- Linear search: best case O(1), worst case O(n), average O(n/2)
- Binary Search: divide and conquer, requires sorted data
- Binary search algorithm: finding mid, comparing, narrowing range
- Binary search Python implementation, iterative approach
- Binary search: best case O(1), worst case O(log n)
- Why binary search is dramatically faster, logarithmic vs linear
- Binary search edge cases: element not found, first/last element
- Linear vs Binary search comparison, detailed table
- When to use which: unsorted data linear, sorted data binary
- Searching in lists, tuples, and dictionaries
- Python's built-in search: in operator, index() method, bisect module
- Board exam pattern: tracing binary search steps, code output prediction

Projects built:
- Search algorithm comparison tool, count comparisons for both
- Phone book search, linear for names, binary for sorted entries
- Searching programs from past 10 years board papers, complete solutions

Practice: 20 binary search tracing problems, comparison with linear search, board exam questions

---

PHASE 4: CLASS 12 SEMESTER 2, SQL, NETWORKS, CONNECTIVITY & BOARD EXAM MASTERY (MONTHS 18-24)

Complete the remaining Class 12 syllabus: SQL and databases, computer networks, Python-MySQL connectivity, then intensive board exam preparation with mock tests and revision.

Months 18-19: Database Management & SQL (Week 69-76)

Database Concepts & SQL Fundamentals

Topics:
- What is a database?, organized collection of related data
- File system vs DBMS: advantages of database approach
- DBMS examples: MySQL, PostgreSQL, Oracle, SQL Server, MongoDB
- Relational Database Management System (RDBMS), storing data in tables
- Relational model terminology: relation (table), attribute (column), tuple (row), domain (valid values)
- Degree of a relation: number of columns, Cardinality: number of rows
- Keys in RDBMS, EXAM CRITICAL:
- Candidate key: uniquely identifies each row (may have multiple)
- Primary key: chosen candidate key for unique identification (only one per table)
- Alternate key: candidate keys that are not primary key
- Foreign key: attribute referencing primary key of another table, establishes relationship
- Composite key: primary key made of two or more columns
- Introduction to SQL: Structured Query Language, not a programming language
- SQL categories: DDL (Data Definition), DML (Data Manipulation), DQL (Data Query)
- MySQL installation and setup, accessing MySQL command line
- SQL data types: CHAR(n), VARCHAR(n), INT, SMALLINT, FLOAT, DOUBLE, DATE, DATETIME
- CHAR vs VARCHAR: fixed vs variable length, when to use which
- Constraints: NOT NULL, UNIQUE, PRIMARY KEY, DEFAULT, CHECK

Projects built:
- Design a school database: tables for Students, Teachers, Classes, Marks
- Identify keys for 10 different real-world scenarios
- Install MySQL and create your first database and tables

Practice: 50 MCQs on database concepts, key identification exercises, Sumita Arora SQL chapter theory questions

SQL DDL & DML Commands

Topics:
- DDL, Data Definition Language (structure commands):
- CREATE DATABASE database_name;, creating a new database
- USE database_name;, selecting active database
- SHOW DATABASES; SHOW TABLES;, listing databases and tables
- CREATE TABLE: defining table structure with columns, data types, constraints
- CREATE TABLE with PRIMARY KEY, NOT NULL, UNIQUE, DEFAULT constraints
- DESCRIBE/DESC table_name;, viewing table structure
- ALTER TABLE: ADD column, MODIFY column data type/size, DROP column
- ALTER TABLE: ADD PRIMARY KEY, DROP PRIMARY KEY
- DROP TABLE table_name;, deleting entire table
- DROP DATABASE database_name;, deleting entire database
- DML, Data Manipulation Language (data commands):
- INSERT INTO: adding single row, adding multiple rows
- INSERT INTO with column list vs without (all columns required)
- INSERT INTO with NULL values and DEFAULT values
- UPDATE: modifying existing data with SET clause
- UPDATE with WHERE clause, conditional update
- UPDATE multiple columns simultaneously
- DELETE FROM: removing rows with WHERE condition
- DELETE vs DROP: removing data vs removing structure
- CAUTION: UPDATE/DELETE without WHERE affects ALL rows

Projects built:
- Create complete school database with 5 tables

- Insert 20+ records in each table, realistic data
- Practice ALTER TABLE: add, modify, drop columns
- UPDATE and DELETE operations with various conditions

Practice: 40 DDL/DML practice queries, Sumita Arora exercises, create-insert-update-delete drill

SQL DQL, SELECT Queries, Clauses & Functions

Topics:
- SELECT statement: retrieving data from tables
- SELECT * FROM table;, all columns, all rows
- SELECT column1, column2 FROM table;, specific columns
- SELECT DISTINCT column FROM table;, removing duplicates
- Column aliases: SELECT column AS alias_name
- WHERE clause: filtering rows based on conditions
- Comparison operators in WHERE: = <> < > <= >=
- Logical operators: AND, OR, NOT, combining conditions
- BETWEEN operator: WHERE column BETWEEN value1 AND value2
- IN operator: WHERE column IN (value1, value2, value3)
- LIKE operator: pattern matching with wildcards
- % wildcard: any number of characters, _ wildcard: single character
- LIKE patterns: 'A%' (starts with A), '%ing' (ends with ing), '%an%' (contains an)
- IS NULL and IS NOT NULL: checking for missing values
- ORDER BY: sorting results, ASC (default) and DESC
- ORDER BY multiple columns, secondary sorting
- Aggregate functions, BOARD EXAM ESSENTIALS:
- COUNT(*), COUNT(column), COUNT(DISTINCT column)
- SUM(column), AVG(column), MAX(column), MIN(column)
- Aggregate functions ignore NULL values (except COUNT(*))
- GROUP BY: grouping rows for aggregate calculations
- HAVING clause: filtering groups (WHERE filters rows, HAVING filters groups)
- Difference between WHERE and HAVING, EXAM CRITICAL
- Query execution order: FROM WHERE GROUP BY HAVING SELECT ORDER BY

Projects built:
- 50-query drill: write SELECT queries for given scenarios
- Student performance analysis: average marks by subject, topper per class
- Employee database queries: salary analysis, department-wise stats
- SQL query challenge: 20 real-world business questions

Practice: 100 SELECT query practice problems, Sumita Arora SQL exercises, previous 10 years board SQL questions

SQL Joins, Functions & Advanced Queries

Topics:
- SQL Functions, Single row functions:
- Math functions: POWER(base, exp), ROUND(num, decimals), MOD(a, b)
- TRUNCATE(num, decimals), ABS(num), CEIL(num), FLOOR(num)
- String/Text functions: UCASE()/UPPER(), LCASE()/LOWER()
- MID()/SUBSTRING()/SUBSTR(str, start, length)
- LENGTH(str), LEFT(str, n), RIGHT(str, n)
- INSTR(str, substr), find position of substring
- LTRIM(), RTRIM(), TRIM(), removing spaces
- CONCAT(str1, str2), joining strings
- Date functions: NOW(), DATE(), MONTH(), MONTHNAME()
- YEAR(), DAY(), DAYNAME(), DAYOFWEEK()
- Joins, combining data from multiple tables:
- Cartesian Product: combining every row of table1 with every row of table2
- Equi-Join: Cartesian product with equality condition on common column
- Natural Join: automatic join on common column names
- JOIN syntax: SELECT ... FROM table1, table2 WHERE table1.col = table2.col
- Table aliases in joins: SELECT a.name, b.dept FROM emp a, dept b WHERE a.deptno = b.deptno
- Self-join concept (CBSE bonus)
- Board exam pattern: write SQL query for given output, find errors in SQL

Projects built:
- Multi-table database project: Student-Marks-Subject tables with joins
- Query-the-database challenge: 30 join-based questions
- SQL function practice: 40 function-based queries
- Complete SQL revision, all concepts in one project

Practice: 50 join queries, 30 function queries, Sumita Arora advanced SQL exercises, board exam SQL from last 10 years

Boolean Algebra & Karnaugh Maps (ISC Class 12, runs parallel to SQL for CBSE)

Topics:
- Boolean algebra postulates and theorems, complete set
- Simplification using algebraic method, 10+ practice expressions
- Sum of Products (SOP) form, minterm representation
- Product of Sums (POS) form, maxterm representation
- Canonical SOP and POS from truth tables
- Karnaugh Map (K-Map): 2-variable, 3-variable, 4-variable
- Grouping rules: groups of 1, 2, 4, 8, must be powers of 2
- Don't care conditions in K-Maps
- Simplification using K-Map, extracting minimal SOP/POS
- Verification of simplified expression using truth tables
- Logic circuit design from Boolean expressions

- Implementing circuits using universal gates (NAND only, NOR only)
- Half adder and full adder circuits, truth tables, expressions, diagrams
- Encoder and decoder circuits
- Multiplexer and demultiplexer concepts

Practice: 30 algebraic simplification problems, 30 K-Map problems, circuit design practice, ISC previous year Boolean algebra questions

Months 20-21: Computer Networks & Python-MySQL Connectivity (Week 77-84)

Computer Networks, Complete Chapter (CBSE & ISC)

Topics:

- Evolution of networking: ARPANET NSFNET Modern Internet
- Data communication: sender, receiver, message, transmission medium, protocol
- Types of data: text, numbers, images, audio, video
- Bandwidth: definition, units (bps, Kbps, Mbps, Gbps)
- Communication modes: simplex, half-duplex, full-duplex
- Switching techniques: circuit switching vs packet switching
- IP addressing: IPv4 (32-bit, dotted decimal), IPv6 (128-bit)
- IP address classes: A, B, C, D, E, ranges and default subnet masks
- Public IP vs Private IP addresses
- Transmission media, Guided (wired):
- Twisted pair cable: UTP, STP, uses, advantages
- Coaxial cable: structure, uses (cable TV, earlier ethernet)
- Fiber optic cable: total internal reflection, uses, advantages, fastest guided medium
- Transmission media, Unguided (wireless):
- Radio waves: long range, omnidirectional, FM, AM, WiFi, Bluetooth
- Microwaves: line of sight, point-to-point, cell towers
- Infrared: short range, line of sight, TV remote, IrDA
- Satellite communication: geostationary orbit, VSAT
- Networking devices: modem (modulator-demodulator), Ethernet card/NIC
- RJ45 connector, repeater (signal amplification), hub (broadcasts to all)
- Switch (intelligent forwarding), router (inter-network routing, IP-based)
- Gateway (protocol conversion), bridge (segment connection)
- WiFi card, access point, wireless networking

Projects built:

- Network diagram design for a school/office, choose appropriate devices and media
- IP addressing worksheet, classify 30 IP addresses, identify class
- Transmission media comparison chart, speed, cost, distance, use cases

Practice: Sumita Arora network chapters, 60 MCQs, previous year network questions, case study practice

Network Topologies, Protocols & Web Technologies

Topics:

- Network topologies, physical layout:
- Star topology: central hub/switch, easy troubleshooting, single point of failure
- Bus topology: single backbone cable, terminators, difficult troubleshooting
- Tree/Hierarchical topology: combination of star and bus
- Mesh topology: every device connected to every other, maximum redundancy
- Ring topology: circular connection, token passing
- Types of networks based on geographical spread:
- PAN (Personal Area Network): Bluetooth, within 10m
- LAN (Local Area Network): within a building, Ethernet, WiFi
- MAN (Metropolitan Area Network): across a city, cable TV network
- WAN (Wide Area Network): across countries, Internet is largest WAN
- Network protocols, rules for communication:
- HTTP (HyperText Transfer Protocol): web page transfer, port 80
- HTTPS: secure HTTP with SSL/TLS encryption, port 443
- FTP (File Transfer Protocol): file transfer, port 21
- SMTP (Simple Mail Transfer Protocol): sending emails, port 25
- POP3 (Post Office Protocol 3): receiving emails, port 110
- IMAP: accessing emails on server, port 143
- TCP/IP (Transmission Control Protocol/Internet Protocol): foundational protocol suite
- PPP (Point-to-Point Protocol): direct connection between two nodes
- TELNET: remote login, port 23, insecure
- VoIP (Voice over IP): voice calls over Internet (WhatsApp calls, Zoom)
- Web concepts: WWW, HTML, XML, domain names, URL structure
- URL components: protocol://domain:port/path?query#fragment
- DNS (Domain Name System): translating domain names to IP addresses
- Web browser, web server, web hosting concepts
- Static vs dynamic web pages
- Cookies: what they store, first-party vs third-party

Projects built:

- Network design case study, layout for multi-floor building with 200 computers
- Protocol identification quiz, match scenarios to protocols
- Web technology report, how the Internet works from URL to page load

Practice: 50 protocol MCQs, topology comparison questions, case study practice (CBSE favorite), board exam network questions

Network Security & Python-MySQL Connectivity (CBSE)

Topics:

- Network security threats:
- Malware: virus (needs host), worm (self-replicating), trojan horse (disguised)

- Ransomware: encrypts data, demands payment, WannaCry, NotPetya examples
- Spyware: secretly monitors, keyloggers
- Adware: unwanted advertisements
- Phishing: fake websites/emails to steal credentials
- Pharming: redirecting website traffic to fake sites
- Denial of Service (DoS): overwhelming server with requests
- Man-in-the-middle attack: intercepting communication
- Security measures: antivirus software, firewall (hardware/software)
- Encryption: converting data to unreadable form
- HTTP vs HTTPS: why HTTPS matters, SSL/TLS certificates
- Hacker vs cracker: ethical hacking vs malicious hacking
- Strong passwords: length, complexity, uniqueness
- Two-factor authentication (2FA)
- Python-MySQL Connectivity (CBSE Class 12 CRITICAL):
- Installing mysql.connector: pip install mysql-connector-python
- Importing: import mysql.connector
- Establishing connection: mysql.connector.connect(host, user, password, database)
- Creating cursor object: connection.cursor()
- Executing SQL queries: cursor.execute('SQL query')
- Fetching results: fetchone(), fetchall(), fetchmany(n)
- cursor.rowcount, number of rows affected
- Committing changes: connection.commit(), MANDATORY for INSERT/UPDATE/DELETE
- Closing connection: connection.close()
- Parameterized queries: preventing SQL injection with %s placeholders
- Complete CRUD operations: Create, Read, Update, Delete through Python

Projects built:

- Complete student management system, Python frontend + MySQL backend
- Library management system with Python-MySQL connectivity
- 4 Python-MySQL programs as required for practical file
- Network security awareness presentation

Practice: 30 Python-MySQL programs, connectivity code output prediction, board exam connectivity questions from last 5 years

Months 22-24: Board Exam Preparation, Intensive Revision & Mock Tests (Week 85-96)

Practical File Completion & Project Submission Preparation

Topics:

- CBSE Practical file requirements: 15+ Python programs + 5+ SQL sets + 4+ Python-MySQL programs
- ISC Practical: complete programming assignment compilation
- Python programs list: functions, file handling (text, binary, CSV), stack, sorting, searching
- SQL query sets: DDL, DML, DQL with single and multi-table queries
- Python-MySQL connectivity programs: CRUD operations
- Project selection for board practical: Python file handling OR Python-MySQL application
- Project documentation template: cover page, certificate, acknowledgement
- Project components: introduction, system requirements, source code, output screenshots, bibliography
- CBSE project ideas: Inventory management, Quiz application, Student database, E-commerce simulator
- ISC project ideas: Library system, Banking application, School management, Payroll system
- Viva voce preparation: top 50 questions with model answers
- Internal assessment preparation and marks distribution understanding

Deliverables:

- Complete practical file (printed/handwritten as per school requirement)
- Project with source code, documentation, and output
- Viva preparation notes, 50 Q&A for each subject area

Chapter-Wise Revision, Programming Topics

Topics:

- CBSE: Python revision, functions, scope, recursion (40 marks in board)
- Exception handling revision with practice programs
- File handling complete revision: text, binary (pickle), CSV
- Data structures revision: stack operations, applications
- Sorting algorithms revision: bubble, selection, insertion, code + tracing
- Searching algorithms revision: linear, binary, code + tracing
- ISC: Java revision, OOP, inheritance, polymorphism
- Data structures revision: stack, queue, circular queue, deque
- Linked list complete revision, all operations
- Binary tree traversal revision
- Recursion revision with 15 standard programs
- Complexity analysis revision, Big O for all algorithms

Practice: Topic-wise previous year questions, formula sheets, quick reference cards

Chapter-Wise Revision, SQL, Networks & Theory

Topics:

- SQL complete revision: DDL, DML, DQL commands
- SQL functions revision: math, string, date, aggregate
- GROUP BY, HAVING, ORDER BY, combined query practice
- Joins revision: Cartesian product, equi-join, natural join
- CBSE: Python-MySQL connectivity revision, connection, cursor, execute, fetch, commit
- Computer networks complete revision: media, devices, topologies, protocols
- ISC: Boolean algebra revision, laws, simplification, K-maps

- Society, law and ethics revision: cybercrime, IPR, IT Act, e-waste
- Case study questions practice, network design scenarios
- Assertion-Reason questions practice, all chapters

Practice: 100 SQL queries revision, network diagram practice, case study solving

Mock Board Exams, Set 1 & 2

Topics:

- Full-length Mock Exam 1: 70 marks, 3 hours, strict exam conditions
- Detailed solution discussion and marking scheme analysis
- Common mistakes identification and correction
- Full-length Mock Exam 2: 70 marks, 3 hours, different question set
- Detailed solution discussion with alternative approaches
- Marks improvement strategies based on mock performance
- Section-wise time allocation strategy:
- Section A (21 marks): 35 minutes, 1.5 min per MCQ
- Section B (14 marks): 20 minutes, 3 min per 2-mark question
- Section C (9-12 marks): 20 minutes, 5 min per 3-mark question
- Section D (8-16 marks): 25 minutes, 6 min per 4-mark question
- Section E (10-15 marks): 20 minutes, 8 min per 5-mark question
- Presentation tips: writing code in exams, proper indentation, comments

Deliverables:

- 2 complete mock papers solved and reviewed
- Personal weak areas identified and improvement plan
- Time management skill developed through timed practice

Mock Board Exams, Set 3, 4 & 5 + Previous Year Paper Analysis

Topics:

- Mock Exam 3, 4, 5: Full-length papers with varying difficulty
- CBSE Previous Year Papers: 2020, 2021, 2022, 2023, 2024, 2025, full solved
- ISC Previous Year Papers: 2020, 2021, 2022, 2023, 2024, 2025, full solved
- CBSE Sample Paper 2026-27, detailed solution with marking scheme
- ISC Specimen Paper 2026-27, detailed solution
- Frequently repeated questions analysis, top 30 most-asked topics
- Marking scheme tricks: how examiners award step marks
- Partial credit strategies: getting marks even if full answer unknown
- Common errors students make, and how to avoid them
- Important program outputs that repeat in exams

Practice: 5 mock papers + 6 previous year papers = 11 full papers solved

Final Revision & Last-Minute Board Exam Tips

Topics:

- One-shot revision: complete syllabus in 2 days, key points only
- Formula sheet / cheat sheet revision: all Python/Java syntax, SQL commands, network concepts
- Top 50 most important programs, practice writing by hand
- Top 30 SQL queries, write without thinking
- Top 20 output prediction questions, instant answer practice
- Board exam day strategy: reading time usage, question selection
- How to write Python code in board exams: indentation, proper syntax
- How to write SQL queries: uppercase commands, proper formatting
- How to draw network diagrams: clean, labeled, with proper legends
- Common last-minute doubts cleared
- Confidence building: you've prepared more than 95% of students
- Final practical exam preparation: lab test strategy, viva confidence

Deliverables:

- Quick revision notes, entire syllabus on 10 pages
- Top programs list, 50 most important programs
- SQL quick reference, all commands on 2 pages
- Network concepts summary, devices, protocols, topologies on 1 page
- READY FOR BOARD EXAM, 95+ score target

PROJECTS THE STUDENT BUILDS AND KEEPS

- Phase 1 (Class 11 Sem 1): menu-driven console programs - calculators, grade and tax calculators, pattern printers, and number-logic programs built while learning Python (CBSE) or Java (ISC) fundamentals
- Phase 2 (Class 11 Sem 2): the complete Class 11 practical file with 20+ programs, plus a documented mini project such as a quiz game, library manager, or student database
- Phase 3 (Class 12 Sem 1): file handling utilities for text, binary (pickle), and CSV files, a record management system with search, update, and delete, and a menu-driven stack implementation
- Phase 4 (Class 12 Sem 2): SQL query sets on a live MySQL database and the final board project - for CBSE, a Python plus MySQL connectivity application with full documentation and viva preparation
- Total: 2 board-ready practical files, 2 submission projects, and 40+ graded programs over the two years

Total projects: 40+ graded programs and mini projects across Class 11 and 12, including 2 complete board practical files and 2 board-submission projects

SKILLS THE STUDENT WILL HAVE AT THE END

- Python Programming (CBSE 083): variables, control flow, strings, lists, tuples, dictionaries,

functions, and exception handling
- File Handling: text files, binary files with the pickle module, and CSV files with the csv module
- Data Structures: stack implementation using lists with push, pop, peek, and application problems
- Databases and SQL: DDL, DML, aggregate functions, GROUP BY, HAVING, and joins on MySQL
- Python-MySQL Connectivity: connecting Python to MySQL, executing queries, and fetching results from a program
- Computer Networks: network types, topologies, transmission media, devices, protocols, and web basics
- Java and OOP (ISC batch): classes, constructors, inheritance, polymorphism, recursion, arrays, and data structures
- Exam Technique: output tracing, error spotting, and writing answers to the CBSE and ISC marking schemes

HOW A TYPICAL WEEK IS SPLIT

Live classes: 3-4 live classes per week, 1 hour each, taught chapter by chapter in sync with the school syllabus
Practical work: 2-3 hours of guided coding practice: practical file programs, SQL queries on a live MySQL database, and output-tracing drills
Board style practice: Weekly chapter tests plus previous year questions, sample papers, and answer writing trained on the CBSE and ISC marking schemes
Doubt support: Dedicated doubt-clearing sessions, with extra slots before school exams, pre-boards, and board exams

SUPPORT INCLUDED

Small batches: Small group batches so every student gets individual attention and screen time
Board specific batches: Separate CBSE (Python) and ISC (Java) batches - syllabus and language are never mixed
Exam season support: Extra revision classes and doubt sessions before pre-boards and board exams
Practical and project help: Step-by-step help with practical file programs and the board project until they are submission-ready
Progress tracking: Regular test results and progress updates shared with parents

CERTIFICATION DETAIL

Course certificate: Modern Age Coders Course Completion Certificate at the end of each academic year
Board exam readiness: Structured revision with 10 years of solved board papers and full mock exams on the current CBSE (083) and ISC pattern: 70 marks theory plus 30 marks practical
Practical file support: Complete guidance on every practical file program, the board project with documentation, and viva preparation for the 30-mark practical exam

WHERE THIS CAN LEAD

- B.Tech / BE in Computer Science or IT with a strong programming foundation before college begins
- BCA, B.Sc Computer Science, and B.Sc IT admissions
- JEE and other engineering entrances with Computer Science as a scoring board subject
- Indian Computing Olympiad (ZIO/ZCO) and school-level coding competitions
- College-level data structures and competitive programming, building on the Class 12 stack and algorithms work
- Python certifications such as PCEP after the course
- Early internships and freelance projects using Python and SQL
- Data science and AI/ML degree specializations that expect Python fundamentals

COMMON QUESTIONS ABOUT THIS COURSE

For anything about cost, use PART 4 and RULE 1. Do not quote two regions.

Q: Are CBSE and ICSE batches really separate?
A: Yes, absolutely. CBSE uses Python and ICSE/ISC uses Java. The syllabus, exam pattern, marking scheme, practical requirements, and even the thinking approach are different. We run completely separate batches with specialized mentors for each board.

Q: Can I join if I have zero programming experience?
A: Yes! Both our CBSE and ISC courses start from absolute scratch. We assume no prior coding experience. You'll learn everything from installing Python/Java to solving complex board-level programs.

Q: Which textbook do you follow?
A: For CBSE, we primarily follow Sumita Arora (Computer Science with Python) supplemented by NCERT textbook. For ISC, we follow Understanding Computer Science by Pandey & Dey (APC Publications) and Sumita Arora ISC edition. Our teaching covers every chapter from these books.

Q: Will this course help me score 95+ in boards?
A: We focus on both understanding and exam strategy.

Q: Do you cover practical file and project work?
A: Yes, completely. We prepare your entire practical file (20+ programs for CBSE, lab assignments for ISC), guide you through the project with documentation, and prepare you for the viva voce examination.

Q: What is the difference between CS and IP in CBSE?
A: CS (Code 083) focuses on deep Python programming, file handling, data structures (stack), sorting/searching algorithms, and Python-MySQL connectivity. IP (Code 065) focuses on data handling with Python Pandas, data visualization with Matplotlib, and SQL. CS is harder and more programming-intensive; IP is application-oriented. Both include SQL.

Q: Is ISC Computer Science harder than CBSE CS?
A: ISC CS covers more advanced topics like linked lists, binary trees, Karnaugh maps, and has a stronger focus on OOP through Java. CBSE CS has more practical connectivity topics (Python-MySQL). Both are challenging in their own ways, our separate batches ensure you're prepared for YOUR specific board.

Q: Do you help with competitive programming too?
A: While this course focuses on board exam preparation, the strong programming foundation you build here, especially in ISC with data structures and algorithms, is an excellent stepping stone for competitive programming. We offer a separate competitive programming course for those interested.

To enrol, message Shivam Sir on +91 9123366161 or send the parent this link: https://learn.modernagecoders.com/courses/cbse-icse-computer-science-class-11-12-python-java-complete-course
For a demo: the Priority Live Demo (guaranteed, today or tomorrow) is booked at https://learn.modernagecoders.com/priority-demo . The free demo is a waiting list with no fixed date.

==========
COURSE 46 OF 137: COPILOT STUDIO AGENT MASTERCLASS FOR PROFESSIONALS
==========

Course link: https://learn.modernagecoders.com/courses/ai-agents-with-microsoft-copilot-studio-masterclass-for-professionals
Subject area: AI Agents & Automation
Designed for: College students
Who can join: Intermediate to advanced (working professionals; no prior agent experience assumed, business software fluency expected)
Course length: 24 classes (12 weeks · 2 classes/week)
Time needed: 4-6 hours/week recommended
Certificate: Certificate from Modern Age Coders, awarded on passing the final assessment

PRICE FOR THIS COURSE (quote only the one that applies to the person asking)
In India, per month: one to one Rs 4,999
Outside India, per month: one to one $150
Classes: one to one in India one live class a week, four a month; one to one outside India two live classes a week, eight a month. Each class is one hour.
Note: this course is taught one to one only. There is no group or mini batch option.
Note: the course length above is counted at two classes a week. In India the one to one plan is one class a week, so if an Indian family asks how long it will take, hand over to Shivam Sir.

WHAT THIS COURSE IS

Ship production AI agents in Microsoft Copilot Studio: 24 live 1-on-1 online classes for working professionals on enterprise grounding, autonomous agents, multi-agent A2A, governance and ROI.

In one line: Most agent projects die in pilot. Learn to build, evaluate, govern and cost agents that survive contact with your organisation, in private 1-on-1 classes built around your actual work.

ABOUT THE PROGRAMME

Gartner projects that over 40% of agentic AI projects will be canceled by the end of 2027, and that by 2027, 40% of enterprises will demote or decommission autonomous agents due to governance failures. The builders who survive that filter are the ones who can answer the unglamorous questions: what is this agent grounded in, who approved its connector permissions, what does a conversation cost in Copilot Credits, and how do we know it is actually resolving anything? This masterclass teaches exactly that, on Microsoft Copilot Studio, the graphical low-code studio that 90% of the Fortune 500 use by Microsoft's own count. Across 24 live 1-on-1 classes you build the full professional stack: enterprise knowledge grounding across SharePoint, Dataverse and connector-indexed enterprise data with tenant graph grounding; designed topics and generative orchestration; the complete tool surface from prebuilt and premium connectors through custom connectors, REST, Prompt tools, agent flows, Model Context Protocol under DLP policies, and computer use with access control, HTTPS enforcement, stored credentials and human supervision; autonomous agents on event

triggers, hardened with approval pauses and run under the maker-credentials rule; multi-agent architectures with child agents, connected agents and the A2A protocol; agent evaluations with test sets and graders; analytics down to outcomes, CSAT and the cost savings metric; and the governance layer that makes it all deployable, from mandatory Microsoft Entra Agent IDs and Conditional Access to Microsoft Agent 365 as the control plane and the Agent Store approval path. You finish with a production-grade capstone agent for your own team plus the governance and ROI pack to defend it in front of your leadership. Because every class is 1-on-1, the whole course runs on your organisation's real use cases, discussed at whatever depth your role demands. The syllabus is a Living Syllabus, re-verified against Microsoft's documentation as the platform ships, so what you learn is the August 2026 platform, not a 2024 recording.

WHAT MAKES THIS COURSE DIFFERENT

- 1-on-1 only, by design: production agent work involves your real processes, your data boundaries and your org's licensing, none of which can be discussed honestly in a group class; a private mentor can go exactly as deep as your role requires.
- Governance is taught as a first-class skill, not an afterthought: Microsoft Entra Agent ID (mandatory for new agents since July 2026), Conditional Access over connector permissions, DLP policies, Microsoft Agent 365 and the Agent Store approval path are all in the syllabus.
- Cost fluency that most builders lack: you learn the Copilot Credits model down to per-feature rates, what a Microsoft 365 Copilot licence covers at no charge, what it does not (computer use), and the 125% capacity cutoff that silently disables over-budget agents.
- The full 2026 tool surface: Prompt tools, agent flows, premium and on-premises connectors, custom connectors, REST, Model Context Protocol, computer use with enterprise guardrails, and deep reasoning, taught with their real limits and billing behaviour.
- Quality you can prove: agent evaluations (GA March 2026) with test sets, graders and multi-turn tests, plus analytics outcomes, CSAT and the cost savings metric, so your capstone ships with evidence, not vibes.
- Living Syllabus: Copilot Studio ships monthly (the current model lineup includes GPT-5.5 Chat and Anthropic Claude Opus 4.7; the A2A protocol went GA in April 2026), and this course is re-verified against Microsoft's What's New pages as features land.

WHAT A STUDENT NEEDS BEFORE STARTING

Device: A laptop or desktop (Windows, Mac or Linux) with the Chrome or Edge browser and a reliable internet connection; Copilot Studio runs fully in the browser

Coding experience: None required. Copilot Studio is a graphical, low-code studio, and this course teaches the design, governance and cost disciplines around it. Professionals who do code can go deeper into custom connectors, REST tools and Power Fx expressions inside the same syllabus

Accounts: Copilot Studio uses a Microsoft work or school (Entra ID) account. With a work email you can self-serve the 30-day trial (which cannot publish agents); ideally you use your employer's tenant with your admin's awareness, and we arrange a practice environment where that is not possible. Your mentor sorts this out with you in the first class

Mindset: The willingness to treat agents as production software: tested before trusted, costed before scaled, and governed before shipped. The course rewards professionals who ask 'who approved this and what does it cost' as instinctively as 'does it work'

WHO THIS COURSE IS FOR

Operations and business analysts: Analysts and process owners who know exactly which workflows are broken and want to ship the agent that fixes one, with the evidence to defend it

It and m365 admins: IT professionals and Microsoft 365 admins who will be asked to govern agents either way, and would rather be the person who understands Entra Agent ID, DLP and Agent 365 before the first incident

Developers and makers: Developers and Power Platform makers adding the 2026 agent stack (MCP, A2A, computer use, evaluations) to skills employers already recognise

Team leads and managers: Leads and managers who must decide what gets automated, what it costs in Copilot Credits, and which agent projects deserve to survive the pilot filter

Consultants and freelancers: Consultants who want to sell agent builds that pass a client's security review, with governance and ROI packs as deliverables, not afterthoughts

FULL CURRICULUM, WEEK BY WEEK

This is the complete teaching plan. Parents can ask about any week.

PHASE 1: PLATFORM & FOUNDATIONS

Map the 2026 agent landscape, learn the anatomy of a Copilot Studio agent, build instruction and testing discipline, and make the model and harness decisions that shape cost and capability.

Class 1: The 2026 Agent Landscape and Where Copilot Studio Sits

Topics:

- What Microsoft ships in 2026: Copilot Studio as a graphical, low-code studio for building and managing AI-powered agents and workflows, run standalone at copilotstudio.microsoft.com on

Power Platform infrastructure
    - The ownership decision Microsoft itself recommends making first: Copilot Studio (SaaS, low-code, managed guardrails) vs Microsoft Foundry (PaaS, pro-code, fine-grained control), and how the two interoperate rather than compete
    - The three build artifacts by their exact names: agents, workflows and agent flows, and which business problems map to which
    - Why the market filter matters to you: Gartner's finding that over 40% of agentic AI projects will be canceled by end of 2027, and what the surviving 60% do differently
    - Environments and tenants: where agents live, why production and practice environments are separated, and what your employer's admin controls
    - Access honestly stated: Copilot Studio needs a Microsoft work or school (Entra ID) account; a work email gets a 30-day self-service trial that cannot publish agents, and this course arranges a practice environment where needed
    - Choosing your capstone: one real process from your own team that an agent could genuinely improve, nominated in Class 1 and refined all course
  Projects built:
    - Write the one-page 'agent opportunity memo' for your organisation: three candidate processes, the data each would need, the risks each carries, and which one becomes your capstone
  Practice: Audit two agents you already encounter at work (a support bot, an IT helpdesk) and reverse-engineer their instructions, knowledge and escalation rules.
  Assessment: Defend your capstone choice in five minutes: the process, the users, the data, the risk, and what 'better' will measurably mean.

Class 2: Agent Anatomy and Instruction Discipline
  Topics:
    - The anatomy every agent shares: name, description, instructions, knowledge, tools, triggers, channels, and where each is configured
    - The new-experience component names as Microsoft spells them: Instructions, Knowledge, Tools and skills, Model, Connected agents, Memory
    - The instruction stack for business agents: identity, scope, tone, format rules, refusals and escalation, in that order
    - Scope fences that survive real users: what the agent must not answer (HR disputes, legal advice, pricing exceptions) and wording refusals that de-escalate
    - Describe-to-create and Build with natural language (preview): what the generators give you and why professionals still rewrite the instructions by hand
    - Instruction anti-patterns from real deployments: contradictions, vague verbs, policy text pasted verbatim, and instructions that fight the knowledge sources
    - Versioning instructions outside the tool from day one, because 'what changed last Tuesday' is a governance question
  Projects built:
    - Build 'Policy Desk v1': an internal FAQ agent for one real policy area of your workplace, with a complete instruction stack and five tested refusals
  Practice: Run the same 10 workplace questions against two instruction variants and score every difference in a comparison table.
  Assessment: Present your instruction stack line by line and state, for each line, what production incident removing it would eventually cause.

Class 3: Testing Like It Is Already in Production
  Topics:
    - The fixed test set: happy path, edge case and adversarial questions written before you tune anything
    - Adversarial testing for business agents: prompt injection attempts, policy-boundary probes, and the disgruntled-user tone test
    - Regression discipline: rerunning the full set after every instruction, knowledge or tool change, and logging verdicts
    - Hallucination triage: distinguishing missing knowledge, bad grounding and model overreach, because each has a different fix
    - The escalation path as a tested feature: 'this needs a human' is a designed outcome, not a failure
    - What you are rehearsing for: agent evaluations (GA March 2026) automate exactly this loop with test sets and graders in Phase 4
    - The rule this course grades you on: no change ships without a retest, and every retest leaves a written trail
  Projects built:
    - Build the permanent 25-question test set for Policy Desk, including five adversarial probes, with expected behaviour written before the first run
  Practice: Attempt three prompt-injection attacks on your own agent, document the outcomes, and patch the weakest point.
  Assessment: Given a transcript with three subtle failures, identify each one and classify it: instructions, knowledge or escalation gap.

Class 4: Models and Harnesses: The Decisions Underneath Everything
  Topics:
    - The model picker in August 2026: GPT-4.1 as default, GPT-5 Chat and GPT-5.5 Chat GA, Anthropic Claude Sonnet 4.6, Claude Opus 4.6 and Claude Opus 4.7 GA, with GPT-5 Reasoning and GPT-5 Auto in preview
    - External models are an admin decision: Anthropic, Mistral and xAI models must be allowed in both the Power Platform admin center and the Microsoft 365 admin center before makers can pick them

- Model release types you must read correctly: Experimental, Preview, GA, Default, Retired (GPT-4o and Claude Sonnet 4.5 are already retired), and why production agents pin to GA
- Harnesses, the 2026 architectural change: the runtime between your design and the model, in three flavours, standard harness, GitHub Copilot harness and Copilot chat harness
- The GitHub Copilot harness honestly costed: most capable, creates Word, Excel, PowerPoint and PDF files natively, supports skills and memory, and bills Copilot Credits from the moment you start building, including preview and testing
- Agents cannot move between harnesses, so the harness choice is made once, per agent, with eyes open
- The Copilot Studio extension for Visual Studio Code (GA January 2026): where low-code agents meet source control and code review

Projects built:
- Run your Policy Desk test set against two GA models (one OpenAI, one Anthropic), score the differences, and write the one-paragraph model decision with evidence attached

Practice: Draft the admin request you would send to enable an external model in your tenant, naming both admin centers and the business justification.

Assessment: Phase 1 gate: rebuild a small business agent from a written spec in 30 minutes, with instruction stack, refusals, a 10-question test and a defended model choice.

PHASE 2: ENTERPRISE KNOWLEDGE

Ground agents in enterprise sources at scale: SharePoint, Dataverse, documents and connector-indexed data, tenant graph grounding, curation strategy, and accuracy audits an auditor would accept.

Class 5: Grounding Strategy: The Knowledge Source Estate

Topics:
- The knowledge source lineup with real limits: public websites via Bing (25 websites), uploaded documents stored in Dataverse (512 MB per file, up to 500 files), SharePoint (25 URLs), Dataverse tables, and enterprise data via connectors indexed by Microsoft Search
- The hard ceilings that force strategy: 500 knowledge sources per agent and 1,000 topics per agent mean knowledge is curated, never dumped
- Generative answers under the hood: how the agent searches sources and composes cited answers, and what 'Allow ungrounded responses' changes
- Citations as a compliance feature: why grounded-with-sources is the difference between an answer and a liability
- Matching source type to content type: policies in SharePoint, structured records in Dataverse, public facts on the website, and why mixing them carelessly produces conflicts
- Web search as a deliberate exception: what 'Use information from the web' adds and when a curated internal agent must leave it off
- Designing the capstone's source map: authoritative, current, permissioned, and small enough to audit

Projects built:
- Ground Policy Desk in a real SharePoint site (or a mirrored practice copy) and prove ten answers cite the correct policy paragraph

Practice: Ask your grounded agent five questions its sources cannot answer and document the exact edge-of-knowledge behaviour.

Assessment: Present your capstone source map: every source, its owner, its update cadence, and why it earns its place under the 500-source discipline.

Class 6: SharePoint and Documents Done Right

Topics:
- Writing documents for retrieval: headings that answer questions, one fact per paragraph, consistent terminology, and the anti-pattern of 40-page PDFs
- SharePoint hygiene that grounding exposes: stale copies, duplicate policies, draft folders, and the librarian pass that fixes them
- Permissions reality: agents surface what the knowledge configuration can reach, so source selection is a security decision, not just a quality one
- Freshness engineering: which source updates win, what happens when the underlying document changes, and update cadences you can promise
- Testing document knowledge surgically: questions whose answers live in one exact paragraph, and what retrieval failure looks like
- The curation multiplier: five well-structured pages outperform fifty messy ones, demonstrated live on your own content
- Data minimisation at the source: what never belongs in agent knowledge (personal data, credentials, unreleased financials)

Projects built:
- Rebuild one messy real document into a retrieval-optimised version, ground both versions side by side, and publish the before-and-after accuracy comparison

Practice: Run a librarian audit on one SharePoint area you actually use: what is in, what is stale, what would embarrass the agent that cites it.

Assessment: Given two document structures, predict which grounds better and prove it with a five-question retrieval test.

Class 7: Dataverse, Connector-Indexed Data and Tenant Graph Grounding

Topics:
- Dataverse as knowledge: structured tables behind conversational answers, and when structure

beats prose
- Enterprise data via connectors, indexed by Microsoft Search: reaching systems beyond Microsoft 365 without exporting them
- Tenant graph grounding with semantic search: retrieval over the tenant's Microsoft Graph, what it unlocks, and the fact that it costs extra Copilot Credits (10 per use)
- Source arbitration: what happens when SharePoint, Dataverse and a website disagree, and how instructions scope question types to sources
- Knowledge source health: monitoring which sources actually get used, and retiring the ones that never answer
- Foundry IQ and Microsoft IQ in preview: where Microsoft is taking enterprise knowledge, flagged honestly as preview, not promised
- Cost-aware knowledge design: grounding choices are billing choices, previewing the credit mathematics of Class 20

Projects built:
- Add a second source type to Policy Desk (Dataverse table or connector-indexed source), then document the arbitration behaviour with five conflict questions

Practice: Write the scoping instructions that route 'how many' and 'which record' questions to structured sources and 'what is the policy' questions to documents.
Assessment: Whiteboard the retrieval path of one question end to end: user, orchestration, source choice, retrieval, citation, answer.

Class 8: Accuracy Audits and Honest Agents

Topics:
- The accuracy audit protocol: scoring 25 grounded answers against the actual source text, with a rubric a non-builder could apply
- Uncertainty language as policy: agents that say 'my sources do not cover that' instead of improvising, and how instructions enforce it
- Bias in the source list: how a one-sided knowledge estate produces a one-sided agent, and the review that catches it
- The 'Allow ungrounded responses' decision as a governance artifact: who signs it, and for which agent categories it is defensible
- Transparency obligations: users must know they are talking to an agent and what it can reach
- The audit trail: accuracy numbers, test logs and source maps as the documents that survive an internal review
- Phase 2 gate: the grounding checklist you will apply to every agent for the rest of your career

Projects built:
- Run the full 25-answer accuracy audit on Policy Desk and publish the result as a one-page report with examples, methodology and a remediation list

Practice: Have a colleague ask your agent ten unscripted questions from their real work and log every answer they would not accept.
Assessment: Phase 2 exam: design the complete knowledge plan for a new use case in writing (sources, limits, scoping, refusals, audit protocol) in 30 minutes.

PHASE 3: ORCHESTRATION & TOOLS

Design conversations for critical paths, choose orchestration modes deliberately, then master the full tool surface: Prompt tools, agent flows, connectors, custom connectors and REST, Model Context Protocol under DLP, computer use with guardrails, and deep reasoning.

Class 9: Topics for Critical Paths

Topics:
- Topics as designed conversation: when a business process demands the same path every time, you design it, you do not hope for it
- Trigger phrases at scale: teaching the many phrasings of one request (topics support up to 200 trigger phrases)
- Question nodes, entities and variables: collecting exactly the data a process needs, with validation for messy human answers
- Condition groups (June 2026): combining tests cleanly, and the escalation branch every customer-facing topic must have
- Adaptive cards for business: structured, tappable responses for approvals, summaries and forms, designed for phones first
- System topics: greeting, escalate, goodbye, and why you customise rather than delete them
- The topic map for your capstone: the five jobs users will actually ask it to do, each with an owner path

Projects built:
- Build 'Support Triage v1': a customer-facing agent with three designed topics (report an issue, check status, escalate to human), entities capturing the details, and an adaptive card summary

Practice: Collect ten real phrasings of one request from colleagues and tune trigger phrases until all ten route correctly.
Assessment: Given four user messages, predict the topic each triggers and the variables each fills, then verify live.

Class 10: Generative Orchestration, Deliberately

Topics:
- The two orchestration modes: classic (trigger phrases select topics) versus generative (the model plans across topics, knowledge and tools), and what each buys you

- What generative orchestration unlocks: multi-intent requests, dynamic tool choice, and the event triggers and autonomy of Phase 4, which require it
- What you trade: determinism, and the instruction patterns that rein the planner back onto approved paths
- Reading the plan: inspecting how the agent chose a topic, source or tool, and turning surprises into design fixes
- The hybrid pattern professionals actually ship: designed topics for critical and regulated paths, generative flexibility for the long tail
- Re-running your guardrail tests after the mode switch, because refusals and scope fences must survive orchestration
- Microsoft's own scale heuristic, previewed: when an agent grows past 30 to 40 choices of tools, topics and agents, you split it, which is where Phase 4's multi-agent work begins

Projects built:
- Migrate Support Triage to generative orchestration, rerun the full test set, and publish the behaviour-change log with a keep-or-fix verdict per change

Practice: Craft three multi-intent messages ('report this, and also what happened to yesterday's ticket, and who do I call') and tune until all three resolve cleanly.
Assessment: Defend your capstone's orchestration choice in writing: mode, why, and the two risks you are explicitly accepting.

Class 11: Prompt Tools and Agent Flows

Topics:
- The tool menu by its exact names: Prompt, Agent flow, Computer use, Custom connector, Model Context Protocol and REST API, plus prebuilt connectors
- Prompt tools: one perfect transformation (summarise, classify, extract, rewrite) with a tested prompt behind a stable interface
- Agent flows: deterministic multi-step automations the agent calls as tools, for anything that must run the same way every time
- Flow anatomy in practice: trigger, steps, conditions, outputs handed back to the conversation, and the error paths that make failure graceful
- The approvals pattern: a flow that pauses for a human decision, the single most reused pattern in business agents
- Tool descriptions as the real API: the orchestrator chooses tools by reading descriptions, so you write them like documentation
- Tool discipline: the platform allows 128 tools per agent under generative orchestration, Microsoft recommends 25 to 30, and good architects use fewer

Projects built:
- Build 'Expense Helper': conversation collects an expense claim, an agent flow validates it, routes it for approval, and returns the outcome, with tested error paths for every step

Practice: Break your flow deliberately (missing field, rejected approval, timeout) and verify the user sees a designed message for each failure.
Assessment: Given five business tasks, assign each to Prompt tool, agent flow, topic or knowledge, and justify each assignment in two sentences.

Class 12: The Connector Estate: Standard, Premium, On-Premises, Custom, REST

Topics:
- The scale of the estate: more than 1,400 prebuilt connectors, categorised as Standard, Premium, Custom and On-premises, with licensing implications per category
- Using prebuilt connectors as tools: reading and writing real systems (SharePoint, Outlook, Planner, third-party SaaS) from inside a conversation
- Authentication honestly explained: connection credentials, who consents to what, and why 'connect your account' is a governance event
- On-premises connectivity: reaching systems behind the firewall via the gateway, and when that is the right call versus an API
- Custom connectors: wrapping your organisation's own REST API so agents (and flows) can call it like any other connector
- The REST API tool: calling an endpoint directly, mapping JSON responses into conversation variables
- DLP preview: connector access is policy-controlled, and the same DLP machinery will govern MCP in the next class

Projects built:
- Wire one real connector tool and one REST or custom connector tool into a practice agent, and demonstrate a conversation that reads and writes live data through both

Practice: Inventory the five systems your capstone's users touch daily and classify the connector path to each: prebuilt, premium, custom or REST.
Assessment: Sketch one tool call end to end (utterance, orchestration, tool selection, auth, call, result, answer) and mark every point where governance can intervene.

Class 13: Model Context Protocol Under Enterprise Governance

Topics:
- MCP in one sentence: the open protocol for plugging tool servers into agents, added in Copilot Studio via Tools, Add a tool, Model Context Protocol
- What an MCP server exposes: Tools and Resources, with per-tool toggles and the Allow all switch you will learn to distrust
- The governance fact that makes MCP enterprise-safe here: MCP runs over Power Platform connector infrastructure, so DLP data policies govern MCP access like any connector
- Why MCP fluency compounds: the same protocol appears in Claude, IDEs and other agent platforms, so this is portable knowledge
- The Windows 365 for Agents MCP server (GA June 2026): full operational control of a Cloud PC

as a case study in how much power a single MCP server can carry
- Evaluating a third-party MCP server before connecting it: capabilities, data flows, failure modes, and the least-power principle
- MCP versus custom connector versus REST: three ways to reach the same system, chosen by governance posture, not fashion

Projects built:
- Add an MCP server to a practice agent, disable every tool you do not need, and document the resulting capability surface as a one-page security note

Practice: Write the DLP review request for your MCP integration as you would submit it to your Power Platform admin, naming the data boundaries.
Assessment: Explain to a skeptical security lead, in three minutes, why this MCP integration is governable and what would make you switch it off.

Class 14: Computer Use and Deep Reasoning: The Power Tools
Topics:
- Computer use (GA 2026): Computer-Using Agents that operate real user interfaces when no API exists, and why it is the tool of last resort, not first
- The model menu with per-step credit costs: OpenAI Computer-Using Agent at 5 credits per step, Claude Sonnet 4.6 at 5, Claude Opus 4.6 at 15 as the premium option
- The four guardrails you configure before any computer-use agent runs: Access control allow-lists, Enforce HTTPS, Stored credentials (internal or Azure Key Vault), Human supervision
- Costing a computer-use task honestly: steps multiply, credits are per step, and computer use is not covered by the Microsoft 365 Copilot licence
- Deep reasoning (preview): the Azure OpenAI o3 model invoked by the keyword 'reason' in agent instructions, US and EU availability, and why preview features stay out of production commitments
- Choosing between a designed flow, an API call and computer use for the same task: the decision tree with cost and fragility on it
- Phase 3 gate: the complete tool architecture of your capstone, every tool justified

Projects built:
- Build a governed computer-use demo: one legacy-UI task automated with allow-lists, HTTPS enforcement and human supervision configured, plus a per-run credit cost estimate

Practice: Take one process from your workplace with no API and write the computer-use feasibility note: steps, guardrails, cost per run, and the API alternative if any.
Assessment: Phase 3 exam: given a use case, design the full tool architecture (tools chosen, tools rejected, governance controls, cost notes) and defend it.

PHASE 4: AUTONOMY, MULTI-AGENT & QUALITY

Ship agents that act on their own and prove they work: event triggers under the maker-credentials rule, hardening, multi-agent architectures with A2A, agent evaluations, analytics, and full cost management in Copilot Credits.

Class 15: Event Triggers and Autonomous Agents
Topics:
- The autonomy switch: event triggers let agents act with no user in the chat, on events like item created in SharePoint, file created in OneDrive, task completed in Planner, and Recurrence schedules
- Generative orchestration required: autonomous behaviour runs on the planning brain, which is why Class 10 preceded this one
- The trigger payload: event data arriving as input, and instructions deciding what the agent does with it
- The security fact that shapes everything: triggers run with the agent maker's credentials, so every autonomous action is effectively signed by you
- Designing the first autonomous job: small, observable, reversible, and logged
- The activity trail habit: knowing exactly what your agent did at 3am, before anyone asks
- Autonomy scoping: which of your capstone's jobs deserve a trigger, and which must stay human-initiated

Projects built:
- Build 'Weekly Reporter': an autonomous agent on a Recurrence trigger that compiles a weekly status summary from real sources and posts it for review, never directly to stakeholders

Practice: Let Weekly Reporter run unattended for three real events and audit every action against what you intended, scoring each.
Assessment: Explain the maker-credentials rule and name the three design constraints you imposed on your agent because of it.

Class 16: Hardening Autonomy: Approval Pauses and Failure Design
Topics:
- From demo to dependable: idempotence (running twice must not double the damage), retries, and safe defaults when inputs surprise you
- Human-in-the-loop as architecture: which autonomous actions pause for approval, how the pause is built, and who the approver is on paper
- Notification etiquette: an autonomous agent that spams gets disabled by its own users, so frequency and channel are design decisions
- Failure diaries: structured capture of what went wrong, so Tuesday's incident is not repeated on Thursday
- Scope creep in autonomy: the 'it could also just' trap, and the change-control habit that

resists it
    - Gartner's warning as a design brief: 40% of enterprises will demote or decommission autonomous agents by 2027 due to governance failures, and hardened agents are how you stay in the other 60%
    - The operations note: one page stating what the agent does, when, with whose permissions, and how to turn it off
  Projects built:
    - Harden Weekly Reporter: add an approval pause before anything leaves draft, an error diary, and a self-report of its own actions, then run it for a full real week
  Practice: Write the operations note for Weekly Reporter and have a colleague verify they could disable the agent using only that page.
  Assessment: Live drill: your mentor corrupts one input source; your agent must fail gracefully and your diary must show why, unedited.

Class 17: Multi-Agent Architecture and the A2A Protocol
  Topics:
    - When one agent becomes several: Microsoft's own heuristic, split when an agent exceeds 30 to 40 choices of tools, topics and agents
    - The four ways to add agents to an agent, by their exact names: child agents, other Copilot Studio agents, agents over the A2A protocol, and (preview) Microsoft Foundry agents, Fabric Data agents and Microsoft 365 Agents SDK agents
    - The A2A protocol, GA since April 2026: agent-to-agent interoperability beyond a single vendor's walls
    - Child agents in practice: decomposing Support Triage into a router plus specialists, each with its own 128-tool budget
    - Interop with Microsoft Foundry: low-code front door, pro-code specialist behind it, the documented enterprise pattern
    - Failure across agent boundaries: timeouts, unclear hand-offs, and the tracing habits that keep multi-agent systems debuggable
    - Architecture review: when multi-agent is real engineering and when it is complexity cosplay
  Projects built:
    - Refactor Support Triage into a two-agent architecture: a routing agent plus a specialist child agent, with documented hand-off contracts and a failure-mode table
  Practice: Diagram your capstone as both a single agent and a multi-agent design, and write the three-sentence verdict on which ships.
  Assessment: Defend one hand-off contract: what crosses the boundary, what must never cross it, and what happens when the far side fails.

Class 18: Agent Evaluations: Quality You Can Prove
  Topics:
    - Agent evaluations, GA March 2026: automated test sets run against your agent, the industrial version of the discipline you built by hand in Class 3
    - Evaluation anatomy: test sets, graders scoring responses, multi-turn tests for whole conversations, and activity maps showing what the agent did
    - Writing graders that mean something: correctness, groundedness, tone and policy compliance as separately scored dimensions
    - The evaluation REST API (preview): wiring evaluations into release habits, flagged honestly as preview
    - Evaluation-gated changes: no instruction, knowledge or tool change ships without a green evaluation run
    - Building the capstone's evaluation suite: the 30 conversations that define 'working' for your use case
    - Evaluations as governance evidence: the artifact you hand to a reviewer instead of a demo
  Projects built:
    - Build the full evaluation suite for your capstone: 30 test conversations, graders for correctness and policy compliance, and a baseline report you will beat by Class 23
  Practice: Make one deliberate regression (weaken an instruction), prove the evaluation suite catches it, then revert.
  Assessment: Present your grader definitions and defend why a passing score actually means the agent is safe to ship.

Class 19: Analytics: Outcomes, CSAT and the Cost Savings Metric
  Topics:
    - The analytics view by its real dimensions: sessions, outcomes (Resolved, Escalated, Abandoned), daily and monthly active users, CSAT, and themes
    - The cost savings metric and custom metrics: putting a defensible number on what the agent is worth
    - Transcript review as design fuel: session details and transcripts are retained 28 days, analytics 360 days, so review cadence is a calendar item, not a hope
    - The Analytics Viewer role: giving stakeholders the numbers without giving them the editor
    - Finding the gap: unanswered and escalated questions, ranked, as the roadmap for the next iteration
    - The improvement loop as a weekly ritual: analytics, hypothesis, one change, evaluation run, remeasure
    - Instrumenting the capstone: the three numbers that will define success in front of your leadership
  Projects built:
    - Analytics sprint: run one agent with at least five real users for a week, review every session, ship two data-demanded improvements, and write the before-and-after

Practice: Draft the monthly one-page agent report your leadership would actually read: outcomes, CSAT, cost savings, next actions.
Assessment: From a set of session transcripts, diagnose the top failure pattern, propose the fix, and prove it with an evaluation run.

Class 20: Cost Management: Copilot Credits Without Surprises
Topics:
- The billing currency since September 1, 2025: Copilot Credits, replacing messages, with pay-as-you-go at $0.01 per credit and prepaid packs at $200 per 25,000 credits per month, billed annually, unused credits not rolling over
- The per-feature rate card you estimate with: classic answer 1 credit, generative answer 2, agent action 5, tenant graph grounding 10, agent flow actions 13 per 100, AI tools at 1, 15 or 100 per 10 responses by tier
- What the Microsoft 365 Copilot licence (at $30 per user per month) covers at no extra charge for licensed users, and the pointed exception: computer use is not included
- The 125% rule: at 125% of prepaid capacity, custom agents are disabled and users see the unavailable message, so capacity planning is an availability feature
- GitHub Copilot harness economics: credits consumed from the moment you start building, including preview, testing and evaluation generation
- Modelling a real workload: your capstone's expected sessions, features used, credits per session, and monthly cost under pack versus pay-as-you-go
- Cost as a design input: grounding choices, tool counts and orchestration mode all move the bill, and you now know by how much

Projects built:
- Build the complete cost model for your capstone: per-session credit estimate by feature, monthly projection at three adoption levels, pack versus pay-as-you-go recommendation, and the 125% risk line

Practice: Re-estimate the cost model twice: once with tenant graph grounding on, once off, and write down what the difference buys.
Assessment: Phase 4 exam: given a described workload, produce the credit estimate, the licensing recommendation and the capacity alert plan in 30 minutes.

PHASE 5: GOVERNANCE, ROLLOUT & CAPSTONE

Master the governance layer that makes agents deployable: Entra Agent ID, Conditional Access, DLP, Microsoft Agent 365 and the Agent Store, then ship a production capstone with the governance and ROI pack to defend it.

Class 21: Identity and Policy: Entra Agent ID, Conditional Access, DLP
Topics:
- The July 2026 line in the sand: all new agents must have Microsoft Entra Agent IDs, with no opt-out, making every agent a first-class identity in your tenant
- What an agent identity buys: connector permissions surfacing as API permissions that Conditional Access policies can target
- DLP policies over the whole tool surface: connectors, custom connectors and MCP governed by the same data policies, reviewed in the Power Platform admin center
- The two admin centers in the loop: Power Platform admin center and Microsoft 365 admin center, and which decisions live where (including enabling Anthropic and other external models)
- Environment strategy as governance: who can make agents where, and why production environments have fewer makers than pilots
- Guest users cannot access Copilot Studio, and other tenant facts that shape rollout plans
- Drafting your capstone's identity and policy plan: the Agent ID, the permissions it needs, and the Conditional Access posture it will live under

Projects built:
- Write the identity and policy plan for your capstone: Entra Agent ID registration, the permission list with justifications, the DLP review outcome, and the Conditional Access recommendation

Practice: Map your organisation's (or a model organisation's) admin roles to the approvals your capstone needs, with named decision points.
Assessment: Role-play the security review: your mentor plays the identity admin, and your plan must answer every 'who approved this' question.

Class 22: The Agent Estate: Microsoft Agent 365, the Agent Store, and Rollout
Topics:
- Microsoft Agent 365, GA May 1, 2026 at $15 per user per month: the control plane for the agent estate, with registry, access control and observability, already holding nearly 40 million registered agents by Microsoft's July 2026 count
- The Agent Store path: publishing a Copilot Studio agent to Microsoft 365 Copilot via Channels, then Microsoft 365 Copilot and Microsoft Teams, followed by admin approval in the Microsoft 365 admin center
- Channel strategy for business agents: Teams and Microsoft 365 Copilot, SharePoint, custom websites, and WhatsApp for customer-facing cases, chosen by audience, not fashion
- Versioning and change control on live channels: what re-publishing replaces and how not to break your users mid-shift
- The rollout playbook: pilot cohort, feedback loop, evaluation gates, comms, training, and the rollback plan nobody hopes to use
- The adoption evidence: IDC's projection of 1.3 billion agents by 2028 (as cited by Microsoft)

and nearly 90% of the Fortune 500 with active agents on Microsoft's low-code tools (Microsoft FY26 Q3 earnings), used correctly as context, not hype
- Pre-launch gate: the 20-point production checklist covering grounding, evaluations, identity, DLP, cost and rollback

Projects built:
- Produce the rollout pack for your capstone: channel plan, pilot design, approval path through the Agent Store or internal publishing, comms draft and rollback runbook

Practice: Run the 20-point production checklist against your capstone as it stands today and file every failure into Class 23's build plan.
Assessment: Present the rollout pack in ten minutes as if to your real leadership, and survive the 'what if it goes wrong' round.

Class 23: Capstone Build Week
Topics:
- Freezing the spec: the capstone's job, users, sources, tools, triggers, channel, identity plan and cost model on one page
- Building in production order: knowledge first, topics second, tools third, triggers last, evaluations running throughout
- Timeboxing with a mentor: what gets cut when reality bites, and why the evaluated core loop is protected
- Beating your baseline: the Class 18 evaluation suite as the bar, rerun at every milestone
- Governance artifacts finalised: identity plan, DLP note, cost model and operations note, versioned alongside the agent
- Polish that earns trust: greeting, transparency statement, escalation tone, card design, error messages
- Dress rehearsal: the full demo with one planned failure and recovery, timed

Projects built:
- Build the complete capstone: a production-grade agent for your own team with grounded knowledge, designed topics, at least one tool or agent flow, one governed trigger if autonomous, a passing evaluation suite, and the full governance pack

Practice: Run the dress rehearsal for a colleague outside the course and fix the two weakest moments they point at.
Assessment: Milestone gate: the capstone beats its evaluation baseline and passes the 20-point production checklist before demo day.

Class 24: Capstone Defence and the Credential Road
Topics:
- The live defence: your capstone demonstrated on a real channel, with evaluations, analytics and the governance pack on the table
- Defending decisions like an architect: why these sources, this orchestration mode, these tools, this identity posture, this cost model
- The retrospective: what you would build differently, and the honest limits of the current platform for your use case
- The credential road mapped: Microsoft Certified: AI Agent Builder Associate (exam AB-620, covering planning and configuring agent solutions, integrating and extending agents, and testing and managing them), with the Applied Skills labs 'Build an agent in Microsoft Copilot Studio' and 'Enhance agents with autonomous capabilities' as nearer milestones, and PL-900 as the on-ramp for teammates you onboard
- Where the skill curve goes: Gartner's projection that by 2029 at least half of knowledge workers will need to work with, govern or create AI agents, and by 2028 at least 15% of day-to-day work decisions will be made autonomously
- Taking it internal: turning your capstone pack into your organisation's agent playbook, and positioning yourself as the person who owns it
- Certificate, feedback, and the Living Syllabus promise: what changed in Copilot Studio while you were learning it, reviewed together

Projects built:
- Deliver the capstone defence and hand over the complete packet: spec, source map, evaluation report, analytics plan, cost model, identity and DLP plan, rollout runbook, and the leadership deck

Practice: Book the next step while momentum is real: an AB-620 study plan, or the internal pitch meeting for your agent playbook.
Assessment: Final evaluation: capstone defence, governance pack review, and the complete documentation packet, graded against the Class 22 production checklist.

PROJECTS THE STUDENT BUILDS AND KEEPS

- Phase 1: an agent opportunity memo for your organisation, Policy Desk v1 with a tested instruction stack, a 25-question adversarial test set, and a defended model-and-harness decision
- Phase 2: a SharePoint-grounded Policy Desk with citation proofs, a retrieval-optimised document rebuild with before-and-after accuracy, a multi-source arbitration study, and a published 25-answer accuracy audit
- Phase 3: Support Triage with designed topics and adaptive cards, a generative-orchestration migration log, the Expense Helper approvals flow with tested error paths, live connector and REST integrations, a governed MCP integration with a security note, and a costed computer-use demo
- Phase 4: the autonomous Weekly Reporter, its hardened successor with approval pauses and an operations note, a two-agent A2A architecture with hand-off contracts, a 30-conversation evaluation suite with graders, an analytics sprint with shipped improvements, and a complete

Copilot Credits cost model
- Phase 5: an identity and policy plan (Entra Agent ID, DLP, Conditional Access), a full rollout pack with rollback runbook, the production capstone build, and the final defence with the leadership deck
- Total: 24 professional deliverables, one per class, finishing with a production capstone agent plus a governance and ROI pack

Total projects: 24 professional deliverables, one per class, finishing with a production capstone agent plus a governance and ROI pack

SKILLS THE STUDENT WILL HAVE AT THE END

- Agent design for business: instruction stacks, scope fences, refusals and escalation paths
- Enterprise knowledge grounding: SharePoint, Dataverse, documents, connector-indexed data and tenant graph grounding, within real platform limits
- Conversation design: topics, trigger phrases, entities, condition groups and adaptive cards for critical paths
- Generative orchestration, chosen deliberately and guarded with retested fences
- The full tool surface: Prompt tools, agent flows, standard, premium, on-premises and custom connectors, REST, and Model Context Protocol under DLP
- Computer use with enterprise guardrails: access control, HTTPS enforcement, stored credentials and human supervision, costed per step
- Autonomous agents: event triggers, the maker-credentials rule, approval pauses, idempotence and operations notes
- Multi-agent architecture: child agents, connected agents, the A2A protocol and Microsoft Foundry interop
- Quality engineering: agent evaluations with test sets and graders, analytics outcomes, CSAT and the cost savings metric
- Cost management: Copilot Credits rates, licence coverage, the 125% cutoff and workload cost modelling
- Governance: Microsoft Entra Agent ID, Conditional Access, DLP policies, Microsoft Agent 365 and the Agent Store approval path

HOW A TYPICAL WEEK IS SPLIT

Live classes: 2 private 1-on-1 classes per week, about 1 hour each, across 12 weeks
Hands on agent work: 1.5-2 hours building, testing and evaluating in Copilot Studio between classes
Project time: 1-1.5 hours completing each class deliverable, usually against your own organisation's use case
Review and doubts: 30-60 minutes reviewing feedback and clearing doubts over WhatsApp before the next class
Homework: A task or problem set after every class, and a monthly mixed-review assignment that deliberately folds in earlier topics

SUPPORT INCLUDED

Dedicated mentor: The same mentor for all 24 classes, who knows your organisation's context, your capstone and your governance constraints
Whatsapp doubts: Doubt support between classes over WhatsApp
Practice environment: Help arranging your Copilot Studio access in Class 1: employer tenant, 30-day trial where appropriate, or a practice environment we arrange
Session recordings: Class recordings available for revision, so a missed detail is never lost

CERTIFICATION DETAIL

Completion: Certificate from Modern Age Coders, awarded on passing the final assessment. Fall short and there is focused revision and a free retest: the certificate certifies real learning, not attendance

WHERE THIS CAN LEAD

- AI agent builder or automation specialist roles, the titles now appearing in real job listings as organisations move from pilots to estates
- Microsoft Certified: AI Agent Builder Associate (exam AB-620), for which this syllabus is direct preparation, with the Applied Skills labs 'Build an agent in Microsoft Copilot Studio' and 'Enhance agents with autonomous capabilities' as nearer milestones
- The internal agent champion or center-of-excellence role: the person who owns the organisation's agent playbook, governance posture and cost model
- Consulting and freelance agent delivery, with a portfolio capstone that includes the governance and ROI artifacts clients' security teams actually ask for
- A bridge to code-first agent engineering: Microsoft Foundry interop from this course, and our Codex + Claude Code masterclass when you want to build agents in code

COMMON QUESTIONS ABOUT THIS COURSE

For anything about cost, use PART 4 and RULE 1. Do not quote two regions.

Q: Do I need to be a developer to take this Copilot Studio masterclass?

A: No. Copilot Studio is a graphical, low-code studio, and the masterclass is built for professionals who own processes, not necessarily code. The hard parts it teaches are design, evaluation, governance and cost discipline, which are not programming skills.

Q: How is this different from watching Copilot Studio tutorials or Microsoft Learn modules?
A: Tutorials teach the clicks; this course builds and defends a production agent for your own team. Microsoft Learn is excellent and free, and we point you at it; what it cannot do is review your specific agent's governance pack line by line, which is what the 1-on-1 mentor does.

Q: Why is this masterclass taught 1-on-1 only?
A: Because the material is your organisation's material. Honest sessions discuss your processes, your data boundaries, your tenant's admin posture and your licensing position, none of which belongs in a group class. The mentor reviews your actual instruction stacks, source maps, evaluation results and governance artifacts every session, and adjusts depth to your role, whether you are an analyst, an admin or an architect.

Q: What do I need to get access to Copilot Studio for the course?
A: A Microsoft work or school (Entra ID) account. With a work email you can self-serve the 30-day trial, which is enough to build and test but cannot publish agents. The better path is your employer's tenant with your admin's awareness, and the course includes drafting exactly that request. Where neither is possible, we arrange a practice environment, and your mentor sorts access out with you in the first class.

Q: Which Microsoft certification does this course prepare me for?
A: The headline target is Microsoft Certified: AI Agent Builder Associate (exam AB-620), whose domains, planning and configuring agent solutions, integrating and extending agents in Copilot Studio, and testing and managing agents, map directly onto this syllabus, including MCP and the A2A protocol named in its prerequisites. On the way, the Applied Skills labs 'Build an agent in Microsoft Copilot Studio' and 'Enhance agents with autonomous capabilities' are natural milestones, and PL-900 is the on-ramp we recommend for teammates you later onboard.

Q: How am I assessed, and is the certificate just for showing up?
A: No. A task follows every class with feedback, monthly reviews deliberately mix new material with earlier topics so nothing is forgotten, and the course ends with a final project defended live, plus a written assessment. Passing earns the certificate; falling short earns focused revision and a free retest. We measure real learning, not attendance.

Q: How current is the syllabus, given how fast the platform is changing?
A: It is a Living Syllabus, re-verified against Microsoft's official documentation and What's New pages as features ship. The current version covers the August 2026 platform: the multi-model lineup including Anthropic Claude Opus 4.7, harnesses, Model Context Protocol under DLP, computer use with enterprise guardrails, the A2A protocol, agent evaluations, mandatory Entra Agent IDs and Microsoft Agent 365. When the platform changes, the course changes, and your mentor tells you what moved while you were learning.

Q: What do I walk away with at the end of the masterclass?
A: A production-grade capstone agent for your own team, demonstrated and defended on a real channel, plus the full professional packet: source map, evaluation suite and baseline report, analytics plan, Copilot Credits cost model, Entra Agent ID and DLP plan, rollout runbook and a leadership deck. You also leave with a Modern Age Coders certificate earned by that defence, and a mapped credential road to AB-620 if you want Microsoft's official stamp.

To enrol, message Shivam Sir on +91 9123366161 or send the parent this link: https://learn.modernagecoders.com/courses/ai-agents-with-microsoft-copilot-studio-masterclass-for-professionals
For a demo: the Priority Live Demo (guaranteed, today or tomorrow) is booked at https://learn.modernagecoders.com/priority-demo . The free demo is a waiting list with no fixed date.

==========
COURSE 47 OF 137: CREATIVE CODING AND ANIMATION: VIDEO, MOTION AND P5.JS
==========

Course link: https://learn.modernagecoders.com/courses/creative-coding-animation-mastery
Subject area: Creative Technology
Designed for: Kids
Who can join: Beginner friendly, ages 13 to adult
Course length: 5-6 months (20-24 weeks)
Time needed: 2 live classes/week + 3-4 hours practice
Certificate: Certificate from Modern Age Coders, awarded on passing the final exam

PRICE FOR THIS COURSE (quote only the one that applies to the person asking)
In India, per month: group Rs 1,499, mini batch Rs 2,999, one to one Rs 4,999
Outside India, per month: group $100, one to one $150
Classes: group and mini batch two live classes a week, eight a month; one to one in India one live class a week, four a month; one to one outside India two live classes a week, eight a month. Each class is one hour.

WHAT THIS COURSE IS

Creative coding and animation course: live online classes for video editing, motion graphics, p5.js generative art, Blender 3D and content craft in 5-6 months.

In one line: Where art meets code: real video editing, motion graphics, generative art with p5.js and Blender 3D, finished as a portfolio that moves.

ABOUT THE PROGRAMME

This course sits at the intersection most creative courses miss: editing and motion design craft on one side, actual creative coding on the other. Students learn professional video editing, motion graphics, animation principles, then cross into p5.js and Processing, where art is written in code and no two runs look the same, and finish with Blender 3D and the content craft that makes work travel online. The toolkit is free-first and honest: DaVinci Resolve, CapCut, Blender, p5.js and Canva cover the entire syllabus at zero software cost, with Adobe After Effects taught as the industry-standard option for students who have access to it. Every week produces finished work, and the course ends with a portfolio capstone and a final exam that decides the certificate. The pace is honest: five months at two live classes a week plus three to four hours of practice, with a sixth month in hand for students who need more time. Homework after every class, a mixed challenge at the end of each month, and a final exam with a free retest after revision. Real craft, real portfolio, depth over dopamine.

WHAT MAKES THIS COURSE DIFFERENT

- Creative coding is real here: p5.js and Processing get a full month, generative art most animation courses never touch
- Free-first toolkit: DaVinci Resolve, CapCut, Blender, p5.js and Canva cover the whole syllabus; After Effects taught as the industry option, never a paywall
- Craft over hacks: animation principles, typography and rhythm, the fundamentals that survive every platform trend
- Every week ends rendered: finished edits, loops, sketches and scenes, building one coherent portfolio
- An honest 5-month arc with a sixth month in hand: nobody is rushed
- Real assessment: weekly homework, monthly mixed challenges, and a final exam that decides the certificate, with a free retest after revision

THE LEARNING PATH, STEP BY STEP

Month 1: Foundations and editing (Weeks 1-4): design principles, animation basics, desktop and mobile video editing
Month 2: Motion graphics (Weeks 5-8): keyframes, easing, kinetic typography and compositing, in After Effects or free equivalents
Month 3: Creative coding (Weeks 9-12): Processing and p5.js, generative art, interactivity and code-driven animation
Month 4: 3D and short-form craft (Weeks 13-16): Blender fundamentals, 3D scenes and renders, and the short-form video craft that travels
Month 5: Channel, portfolio and the exam (Weeks 17-20): long-form storytelling, honest analytics, a portfolio that opens doors, and the final capstone

WHAT A STUDENT NEEDS BEFORE STARTING

Experience: None. Design, editing and code are all taught from zero
Equipment: A computer with a stable internet connection; a mid-range machine handles the whole course, and every required tool is free
Age: 13 to adult; batches are grouped by age and pace
Time commitment: 2 live classes plus 3-4 hours of making a week

WHO THIS COURSE IS FOR

Aspiring animators: Teens and adults who dream of creating animations and motion graphics
Content creators: Aspiring YouTubers, Instagram creators, and TikTok creators
Design enthusiasts: Anyone passionate about visual design and digital art
Career switchers: Professionals wanting to switch to creative technology roles
Freelancers: People who want to offer video editing, animation, or design services
Creative coders: Developers who want to explore the intersection of code and art

FULL CURRICULUM, WEEK BY WEEK

This is the complete teaching plan. Parents can ask about any week.

MONTH 1: CREATIVE FOUNDATIONS & VIDEO EDITING BASICS

Master design principles, animation fundamentals, and professional video editing.

Design Principles & Digital Art Basics
Topics:

- Elements of design: line, shape, color, texture, space
- Principles of design: balance, contrast, emphasis, movement
- Color theory: RGB/CMYK, color harmony, psychology
- Typography fundamentals and font pairing
- Composition and rule of thirds
- Visual hierarchy and flow
- Mood boards and style guides
- Design trends and aesthetics
- Digital canvas setup and resolution
- File formats: when to use what
- Asset organization and management
- Copyright and creative commons

Projects built:
- Personal Brand Identity: Logo, color palette, style guide
- Mood Board Collection: 5 different aesthetic mood boards
- Social Media Template Set: Consistent design templates

Practice: Pick a real poster or flyer you like, rebuild it with a stronger visual hierarchy and a deliberate color harmony, and note which design principle drove each change.

Animation Principles & 2D Basics

Topics:
- 12 principles of animation (Disney)
- Squash and stretch techniques
- Anticipation and follow-through
- Timing and spacing fundamentals
- Ease in and ease out
- Arcs and natural motion
- Secondary animation
- Frame rates and formats
- Storyboarding and animatics
- Character design basics
- Walk cycles and run cycles
- Lip sync fundamentals

Projects built:
- Bouncing Ball Animation: Master timing and physics
- Character Walk Cycle: Create smooth character movement
- Animated Logo Reveal: Bring brand to life

Practice: Animate a simple bouncing ball that shows squash and stretch plus ease in and ease out, and export a five second clip.

Video Editing Fundamentals

Topics:
- Non-linear editing concepts
- Timeline and tracks understanding
- Cutting and trimming techniques
- Transitions: cuts, fades, wipes
- Audio editing and synchronization
- Color correction basics
- Text and titles creation
- B-roll and coverage
- Pacing and rhythm in editing
- Continuity editing rules
- Jump cuts and match cuts
- Montage theory and practice

Projects built:
- Day in Life Vlog: Edit personal vlog footage
- Product Commercial: 30-second product showcase
- Music Video Edit: Sync video to music

Practice: Cut a 60 second highlight video from any raw footage using at least three transition types and synced background audio.

Mobile Video Editing & Quick Content

Topics:
- Mobile editing workflow
- Vertical video best practices
- Quick edits for social media
- Filters and effects
- Mobile color grading
- Text animations on mobile
- Stickers and overlays
- Green screen on mobile
- Mobile audio editing
- Aspect ratio management
- Export settings for platforms
- Cloud storage workflow

Projects built:
- Instagram Reels Series: 5 trending reels
- YouTube Shorts Collection: Engaging short-form content

Practice: Shoot and edit a 30 second vertical reel on your phone with captions, one filter and a mobile color grade.
Assessment: Month 1 check: a timed edit from provided footage, plus a mixed quiz on design and animation principles

---
MONTH 2: MOTION GRAPHICS & AFTER EFFECTS MASTERY

Master motion design, visual effects, and professional animation techniques.

After Effects Fundamentals
Topics:
- After Effects interface and workflow
- Compositions and layers
- Transform properties: position, scale, rotation
- Keyframe animation basics
- Graph editor and easing
- Parenting and null objects
- Masks and shape layers
- Text animation presets
- Effects and presets library
- Rendering and export settings
- Work areas and previewing
- Project organization
Projects built:
- Animated Title Sequence: Professional title animation
- Kinetic Typography: Text-driven animation
- Logo Animation Pack: Brand animations
Practice: Recreate a short channel intro in After Effects by keyframing position, scale and rotation on three layers, then smooth the motion in the graph editor.

Advanced Motion Graphics
Topics:
- Shape layer animation mastery
- Trim paths and stroke animation
- Morphing shapes and transitions
- 2.5D animation with cameras
- Parallax effects
- Expression basics
- Wiggle and random expressions
- Time remapping
- Motion blur and echo effects
- Particle systems basics
- Audio-driven animation
- Data-driven graphics
Projects built:
- Explainer Video: 2-minute animated explainer
- Music Visualizer: Audio-reactive graphics
- Social Media Pack: Animated social elements
Practice: Build a ten second logo reveal using trim paths and one morphing shape transition.

Character Animation & Rigging
Topics:
- Character rigging with Duik
- Puppet pin tool mastery
- Bone and IK systems
- Walk cycle in After Effects
- Facial animation techniques
- Lip sync animation
- Character emotions and acting
- Rubber hose animation
- Limber and RubberHose plugins
- Character interaction
- Scene composition
- Character design for animation
Projects built:
- Character Explainer: Character-driven narrative
- Animated Mascot: Brand character creation
- Motion Comic: Comic panels animated
Practice: Rig a simple two legged character with Duik and animate a basic four step walk cycle.

Visual Effects & Compositing
Topics:
- Green screen keying techniques
- Rotoscoping fundamentals
- Motion tracking basics
- Camera tracking introduction

- Color correction and grading
- Light and shadow effects
- Particle effects creation
- Fire, smoke, and water effects
- Glitch and distortion effects
- 3D integration basics
- Matte painting basics
- Compositing workflows

Projects built:
- VFX Short Film: Effects-heavy sequence
- Product VFX Commercial: Product with effects
- Music Video Effects: Visual effects for music

Practice: Key out a green screen clip, place the subject on a new background and match the color and shadows so the composite holds up.

Assessment: Month 2 check: a 10-second motion piece built live, with questions reaching back to month 1

MONTH 3: CREATIVE CODING & INTERACTIVE MEDIA

Master creative programming with Processing, p5.js, and interactive installations.

Processing Fundamentals

Topics:
- Introduction to creative coding
- Processing environment setup
- Coordinate system and drawing
- Shapes and colors in code
- Variables and data types
- Loops and iteration
- Conditional statements
- Functions and modularity
- Arrays and collections
- Object-oriented programming basics
- Animation with code
- Interactivity with mouse and keyboard

Projects built:
- Generative Art System: Algorithmic art creation
- Interactive Visualization: Data-driven graphics
- Particle System: Dynamic particle effects

Practice: Code a Processing sketch that draws a repeating pattern using loops, variables and at least three colors.

p5.js and Web-Based Creative Coding

Topics:
- p5.js setup and differences from Processing
- JavaScript fundamentals for creative coding
- DOM manipulation with p5.js
- Loading and displaying media
- Sound library integration
- WebGL and 3D graphics
- Mobile interaction and touch events
- API integration and data fetching
- Local storage and cookies
- Hosting and sharing web sketches
- p5.js libraries and extensions
- Performance optimization

Projects built:
- Interactive Website: Creative coding in web design
- Audio Visualizer Web App: Music-reactive visuals
- Browser Game: Playable web game

Practice: Port one of your Processing sketches to p5.js and add mouse interaction plus one sound trigger.

Interactive Installations & Physical Computing

Topics:
- Arduino and Processing communication
- Serial communication basics
- Sensor data visualization
- Projection mapping introduction
- Kinect and depth sensing
- Computer vision with OpenCV
- Touch surfaces and multitouch
- MIDI controller integration
- OSC protocol for networking
- Real-time data streams
- Installation planning and setup
- Documentation and presentation

Projects built:

- Interactive Wall: Projection mapping installation
- Motion-Controlled Art: Body tracking visuals
- Data Sculpture: Physical data visualization

Practice: Plan a small sensor driven installation on paper and prototype its visual response in Processing using simulated input values.

Creative Coding Applications

Topics:

- Generative design principles
- Procedural content generation
- Machine learning in creative coding
- Neural networks and art
- Style transfer techniques
- Evolutionary algorithms
- Swarm intelligence
- Biomimicry in code
- Shader programming basics
- GLSL introduction
- Live coding performances
- Creative coding for VJing

Projects built:

- AI Art Generator: ML-powered creativity
- Live Performance Tool: VJ/DJ visual system
- Generative Brand System: Dynamic identity

Practice: Generate three variations of one generative art piece by changing the rules and the randomness, then pick the strongest for your portfolio.

Assessment: Month 3 check: a small generative sketch written live, plus mixed review of earlier months

---

MONTH 4: BLENDER 3D AND SHORT-FORM CRAFT

Three weeks of honest Blender fundamentals, then the short-form editing craft that makes work travel.

3D Animation Fundamentals with Blender

Topics:

- Blender interface and navigation
- 3D viewport and object manipulation
- Modeling basics: primitives and modifiers
- Edit mode: vertices, edges, faces
- Sculpting introduction
- Materials and textures basics
- UV unwrapping fundamentals
- Lighting: three-point setup
- Camera animation and framing
- Keyframe animation in 3D
- Timeline and dope sheet
- Rendering with Cycles and Eevee

Projects built:

- 3D Logo Animation: Brand in 3D space
- Product Visualization: Photorealistic product render
- Abstract Animation: Motion graphics in 3D

Practice: Model a simple low poly object in Blender using primitives and modifiers, then apply basic materials and render one image.

Character Animation & Rigging in 3D

Topics:

- Character modeling workflow
- Retopology for animation
- Armature and bone creation
- IK (Inverse Kinematics) setup
- Weight painting
- Shape keys and blend shapes
- Facial rigging basics
- Animation principles in 3D
- Walk cycles in 3D
- Motion capture basics
- Non-linear animation editor
- Physics simulation for cloth and hair

Projects built:

- Animated Character: Full character pipeline
- Creature Animation: Non-human character
- Crowd Simulation: Multiple character animation

Practice: Add an armature to a basic character mesh, weight paint two joints and pose the character in three distinct positions.

Advanced VFX & Compositing

Topics:

- Advanced keying techniques
- Roto and paint workflows
- 3D tracking and matchmoving
- CG integration with live footage
- Advanced color grading with nodes
- Film emulation and looks
- Atmospheric effects creation
- Destruction and dynamics
- Fluid simulations basics
- Smoke and fire effects
- Advanced compositing nodes
- Multi-pass compositing

Projects built:
- VFX Breakdown Reel: Professional VFX shots
- Invisible Effects: Seamless integration
- Sci-Fi Sequence: Futuristic effects

Practice: Track a short live action clip and composite one graphic or CG element so it sticks to the scene convincingly.

Short-Form Video Craft

Topics:
- The grammar of reels and shorts: hooks, pacing, payoff
- Editing rhythm: cuts on beats, breath and surprise
- Captions and text animation that people actually read
- Sound design for small screens
- Covers, thumbnails and the three-second test
- Repurposing one piece across formats honestly
- Trends as ingredients, craft as the recipe
- A week of daily publishing practice, reviewed

Projects built:
- Three finished short-form pieces from one shoot or one render
- A motion-graphics short built for vertical

Practice: Edit one short piece daily; review the best two in class

Assessment: Month 4 check: a timed edit challenge plus a mixed quiz over months 1-4

MONTH 5: CHANNEL, PORTFOLIO AND THE FINALE

Long-form storytelling, honest analytics, a portfolio that opens doors, and the final capstone exam.

Long-Form Video and Storytelling

Topics:
- YouTube algorithm and discovery
- Channel setup and optimization
- Thumbnail design psychology
- Title and description SEO
- YouTube Shorts strategy
- Long-form vs short-form balance
- Playlist optimization
- End screens and cards
- YouTube Analytics mastery
- Community tab usage
- Premiere and live streaming
- Story structure for longer pieces: promise, journey, payoff

Projects built:
- YouTube Channel Launch: Complete channel setup
- Tutorial Series: Educational content
- Vlog Documentary: Long-form storytelling

Practice: Design two alternative thumbnails and titles for the same video idea and explain which pairing you would A/B test first.

Publishing Strategy and Honest Analytics

Topics:
- Content repurposing strategies
- Platform-specific adaptations
- Cross-platform promotion
- Content scheduling tools
- Analytics interpretation
- A/B testing methods
- ROI measurement
- Audience insights and personas
- Competitive analysis
- Trend forecasting
- Content performance metrics
- Growth hacking techniques
- Reading analytics without fooling yourself: retention over vanity numbers

Projects built:
- Omnichannel Campaign: Multi-platform launch

- Content Repurposing System: Efficient content creation
- Analytics Dashboard: Performance tracking

Practice: Repurpose one long form video into a short, a carousel and a text post, each genuinely adapted to its platform.

Portfolio Development & Personal Branding

Topics:
- Portfolio website creation
- Case study development
- Project presentation skills
- Personal brand strategy
- Logo and identity design
- Business card and stationery
- Email signature design
- LinkedIn optimization
- Behance portfolio setup
- Dribbble presence
- ArtStation for 3D work
- Showreel creation

Projects built:
- Portfolio Website: Professional online presence
- Demo Reel: Best work compilation
- Brand Identity Package: Complete personal brand

Practice: Draft your portfolio homepage with three case studies, each telling the problem, process and result in one paragraph.

Capstone, Demo Day and Final Exam

Topics:
- The capstone: one polished portfolio piece that uses editing, motion and code or 3D
- A working-brief simulation: brief, drafts, revisions, delivery, the professional loop
- Final portfolio assembly and presentation order
- Presenting creative work: intent, references, decisions
- Full-course mixed review before the exam

Projects built:
- The capstone piece, rendered and presented at demo day with the full portfolio

Practice: Daily capstone progress with an edit log

Assessment: FINAL EXAM: capstone presentation plus a practical challenge and written questions mixed from the whole course. Passing earns the certificate; falling short earns focused revision and a free retest

PROJECTS THE STUDENT BUILDS AND KEEPS

- Month 1 (Weeks 1-4): Digital art, 2D animation, video editing fundamentals
- Month 2 (Weeks 5-8): Motion graphics, After Effects, character animation, VFX
- Month 3 (Weeks 9-12): Creative coding with Processing & p5.js, interactive media
- Month 4 (Weeks 13-16): 3D animation with Blender, advanced VFX, motion capture
- Month 5 (Weeks 17-20): Social media content mastery - Instagram, TikTok, YouTube
- Month 6 (Weeks 21-26): Professional portfolio, client projects, capstone

Total projects: 50+ creative projects + professional showreel portfolio

SKILLS THE STUDENT WILL HAVE AT THE END

- Digital Art: design principles, color theory, composition, digital painting
- Video Editing: DaVinci Resolve, CapCut, mobile editing, color grading
- Motion Graphics: After Effects, keyframing, expressions, kinetic typography
- 3D Animation: Blender, modeling, rigging, character animation, VFX
- Creative Coding: Processing, p5.js, generative art, interactive installations
- Social Media: Instagram Reels, TikTok, YouTube - platform-specific strategies
- Professional: portfolio development, client management, personal branding
- Hardware: Arduino basics, physical computing, interactive installations

HOW A TYPICAL WEEK IS SPLIT

Live classes: 2 live one-hour classes per week, making along with the instructor
Homework: A finished piece after every class, and a mixed challenge at the end of every month
Practice: 3-4 hours of making between classes
Review: Every submission critiqued with written feedback; craft gaps reopened in class

SUPPORT INCLUDED

Doubt support: WhatsApp doubt support between classes for stuck renders and broken timelines
Progress updates: Monthly written feedback on craft: what is working, what to push next

CERTIFICATION DETAIL

Completion: Certificate from Modern Age Coders, awarded on passing the final exam, a capstone presentation plus practical and written challenges. Fall short and there is focused revision and a free retest

WHERE THIS CAN LEAD

- Motion Graphics Designer
- Content Creator / Influencer
- Video Editor
- Creative Technologist
- Animation Artist
- Social Media Manager
- VFX Artist
- Creative Director
- Freelance Designer

COMMON QUESTIONS ABOUT THIS COURSE

For anything about cost, use PART 4 and RULE 1. Do not quote two regions.

Q: What skills does this creative coding and animation course cover?
A: The 6-month program moves through video editing, motion graphics in After Effects, creative coding with Processing and p5.js, 3D animation in Blender, and content strategy for Instagram, TikTok, and YouTube. Students finish with a capstone project and a professional portfolio of animations, edits, and interactive art.

Q: Who is this course suitable for?
A: It is designed for ages 14 and up, so it works for teens as well as adults exploring a creative career or a serious side skill. We teach students from ages 6 to 65 across coding and maths, and this course sits at the older, creator-focused end of that range.

Q: How long does it take to learn video editing and animation?
A: To a genuine portfolio level across editing, motion graphics, creative coding and 3D basics: 5 months at 2 live classes a week plus 3 to 4 hours of practice. The course keeps a sixth month in hand for students who need more time, with no rushing and no penalty. First finished edits appear in week 3; the compounding starts immediately.

Q: How is progress assessed? Is the certificate just for attending?
A: No. Every class ends with a piece to finish, every month ends with a mixed challenge that revisits earlier skills, and the course ends with a final exam: a capstone presentation plus practical and written challenges drawn from the whole syllabus. Passing earns the certificate; falling short earns focused revision and a free retest.

Q: Do students need design or coding experience first?
A: No. The course starts with design and animation principles from zero, and the creative coding modules introduce programming gently through visual output, so beginners see results from the first weeks.

Q: Which software is used, and do we have to buy anything?
A: No purchases are required: DaVinci Resolve (free version), CapCut, Blender, Processing, p5.js and free Canva cover the entire syllabus. After Effects, the motion-graphics industry standard, is taught as an option for students who already have Adobe access, and every concept it demonstrates is also shown in the free tools. A mid-range computer handles the whole course.

Q: Where can these skills lead after the course?
A: Graduates leave with a portfolio spanning editing, motion graphics, and creative code, a strong foundation for freelance work, a content channel, or deeper study in design and development. Many students pair this course with our web development track to add interactive websites to their creative range.

Q: Is there a demo class before committing?
A: Yes, and it is completely free with no obligation to continue.

Q: What is the class format?
A: Live 1-hour online classes with a real instructor, never recorded lectures. Sessions are interactive and kept to small groups, so every student presents work, receives direct feedback, and asks questions freely.

Q: Do students receive certification?
A: Yes, and it is earned: the certificate is awarded on passing the final exam, a capstone presentation plus practical and written challenges, with a free retest after revision if needed. The portfolio matters more though: finished edits, motion pieces, generative art and 3D renders that show exactly what you can make.

To enrol, message Shivam Sir on +91 9123366161 or send the parent this link: https://learn.modernagecoders.com/courses/creative-coding-animation-mastery
For a demo: the Priority Live Demo (guaranteed, today or tomorrow) is booked at https://learn.modernagecoders.com/priority-demo . The free demo is a waiting list with no fixed date.

==========

COURSE 48 OF 137: CREATIVE MEDIA FOR TEENS: PHOTO, VIDEO AND DESIGN
==========

Course link: https://learn.modernagecoders.com/courses/creative-media-design-masterclass-teens
Subject area: Design and Creativity
Designed for: Teens
Who can join: Beginner friendly, ages 13 to 18
Course length: 8-10 months (32-40 weeks)
Time needed: 2 live classes/week + 2-3 hours practice
Certificate: Certificate from Modern Age Coders, awarded on passing the final exam

PRICE FOR THIS COURSE (quote only the one that applies to the person asking)
  In India, per month: group Rs 1,499, mini batch Rs 2,999, one to one Rs 4,999
  Outside India, per month: group $100, one to one $150
  Classes: group and mini batch two live classes a week, eight a month; one to one in India one live class a week, four a month; one to one outside India two live classes a week, eight a month. Each class is one hour.

WHAT THIS COURSE IS

  Creative media course for teens aged 13-18: photo editing, video production and graphic design in live online classes, with a real portfolio in 8-10 months.

  In one line: Photo, video and design taught as one craft: eight honest months from first edit to a portfolio that looks like taste, not templates.

ABOUT THE PROGRAMME

  Teens live inside visual media; very few can make it well. This live online course for ages 13 to 18 teaches the full creative trio properly: photo editing from honest corrections to real compositing, video from cuts and rhythm to short productions with sound design, and graphic design from principles to a small brand built end to end. The final months add advanced video effects, real photography craft with whatever camera the family owns, and a portfolio capstone presented at demo day. The toolkit is free-first and honest: strong free tools cover the entire syllabus, and industry options like Photoshop are taught as exactly that, options, for families that have them. There is no viral-chasing, no monetization coaching and no freelance pressure aimed at teenagers; the course builds craft and taste, the assets that actually compound. The pace is real: eight months at two live classes a week plus two to three hours of practice, with two more months in hand when needed. Homework after every class, monthly mixed challenges, and a final exam, portfolio review plus a live editing task, that decides the certificate with a free retest. Real craft, real portfolio, depth over dopamine.

WHAT MAKES THIS COURSE DIFFERENT

  - The full trio in one arc: photo, video and design, taught as one connected craft
  - Free-first tools with honest options: the whole syllabus works at zero software cost
  - Critique every week: kind, specific feedback is the actual engine of taste
  - No viral-chasing or freelance pressure for teens: craft first, always
  - An honest 8-month arc with 2 months in hand
  - Real assessment: monthly mixed challenges and a final exam that decides the certificate, with a free retest

THE LEARNING PATH, STEP BY STEP

  Phase 1: The creative core (Months 1-6): photo editing, video production and graphic design with a small real brand
  Phase 2: Advanced craft and the finale (Months 7-8): visual effects, photography with real light, the portfolio capstone and the exam

WHAT A STUDENT NEEDS BEFORE STARTING

  Experience: None. Every tool and principle is taught from zero
  Equipment: A computer with a stable internet connection; a phone camera is enough for the photography weeks, and free tools cover the whole syllabus
  Age: 13 to 18. Batches are grouped by age and pace
  Time commitment: 2 live classes plus 2-3 hours of making a week

WHO THIS COURSE IS FOR

  Creators: Teens already posting who want their work to look intentional
  Visual minds: Students who think in images and want real craft under the instinct
  Club heroes: The teen every school event already asks for posters and aftermovies
  Future designers: Anyone testing the creative road with a portfolio as the answer
  Complete beginners: No experience needed: taste is built, not born

FULL CURRICULUM, WEEK BY WEEK

  This is the complete teaching plan. Parents can ask about any week.

PHASE 1: THE CREATIVE CORE (MONTHS 1-6, WEEKS 1-26)

Photo editing, video production and graphic design, each learned to real competence with
weekly critiqued builds.

  Months 1-2: Creative Fundamentals & Photo Editing Basics (Weeks 1-8)
    Introduction to Digital Creativity & Setup
      Topics:
        - The creative industry landscape for Gen Z
        - Career paths: YouTuber, Designer, Photographer, Filmmaker
        - Essential hardware: Computer specs, tablets, phones
        - Free vs paid software options
        - Setting up Adobe Creative Cloud (student discount)
        - Alternative free tools: GIMP, DaVinci Resolve, Canva
        - File management and organization
        - Understanding file formats: JPG, PNG, RAW, MP4, MOV
        - Resolution, DPI, and pixel basics
        - Color theory fundamentals: RGB vs CMYK
        - Creating your first creative workspace
        - Building a creative routine and staying inspired
      Projects built:
        - Set up complete creative workstation
        - Create organized folder structure for projects
        - Design a personal creative brand/logo
      Practice: Daily: 30 min creative exploration, 1 hour tool familiarization
    Photoshop Fundamentals
      Topics:
        - Photoshop interface tour and customization
        - Essential panels: Layers, Properties, History
        - Working with layers: Creating, organizing, blending modes
        - Selection tools: Marquee, Lasso, Magic Wand, Quick Selection
        - Basic adjustments: Brightness, Contrast, Levels, Curves
        - Color correction: Hue/Saturation, Color Balance
        - Cropping and straightening images
        - Removing objects: Spot Healing, Clone Stamp, Content-Aware Fill
        - Working with text: Fonts, effects, formatting
        - Saving for different purposes: Web, print, social media
        - Non-destructive editing with adjustment layers
        - Keyboard shortcuts for speed
      Projects built:
        - Edit 10 personal photos to perfection
        - Design custom phone wallpapers
      Practice: Edit 5 different photos daily using various techniques
    Advanced Photo Manipulation
      Topics:
        - Advanced selections: Select and Mask, Color Range
        - Compositing: Combining multiple images seamlessly
        - Sky replacement and background changes
        - Portrait retouching: Skin, eyes, teeth, hair
        - Frequency separation for professional retouching
        - Creating realistic shadows and reflections
        - Photo filters and effects: Vintage, cinematic, artistic
        - Double exposure and creative effects
        - Creating social media templates
        - Batch processing multiple photos
        - Actions and automation for efficiency
        - RAW processing basics with Camera Raw
      Projects built:
        - Create surreal photo manipulation artwork
        - Professional portrait retouching project
        - Design Instagram post templates
      Practice: Complete 20 photo manipulation challenges
    Mobile Photography & Editing
      Topics:
        - Smartphone photography techniques
        - Composition rules: Rule of thirds, leading lines, symmetry
        - Lighting for photos: Natural vs artificial
        - Portrait mode and depth effects
        - Mobile editing apps: VSCO, Snapseed, Lightroom Mobile
        - Creating consistent Instagram feeds
        - Instagram Stories design and templates
        - TikTok photo slideshow trends
        - Pinterest-worthy photo editing
        - Mobile photography accessories
        - Shooting and editing vertical content
        - Quick edits for immediate posting
      Projects built:

```
      - 30-day Instagram feed makeover
      - Mobile photography portfolio
    Practice: Post one edited photo daily on social media
    Assessment: Months 1-2 check: a photo-edit set completed live, plus a mixed take-home
    challenge

Months 3-4: Video Editing & Production Basics (Weeks 9-17)
  Video Production Fundamentals
    Topics:
      - Video production workflow overview
      - Pre-production: Planning, scripting, storyboarding
      - Camera basics: Frames per second, resolution (1080p, 4K)
      - Shooting techniques: Angles, movements, stability
      - Smartphone videography tips and tricks
      - Audio importance: Recording clean sound
      - Basic lighting setups with household items
      - B-roll and why it matters
      - Understanding codecs and compression
      - Organizing footage and project files
      - Copyright and music licensing basics
      - Finding royalty-free music and sound effects
    Projects built:
      - Shoot and plan first short film (2-3 minutes)
      - Create a day-in-my-life vlog
      - Record product review video
    Practice: Shoot 10 different video types (slow-mo, time-lapse, etc.)
  Premiere Pro Essentials
    Topics:
      - Premiere Pro interface and workspace setup
      - Project settings and sequence creation
      - Importing and organizing media
      - Timeline basics: Tracks, clips, navigation
      - Essential editing tools: Selection, Razor, Ripple
      - Cutting techniques: J-cuts, L-cuts, match cuts
      - Transitions: Cuts, fades, wipes, custom transitions
      - Audio editing: Levels, fades, noise reduction
      - Color correction basics: Lumetri Color panel
      - Adding titles and lower thirds
      - Exporting for different platforms
      - Premiere Pro keyboard shortcuts
    Projects built:
      - Edit a cinematic travel video
      - Create YouTube video with intro/outro
      - Edit multi-camera interview
    Practice: Edit one video daily for different platforms
  YouTube Content Creation
    Topics:
      - Thumbnail design in Photoshop
      - Creating clickable titles without clickbait
      - YouTube video structure: Hook, content, CTA
      - Editing styles: Gaming, vlog, tutorial, reaction
      - Jump cuts and pacing for retention
      - Adding subtitles and captions
      - End screens and cards setup
      - YouTube Shorts vs long-form content
      - Analytics: Understanding retention graphs
      - Building a consistent upload schedule
      - Collaborating with other creators
    Projects built:
      - Complete YouTube channel setup and branding
      - Create and upload 5 different video styles
      - Design thumbnail templates
    Practice: Analyze 20 successful YouTube videos in your niche
  TikTok & Short-Form Content
    Topics:
      - Vertical video best practices
      - TikTok trends and how to spot them
      - CapCut advanced features
      - Speed ramping and velocity edits
      - Text animations and reveals
      - Transition mastery for TikTok
      - Green screen and effects
      - Instagram Reels optimization
      - YouTube Shorts specific editing
      - Sound sync and beat matching
      - Creating series and themed content
    Projects built:
      - Create 30 TikToks in different styles
      - Develop signature editing style
```

- Build following to 1000+ followers
Practice: Post one short-form video daily for 30 days
Month 3-4 Review & Portfolio Building
Topics:
- Portfolio website creation basics
- Organizing and presenting work
- Creating demo reels
- Getting first clients as a teen
- Pricing your services
Projects built:
- CAPSTONE: Create 5-minute portfolio showreel
- Build online portfolio website
Assessment: Months 3-4 check: a one-minute edit cut live from provided footage, plus mixed review

Months 5-6: Graphic Design & Brand Creation (Weeks 18-26)
Illustrator & Vector Design
Topics:
- Vector vs raster graphics explained
- Illustrator interface and tools
- Pen tool mastery: Curves, angles, handles
- Shape tools and pathfinder operations
- Creating logos from scratch
- Typography and custom lettering
- Color palettes and swatches
- Gradient and pattern creation
- Icon design for apps and web
- Business card and stationery design
- Tracing and vectorizing images
- Exporting for different uses
Projects built:
- Design 5 different logo concepts
- Create complete brand identity package
- Design custom icon set
Practice: Create one vector illustration daily
Social Media Design & Branding
Topics:
- Understanding platform specifications
- Instagram post and story templates
- Facebook cover and post designs
- Twitter/X header and post graphics
- LinkedIn professional graphics
- Pinterest pin optimization
- Consistent brand aesthetics
- Creating content calendars
- Carousel posts and slideshows
- Infographic design principles
- Data visualization basics
- Canva for quick designs
Projects built:
- 30-day social media content package
- Brand guide for personal brand
- Infographic series on trending topic
Practice: Design social media posts for 5 different brands
Print Design & Merchandise
Topics:
- Print vs digital design differences
- Understanding bleeds and margins
- CMYK color mode and print preparation
- T-shirt and apparel design
- Sticker and label design
- Poster and flyer creation
- Album and book cover design
- Magazine layout basics
- Packaging design introduction
- Print-on-demand platforms
- Setting up online merchandise store
- Copyright and trademark basics
Projects built:
- Design merch line with 10 products
- Create concert poster series
- Design and sell first products online
Practice: Create designs for different print formats
Web & UI Design Basics
Topics:
- Web design principles for beginners
- User interface (UI) fundamentals
- User experience (UX) basics
- Wireframing and prototyping

- Figma introduction and basics
- Designing responsive layouts
- Mobile app interface design
- Website banner and hero images
- Button and form design
- Color psychology in web design
- Landing page creation
- Portfolio website design

Projects built:

- Design mobile app interface
- Create landing page design
- Redesign favorite website

Practice: Daily UI challenge for 30 days

Phase 1 Capstone Project

Topics:

- Project planning and time management
- Client communication basics
- Creating project proposals
- Feedback incorporation
- Final presentation skills

Projects built:

- MAJOR CAPSTONE: Complete Brand Identity Project
- Logo, social media kit, video intro, merchandise designs

Assessment: Phase check: present the mini brand kit, plus a mixed challenge spanning months 1-6

PHASE 2: ADVANCED CRAFT AND THE FINALE (MONTHS 7-8, WEEKS 27-32)

Visual effects and real photography craft, then the portfolio capstone and the final exam.

Months 7-8: Effects, Light and the Portfolio (Weeks 27-32)

Advanced Video: Effects and Sound

Topics:

- Transitions that mean something, not just move
- Keyframing: motion inside the frame
- Green screen done properly at home
- Color grading: the honest before-and-after
- Sound design: the half of video nobody sees
- Titles and captions that people actually read
- A polish pass on your best earlier edit

Projects built:

- A 60-90 second short with effects, grade and sound design

Practice: One micro-edit daily; review the best two in class

Photography: Real Light, Any Camera

Topics:

- Composition: the five framings that fix most photos
- Light: window, golden hour and one lamp, used deliberately
- Phone camera mastery: focus, exposure and RAW where available
- Editing your own shots: honest corrections, tasteful grades
- A themed photo series: shooting with intent
- Selecting: the discipline of choosing 6 from 200

Projects built:

- A themed 6-photo series, shot, edited and sequenced

Practice: A daily frame: one deliberate photograph every day

Portfolio Capstone

Topics:

- Choosing the capstone: one campaign across photo, video and design
- Curation over collection: the best 12 pieces, sequenced
- Presenting decisions: intent, references, choices
- Critique rounds: kind, specific, final

Projects built:

- THE CAPSTONE: a campaign plus the curated portfolio

Practice: One critique given and one received, daily

Demo Day and the Final Exam

Topics:

- Presenting the capstone and portfolio
- A live editing task under friendly time pressure
- A full-course mixed review
- Where this leads: creative coding, motion design, and making for your own channels

Projects built:

- Demo day presentation delivered to the batch

Assessment: FINAL EXAM: portfolio review plus a live editing task and mixed questions from the whole course. Passing earns the certificate; falling short earns focused revision and a free retest

PROJECTS THE STUDENT BUILDS AND KEEPS

- Months 1-2: photo edit sets, restorations and honest retouching

- Months 3-4: cut sequences, a one-minute story and sound-fixed edits
- Months 5-6: design sets and a mini brand built end to end
- Months 7-8: an effects short, a themed photo series, and the capstone portfolio

Total projects: 60+ critiqued pieces across photo, video and design, curated into a portfolio

SKILLS THE STUDENT WILL HAVE AT THE END

- Photo editing: correction, retouching and compositing with taste
- Video: cutting rhythm, effects, grading and sound design
- Design: hierarchy, type and color through real briefs
- Photography: composition and light with any camera
- Critique: giving and taking feedback like a working creative

HOW A TYPICAL WEEK IS SPLIT

Live classes: 2 live one-hour classes per week, making along with the instructor
Homework: A piece after every class, and a mixed challenge at the end of every month
Practice: 2-3 hours of making between classes
Review: Every piece critiqued with written feedback; craft gaps reopened in class

SUPPORT INCLUDED

Doubt support: WhatsApp doubt support between classes
Progress updates: Monthly written feedback on craft: what is working, what to push next

CERTIFICATION DETAIL

Completion: Certificate from Modern Age Coders, awarded on passing the final exam, a portfolio review plus a live editing task. Fall short and there is focused revision and a free retest

WHERE THIS CAN LEAD

- Creative Coding and Animation: where this craft meets motion graphics and code
- Canva and AI Design: the design-systems road
- School and club media done at another level, immediately
- Personal channels with work that stands out for craft
- Later professional tools: the principles here transfer to every suite

COMMON QUESTIONS ABOUT THIS COURSE

For anything about cost, use PART 4 and RULE 1. Do not quote two regions.

Q: What will my teen learn and make in this course?
A: The full creative trio across eight months: photo editing from honest corrections to compositing, video from cutting rhythm to an effects-and-sound short, graphic design through a mini brand built end to end, then real photography craft with any camera, and a portfolio capstone, a campaign across all three skills, presented at demo day. Sixty-plus critiqued pieces in total.

Q: How long does it take to get genuinely good?
A: Eight months at 2 live classes a week plus 2 to 3 hours of practice, with two more months in hand for teens who want longer. Creative skill is rep-based: the weekly critiqued pieces are the actual course, and the difference shows within the first month.

Q: How is my teen assessed? Is the certificate just for attending?
A: No. A piece follows every class, every month ends with a mixed challenge that revisits earlier skills, and the course ends with a final exam: a portfolio review plus a live editing task. Passing earns the certificate; falling short earns focused revision and a free retest.

Q: Which software is used, and do we have to buy anything?
A: Nothing needs to be purchased: strong free tools cover the entire syllabus for photo, video and design. Industry options like Photoshop are taught as options for families that already have Adobe access; every technique is also shown in the free equivalents, because the craft is the point, not the subscription.

Q: Does this course teach growing on social media or earning as a creator?
A: No, deliberately: no viral formulas, no monetization coaching, no freelance pressure aimed at teenagers. Craft and taste are what compound, and they are the whole syllabus. A teen whose work is genuinely good will never struggle for an audience later; the reverse is not true.

Q: Does my teen need a good camera?
A: No: the photography weeks are built around whatever camera the family owns, usually a phone, because composition and light matter far more than gear. The editing and design work needs only a normal computer.

Q: Is there a free trial class?

A: Yes, a free demo class with no commitment: book at learn.modernagecoders.com/contact or message us on WhatsApp at +91 91233 66161. Your teen will edit something real inside the demo. (Agent note: the free demo is a waiting list with no fixed date. The Priority Live Demo is a guaranteed class today or tomorrow, booked at https://learn.modernagecoders.com/priority-demo . Offer both, as RULE 3 says.)

Q: Are classes live or recorded?
A: Live, always: small groups with a real instructor critiquing your teen's actual work, never pre-recorded videos. Taste is built through critique, and critique needs eyes on the specific piece.

To enrol, message Shivam Sir on +91 9123366161 or send the parent this link: https://learn.modernagecoders.com/courses/creative-media-design-masterclass-teens
For a demo: the Priority Live Demo (guaranteed, today or tomorrow) is booked at https://learn.modernagecoders.com/priority-demo . The free demo is a waiting list with no fixed date.

==========

COURSE 49 OF 137: CYBERSECURITY COMPETITIONS FOR TEENS: PICOCTF AND CYBERPATRIOT PREP

==========

Course link: https://learn.modernagecoders.com/courses/picoctf-cyberpatriot-cybersecurity-competition-prep-for-teens
Subject area: Cybersecurity
Designed for: Teens
Who can join: Beginner to intermediate, ages 13 to 18, no prior security experience needed
Course length: 6 months (24 weeks)
Time needed: 2 live classes/week + 2-3 hours practice
Certificate: Certificate from Modern Age Coders, awarded on passing the final assessment

PRICE FOR THIS COURSE (quote only the one that applies to the person asking)
In India, per month: group Rs 1,499, mini batch Rs 2,999, one to one Rs 4,999
Outside India, per month: group $100, one to one $150
Classes: group and mini batch two live classes a week, eight a month; one to one in India one live class a week, four a month; one to one outside India two live classes a week, eight a month. Each class is one hour.

WHAT THIS COURSE IS

Live online cybersecurity competition prep for ages 13 to 18: CyberPatriot-style system hardening on Windows and Linux, and picoCTF-style CTF skills, ethical and defensive.

In one line: Two of the best-known student cyber competitions, one defensive skill set, and a clear line between what is allowed and what is not.

ABOUT THE PROGRAMME

Student cybersecurity competitions come in two main shapes, and this course prepares for both. CyberPatriot, the National Youth Cyber Education Program created by the Air & Space Forces Association, runs the National Youth Cyber Defense Competition, in which teams of middle and high school students find and fix security vulnerabilities in virtual Windows and Linux systems and are scored on how secure they make them. picoCTF, the capture-the-flag program built at Carnegie Mellon University and now part of CMU's free CyLab Security Academy, sets puzzle challenges in areas such as general skills, cryptography and forensics, each hiding a flag to find. The first two months build the foundations both need: the Linux command line, Windows administration, how networks move data, and a written white-hat agreement that every student signs before any practice begins. Months three and four are CyberPatriot-style hardening: user and password policy, services, firewalls, updates, permissions and the forensics questions on a practice virtual machine each student sets up with the teacher, worked against the clock and as a team. Months five and six are capture-the-flag skills: encodings and ciphers, file and packet forensics, reading code, and how web and memory bugs are recognised and fixed. Everything is ethical and defensive. Students practise only on a practice virtual machine they set up with the teacher and on platforms designed for practice, where every challenge is meant to be solved. Nobody is taught to touch a system they do not own or have permission to test, and the legal and ethical lines are taught as part of the skill, not as a disclaimer.

WHAT MAKES THIS COURSE DIFFERENT

- Prepares for both competition styles: CyberPatriot-style defence of Windows and Linux systems, and picoCTF-style capture-the-flag puzzles
- Defensive by design: every bug a student finds in a CTF challenge is paired with the fix a defender would make
- Practice only on your own practice virtual machine and on purpose-built practice platforms, never on real systems
- A white-hat agreement signed in week one and revisited every month, covering permission, disclosure and competition rules
- Team skills taught on purpose: roles, checklists and communication during a timed round
- Written solutions for every challenge, so students learn to explain their reasoning as well as find the answer

THE LEARNING PATH, STEP BY STEP

Phase 1: Foundations and ethics: the white-hat agreement, the Linux command line, Windows administration and networking basics
Phase 2: System hardening in the CyberPatriot style: Windows and Linux hardening checklists, forensics questions, network fundamentals and timed team rounds
Phase 3: Capture-the-flag skills in the picoCTF style: encodings and cryptography, forensics, reading code, web and memory bugs with their fixes, and a mock CTF

WHAT A STUDENT NEEDS BEFORE STARTING

Coding experience: None required. Some Python helps in month 5, and we teach the small amount needed
Computer skills: Comfortable installing software, managing files and using settings menus
Equipment: A laptop or desktop that can run a virtual machine, with a stable internet connection. We check the computer and help set up the free virtual machine software in the first week
Age: 13 to 18
Mindset: Willingness to sign and keep the white-hat agreement: practise only where you have permission, and report rather than exploit

WHO THIS COURSE IS FOR

School cyber team members: Students on, or joining, a school or club CyberPatriot team who want stronger individual skills to bring to it
Capture the flag beginners: Teens who have heard of picoCTF or capture-the-flag events and want a structured start
Puzzle solvers: Students who enjoy codes, logic and detective work
Future security students: Teens considering cybersecurity or computer science who want real hands-on foundations
Cybersecurity course graduates: Students who finished our Cybersecurity for Teens course and want a competition-focused next step

FULL CURRICULUM, WEEK BY WEEK

This is the complete teaching plan. Parents can ask about any week.

PHASE 1: FOUNDATIONS AND ETHICS (MONTHS 1-2, WEEKS 1-8)

The shared foundations of both competitions, starting with the rules: what is allowed, what is not, and why that line matters.

Month 1: The White-Hat Agreement and the Linux Command Line (Weeks 1-4)
Weeks 1-2: Rules, Ethics and the Practice Lab
Topics:
- Permission as the dividing line between security work and crime
- Competition rules: what is allowed during a round and what gets a team disqualified
- The white-hat agreement every student signs before practice begins
- How CyberPatriot and capture-the-flag events differ, and what each one rewards
- Setting up a practice lab with a free virtual machine program
- Snapshots: how to break a practice system safely and restore it

Projects built:
- Signed white-hat agreement and a working practice lab with a Linux virtual machine and a restore snapshot

Practice: Write a short note explaining, in your own words, why practising only on authorised systems matters
Weeks 3-4: Linux Command Line Essentials
Topics:
- Navigating the file system: pwd, ls, cd and paths
- Reading files with cat, less, head and tail
- Searching with grep and find
- Pipes and redirection
- File permissions and ownership with ls -l, chmod and chown
- Users, groups and sudo

Projects built:
- Command line treasure hunt: an instructor-built set of files and folders with clues found only by using the right commands

Practice: Solve ten general skills challenges on a practice platform and keep a command notebook
Assessment: Month 1 check: a timed command line task in the practice lab

Month 2: Windows Administration and Networking (Weeks 5-8)
Weeks 5-6: Windows Administration
Topics:
- Local users and groups, and who should be an administrator
- Password and account lockout policies in Local Security Policy
- Services: what runs automatically and why that matters

- Windows Update, Windows Security and the firewall
- Installed programs and how to spot software that should not be there
- Event Viewer as a record of what happened

Projects built:
- Read-only Windows settings audit on your own computer: users, services and updates checked against a written checklist, nothing changed

Practice: Document ten Windows security settings: where each one lives and what the secure value is

Weeks 7-8: How Networks Move Data

Topics:
- IP addresses, subnets and the idea of a network
- Ports and services: what is listening and why
- TCP, UDP and the handshake
- DNS and how names become addresses
- Reading a packet capture in Wireshark on files we provide
- Switches, routers and how traffic finds its way

Projects built:
- Packet capture walkthrough: an annotated explanation of a provided capture from first packet to last

Practice: Answer a set of questions about two provided packet captures and explain how each answer was found

Assessment: Phase 1 assessment: a written and practical check on Linux, Windows and networking basics, plus the ethics questions

---

PHASE 2: SYSTEM HARDENING IN THE CYBERPATRIOT STYLE (MONTHS 3-4, WEEKS 9-16)

Defence under a clock: securing Windows and Linux systems against a scenario, answering forensics questions, learning network fundamentals and working as a team.

Month 3: Hardening Windows and Linux (Weeks 9-12)

Weeks 9-10: Hardening Windows

Topics:
- Reading the scenario first: which users, software and services are authorised
- Removing unauthorised users and fixing administrator rights
- Setting password, lockout and audit policies
- Disabling unneeded services and features
- Updates, firewall and built-in protection settings
- Answering forensics questions before changing anything that might destroy evidence

Projects built:
- Personal Windows hardening checklist, checked read-only against your own computer's settings

Practice: Harden one practice image and record every change made, why it was made and how it was checked

Weeks 11-12: Hardening Linux

Topics:
- Users, groups and the sudoers file
- Password policy and locking unused accounts
- Package updates with the system package manager
- The uncomplicated firewall, ufw
- Securing remote login settings and disabling what is not needed
- Finding unwanted software, scheduled tasks and dangerous file permissions

Projects built:
- Personal Linux hardening checklist, tested on your own Linux practice virtual machine

Practice: Harden one Linux practice image and compare your checklist with a classmate's

Assessment: Month 3 check: a timed hardening round on a practice image, reviewed item by item against the scenario and your checklist

Month 4: Network Fundamentals and Team Rounds (Weeks 13-16)

Weeks 13-14: Network Fundamentals and Server Roles

Topics:
- IP addressing and subnetting practice
- Configuring a small simulated network: addresses, switches and a router
- Common server roles and the extra settings they need
- Secure file sharing and remote access settings
- Networking quiz practice in the style of the Cisco Networking Challenge
- Using the official training materials when a coach provides access

Projects built:
- Small simulated network built and documented, with a subnetting worksheet

Practice: Complete a networking quiz and build one small simulated network from a written brief

Weeks 15-16: Team Rounds

Topics:
- Team roles: Windows lead, Linux lead, forensics, and someone tracking the score
- Splitting work using the scenario and the checklists
- Communicating clearly under time pressure
- Keeping notes so nothing is done twice or undone
- Reviewing a round: what scored, what was missed and why
- Competition rules on outside help during a round

Projects built:

```
        - Full mock team round on your Linux practice virtual machines and written Windows scenarios,
          followed by a written team review
      Practice: Write your role card for a team round: your checklist, your handoffs and what
      you report
      Assessment: Phase 2 assessment: a timed team round plus an individual hardening task

  ------------------------------------------------------------
  PHASE 3: CAPTURE-THE-FLAG SKILLS IN THE PICOCTF STYLE (MONTHS 5-6, WEEKS 17-24)
  ------------------------------------------------------------
  Puzzle-style security challenges on purpose-built practice platforms: encodings and ciphers,
  forensics, reading code, and how web and memory bugs are recognised and fixed, ending in a
  mock CTF.

    Month 5: Cryptography and Forensics (Weeks 17-20)
      Weeks 17-18: Encodings and Cryptography
        Topics:
          - Encodings are not encryption: binary, hexadecimal, ASCII and Base64
          - Classical ciphers: Caesar, substitution and Vigenere, and how they are broken
          - XOR and why reusing a key is a mistake
          - Hashes: what they are for and why passwords are stored as hashes
          - Public-key encryption explained with small numbers
          - Writing short Python scripts to automate decoding
        Projects built:
          - Cryptography challenge set solved on a practice platform, with a written solution for each
        Practice: Solve five cryptography challenges and explain the weakness each one relied
        on
      Weeks 19-20: Forensics
        Topics:
          - File signatures and why a file's name can lie about its type
          - Metadata in images and documents
          - Hidden data and simple steganography
          - Searching files and disk images for strings
          - Packet captures as evidence: following a conversation in Wireshark
          - Keeping a clean record of what was found and how
        Projects built:
          - Forensics challenge set solved on a practice platform, with a written solution for each
        Practice: Solve five forensics challenges and write the tool and the clue that cracked
        each one
        Assessment: Month 5 check: a timed mixed cryptography and forensics set with written
        solutions

    Month 6: Reading Code, Bugs and Fixes, and a Mock CTF (Weeks 21-24)
      Weeks 21-22: Reading Code and Recognising Bugs
        Topics:
          - Reading short Python and C programs to work out what they do
          - Reverse engineering basics: understanding a program without its source
          - How web applications trust input, and how input validation fixes that
          - Injection and cross-site scripting explained with the defender's fix: parameterised queries
            and output encoding
          - Memory safety: what a buffer overflow is and how bounds checking prevents it
          - Practising only on the platform's purpose-built challenges, never on real sites or programs
        Projects built:
          - Bug and fix notebook: for each practice challenge, the bug, how it was recognised and the
            code change that would fix it
        Practice: Solve three reading-code challenges and write the fix for each bug found
      Weeks 23-24: Mock CTF and the Road Ahead
        Topics:
          - Competition strategy: reading every challenge, taking the quick points first
          - Team play in a CTF: splitting categories and sharing notes
          - When to use a hint and when to move on
          - Writing clear solutions after the event
          - Responsible disclosure: what to do if you ever find a real vulnerability
          - Where to keep practising: free platforms built for students
        Projects built:
          - Mock CTF on an instructor-built challenge set, followed by a polished solution portfolio
        Practice: Write up your three favourite challenges from the course as portfolio pieces
        Assessment: Final assessment: mock CTF performance, the hardening and solution
        portfolio, and a short ethics conversation

PROJECTS THE STUDENT BUILDS AND KEEPS

  - Signed white-hat agreement and a personal practice lab
  - Command line treasure hunt and command notebook
  - Windows audit report on a practice image
  - Annotated packet capture walkthrough
  - Tested Windows and Linux hardening checklists
  - Documented simulated network with a subnetting worksheet
  - Mock team round with a written team review
  - Cryptography and forensics solution sets
```

- Bug and fix notebook
- Mock CTF solution portfolio

Total projects: 10 defensive artifacts: checklists, audits, team reviews and written CTF solutions

SKILLS THE STUDENT WILL HAVE AT THE END

- Linux command line: files, permissions, users, search and pipes
- Windows administration: users, policies, services, updates and the firewall
- Networking basics: addressing, ports, protocols and packet captures
- System hardening against a scenario, under time, as a team
- CTF skills: encodings, classical and modern cryptography ideas, and forensics
- Recognising common web and memory bugs and describing the defensive fix
- Security ethics: permission, competition rules and responsible disclosure

HOW A TYPICAL WEEK IS SPLIT

Live classes: 2 live one-hour classes per week, with demonstrations and hands-on lab work
Practice: 2-3 hours between classes on practice images and practice-platform challenges
Review: Every checklist, audit and written solution reviewed with feedback
Homework: A lab task or challenge set after every class, and a monthly mixed-review task that brings back earlier skills

SUPPORT INCLUDED

Doubt support: WhatsApp doubt support between classes, including help when a practice lab will not start
Progress updates: Regular progress notes to parents, including the ethics agreement their teen signed

CERTIFICATION DETAIL

Completion: Certificate from Modern Age Coders, awarded on passing the final assessment. Fall short and there is focused revision and a free retest: the certificate certifies real learning, not attendance

WHERE THIS CAN LEAD

- Entering CyberPatriot through a school or approved organisation team, with practised skills
- Competing in capture-the-flag events on free platforms built for students
- Our Python or programming courses, where scripting and safe-coding habits grow further
- Further study toward defensive roles such as security analyst or incident responder, which build on these foundations
- Computer science electives and clubs, with a security perspective few classmates have

COMMON QUESTIONS ABOUT THIS COURSE

For anything about cost, use PART 4 and RULE 1. Do not quote two regions.

Q: Is this course ethical and legal?
A: Yes, by design. Students practise only on a practice virtual machine they set up with the teacher and on practice platforms where every challenge is meant to be solved. Every student signs a white-hat agreement in week one: practise only with permission, follow competition rules, and report rather than exploit. When a capture-the-flag challenge involves a bug, students learn the fix a defender would make, not how to use it elsewhere.

Q: What is CyberPatriot?
A: CyberPatriot is the National Youth Cyber Education Program created by the Air & Space Forces Association. Its National Youth Cyber Defense Competition puts teams of high school and middle school students in charge of finding and fixing security vulnerabilities in virtual Windows and Linux systems, and teams are scored on how secure they make them. Alongside that Network Security Challenge, CyberPatriot describes a Cisco Networking Challenge made up of an online quiz and a virtual networking exercise. Rounds run online, and teams choose a four-hour period on the competition weekend.

Q: Can you register my teen's CyberPatriot team?
A: No. CyberPatriot teams register through a school or approved youth organisation, with an adult coach. This course trains individual students so they bring stronger skills to their team; it is not a team itself. Check eligibility and dates with CyberPatriot directly.

Q: What is picoCTF, and where is it now?
A: picoCTF is the capture-the-flag program built by Carnegie Mellon University. picoctf.org now points to CyLab Security Academy, CMU's free cybersecurity learning platform, where existing picoCTF accounts carry over. It has practice challenges across areas such as general skills, cryptography, web exploitation, forensics, binary exploitation and reverse engineering, plus timed events, some of which allow team play.

Q: Does my teen need to know coding?
A: No. The first four months are about the command line, system settings and networks rather

than programming. Month 5 uses a little Python to automate decoding, and we teach what is needed. Students who already code get more out of the reading-code weeks.

Q: Is this different from your Cybersecurity for Teens course?
A: Yes. Cybersecurity for Teens is a broad, defensive introduction to online safety, attacks and defence for any teen, with no coding and no lab setup. This course is hands-on competition preparation: virtual machines, system hardening, network exercises and capture-the-flag practice. Many students take Cybersecurity for Teens first, but it is not required.

Q: What computer does my teen need?
A: A laptop or desktop that can run a virtual machine, plus a stable internet connection. Tablets and most Chromebooks are not suitable. We check the computer and help set up the free virtual machine software in the first week.

Q: Will this guarantee a place in a competition final?
A: No, and nobody honest can promise that. Results depend on the team, the round and the student's own practice. What the course does is build real skills, tested in timed practice rounds, so a student walks into a competition prepared.

Q: How are the classes run?
A: Live online classes, twice a week, with a real teacher, in a group of 15 to 20 students, a mini batch of up to 6, or one to one. Current fees for your region are shown in the pricing section of this page.

Q: Can we try a class first?
A: Yes. Book a free demo class. The teacher walks your teen through a short practice challenge, explains the ethics agreement, and suggests whether group, mini batch or one-to-one classes fit best. Parents are welcome to watch. There is no obligation to enrol. (Agent note: the free demo is a waiting list with no fixed date. The Priority Live Demo is a guaranteed class today or tomorrow, booked at https://learn.modernagecoders.com/priority-demo . Offer both, as RULE 3 says.)

To enrol, message Shivam Sir on +91 9123366161 or send the parent this link: https://learn.modernagecoders.com/courses/picoctf-cyberpatriot-cybersecurity-competition-prep-for-teens
For a demo: the Priority Live Demo (guaranteed, today or tomorrow) is booked at https://learn.modernagecoders.com/priority-demo . The free demo is a waiting list with no fixed date.

==========
COURSE 50 OF 137: CYBERSECURITY FOR TEENS: ONLINE SAFETY & WHITE-HAT DEFENSE
==========

Course link: https://learn.modernagecoders.com/courses/cybersecurity-course-for-teens-ethical-defensive
Subject area: Cybersecurity
Designed for: Teens
Who can join: Beginner, ages 13 to 18, no coding required
Course length: 6 months (24 weeks)
Time needed: 2 live classes/week + 2-3 hours practice
Certificate: Certificate from Modern Age Coders, awarded on passing the final assessment

PRICE FOR THIS COURSE (quote only the one that applies to the person asking)
In India, per month: group Rs 1,499, mini batch Rs 2,999, one to one Rs 4,999
Outside India, per month: group $100, one to one $150
Classes: group and mini batch two live classes a week, eight a month; one to one in India one live class a week, four a month; one to one outside India two live classes a week, eight a month. Each class is one hour.

WHAT THIS COURSE IS

Live online cybersecurity course for teens (13-18): learn how attacks work and how defense wins, from passwords and phishing to encryption and CTF puzzles.

In one line: Teens live online. This course teaches them how that world actually works, how it gets attacked, and how defenders win.

ABOUT THE PROGRAMME

Most teenagers manage more online accounts than their parents, yet nobody has ever taught them how any of it works or how it fails. This 6-month live course fixes that, and it does so honestly: this is a defensive course. Students learn how attacks work conceptually, how a phishing email is constructed, why password reuse is the root of most account theft, how ransomware spreads, because you cannot defend against what you do not understand. Nobody here is taught to break into anything, and every student signs a white-hat code of conduct in week one that we return to all course long. The arc runs from how the internet actually moves data, through passwords, hashing, and two-factor authentication, into phishing and social engineering recognition, malware concepts and safe habits, then encryption from paper ciphers to the HTTPS padlock, and web security ideas like cookies and sessions. It ends with a capture-the-flag month: instructor-built puzzle competitions in cryptography, logic, and file

forensics that are legal, safe, and genuinely fun. Along the way students harden their own accounts, audit their own digital footprint, and brief their own families, so the payoff starts in week one, not after graduation.

WHAT MAKES THIS COURSE DIFFERENT

- Strictly defensive and ethical: attacks are explained conceptually so defense makes sense, and no offensive tooling is ever taught
- A white-hat ethics thread runs through every month, starting with a signed code of conduct in week one
- Students secure their real digital lives during the course: accounts hardened, backups running, families briefed
- Case studies of real incidents are read the way defenders read them: what failed, and what would have stopped it
- The capstone is a capture-the-flag event built entirely by our instructors, so every puzzle is legal, safe, and age-appropriate
- No coding required: the course is about systems and judgment, and the safe-coding week meets students at whatever level they code

THE LEARNING PATH, STEP BY STEP

Phase 1: How the digital world works and how to protect your own corner of it: networks, digital footprints, threat thinking, passwords, hashing, and 2FA
Phase 2: Attacks understood, defenses built: phishing and social engineering recognition, malware concepts, backups, and hardening real devices
Phase 3: Cryptography from paper ciphers to HTTPS, web security concepts, safe coding habits, and a capture-the-flag capstone with written solutions

WHAT A STUDENT NEEDS BEFORE STARTING

Coding experience: None required. The safe-coding week adapts to whatever level a student codes at, including none
Computer skills: Comfortable using a browser, apps, and settings menus
Equipment: A computer with a modern browser and a stable internet connection; no special tools are installed
Age: 13 to 18. The course discusses real scams and real incidents at a depth suited to this range
Mindset: Willingness to sign and honor the white-hat code of conduct; this course is for defenders

WHO THIS COURSE IS FOR

Every online teen: Students who live online, which is all of them, and have never been taught how any of it works or fails
Curious about hacking: Teens drawn to the hacking mystique who deserve the honest, legal, defensive version of that curiosity
Future security professionals: Students considering cybersecurity as a field who need the real foundation before any advanced study
Puzzle lovers: Teens who enjoy ciphers, logic problems, and competitions; the CTF capstone is built for them
Family tech helpers: The teen everyone in the house already asks for tech help, upgraded into the family's actual defender

FULL CURRICULUM, WEEK BY WEEK

This is the complete teaching plan. Parents can ask about any week.

PHASE 1: THE DIGITAL WORLD AND YOUR IDENTITY (MONTHS 1-2, WEEKS 1-8)

You cannot secure what you do not understand. First the internet itself, then the single most attacked thing on it: your identity.

Month 1: How the Internet Actually Works (Weeks 1-4)

The Life of a Web Request

Topics:
- The white-hat code of conduct: what we do, what we never do, and why, signed by every student
- What happens when you type a URL: DNS, IP addresses, and servers in plain language
- Packets: how data travels in pieces and reassembles
- Clients and servers: who asks, who answers
- Watching a request travel with standard diagnostic tools like traceroute
- Why understanding the plumbing is the first defensive skill

Projects built:
- Map the full path of a web request as an annotated diagram, from keyboard to server and back

Practice: Trace three websites you use daily and note how many network hops each takes

Networks Around You

Topics:
- Home networks: router, Wi-Fi, and every device quietly connected
- Public Wi-Fi: what it can expose and sensible rules for using it

- What the cloud really is: someone else's computer, and what that implies
- Wi-Fi encryption settings and router passwords in plain terms
- The guest network: a simple defense most homes never switch on
- IoT devices: why the smart bulb is part of your security story

Projects built:
- Home network inventory: every connected device listed, with a written safety checklist for the household

Practice: Check your home router's basics with a parent: admin password changed, encryption on, firmware updated

Your Digital Footprint

Topics:
- What websites and apps collect, and where it goes
- Cookies at a first glance: useful, and worth understanding
- Search-engine results for your own name: the public footprint
- Privacy settings that actually matter on the platforms teens use
- Oversharing patterns: location tags, school names, and routines
- The permanence problem: why deleted rarely means gone

Projects built:
- Personal digital footprint audit: what is publicly findable about you, plus a written cleanup plan you execute

Practice: Complete a privacy-settings review on your two most used apps and record what you changed

Thinking Like a Defender

Topics:
- Assets, threats, and risk: security's core vocabulary made concrete
- Threat modeling a phone: what is worth stealing, who might want it, how it is reached
- Likelihood vs impact: why we defend against the boring attacks first
- Defense in depth: layers, not walls
- The human layer: why most successful attacks start with a person, not a computer
- Ethics checkpoint: knowledge of weaknesses creates responsibility, never permission

Projects built:
- Full threat model for a fictional student's phone and accounts, with ranked risks and matched defenses

Practice: Write a one-page threat model for something you own and care about

Assessment: Month 1 check: explain the path of a web request and defend your threat model in a short viva

Month 2: Passwords, Hashing, and Proving Who You Are (Weeks 5-8)

How Passwords Fail

Topics:
- How attackers actually get passwords: guessing, leaked databases, and reuse, explained conceptually
- Credential stuffing: why one leaked password opens five accounts
- What makes a password strong: length beats cleverness
- Passphrases: four random words and why the maths favors them
- Password managers: what they are, how they help, how families adopt one
- Checking exposure: how breach-notification services like Have I Been Pwned work

Projects built:
- Password health review of your own accounts, done privately at home with a parent, with a migration plan to unique passphrases

Practice: Move your three most important accounts to strong unique passphrases and record the process, never the passwords

Hashing: Why Good Sites Never Store Your Password

Topics:
- What a hash function is: one-way, deterministic, avalanche effect
- Hands-on with SHA-256 in a browser demo: same input, same fingerprint
- Why websites store hashes instead of passwords
- Salting: why two users with the same password get different hashes
- What a data breach actually leaks, and why hashing changes the damage
- Hash checking downloads: verifying a file is what it claims to be

Projects built:
- Hashing lab worksheet: predict, test, and explain hash behavior across a set of inputs, including a tampered file

Practice: Verify the published hash of a real downloaded file and write up the steps

Two-Factor Authentication and Beyond

Topics:
- Factors: something you know, have, and are
- Authenticator apps vs SMS codes: why one resists phishing better
- Passkeys: where sign-in is heading and why
- Recovery codes: the step everyone skips until it hurts
- Account recovery hygiene: recovery email and phone numbers kept current
- When 2FA prompts themselves become the attack: fatigue prompts, conceptually

Projects built:
- Account lockdown: 2FA enabled on your key accounts with recovery codes stored safely, checklist evidence submitted

Practice: Help one family member enable 2FA on one account and note what confused them

Identity Theft and Scams That Target Teens

Topics:
- Gaming account theft: the scams built around skins, coins, and trades

- Marketplace and fan-merch scams: too good to be true, quantified
- Impersonation: fake friend accounts and what verification actually verifies
- What identity theft does to a real person: a case walk-through
- Reporting channels: platforms, banks, and India's cybercrime portal
- Ethics checkpoint: what you do when a friend's account is clearly compromised

Projects built:
- Family security briefing: a one-page document teaching your household the month's defenses, delivered as a short talk at home

Practice: Collect two real scam attempts from family chat groups and annotate the tells

Assessment: Month 2 check: passwords and identity quiz plus a live walkthrough of your family briefing

---

PHASE 2: ATTACKS RECOGNIZED, DEFENSES BUILT (MONTHS 3-4, WEEKS 9-16)

The two attack families that touch everyone: deception aimed at people, and malicious software aimed at machines. Recognition first, then working defenses.

Month 3: Phishing and Social Engineering (Weeks 9-12)

Anatomy of a Phishing Email

Topics:
- The standard skeleton: spoofed sender, urgent story, poisoned link
- Reading the real sender address behind a display name
- Lookalike domains: rn vs m, and the tricks typography plays
- Hovering before clicking: reading a link's true destination
- Email headers at a basic level: where a message really came from
- Why banks and platforms never ask for your password by email

Projects built:
- Phish anatomy poster: dissect one anonymized real phishing email into its labeled parts

Practice: Review your own spam folder with a parent and identify the technique in five messages

Beyond Email: Where Teens Actually Get Phished

Topics:
- Smishing: scam texts about deliveries, prizes, and blocked accounts
- Fake login pages: pixel-perfect copies and the URL that gives them away
- Discord, WhatsApp, and in-game phishing: free-item links and fake giveaways
- QR code scams: why a square of dots deserves the same suspicion as a link
- Browser warnings and what they actually mean
- The verification habit: independently checking through the real app or site

Projects built:
- Spot-the-phish gallery: grade 15 anonymized real samples as safe or suspicious, with written reasoning for each call

Practice: Build your own three-question checklist for judging any unexpected message

The Psychology of Social Engineering

Topics:
- The levers: authority, urgency, fear, and flattery
- Pretexting: attacks that begin with a believable story
- Case study read as defenders: a major breach that started with a phone call
- Why smart people fall for scams: stress and context, not stupidity
- OSINT awareness: how oversharing feeds targeted attacks, tying back to week 3
- Ethics checkpoint: persuasion skills and the bright line around consent and honesty

Projects built:
- Case study brief: reconstruct a documented social engineering incident and identify the three points where defense could have stopped it

Practice: Find the persuasion lever in five real scam messages from the class archive

The Phish Detector Field Guide

Topics:
- Consolidating the month into a usable field guide
- Writing detection rules a grandparent could follow
- Reporting phishing properly: platform tools and national portals
- What to do after a wrong click: damage control steps in order
- Designing the class recognition tournament
- Teaching as testing: explaining a tell proves you understand it

Projects built:
- Phish detector field guide: an illustrated recognition and response guide, then the class phishing-recognition tournament

Practice: Test your field guide on a family member and revise the rule they misunderstood

Assessment: Month 3 check: timed recognition tournament across 20 fresh samples, plus field guide review

Month 4: Malware Concepts and Safe Habits (Weeks 13-16)

The Malware Families

Topics:
- Viruses, worms, and trojans: what each name actually means
- Ransomware: encryption turned against you, conceptually
- Spyware and keyloggers: the quiet observers
- Adware and unwanted programs: the grey zone
- How infections really begin: attachments, cracked software, fake updates, and bundled

installers
- Why cracked games are the classic teen infection route

Projects built:
- Malware family tree: an illustrated chart mapping each family to its behavior and its most common arrival route

Practice: Write plain-language definitions of five malware terms for a younger sibling

Defenses That Actually Work

Topics:
- Updates as defense: what a patch is and why delay is dangerous
- Antivirus and built-in protections: what they catch and what they miss
- Least privilege at home: why daily life should not run on an admin account
- Sandboxing as a concept: why apps on a phone cannot read each other's data
- Backups and the 3-2-1 rule: the defense that defeats ransomware
- Restore drills: an untested backup is a hope, not a plan

Projects built:
- Personal backup plan: design and actually implement a 3-2-1 backup for your own important files, with a test restore

Practice: Run updates on your devices with a parent and document what was pending

Case Study: A Ransomware Outbreak, Read as Defenders

Topics:
- The WannaCry outbreak: what happened, in sequence
- The unpatched systems that let it spread
- Who was hit and what it cost, including hospitals
- The defenses that worked where it failed to spread
- What a recovery effort looks like from the inside
- Ethics checkpoint: responsible disclosure, and the researchers who reported flaws the right way

Projects built:
- Defender's timeline: reconstruct the outbreak and mark every point where standard defenses from week 14 would have changed the outcome

Practice: Read one news report on a recent incident and identify which defense was missing

Hardening Your Own Machines

Topics:
- Safe downloading: official sources, and reading installer screens instead of clicking next
- Browser hygiene: extensions audited, permissions reviewed
- App permissions on phones: flashlight apps that want your contacts
- Recognizing fake download buttons and bundled junk
- The family device sweep: applying the whole month at home
- Writing a maintenance routine you will actually follow

Projects built:
- Harden-your-browser lab: full extension and permission audit on your own browser and phone, with before-and-after notes

Practice: Complete the device sweep on one family computer and log every change made

Assessment: Month 4 check: malware and defenses quiz plus review of your implemented backup and hardening evidence

---

PHASE 3: CRYPTOGRAPHY, THE WEB, AND THE CTF CAPSTONE (MONTHS 5-6, WEEKS 17-24)

The mathematics of secrets, the trust machinery of the web, safer coding habits, and a capture-the-flag capstone that turns six months of defense into sport.

Month 5: Encryption and How the Web Stays Trustworthy (Weeks 17-20)

Classical Ciphers by Hand

Topics:
- The Caesar cipher: shifting the alphabet, and breaking it by brute force
- Substitution ciphers and keys
- Frequency analysis: why English's love of the letter E breaks substitution
- The Vigenere idea: why longer keys resist analysis
- A short history: ciphers, wars, and the codebreakers of Bletchley Park
- What classical failures teach modern cryptography

Projects built:
- Cipher exchange: encode messages for classmates, then break intercepted ones using frequency analysis worksheets

Practice: Break three prepared ciphertexts of increasing difficulty and document your method

Modern Encryption, Conceptually

Topics:
- Symmetric encryption: one shared key, and the delivery problem it creates
- Public-key encryption: the open padlock idea that solved key delivery
- Digital signatures: proving who wrote a message
- Key length and why brute force fails against modern ciphers
- End-to-end encryption: what your messaging apps actually promise
- Why nobody invents their own cipher: the first rule of cryptography

Projects built:
- Concept comic or storyboard: explain the padlock analogy for public-key encryption well enough to teach it

Practice: Identify which of your daily apps use end-to-end encryption and what that

covers
Cookies, Sessions, and the Padlock
Topics:
- What logged in actually means: sessions and cookies doing their real jobs
- Why stolen cookies matter: the session as a temporary key
- HTTPS vs HTTP: what the padlock encrypts and what it does not promise
- Certificates: how your browser decides whom to trust
- Certificate warnings: what they mean and when to walk away
- Public Wi-Fi revisited with new eyes: what HTTPS protects there and what it cannot
Projects built:
- Trust tour: inspect certificates and cookies on five real sites using browser dev tools, documenting what each reveals
Practice: Find one HTTP-only site in the wild and write up why the warning matters
Safe Coding Habits
Topics:
- Why apps get hacked, conceptually: trusting user input is the root of most classics
- Validating input: the habit, shown at whatever level students code
- Secrets never go in code: passwords, keys, and the accidental publish
- Dependencies age: why software built on old parts inherits their holes
- A gentle look at injection as an idea: data that gets treated as instructions
- Ethics checkpoint: finding a flaw in a real site means reporting, never poking further
Projects built:
- Code safety review: audit one of your own past projects, from any language or even Scratch, against a provided safety checklist
Practice: Add input validation to one small program you have written, or trace validation in a provided example
Assessment: Month 5 check: cryptography and web trust quiz plus cipher-breaking practical

Month 6: The Capture-the-Flag Capstone (Weeks 21-24)
Welcome to CTF
Topics:
- What a capture-the-flag competition is, and its role in real security education
- Our rules: every puzzle is instructor-built, self-contained, legal, and safe
- Puzzle categories: cipher breaking, logic, metadata forensics, and web-trust trivia
- Reading a puzzle: what is given, what is asked, what is hidden
- The solver's notebook: keeping notes that turn into writeups
- Practice round one, solved together as a class
Projects built:
- Practice CTF round: five starter puzzles solved individually with notes, then reviewed together
Practice: Solve three take-home puzzles and log your approach for each, including dead ends
Training Camp
Topics:
- Cipher puzzles under time: applying month 5 at speed
- File forensics-lite: what image metadata and file properties reveal
- Logic and encoding puzzles: binary, hexadecimal, and Base64 as everyday costumes for data
- Teamwork in CTFs: splitting categories and sharing notes
- Hint discipline: when to take a hint and what it costs
- The writeup format: challenge, approach, solution, lesson
Projects built:
- Team training rounds in every category, plus one polished writeup of your favorite solved puzzle
Practice: Daily puzzle streak: one puzzle per day with a two-line log entry each
The Capstone CTF Event
Topics:
- Final event briefing and team formation
- Competition strategy: triage easy points first
- The event itself: multi-category, scored, across class sessions
- Staying methodical under a clock
- Sportsmanship and collaboration within the rules
- Post-event solution reveal for every unsolved puzzle
Projects built:
- The capstone CTF: a scored, multi-category competition built from the entire course's material
Practice: Draft writeups for every puzzle your team solved while they are fresh
Writeups and the White-Hat Road Ahead
Topics:
- Polishing writeups into a portfolio piece
- Responsible disclosure as a practice: how professionals report what they find
- Defensive security careers surveyed honestly: analyst, incident response, security engineering, and the study each requires
- Where to keep learning: age-appropriate CTF platforms and safety-first communities
- The code of conduct, revisited as a graduation promise
- Presentations and certificates
Projects built:
- Final CTF writeup portfolio presented to the class, alongside your family briefing and audit documents from the course

Practice: Write a one-page letter to your future self on the security habits you intend to keep
Assessment: Capstone assessment: CTF performance, writeup portfolio, and a short ethics viva

PROJECTS THE STUDENT BUILDS AND KEEPS

- Annotated map of a web request's full path
- Home network inventory with a household safety checklist
- Personal digital footprint audit with an executed cleanup plan
- Threat model for a fictional student's phone and accounts
- Account lockdown: passphrases, 2FA, and recovery codes on real accounts
- Family security briefing, written and delivered at home
- Phish detector field guide plus recognition tournament
- Implemented 3-2-1 backup plan with a test restore
- Defender's timeline of a real ransomware outbreak
- Capture-the-flag writeup portfolio from the capstone event

Total projects: 10+ defensive artifacts: audits, field guides, hardened accounts, and CTF writeups

SKILLS THE STUDENT WILL HAVE AT THE END

- Networks and the web: how data moves, where trust lives, and what the padlock really promises
- Identity defense: passphrases, hashing, 2FA, and recovery done properly on real accounts
- Attack recognition: phishing, social engineering, and malware understood well enough to spot cold
- Practical hardening: backups, updates, permissions, and browser hygiene, implemented not just discussed
- Cryptography foundations: from breaking Caesar ciphers by hand to explaining public-key encryption
- White-hat judgment: ethics, responsible disclosure, and the habit of reporting rather than exploiting

HOW A TYPICAL WEEK IS SPLIT

Live classes: 2 live one-hour classes per week, with demonstrations, case studies, and hands-on labs
Practice: 2-3 hours between classes: audits, puzzles, and real hardening tasks on the student's own devices
Review: Every artifact reviewed with written feedback; the ethics thread checked in every month
Homework: A task or problem set after every class, and a monthly mixed-review assignment that deliberately folds in earlier topics

SUPPORT INCLUDED

Doubt support: WhatsApp doubt support between classes, including help when a real security question comes up at home
Progress updates: Regular progress notes to parents, who also receive the family briefing their teen produces in month 2

CERTIFICATION DETAIL

Completion: Certificate from Modern Age Coders, awarded on passing the final assessment. Fall short and there is focused revision and a free retest: the certificate certifies real learning, not attendance

WHERE THIS CAN LEAD

- Further defensive study toward security analyst and incident response roles, which build directly on these concepts
- Age-appropriate CTF platforms and school cyber competitions, entered with real preparation
- Our Python and programming courses, where the safe-coding habits from month 5 get applied for real
- Computer science electives and projects with a security perspective few classmates will have
- The informal but real role of family and school security helper, taken on responsibly

COMMON QUESTIONS ABOUT THIS COURSE

For anything about cost, use PART 4 and RULE 1. Do not quote two regions.

Q: Will my teen learn to hack?
A: Not in the sense the movies mean, and we are upfront about that. This is a defensive course: students learn how attacks work conceptually, how phishing is built, how malware spreads, how passwords get stolen, because recognition is the heart of defense. Nobody is taught intrusion tools or techniques for breaking into systems, every student signs a white-hat code of conduct in week one, and the capture-the-flag puzzles are instructor-built, self-contained, and legal.

Q: Is this course safe and legal?
A: Yes, by design. Every exercise runs on the student's own accounts and devices or on materials we built for the class; nothing ever touches systems that are not ours to touch. The course actively teaches the legal and ethical lines, including responsible disclosure, so students finish knowing not just what is possible but what is right. Parents are involved directly: several assignments, like the account lockdown and home network review, are done with a parent.

Q: Does my teen need to know coding first?
A: No. The course is about systems, judgment, and habits rather than programming, and most weeks involve no code at all. The one safe-coding week in month 5 meets each student at their level, whether that is Scratch, some Python, or nothing yet. Students who do code get a useful bonus: they learn to look at their own projects the way an attacker would, and fix what they find.

Q: What does my teen actually produce in this course?
A: Real defensive artifacts, most of them immediately useful: a digital footprint audit with an executed cleanup, hardened accounts with strong passphrases and 2FA, a working 3-2-1 backup with a test restore, a phishing field guide, a family security briefing delivered at home, and a portfolio of capture-the-flag writeups from the capstone. The family typically becomes measurably safer while the course is still running.

Q: Is this useful for a cybersecurity career?
A: It is the correct first step, and we will not overclaim beyond that. Professional security roles require further study, in networking, operating systems, and usually programming, but they all build on exactly the concepts this course teaches: threat thinking, cryptography basics, authentication, and attack recognition. A teen who finishes this course knows whether the field genuinely interests them and holds a foundation most college freshmen lack. The safety payoff, meanwhile, is immediate rather than someday.

Q: What is a CTF, and is it appropriate for teens?
A: Capture the flag is the puzzle-competition format used across security education worldwide: players solve challenges, break a practice cipher, find data hidden in a file's metadata, decode a message, to find hidden flags and score points. Ours is entirely instructor-built, so every puzzle is age-appropriate, legal, and self-contained. It is the most anticipated month of the course, and the writeups students produce are genuine analytical work.

Q: How are the classes taught?
A: Live one-hour online classes, twice a week, with a real instructor and groups capped at 20 students. Mini-batch (up to 6 students) and personal 1-on-1 options are available.

Q: How am I assessed, and is the certificate just for showing up?
A: No. A task follows every class with feedback, monthly reviews deliberately mix new material with earlier topics so nothing is forgotten, and the course ends with a final exam covering the whole course. Passing earns the certificate; falling short earns focused revision and a free retest. We measure real learning, not attendance.

Q: Can we try a class before enrolling?
A: Yes, the first demo class is free with no obligation. Book at learn.modernagecoders.com/contact or message us on WhatsApp at +91 91233 66161. Parents are welcome to observe, and for this course in particular we encourage it: you will see exactly how the defensive, ethics-first approach works in practice.

To enrol, message Shivam Sir on +91 9123366161 or send the parent this link: https://learn.modernagecoders.com/courses/cybersecurity-course-for-teens-ethical-defensive
For a demo: the Priority Live Demo (guaranteed, today or tomorrow) is booked at https://learn.modernagecoders.com/priority-demo . The free demo is a waiting list with no fixed date.

==========

COURSE 51 OF 137: DATA ANALYSIS COURSE: EXCEL, SQL, PYTHON & BI

==========

Course link: https://learn.modernagecoders.com/courses/data-analysis-mastery-course-college
Subject area: Data Science
Designed for: College students
Who can join: Complete beginner (18+); college students, graduates and working professionals
Course length: 8-10 months (35-43 weeks)
Time needed: 2 live classes/week + 4-6 hours practice
Certificate: Certificate from Modern Age Coders, awarded on passing the final exam

PRICE FOR THIS COURSE (quote only the one that applies to the person asking)
In India, per month: group Rs 1,499, mini batch Rs 2,999, one to one Rs 4,999
Outside India, per month: group $100, one to one $150
Classes: group and mini batch two live classes a week, eight a month; one to one in India one live class a week, four a month; one to one outside India two live classes a week, eight a month. Each class is one hour.

WHAT THIS COURSE IS

Data analysis course for college students and professionals: Excel mastery, statistics and SQL, then Python with Pandas, BI dashboards and industry analytics, ending in a portfolio capstone, in 8-10 months.

In one line: The honest analyst toolkit in the order jobs use it: Excel done properly, statistics and SQL, then Python, BI dashboards and the industry literacy that makes analysis land.

ABOUT THE PROGRAMME

Data analyst is the most reachable serious tech role there is, and the job is concrete: take messy business data, make it trustworthy, and turn it into answers a decision-maker can act on. This live online course teaches exactly that craft in the order real work uses it: Excel to genuine mastery first, because it remains the language of business, with the statistics that keep analysis honest, then SQL to production analyst level including window functions, then the Python layer: Pandas for cleaning and transformation, real exploratory analysis, visualization, BI dashboards and data storytelling, plus practical machine learning for analysts. The third phase adds what bootcamps skip: industry literacy across finance, healthcare, retail, supply chain and HR analytics, cloud platforms, and the advanced statistical methods behind A/B tests. A finale month ships a portfolio capstone and sits the final exam. The pace is honest: about seven months of teaching at two live classes a week plus four to six hours of practice, with margin built in for revision and life. Problem sets, monthly mixed reviews, phase exams, and a final exam that decides the certificate with a free retest.

WHAT MAKES THIS COURSE DIFFERENT

- Excel respected, not skipped: business still speaks it, so analysts must own it
- SQL to real analyst depth: joins, aggregation and window functions, not SELECT-star tutorials
- Storytelling as a core skill: analysis that changes decisions, not chart dumps
- Industry literacy included: finance, healthcare, retail, supply chain and HR analytics
- An honest 8-month arc with 2 months in hand
- Real assessment: weekly problem sets, monthly mixed reviews, phase exams and a final exam with a free retest

THE LEARNING PATH, STEP BY STEP

Phase 1: Excel, statistics and SQL (Months 1-3): the trustworthy-numbers foundation
Phase 2: Python, Pandas and BI (Months 3-5): cleaning, analysis, dashboards and storytelling
Phase 3: Industry analytics (Months 5-7): domain literacy, cloud platforms and advanced methods
Phase 4: The finale (Month 8): a portfolio capstone and the final exam

WHAT A STUDENT NEEDS BEFORE STARTING

Coding experience: None. Everything is taught from the first line
Equipment: Any computer with a stable internet connection; every tool used is free
Age: 18+; college students, graduates and working professionals
Time commitment: 2 live classes plus 4-6 hours of practice a week

WHO THIS COURSE IS FOR

College students: Students who want the most reachable serious data role
Working professionals: Professionals whose jobs already involve spreadsheets and reporting
Career switchers: Newcomers who want a concrete, employable data skill without a maths gauntlet
Business roles: Operations, marketing and finance people ready to own their own numbers
Future data scientists: Learners using the analyst road as the honest first step toward data science

FULL CURRICULUM, WEEK BY WEEK

This is the complete teaching plan. Parents can ask about any week.

PHASE 1: EXCEL, STATISTICS & SQL (MONTHS 1-3, WEEKS 1-10)

Build strong foundations in data concepts, statistics, and become an Excel power user.

Month 1: Data Fundamentals & Excel (Weeks 1-3)
Introduction to Data Analysis
Topics:
- What is data analysis? Role in modern business
- Types of data: structured, unstructured, semi-structured
- Data analysis lifecycle and methodology
- Quantitative vs qualitative analysis
- Descriptive, diagnostic, predictive, prescriptive analytics
- Industry applications and case studies

- Tools ecosystem overview
- Career paths in data analysis
- Setting up your analysis environment
- Introduction to datasets and data sources
- Data ethics and privacy considerations
- Building analytical thinking

Projects built:
- Personal data audit project
- Industry analysis report
- Data source catalog creation

Practice: Analyze 10 real-world data scenarios

Excel Fundamentals & Formulas

Topics:
- Excel interface mastery and shortcuts
- Data types and formatting
- Cell references: absolute, relative, mixed
- Essential formulas: SUM, AVERAGE, COUNT, MIN, MAX
- Logical functions: IF, AND, OR, NOT
- Nested IF statements and IFS function
- Text functions: CONCATENATE, LEFT, RIGHT, MID, TRIM
- Date and time functions
- Mathematical functions: ROUND, ABS, MOD
- Error handling: IFERROR, IFNA
- Formula auditing and debugging
- Named ranges and structured references

Projects built:
- Sales calculator dashboard
- Employee timesheet system
- Grade calculation spreadsheet

Practice: Complete 50 Excel formula challenges

Excel Advanced Functions

Topics:
- LOOKUP functions: VLOOKUP, HLOOKUP, XLOOKUP
- INDEX and MATCH combinations
- SUMIF, COUNTIF, AVERAGEIF functions
- SUMIFS for multiple criteria
- Array formulas and dynamic arrays
- FILTER, SORT, UNIQUE functions
- Statistical functions in Excel
- Financial functions: NPV, IRR, PMT
- Database functions: DSUM, DCOUNT
- INDIRECT and OFFSET for dynamic references
- Creating custom functions with VBA basics
- Excel automation introduction

Projects built:
- Dynamic sales report system
- Financial analysis model
- HR analytics dashboard

Practice: Build 25 complex Excel solutions

Month 2: Statistics & Data Visualization in Excel (Weeks 4-6)

Statistics Fundamentals

Topics:
- Types of data: nominal, ordinal, interval, ratio
- Population vs sample
- Measures of central tendency: mean, median, mode
- Measures of spread: range, variance, standard deviation
- Quartiles and interquartile range
- Skewness and kurtosis
- Normal distribution and z-scores
- Central limit theorem basics
- Confidence intervals introduction
- Hypothesis testing concepts
- P-values and significance levels
- Type I and Type II errors

Projects built:
- Statistical analysis report
- A/B testing simulator
- Quality control dashboard

Practice: Perform 30 statistical analyses

Excel Data Analysis Tools

Topics:
- PivotTables creation and customization
- PivotTable calculations and summaries
- Slicers and timeline filters
- PivotCharts and interactive dashboards
- Power Pivot introduction
- Data Model and relationships
- DAX formulas basics

```
      - What-if analysis: Goal Seek, Scenario Manager
      - Data tables for sensitivity analysis
      - Solver for optimization problems
      - Analysis ToolPak features
      - Regression analysis in Excel
    Projects built:
      - Sales performance dashboard
      - Budget optimization model
      - Multi-dimensional analysis cube
    Practice: Create 20 PivotTable reports
  Data Visualization in Excel
    Topics:
      - Chart types and when to use them
      - Column, bar, and line charts
      - Pie charts and donut charts
      - Scatter plots and bubble charts
      - Combination charts
      - Sparklines for inline visualization
      - Conditional formatting techniques
      - Data bars, color scales, icon sets
      - Heat maps and treemaps
      - Waterfall and funnel charts
      - Chart formatting and design principles
      - Creating interactive dashboards
    Projects built:
      - Executive dashboard
      - KPI scorecard
      - Interactive sales report
    Practice: Design 30 data visualizations

Month 3: SQL & Python for Data Analysis (Weeks 7-10)
  SQL Fundamentals
    Topics:
      - Database concepts and relational model
      - SQL syntax and structure
      - SELECT statements and filtering with WHERE
      - Sorting with ORDER BY
      - LIMIT and OFFSET for pagination
      - DISTINCT for unique values
      - Aggregate functions: COUNT, SUM, AVG, MIN, MAX
      - GROUP BY for aggregation
      - HAVING clause for group filtering
      - Working with NULL values
      - Date and time functions in SQL
      - String manipulation in SQL
    Projects built:
      - Customer analysis queries
      - Sales performance reports
      - Inventory tracking system
    Practice: Write 100 SQL queries
  SQL Joins & Advanced Queries
    Topics:
      - Understanding table relationships
      - INNER JOIN for matching records
      - LEFT and RIGHT OUTER JOINS
      - FULL OUTER JOIN usage
      - CROSS JOIN and Cartesian products
      - Self joins for hierarchical data
      - Multiple joins in complex queries
      - Subqueries and nested queries
      - Correlated subqueries
      - Common Table Expressions (CTEs)
      - UNION, INTERSECT, EXCEPT operations
      - Query optimization basics
    Projects built:
      - Multi-table reporting system
      - Customer journey analysis
      - Supply chain analytics
    Practice: Master 50 complex join scenarios
  SQL Analytics Functions
    Topics:
      - Window functions introduction
      - ROW_NUMBER, RANK, DENSE_RANK
      - Running totals with SUM() OVER
      - Moving averages with AVG() OVER
      - LAG and LEAD for time comparisons
      - FIRST_VALUE and LAST_VALUE
      - Percentile calculations
      - Pivoting and unpivoting data
```

```
        - CASE statements for conditional logic
        - Creating views for reusable queries
        - Stored procedures basics
        - Database performance tuning
      Projects built:
        - Time series analysis system
        - Cohort analysis platform
        - RFM segmentation model
      Practice: Build 30 analytical queries
    Python Fundamentals for Analysis
      Topics:
        - Python setup for data analysis
        - Jupyter Notebook environment
        - Variables and data types
        - Lists, tuples, dictionaries
        - Control flow: if, for, while
        - Functions and lambda expressions
        - File handling and CSV processing
        - Error handling basics
        - Libraries: NumPy basics
        - Introduction to Pandas
        - Reading data from various sources
        - Google Colab for cloud computing
      Projects built:
        - Data processing pipeline
        - File converter utility
        - Analysis automation script
      Practice: Complete 50 Python exercises
      Assessment: Phase 1 exam: a practical build defended live, plus a written paper mixing
      this phase with everything before it

---------------------------------------------------------------
PHASE 2: PYTHON, PANDAS & BUSINESS INTELLIGENCE (MONTHS 3-5, WEEKS 11-20)
---------------------------------------------------------------
Master Python for data analysis, pandas, data cleaning, and exploratory data analysis.

  Month 4: Pandas & Data Manipulation (Weeks 11-14)
    Pandas Fundamentals
      Topics:
        - Pandas Series and DataFrames
        - Creating DataFrames from various sources
        - Reading CSV, Excel, JSON files
        - DataFrame indexing and selection
        - loc and iloc for data access
        - Column operations and manipulation
        - Adding and removing columns
        - Data type conversions
        - Sorting and ranking data
        - Handling duplicate data
        - Reset and set index
        - DataFrame information and summary
      Projects built:
        - Data loader utility
        - DataFrame explorer tool
        - Data profiling system
      Practice: Complete 60 pandas exercises
    Data Cleaning with Pandas
      Topics:
        - Identifying missing data patterns
        - Handling missing values strategies
        - fillna, dropna, interpolate methods
        - Data type issues and conversions
        - String cleaning and standardization
        - Regular expressions for data cleaning
        - Handling outliers detection and treatment
        - Data validation techniques
        - Dealing with inconsistent data
        - Date and time parsing
        - Encoding categorical variables
        - Data quality metrics
      Projects built:
        - Data cleaning pipeline
        - Quality assurance tool
        - Automated data validator
      Practice: Clean 25 messy datasets
    Data Transformation & Aggregation
      Topics:
        - GroupBy operations in pandas
        - Aggregation functions: sum, mean, count
```

```
      - Multiple aggregations with agg()
      - Transform and apply functions
      - Pivot tables in pandas
      - Crosstab for frequency tables
      - Melt and wide-to-long reshaping
      - Merging and joining DataFrames
      - Concatenating data
      - Window functions in pandas
      - Rolling statistics
      - Resampling time series data
    Projects built:
      - Sales analytics engine
      - Customer segmentation tool
      - Time series processor
    Practice: Perform 40 transformation tasks
  Exploratory Data Analysis (EDA)
    Topics:
      - EDA methodology and workflow
      - Univariate analysis techniques
      - Bivariate analysis methods
      - Multivariate exploration
      - Distribution analysis
      - Correlation analysis
      - Statistical testing in Python
      - Feature engineering basics
      - Dimensionality reduction intro
      - Automated EDA tools
      - Creating EDA reports
      - EDA best practices
    Projects built:
      - Automated EDA pipeline
      - Data insights generator
      - Statistical report builder
    Practice: Complete EDA on 20 datasets

Month 5: Data Visualization & Storytelling (Weeks 15-17)
  Matplotlib & Seaborn
    Topics:
      - Matplotlib basics and figure structure
      - Line plots, scatter plots, bar charts
      - Customizing plots: colors, labels, legends
      - Subplots and figure layouts
      - Saving and exporting figures
      - Seaborn for statistical visualization
      - Distribution plots: histograms, KDE, box plots
      - Categorical plots: bar, count, violin
      - Relationship plots: scatter, line, regression
      - Heatmaps and correlation matrices
      - Pair plots for multivariate analysis
      - Style and theme customization
    Projects built:
      - Visualization library
      - Statistical plot generator
      - Report automation system
    Practice: Create 50 visualizations
  Business Intelligence Tools
    Topics:
      - Introduction to Tableau
      - Connecting to data sources in Tableau
      - Creating worksheets and dashboards
      - Calculated fields and parameters
      - Filters and hierarchies
      - Tableau story creation
      - Power BI fundamentals
      - Data modeling in Power BI
      - DAX formulas for calculations
      - Power BI service and sharing
      - Google Data Studio basics
      - Choosing the right BI tool
    Projects built:
      - Tableau executive dashboard
      - Power BI sales report
      - Cross-platform BI solution
    Practice: Create 15 BI dashboards
  Data Storytelling & Presentation
    Topics:
      - Principles of data storytelling
      - Narrative structure for data
      - Choosing the right visualization
```

```
        - Color theory and design principles
        - Minimalism and clarity
        - Annotation and highlighting insights
        - Creating compelling presentations
        - Executive communication strategies
        - Handling questions and objections
        - Written reports and documentation
        - Video presentations of data
        - Stakeholder management
      Projects built:
        - Data story presentation
        - Executive briefing deck
        - Insight communication toolkit
      Practice: Present 10 data stories

  Month 6: Machine Learning & Automation for Analysts (Weeks 18-20)
    Machine Learning Fundamentals
      Topics:
        - Introduction to machine learning
        - Supervised vs unsupervised learning
        - Training and test data splitting
        - Feature selection and engineering
        - Scikit-learn library basics
        - Linear regression implementation
        - Logistic regression for classification
        - Decision trees and random forests
        - Model evaluation metrics
        - Cross-validation techniques
        - Overfitting and underfitting
        - Hyperparameter tuning basics
      Projects built:
        - Sales prediction model
        - Customer churn predictor
        - Classification system
      Practice: Build 20 ML models
    Clustering & Segmentation
      Topics:
        - K-means clustering algorithm
        - Hierarchical clustering
        - DBSCAN for density-based clustering
        - Determining optimal clusters
        - Customer segmentation strategies
        - Market segmentation analysis
        - Behavioral segmentation
        - Dimensionality reduction with PCA
        - t-SNE for visualization
        - Anomaly detection methods
        - Outlier detection algorithms
        - Practical segmentation applications
      Projects built:
        - Customer segmentation engine
        - Anomaly detection system
        - Market analysis tool
      Practice: Perform 15 clustering analyses
    APIs & Automation
      Topics:
        - Working with APIs in Python
        - RESTful API concepts
        - Authentication and API keys
        - Requests library for API calls
        - JSON data handling
        - Web scraping with BeautifulSoup
        - Automating data collection
        - Scheduling scripts with cron/Task Scheduler
        - Email automation for reports
        - Cloud functions for automation
        - ETL pipeline creation
        - Real-time data processing basics
      Projects built:
        - API data collector
        - Automated reporting system
        - ETL pipeline
      Practice: Build 10 automation scripts
      Assessment: Phase 2 exam: a practical build defended live, plus a written paper mixing
      this phase with everything before it

----------------------------------------------------------------
PHASE 3: INDUSTRY ANALYTICS & THE WORKING ANALYST (MONTHS 5-7, WEEKS 21-30)
----------------------------------------------------------------
```

Master industry-specific analytics, cloud platforms, and prepare for professional roles.

Month 7: Industry-Specific Analytics (Weeks 21-25)
Financial Analytics
Topics:
- Financial statements analysis
- Ratio analysis and metrics
- Cash flow analysis
- Working capital management
- Investment analysis metrics
- Risk metrics: VaR, Sharpe ratio
- Portfolio analysis basics
- Credit risk scoring
- Fraud detection techniques
- Time value of money calculations
- Financial forecasting models
- Regulatory reporting basics
Projects built:
- Financial dashboard
- Risk assessment model
- Fraud detection system
Practice: Analyze 15 financial datasets
Healthcare Analytics
Topics:
- Healthcare data types and standards
- Patient data analysis
- Clinical trial analysis
- Healthcare KPIs and metrics
- Disease prediction models
- Patient readmission analysis
- Healthcare cost analysis
- Drug effectiveness studies
- Population health management
- HIPAA compliance basics
- Medical coding systems
- Healthcare dashboards
Projects built:
- Patient analytics dashboard
- Readmission predictor
- Healthcare KPI tracker
Practice: Work with 10 healthcare datasets
Retail & E-commerce Analytics
Topics:
- Retail metrics and KPIs
- Sales performance analysis
- Inventory analytics
- Customer basket analysis
- Product recommendation systems
- Price optimization strategies
- Demand forecasting
- Customer journey mapping
- Conversion rate optimization
- Return analysis
- Store performance comparison
- Omnichannel analytics
Projects built:
- Retail analytics platform
- Recommendation engine
- Inventory optimizer
Practice: Analyze 20 retail scenarios
Supply Chain Analytics
Topics:
- Supply chain metrics and KPIs
- Demand planning and forecasting
- Inventory optimization
- Supplier performance analysis
- Transportation analytics
- Warehouse efficiency metrics
- Order fulfillment analysis
- Supply chain risk assessment
- Network optimization
- Logistics analytics
- Procurement analytics
- Sustainability metrics
Projects built:
- Supply chain dashboard
- Demand forecasting model
- Route optimization tool
Practice: Optimize 10 supply chain processes

HR & People Analytics
Topics:
- HR metrics and KPIs
- Employee turnover analysis
- Recruitment analytics
- Performance management metrics
- Compensation analysis
- Diversity and inclusion metrics
- Employee engagement analysis
- Workforce planning
- Talent analytics
- Learning and development metrics
- Succession planning analytics
- HR dashboard creation
Projects built:
- HR analytics dashboard
- Turnover prediction model
- Compensation analyzer
Practice: Analyze 15 HR scenarios

Month 8: Cloud Analytics & Your Portfolio (Weeks 26-27)
Cloud Platforms for Analytics
Topics:
- Cloud computing fundamentals
- AWS for data analytics
- S3 for data storage
- Athena for SQL queries
- Redshift data warehouse
- Google Cloud Platform basics
- BigQuery for analytics
- Azure data services
- Databricks introduction
- Snowflake basics
- Cloud cost optimization
- Security in cloud analytics
Projects built:
- Cloud migration project
- BigQuery analytics pipeline
- Multi-cloud solution
Practice: Deploy 10 cloud analytics solutions
Portfolio Development
Topics:
- Building an analytics portfolio
- GitHub for data analysts
- Creating compelling case studies
- Documentation best practices
- Jupyter notebook presentation
- Blog writing for analysts
- Personal website creation
- Kaggle competitions
- Contributing to open source
- Networking strategies
- Building online presence
Projects built:
- Portfolio website
- 5 detailed case studies
- GitHub repository organization
Practice: Complete portfolio preparation

Month 9: Advanced Methods, Engineering & Strategy (Weeks 28-30)
Advanced Statistical Methods
Topics:
- Bayesian statistics introduction
- Time series advanced techniques
- ARIMA models
- Survival analysis
- Factor analysis
- Structural equation modeling
- Monte Carlo simulations
- Bootstrapping methods
- Non-parametric tests
- Multivariate analysis
- Experimental design
- Causal inference basics
Projects built:
- Advanced statistical toolkit
- Simulation framework
- Causal analysis project
Practice: Implement 10 advanced methods

```
    Data Engineering Basics
      Topics:
        - Data pipeline architecture
        - ETL vs ELT strategies
        - Apache Airflow basics
        - Data quality frameworks
        - Data governance principles
        - Master data management
        - Data cataloging
        - Metadata management
        - Data lineage tracking
        - DataOps practices
        - CI/CD for data pipelines
        - Monitoring and alerting
      Projects built:
        - ETL pipeline
        - Data quality monitor
        - Automated data pipeline
      Practice: Build 5 data pipelines
    Business Strategy & Analytics
      Topics:
        - Strategic analytics frameworks
        - Competitive intelligence
        - Market analysis techniques
        - Customer analytics strategy
        - Product analytics
        - Growth analytics
        - Pricing analytics
        - Risk analytics
        - Performance management
        - Balanced scorecard
        - OKR tracking and analysis
        - Executive advisory skills
      Projects built:
        - Strategy dashboard
        - Competitive analysis report
        - Growth model
      Practice: Develop 5 strategic analyses
      Assessment: Phase 3 exam: a practical build defended live, plus a written paper mixing
      this phase with everything before it

----------------------------------------------------------------
PHASE 4: THE FINALE (MONTH 8, WEEKS 31-35)
----------------------------------------------------------------
The capstone month: spec, build, ship and defend, then the final exam that decides the
certificate.

  Month 8: Capstone and the Final Exam (Weeks 31-35)
    Capstone Spec and Setup
      Topics:
        - Choosing the capstone: a complete analyst project: a real business dataset cleaned, analysed
          and delivered as a dashboard with a recommendation deck
        - A one-page spec: scope, milestones, stack
        - Repository and skeleton ready on day one
        - Instructor sign-off before the build begins
      Projects built:
        - Approved capstone spec plus the running skeleton
      Practice: Pitch the spec to the batch and absorb one hard question
    Capstone Build
      Topics:
        - Two focused weeks in vertical slices
        - Instructor checkpoints and honest scope cuts
        - Using the whole course: Excel judgment, SQL, Pandas, visualization, storytelling and the
          statistics that keep it honest
        - Daily commits and an always-working build
      Projects built:
        - The capstone, feature-complete with version control
      Practice: A working build at the end of every session
    Ship and Polish
      Topics:
        - The finishing pass: edge cases, errors, documentation
        - Dashboard live and deck delivered: analysis a decision-maker can actually use
        - A README worth reading and a demo worth watching
        - A full-course spiral review before the exam
      Projects built:
        - The capstone shipped, documented and rehearsed
      Practice: Two mock demos, each tighter than the last
    Demo Day and the Final Exam
      Topics:
```

- Presenting the capstone: live demo plus the hardest bug story
- The honest map of next roads: analyst roles, business intelligence depth, or the road into data science
- Where our other courses continue the journey

Projects built:
- Demo day presentation delivered to the batch

Assessment: FINAL EXAM: a practical build plus a written paper with questions mixed from every phase. Passing earns the certificate; falling short earns a focused revision plan and a free retest

PROJECTS THE STUDENT BUILDS AND KEEPS

- Phase 1: Excel analyses and SQL query projects on business data
- Phase 2: Pandas cleaning pipelines, EDA reports and BI dashboards
- Phase 3: industry case analyses across five domains
- Phase 4: the portfolio capstone: dashboard plus recommendation deck

Total projects: 15+ real analyses, crowned by a portfolio capstone with dashboard and deck

SKILLS THE STUDENT WILL HAVE AT THE END

- Excel at professional depth: formulas, pivots, analysis tools and honest charts
- Statistics for analysts: distributions, inference and A/B thinking
- SQL at analyst level: joins, aggregation and window functions
- Python with Pandas: cleaning, transformation and exploratory analysis
- BI and storytelling: dashboards and decks that change decisions

HOW A TYPICAL WEEK IS SPLIT

Live classes: 2 live one-hour classes per week, coding along with the instructor
Homework: A problem set after every class, and a mixed-review assignment at the end of every month
Practice: 4-6 hours of building between classes
Review: Every submission reviewed with written feedback; recurring gaps reopened in class

SUPPORT INCLUDED

Doubt support: WhatsApp doubt support between classes
Progress updates: Honest monthly progress reviews: what is solid, what is wobbly, and the plan for the wobble

CERTIFICATION DETAIL

Completion: Certificate from Modern Age Coders, awarded on passing the final exam. Fall short and there is focused revision and a free retest: the certificate certifies knowledge, not attendance

WHERE THIS CAN LEAD

- Data analyst and business analyst roles across every industry
- Business intelligence specialization: deeper Power BI and dashboard craft
- Our data science course continues into machine learning and deep learning
- Analytics engineering: the SQL and pipeline road

EARNING POTENTIAL (share only if asked, and never promise it)

Market context: The ranges below are general market salary bands for these roles in India and abroad, drawn from public industry data. They are shown for career context only and are not a promise or guarantee of income. Actual pay depends on your skills, experience, location, and the job market.
Early career roles: Rs 3-5 LPA (Junior Analyst); Rs 5-8 LPA (Data Analyst)
Growing roles: Rs 8-15 LPA (Senior Analyst)
Other roles: Rs 15-25+ LPA (Lead/Manager)
Freelance: Rs 500-2,000/hour
International: $50k-100k+ USD

COMMON QUESTIONS ABOUT THIS COURSE

For anything about cost, use PART 4 and RULE 1. Do not quote two regions.

Q: What does this data analysis course cover?
A: The full analyst toolkit in working order: Excel to professional depth with the statistics that keep analysis honest, SQL including window functions, Python with Pandas for cleaning and exploratory analysis, visualization, BI dashboards, data storytelling and practical machine learning for analysts, then industry applications across finance, healthcare, retail, supply chain and HR, cloud analytics platforms and advanced statistical methods. A finale month ships a portfolio capstone and sits the final exam.

Q: How long does it take to become job-ready in data analysis?

A: About seven months of teaching at 2 live classes a week plus 4 to 6 hours of practice, with margin built in beyond that for learners who need it. Three phases build Excel with statistics and SQL, then Python with BI and storytelling, then industry applications; the finale month ships a portfolio capstone and sits the final exam.

Q: How am I assessed? Is the certificate just for attending?
A: No. Problem sets follow every class with written feedback, monthly reviews deliberately mix new material with earlier topics, each phase ends with a cumulative exam, and the course ends with a final exam: a practical build plus written questions from the whole syllabus. Passing earns the certificate; falling short earns focused revision and a free retest.

Q: Data analysis or data science: which course should I take?
A: Ask what you want to do daily. Analysts answer business questions: cleaning data, writing SQL, building dashboards and telling the story, employable sooner and everywhere. Data scientists build models on top of that craft. This course makes you the first; our data science course continues into the second, and the skills stack rather than compete.

Q: Do I need coding experience or strong maths?
A: Neither. The course starts in Excel, where most professionals already live, and introduces SQL and Python step by step with practice after every class. The maths is the statistics an analyst genuinely uses, distributions, inference, A/B thinking, taught in plain language on real business data.

Q: Can I try a class before enrolling?
A: Yes, a free demo class with no commitment: book at learn.modernagecoders.com/contact or message us on WhatsApp at +91 91233 66161. (Agent note: the free demo is a waiting list with no fixed date. The Priority Live Demo is a guaranteed class today or tomorrow, booked at https://learn.modernagecoders.com/priority-demo . Offer both, as RULE 3 says.)

Q: Are classes live or recorded?
A: Live, always: small groups with a real instructor reading your actual code, never pre-recorded videos.

To enrol, message Shivam Sir on +91 9123366161 or send the parent this link: https://learn.modernagecoders.com/courses/data-analysis-mastery-course-college
For a demo: the Priority Live Demo (guaranteed, today or tomorrow) is booked at https://learn.modernagecoders.com/priority-demo . The free demo is a waiting list with no fixed date.

==========
COURSE 52 OF 137: DATA AND AI ANALYTICS FOR NON-PROGRAMMERS (EXCEL, SHEETS, POWER BI)
==========

Course link: https://learn.modernagecoders.com/courses/data-and-ai-analytics-for-non-programmers-course
Subject area: Data and AI Analytics
Designed for: Working professionals
Who can join: Working professionals and students with no programming background; spreadsheet familiarity helps but is not required
Course length: 4 months (16 weeks), joinable any month
Time needed: 2 live classes/week + weekly work on real datasets
Certificate: Certificate from Modern Age Coders, awarded on passing the final assessment

PRICE FOR THIS COURSE (quote only the one that applies to the person asking)
In India, per month: group Rs 1,499, mini batch Rs 2,999, one to one Rs 4,999
Outside India, per month: group $100, one to one $150
Classes: group and mini batch two live classes a week, eight a month; one to one in India one live class a week, four a month; one to one outside India two live classes a week, eight a month. Each class is one hour.

WHAT THIS COURSE IS

Live online data analytics for working professionals who do not code: clean and model data in Excel and Sheets, build Power BI dashboards, and use AI assistants to work faster without being misled.

In one line: Become the person in the room who can actually answer the question with data, without writing a line of code.

ABOUT THE PROGRAMME

Most people who need to work with data are not going to become programmers, and they do not need to. The person who can take a messy export, clean it, find the real pattern and present it clearly in a dashboard is enormously valuable in any team, and almost none of that requires code. What it requires is knowing how to structure data, which comparison is honest, and how to build something a decision-maker can actually read. This course teaches exactly that path, in the tools your workplace already has. You start with spreadsheets done properly, Excel and Google Sheets, including the lookup and pivot skills most people never learn. You move into cleaning and shaping real messy data, which is where most analysis actually fails. Then you build interactive dashboards in Power BI and learn to model relationships between tables so the numbers hold up under questioning. AI runs through the whole course, honestly. Modern AI assistants can write your formulas, summarise a dataset and

suggest a chart, and used well they make you considerably faster. Used badly they produce confident nonsense that you then present to your manager. So we teach both: how to use AI to accelerate the work, and how to check what it gives you before you trust it. Every module ends with real, messy datasets rather than tidy teaching examples, because tidy data is not what anybody actually receives.

WHAT MAKES THIS COURSE DIFFERENT

- No coding required at any point, and no pretending you will secretly need Python later
- Built on the tools your workplace already has: Excel, Google Sheets and Power BI
- Real messy data from week one, because cleaning is where most analysis actually fails
- AI assistants taught honestly: how to go faster with them, and how to catch the confident nonsense before you present it
- Focused on the question behind the request, since the hard part is usually deciding what to measure
- Live, small batches where your dashboard gets critiqued like a colleague would critique it

THE LEARNING PATH, STEP BY STEP

Phase 1: Spreadsheets done properly: structure, lookups, pivots and the formulas that matter
Phase 2: Cleaning and shaping messy real data, then statistics that keep you honest
Phase 3: Power BI dashboards, data modelling, AI-assisted analysis and a portfolio project

WHAT A STUDENT NEEDS BEFORE STARTING

Title: What You Need to Start

WHO THIS COURSE IS FOR

Title: Who This Course Is For

FULL CURRICULUM, WEEK BY WEEK

This is the complete teaching plan. Parents can ask about any week.

PHASE 1: SPREADSHEETS DONE PROPERLY

The foundation almost everyone half-knows, rebuilt so the later work holds up.

Month 1: Excel and Google Sheets Foundations (Weeks 1-4)

Structuring Data So It Can Be Analysed

Topics:

- What a clean table actually looks like, and why yours probably is not one
- Rows as records, columns as fields, and one fact per cell
- Why merged cells and colour-as-data destroy analysis
- Data types, dates and the formatting traps that silently break totals
- Turning a human-formatted sheet into an analysable one

Projects built:

- Take a genuinely badly structured sheet and restructure it into a usable table

Practice: Restructure three messy real-world sheets

The Formulas That Actually Matter

Topics:

- Absolute and relative references, and why formulas break when copied
- IF, nested conditions, and when to stop nesting
- SUMIF, COUNTIF, AVERAGEIF and their multi-criteria versions
- Text and date functions for real cleanup
- Error handling so a broken cell does not poison a whole column

Projects built:

- Build a summary sheet driven entirely by formulas from a raw data tab

Practice: 20 formula tasks against a real dataset

Lookups and Joining Data

Topics:

- VLOOKUP, XLOOKUP and INDEX with MATCH, and when each is right
- Joining two tables on a common key
- Handling missing matches honestly instead of hiding them
- Duplicate keys and the quiet damage they do
- The equivalents in Google Sheets

Projects built:

- Combine three separate exports into one analysable table and reconcile the mismatches

Practice: 15 lookup and join exercises including deliberately broken keys

Assessment: A timed spreadsheet task: clean, join and summarise a real dataset

Pivot Tables and Fast Summaries

Topics:

- Pivot tables from the ground up
- Grouping, filtering and calculated fields
- Slicing by dimension to find where a number actually comes from
- Reading a pivot critically instead of accepting it
- Charts that clarify rather than decorate

      Projects built:
        - Answer five real business questions about one dataset using only pivots
      Practice: Build pivots answering supplied questions, then explain each finding

---
PHASE 2: CLEANING REAL DATA AND ANALYSING IT HONESTLY

Where most analysis fails, and the statistics you need to avoid fooling yourself.

  Month 2: Data Cleaning and Practical Statistics (Weeks 5-8)
    Cleaning Messy Real Data
      Topics:
        - Duplicates, near-duplicates and how to decide which is real
        - Missing values and the options: exclude, impute or report
        - Inconsistent categories and text normalisation
        - Outliers, and telling a data error from a genuine extreme
        - Documenting every cleaning decision so your numbers are defensible
      Projects built:
        - Clean a genuinely messy dataset and write a short log of every decision made
      Practice: Clean three datasets with different problems
    Power Query for Repeatable Cleaning
      Topics:
        - Why manual cleaning does not survive next month's file
        - Power Query basics: importing, transforming and loading
        - Building a repeatable cleaning pipeline
        - Unpivoting and reshaping data
        - Refreshing when new data arrives, with no rework
      Projects built:
        - Build a Power Query pipeline that cleans a monthly export automatically
      Practice: Convert last week's manual cleaning into a repeatable query
    Statistics That Keep You Honest
      Topics:
        - Mean, median and when the average actively misleads
        - Spread and why two datasets with the same average differ completely
        - Percentages, percentage points and the errors that get presented in meetings
        - Correlation is not causation, with real examples
        - Sample size and why small numbers should not drive big decisions
      Projects built:
        - Take a real claim from a report and check whether the data actually supports it
      Practice: Critique supplied analyses and identify what each gets wrong
      Assessment: A written critique of a deliberately misleading analysis
    Charts That Do Not Lie
      Topics:
        - Choosing the chart from the question, not from preference
        - Truncated axes and the other ways charts mislead
        - Comparing like with like
        - Labelling so a chart survives being forwarded without you
        - Removing everything that is not carrying information
      Projects built:
        - Redesign three bad charts and explain what each change fixes
      Practice: Build charts for supplied questions and defend each choice

---
PHASE 3: POWER BI, AI-ASSISTED ANALYSIS AND YOUR PORTFOLIO

Turning analysis into something a decision-maker uses, with AI as an accelerator rather than
an oracle.

  Month 3: Power BI and Data Modelling (Weeks 9-12)
    Power BI Foundations
      Topics:
        - Connecting to data and shaping it on import
        - The difference between a report and a dashboard
        - Core visuals and when each is appropriate
        - Filters, slicers and cross-filtering
        - Publishing and sharing safely
      Projects built:
        - Build your first working Power BI report from a real dataset
      Practice: Rebuild an existing spreadsheet report as a Power BI report
    Data Modelling and Relationships
      Topics:
        - Fact and dimension tables in plain language
        - Relationships and why a star schema keeps numbers correct
        - The problems caused by one flat table
        - Date tables and time intelligence
        - Diagnosing a wrong total caused by a bad relationship
      Projects built:
        - Model a multi-table dataset properly and prove the totals reconcile
      Practice: Fix three broken data models

DAX Measures Without Fear
Topics:
- Calculated columns versus measures, and why the difference matters
- Core DAX: SUM, AVERAGE, COUNTROWS, CALCULATE
- Filter context in plain terms
- Time comparisons: month on month, year on year
- Writing measures you can still understand next quarter
Projects built:
- Add a full measure set to your model including period comparisons
Practice: 15 DAX exercises building from simple to filtered
Assessment: A timed dashboard task assessed on correctness and clarity
Designing Dashboards People Actually Use
Topics:
- Starting from the decision the dashboard should support
- Layout, hierarchy and what belongs above the fold
- Restraint: fewer visuals, better chosen
- Making it self-explanatory without you presenting it
- Testing it on someone who has never seen it
Projects built:
- Redesign your dashboard after watching someone else try to use it
Practice: Peer usability reviews of each other's dashboards

Month 4: AI-Assisted Analysis and the Capstone (Weeks 13-16)
Using AI Assistants Well
Topics:
- What AI assistants are genuinely good at in analytics work
- Getting formulas, DAX and cleaning steps written for you
- Asking for an explanation of a formula you inherited
- Writing a prompt that includes the context the model needs
- Speed gains that are real, and the ones that are illusory
Projects built:
- Solve a full analysis task using AI assistance and log where it helped and where it did not
Practice: Complete supplied tasks with AI, then verify every output
Checking What AI Gives You
Topics:
- Why an AI can produce a confident, plausible, wrong formula
- Verifying a result against a known subtotal before trusting it
- Spot-checking summaries against the raw data
- Never pasting confidential data into a tool that is not approved
- Being able to explain any number you present, whatever produced it
Projects built:
- Audit a set of AI-produced analyses and find the errors deliberately planted in them
Practice: Verification drills on AI output
Assessment: A verification test: find every error in an AI-assisted analysis
Capstone Build
Topics:
- Choosing a question that matters to a real audience
- Sourcing and cleaning the data end to end
- Modelling, measures and dashboard build
- Documenting assumptions and limitations honestly
- Preparing to defend every number
Projects built:
- Build your full capstone: question, clean data, model, dashboard, findings
Practice: Capstone checkpoints with review
Presenting and Your Portfolio
Topics:
- Leading with the finding, not the method
- Telling the story a decision-maker needs in two minutes
- Answering the hard question about your data honestly
- Packaging the project for a portfolio or interview
- What to say when the data does not support the hoped-for answer
Projects built:
- Present your capstone and take questions from the group
Practice: Rehearsed presentations with critique
Assessment: Final capstone presentation assessed on clarity, correctness and honesty

HOW A TYPICAL WEEK IS SPLIT

Homework: A task or problem set after every class, and a monthly mixed-review assignment that deliberately folds in earlier topics

CERTIFICATION DETAIL

Completion: Certificate from Modern Age Coders, awarded on passing the final assessment. Fall short and there is focused revision and a free retest: the certificate certifies real learning, not attendance

WHERE THIS CAN LEAD

  - Business analyst, operations analyst or MIS roles
  - Business intelligence and reporting work
  - A stronger position in your current job as the person who can answer with data
  - A portfolio project that demonstrates the whole workflow end to end
  - A natural later step into Python or SQL if you ever want it

COMMON QUESTIONS ABOUT THIS COURSE

  For anything about cost, use PART 4 and RULE 1. Do not quote two regions.

  Q: Do I really not need to learn programming?
  A: Correct. Everything in this course is done in Excel, Google Sheets and Power BI, all of which are built for exactly this work. Power Query and DAX are used, and although DAX is a formula language it is far closer to spreadsheet formulas than to programming. If you later want Python or SQL, this course leaves you well placed, but nothing here depends on it.

  Q: How am I assessed, and is the certificate just for showing up?
  A: No. A task follows every class with feedback, monthly reviews deliberately mix new material with earlier topics so nothing is forgotten, and the course ends with a final project defended live, plus a written assessment. Passing earns the certificate; falling short earns focused revision and a free retest. We measure real learning, not attendance.

  Q: How is AI actually used in the course?
  A: Honestly, and in both directions. AI assistants are genuinely good at writing formulas, drafting DAX, explaining an inherited spreadsheet and suggesting cleaning steps, and used well they make you noticeably faster. They are also very capable of producing a confident wrong answer. So we teach you to use them and to verify everything they produce against known subtotals before you present it.

  Q: Will I have something to show at the end?
  A: Yes. The final month is a capstone: you choose a real question, source and clean the data, model it, build the dashboard and present the findings, including your assumptions and limitations. It is designed to be the project you show in an interview, because it demonstrates the entire workflow rather than one tool.

  Q: I have tried a data course before and gave up. Why would this be different?
  A: Most data courses lose people because they open with programming or with tidy academic datasets that behave nothing like real ones. This one starts in the tools you already have and works with genuinely messy data from the first weeks, because cleaning is the part where real analysis actually fails. It is live and small, so you get unstuck in class rather than quietly falling behind.

  To enrol, message Shivam Sir on +91 9123366161 or send the parent this link: https://learn.modernagecoders.com/courses/data-and-ai-analytics-for-non-programmers-course
  For a demo: the Priority Live Demo (guaranteed, today or tomorrow) is booked at https://learn.modernagecoders.com/priority-demo . The free demo is a waiting list with no fixed date.

==
COURSE 53 OF 137: DATA SCIENCE COURSE: PYTHON, ML & DEEP LEARNING
==

Course link: https://learn.modernagecoders.com/courses/data-science-complete-masterclass-college
Subject area: Data Science
Designed for: College students
Who can join: Complete beginner (18+); college students, graduates and working professionals
Course length: 10-12 months (44-52 weeks)
Time needed: 2 live classes/week + 4-6 hours practice
Certificate: Certificate from Modern Age Coders, awarded on passing the final exam

PRICE FOR THIS COURSE (quote only the one that applies to the person asking)
  In India, per month: group Rs 1,499, mini batch Rs 2,999, one to one Rs 4,999
  Outside India, per month: group $100, one to one $150
  Classes: group and mini batch two live classes a week, eight a month; one to one in India one live class a week, four a month; one to one outside India two live classes a week, eight a month. Each class is one hour.

WHAT THIS COURSE IS

  Data science course for college students and professionals: Python, statistics and SQL, machine learning done honestly, then deep learning and NLP, ending in a deployed capstone, in 10-12 months.

  In one line: The full pipeline, honestly taught: Python, statistics and SQL, machine learning that holds up, then deep learning, ending with a capstone you deploy.

ABOUT THE PROGRAMME

  Data science hiring has grown sceptical: everyone lists the same libraries, so interviews now

dig for the difference between importing scikit-learn and understanding what the model just did. This live online masterclass builds that difference in order: Python with NumPy and Pandas properly, statistics that survive contact with real data, SQL and EDA as daily craft, then machine learning done honestly, regression to ensembles with evaluation you can defend, real end-to-end projects and Kaggle practice, then the deep learning layer: neural networks, CNNs, RNNs and NLP, applied computer vision and a research-paper implementation to prove you can read the field. A finale month ships a deployed capstone and sits the final exam. The pace is honest: ten teaching months at two live classes a week plus four to six hours of practice, with two more in hand. Problem sets, monthly mixed reviews, phase exams, and a final exam that decides the certificate with a free retest.

WHAT MAKES THIS COURSE DIFFERENT

- Statistics before models: evaluation and honesty are the actual job
- End-to-end from mid-course: raw data to working model, not notebook fragments
- Kaggle as training ground, framed honestly: practice, not trophies
- A research-paper implementation: proof you can read the field, not just tutorials
- An honest 10-month arc with 2 months in hand
- Real assessment: weekly problem sets, monthly mixed reviews, phase exams and a final exam with a free retest

THE LEARNING PATH, STEP BY STEP

Phase 1: Foundations (Months 1-3): Python, NumPy, Pandas, statistics, SQL and EDA
Phase 2: Machine learning (Months 4-6): supervised to unsupervised, real projects, honest evaluation
Phase 3: Deep learning (Months 7-9): neural networks, CNNs, RNNs, NLP and applied vision
Phase 4: The finale (Month 10): a deployed capstone and the final exam

WHAT A STUDENT NEEDS BEFORE STARTING

Coding experience: None. Everything is taught from the first line
Equipment: Any computer with a stable internet connection; every tool used is free
Age: 18+; college students, graduates and working professionals
Time commitment: 2 live classes plus 4-6 hours of practice a week

WHO THIS COURSE IS FOR

College students: Students targeting data science and analytics placements
Career switchers: Professionals moving into data roles with a structured, honest path
Analysts upskilling: Analysts ready to add ML and deep learning to their toolkit
Engineers: Developers who want the data half of modern software
Self taught: Learners with scattered notebook experience that needs a spine

FULL CURRICULUM, WEEK BY WEEK

This is the complete teaching plan. Parents can ask about any week.

PHASE 1: FOUNDATIONS OF DATA SCIENCE (MONTHS 1-3, WEEKS 1-13)

Build rock-solid foundations in Python programming, statistics, data analysis, and SQL that form the backbone of data science.

Months 1-2: Python & Statistical Foundations (Weeks 1-8)
Python Programming for Data Science
Topics:
- Why Python for Data Science?
- Setting up the data science environment (Anaconda, Jupyter)
- Python basics: variables, data types, operators
- Data structures: lists, tuples, sets, dictionaries
- Control flow: if-else, loops (for, while)
- Functions and lambda expressions
- Object-oriented programming basics
- File handling and exception management
- Python libraries ecosystem for data science
- Git and version control for data science projects
- Jupyter notebooks best practices
- Google Colab for cloud computing
Projects built:
- Python fundamentals practice notebook
- Building a data science toolkit with functions
- Automated data processing script
Practice: Complete 100 Python coding challenges
NumPy for Numerical Computing
Topics:
- Introduction to NumPy and its importance
- NumPy arrays: creation and properties
- Array indexing, slicing, and reshaping

- Broadcasting and vectorization
- Mathematical operations on arrays
- Statistical functions in NumPy
- Linear algebra operations
- Random number generation
- Array manipulation techniques
- Performance optimization with NumPy
- Memory management in NumPy
- NumPy for image processing basics

Projects built:

- Image manipulation with NumPy arrays
- Statistical calculator using NumPy
- Matrix operations library
- Performance comparison: NumPy vs pure Python

Practice: Solve 50 NumPy exercises

Data Manipulation with Pandas

Topics:

- Introduction to Pandas DataFrames and Series
- Reading data from various formats (CSV, Excel, JSON, SQL)
- Data inspection and understanding
- Indexing and selecting data (.loc, .iloc)
- Filtering and boolean indexing
- Handling missing data strategies
- Data transformation and feature creation
- Groupby operations and aggregations
- Merging, joining, and concatenating data
- Pivot tables and cross-tabulation
- Time series data handling
- Performance optimization in Pandas

Projects built:

- Complete EDA on retail sales dataset
- Data cleaning pipeline for messy dataset
- Time series analysis of stock prices
- Customer behavior analysis

Practice: Clean and analyze 10 different datasets

Statistical Foundations for Data Science

Topics:

- Descriptive statistics: measures of central tendency and spread
- Probability theory and distributions
- Normal distribution and Central Limit Theorem
- Sampling and sampling distributions
- Hypothesis testing fundamentals
- T-tests, Chi-square tests, ANOVA
- P-values and statistical significance
- Confidence intervals
- Correlation and covariance
- Type I and Type II errors
- Power analysis and sample size determination
- Bayesian statistics introduction

Projects built:

- Statistical analysis of A/B test results
- Hypothesis testing on real datasets
- Building a statistical testing framework
- Correlation analysis of multiple variables

Practice: Perform statistical tests on 15 different scenarios

Month 3: Data Visualization & SQL (Weeks 9-13)

Data Visualization Mastery

Topics:

- Principles of effective data visualization
- Matplotlib: creating publication-quality plots
- Seaborn for statistical visualizations
- Plotly for interactive visualizations
- Creating dashboards with Streamlit/Dash
- Geospatial visualization with Folium
- Time series visualization techniques
- Heatmaps and correlation matrices
- Network graphs and tree visualizations
- 3D visualizations
- Animation in data visualization
- Best practices for different chart types

Projects built:

- Interactive COVID-19 dashboard
- Sales performance dashboard
- Geospatial analysis of crime data
- Animated visualization of algorithm performance

Practice: Create 30 different types of visualizations

SQL for Data Scientists

Topics:

- Relational database concepts
- SQL fundamentals: SELECT, WHERE, ORDER BY
- Aggregate functions and GROUP BY
- Joins: INNER, LEFT, RIGHT, FULL OUTER
- Subqueries and CTEs
- Window functions for advanced analytics
- Database design and normalization
- Performance optimization and indexing
- NoSQL databases introduction (MongoDB)
- Connecting Python to databases
- SQL vs Pandas: when to use what
- Big data SQL: Spark SQL, Presto

Projects built:
- Building a data warehouse schema
- Complex business queries with window functions
- Python-SQL integration project
- Database performance optimization

Practice: Write 100 SQL queries of increasing complexity

Exploratory Data Analysis (EDA) & Feature Engineering

Topics:
- EDA methodology and workflow
- Univariate, bivariate, and multivariate analysis
- Identifying patterns and anomalies
- Feature engineering techniques
- Creating polynomial and interaction features
- Binning and discretization
- Encoding categorical variables
- Feature scaling and normalization
- Handling imbalanced datasets
- Feature selection methods
- Dimensionality reduction (PCA introduction)
- Domain-specific feature engineering

Projects built:
- PHASE 1 CAPSTONE: End-to-End EDA Project
- Complete EDA and feature engineering on Kaggle dataset
- Build reusable feature engineering pipeline
- Create automated EDA report generator

Assessment: Phase 1 exam: a practical build defended live, plus a written paper mixing this phase with everything before it

---

PHASE 2: MACHINE LEARNING MASTERY (MONTHS 4-6, WEEKS 14-26)

Master classical machine learning algorithms, model evaluation, and participate in Kaggle competitions.

Months 4-5: Supervised Learning (Weeks 14-22)

Regression Algorithms

Topics:
- Machine learning workflow and pipeline
- Linear regression from scratch
- Multiple linear regression
- Polynomial regression
- Ridge and Lasso regression
- Elastic Net
- Logistic regression for classification
- Evaluation metrics for regression
- Cross-validation strategies
- Bias-variance tradeoff
- Regularization techniques
- Feature importance analysis

Projects built:
- House price prediction model
- Sales forecasting system
- Customer lifetime value prediction
- Build regression library from scratch

Practice: Implement 5 regression algorithms from scratch

Classification Algorithms

Topics:
- k-Nearest Neighbors (KNN)
- Decision trees and pruning
- Random Forests
- Gradient Boosting (XGBoost, LightGBM, CatBoost)
- Support Vector Machines (SVM)
- Naive Bayes classifier
- Evaluation metrics for classification
- ROC curves and AUC
- Handling imbalanced classes
- Multi-class classification strategies

- Ensemble methods
- Stacking and blending

Projects built:
- Credit default prediction
- Customer churn prediction
- Disease diagnosis system
- Fraud detection model

Practice: Build 10 classification models on different datasets

Advanced Machine Learning Techniques

Topics:
- Hyperparameter tuning: Grid Search, Random Search, Bayesian Optimization
- AutoML tools and techniques
- Feature selection algorithms
- Dimensionality reduction: PCA, t-SNE, UMAP
- Anomaly detection algorithms
- Time series forecasting: ARIMA, Prophet
- Recommendation systems: collaborative filtering, content-based
- Model interpretation: SHAP, LIME
- Handling missing data: advanced imputation
- Semi-supervised learning
- Active learning strategies
- Transfer learning in classical ML

Projects built:
- Anomaly detection in network traffic
- Movie recommendation system
- Sales forecasting with Prophet
- Model interpretation dashboard

Practice: Apply advanced techniques to improve previous models

Unsupervised Learning

Topics:
- Clustering algorithms: K-Means, DBSCAN, Hierarchical
- Gaussian Mixture Models
- Clustering evaluation metrics
- Market basket analysis
- Association rules: Apriori, FP-Growth
- Topic modeling: LDA, NMF
- Autoencoders for dimensionality reduction
- Self-organizing maps
- Isolation Forest for anomaly detection
- Applications in customer segmentation
- Image compression with clustering
- Text clustering and document similarity

Projects built:
- Customer segmentation analysis
- Market basket analysis for retail
- Document clustering system
- Anomaly detection in IoT data

Practice: Apply clustering to 5 different domains

Kaggle Competition Participation

Topics:
- Understanding Kaggle competitions
- Competition strategies and workflow
- Data augmentation techniques
- Advanced feature engineering
- Ensemble strategies for competitions
- Learning from kernels and discussions
- Leaderboard probing
- Cross-validation strategies
- Submission strategies
- Post-competition analysis

Projects built:
- Participate in current Kaggle competition
- Achieve top 50% in beginner competition
- Write competition solution walkthrough
- Build reusable competition pipeline

Practice: Complete 3 past Kaggle competitions

Month 6: Real-world ML Projects (Weeks 23-26)

End-to-End ML Project Development

Topics:
- Problem formulation and scoping
- Data collection strategies
- Building data pipelines
- Feature store design
- Model versioning and experiment tracking
- A/B testing for ML models
- Model monitoring and drift detection
- Building ML APIs with Flask/FastAPI
- Containerization with Docker

- Cloud deployment (AWS, GCP, Azure)
- Cost optimization for ML
- Documentation and reporting

Projects built:
- Build complete ML pipeline from scratch
- Deploy model as REST API
- Create model monitoring dashboard
- Implement A/B testing framework

Practice: Deploy 3 models to production

Industry-Specific Applications

Topics:
- Healthcare: disease prediction, drug discovery
- Finance: risk assessment, algorithmic trading
- Retail: demand forecasting, pricing optimization
- Marketing: customer segmentation, campaign optimization
- Manufacturing: predictive maintenance, quality control
- Transportation: route optimization, demand prediction
- Energy: consumption forecasting, grid optimization
- Agriculture: crop yield prediction, pest detection
- Real estate: price prediction, investment analysis
- Sports analytics: player performance, game prediction

Projects built:
- Choose 2 industries and build domain-specific models
- Create industry-specific feature engineering
- Build domain knowledge documentation

Practice: Analyze datasets from 5 different industries

ML Engineering Best Practices

Topics:
- Code organization for ML projects
- Testing ML code: unit tests, integration tests
- Continuous Integration/Continuous Deployment (CI/CD)
- MLflow for experiment tracking
- DVC for data versioning
- Weights & Biases for experiment management
- Model registry and governance
- Feature stores: Feast, Tecton
- Reproducibility in ML
- Debugging ML models
- Performance optimization
- Security in ML systems

Projects built:
- Set up MLOps pipeline
- Implement CI/CD for ML project
- Build feature store
- Create model governance framework

Practice: Refactor all projects with engineering best practices

Phase 2 Capstone Project

Topics:
- Complex problem solving
- Multi-model systems
- Production-ready code
- Professional documentation
- Stakeholder presentation

Projects built:
- PHASE 2 CAPSTONE: Production ML System
- Build end-to-end ML system for real business problem
- Include data pipeline, multiple models, API, monitoring
- Deploy to cloud with full MLOps pipeline

Assessment: Phase 2 exam: a practical build defended live, plus a written paper mixing this phase with everything before it

---

PHASE 3: DEEP LEARNING & ADVANCED AI (MONTHS 7-9, WEEKS 27-39)

Master deep learning, computer vision, NLP, and cutting-edge AI techniques.

Months 7-8: Deep Learning Fundamentals (Weeks 27-35)

Neural Network Fundamentals

Topics:
- Introduction to deep learning
- Perceptron and multi-layer perceptrons
- Backpropagation algorithm
- Activation functions
- Weight initialization strategies
- Gradient descent variations
- Learning rate scheduling
- Batch normalization
- Dropout and regularization
- Building neural networks from scratch

```
    - Introduction to TensorFlow and Keras
    - PyTorch fundamentals
  Projects built:
    - Neural network from scratch in NumPy
    - MNIST digit classification
    - Binary classification with deep learning
    - Regression with neural networks
  Practice: Implement 5 different neural network architectures
Convolutional Neural Networks (CNNs)
  Topics:
    - CNN architecture and intuition
    - Convolution and pooling layers
    - Popular architectures: LeNet, AlexNet, VGG, ResNet
    - Transfer learning and fine-tuning
    - Data augmentation for images
    - Object detection: YOLO, R-CNN
    - Image segmentation: U-Net
    - Face recognition systems
    - Style transfer
    - Generative models: VAE, GAN basics
    - CNN applications beyond images
    - Deploying CNN models
  Projects built:
    - Image classification on custom dataset
    - Object detection system
    - Face recognition application
    - Image segmentation for medical images
  Practice: Build 5 computer vision applications
Recurrent Neural Networks (RNNs)
  Topics:
    - RNN architecture and applications
    - Vanishing gradient problem
    - LSTM and GRU architectures
    - Bidirectional RNNs
    - Sequence-to-sequence models
    - Attention mechanism
    - Time series prediction with RNNs
    - Text generation
    - Sentiment analysis
    - Named Entity Recognition
    - Machine translation basics
    - Speech recognition introduction
  Projects built:
    - Stock price prediction with LSTM
    - Text generation model
    - Sentiment analysis system
    - Time series anomaly detection
  Practice: Implement 5 sequence modeling tasks
Natural Language Processing
  Topics:
    - Text preprocessing and tokenization
    - Word embeddings: Word2Vec, GloVe
    - Text classification techniques
    - Named Entity Recognition (NER)
    - Part-of-speech tagging
    - Topic modeling with deep learning
    - Transformer architecture
    - BERT and GPT models
    - Fine-tuning pre-trained models
    - Question answering systems
    - Text summarization
    - Chatbot development
  Projects built:
    - Build custom chatbot
    - News article classifier
    - Question answering system
    - Text summarization tool
  Practice: Complete 5 NLP projects using transformers
Advanced Deep Learning Topics
  Topics:
    - Autoencoders and variational autoencoders
    - Generative Adversarial Networks (GANs)
    - Deep Reinforcement Learning basics
    - Graph Neural Networks introduction
    - Meta-learning and few-shot learning
    - Neural Architecture Search
    - Model compression and quantization
    - Edge deployment of deep learning
    - Adversarial machine learning
```

```
      - Explainable AI for deep learning
      - Multi-modal learning
      - Self-supervised learning
    Projects built:
      - Build and train a GAN
      - Implement autoencoder for anomaly detection
      - Model compression project
      - Multi-modal classification system
    Practice: Experiment with 3 cutting-edge techniques

Month 9: Applied Vision, NLP & Research Practice (Weeks 36-39)
  Computer Vision Projects
    Topics:
      - Medical image analysis
      - Autonomous driving perception
      - Facial emotion recognition
      - Pose estimation
      - Video analysis and action recognition
      - 3D computer vision
      - Document analysis and OCR
      - Satellite image analysis
      - Real-time vision systems
      - Mobile and edge deployment
      - Vision transformers
      - Self-supervised learning in vision
    Projects built:
      - Medical diagnosis from X-rays
      - Real-time object tracking system
      - Document scanner with OCR
      - Pose estimation application
    Practice: Build portfolio of 5 vision projects
  Advanced NLP Applications
    Topics:
      - Large Language Models (LLMs)
      - Prompt engineering
      - Fine-tuning LLMs
      - Retrieval Augmented Generation (RAG)
      - Building with LangChain
      - Vector databases
      - Semantic search
      - Document intelligence
      - Code generation with AI
      - Multimodal models
      - Ethical considerations in NLP
      - Production NLP systems
    Projects built:
      - RAG-based question answering system
      - Semantic search engine
      - AI writing assistant
      - Code generation tool
    Practice: Build 5 LLM-powered applications
  Research Paper Implementation
    Topics:
      - Reading and understanding research papers
      - Reproducing paper results
      - Implementing novel architectures
      - Benchmarking and evaluation
      - Writing technical reports
      - Contributing to open source
      - Publishing your own research
      - Staying updated with latest research
      - Research tools and resources
      - Building research portfolio
      - Collaboration in research
      - Ethics in AI research
    Projects built:
      - Implement 2 recent research papers
      - Write detailed implementation report
      - Open source your implementations
      - Create tutorial for community
    Practice: Read and summarize 20 research papers
  Phase 3 Capstone Project
    Topics:
      - Complex deep learning systems
      - Multi-model architectures
      - Production deployment
      - Performance optimization
      - Comprehensive evaluation
    Projects built:
```

- PHASE 3 CAPSTONE: State-of-the-art AI System
- Build cutting-edge AI application
- Combine multiple deep learning techniques
- Deploy with full production pipeline
- Achieve competitive performance metrics

Assessment: Phase 3 exam: a practical build defended live, plus a written paper mixing this phase with everything before it

---

PHASE 4: THE FINALE (MONTH 10, WEEKS 40-44)

The capstone month: spec, build, ship and defend, then the final exam that decides the certificate.

Month 10: Capstone and the Final Exam (Weeks 40-44)

Capstone Spec and Setup

Topics:

- Choosing the capstone: an end-to-end data science project: raw data to a deployed model with an evaluation you can defend
- A one-page spec: scope, milestones, stack
- Repository and skeleton ready on day one
- Instructor sign-off before the build begins

Projects built:

- Approved capstone spec plus the running skeleton

Practice: Pitch the spec to the batch and absorb one hard question

Capstone Build

Topics:

- Two focused weeks in vertical slices
- Instructor checkpoints and honest scope cuts
- Using the whole course: the statistics spine, ML judgment, deep learning where it earns its place, and honest evaluation
- Daily commits and an always-working build

Projects built:

- The capstone, feature-complete with version control

Practice: A working build at the end of every session

Ship and Polish

Topics:

- The finishing pass: edge cases, errors, documentation
- Deployed and documented: the model serving predictions outside the notebook
- A README worth reading and a demo worth watching
- A full-course spiral review before the exam

Projects built:

- The capstone shipped, documented and rehearsed

Practice: Two mock demos, each tighter than the last

Demo Day and the Final Exam

Topics:

- Presenting the capstone: live demo plus the hardest bug story
- The honest map of next roads: data science roles, ML engineering depth, or the analytics leadership track
- Where our other courses continue the journey

Projects built:

- Demo day presentation delivered to the batch

Assessment: FINAL EXAM: a practical build plus a written paper with questions mixed from every phase. Passing earns the certificate; falling short earns a focused revision plan and a free retest

PROJECTS THE STUDENT BUILDS AND KEEPS

- Phase 1: EDA and SQL projects on real, messy datasets
- Phase 2: end-to-end ML projects and Kaggle practice with honest write-ups
- Phase 3: deep learning builds: vision, NLP and a research-paper implementation
- Phase 4: the deployed capstone, defended at demo day

Total projects: 15+ real projects, crowned by a deployed end-to-end capstone

SKILLS THE STUDENT WILL HAVE AT THE END

- Python for data: NumPy, Pandas and visualization as daily craft
- Statistics that survive real data: inference, uncertainty, honest claims
- Machine learning with judgment: model choice, tuning and defensible evaluation
- Deep learning: neural networks, CNNs, RNNs and NLP in practice
- The pipeline craft: SQL, EDA, feature engineering and deployment

HOW A TYPICAL WEEK IS SPLIT

Live classes: 2 live one-hour classes per week, coding along with the instructor
Homework: A problem set after every class, and a mixed-review assignment at the end of every month
Practice: 4-6 hours of building between classes

  Review: Every submission reviewed with written feedback; recurring gaps reopened in class

SUPPORT INCLUDED

  Doubt support: WhatsApp doubt support between classes
  Progress updates: Honest monthly progress reviews: what is solid, what is wobbly, and the
    plan for the wobble

CERTIFICATION DETAIL

  Completion: Certificate from Modern Age Coders, awarded on passing the final exam. Fall short
    and there is focused revision and a free retest: the certificate certifies knowledge, not
    attendance

WHERE THIS CAN LEAD

  - Data scientist and ML roles: the full-pipeline profile fits the screen
  - Our AI/ML engineering course deepens the modelling road
  - Analytics engineering: SQL and pipeline craft compound here
  - The data analytics mathematics course strengthens the statistical spine

EARNING POTENTIAL (share only if asked, and never promise it)

  Market context: The ranges below are general market salary bands for these roles in India and
    abroad, drawn from public industry data. They are shown for career context only and are not a
    promise or guarantee of income. Actual pay depends on your skills, experience, location, and
    the job market.
  Growing roles: Rs 6-10 LPA (Junior Data Scientist)
  Experienced roles: Rs 10-20 LPA (Data Scientist); Rs 15-30 LPA (Senior Data Scientist); Rs
    20-50+ LPA (Lead/Principal Data Scientist)
  Freelance: Rs 3,000-10,000/hour based on expertise
  International: $80k-200k USD based on location and experience

COMMON QUESTIONS ABOUT THIS COURSE

  For anything about cost, use PART 4 and RULE 1. Do not quote two regions.

  Q: What does this data science course cover?
  A: The full pipeline in order: Python with NumPy and Pandas, statistics, data visualization,
  SQL and exploratory data analysis with feature engineering; then machine learning,
  regression, classification, ensembles and unsupervised methods with honest evaluation,
  end-to-end projects and Kaggle practice; then deep learning, neural networks, CNNs, RNNs,
  NLP, applied computer vision and a research-paper implementation. A finale month ships a
  deployed capstone and sits the final exam.

  Q: How long does it take to learn data science properly?
  A: Ten months of teaching at 2 live classes a week plus 4 to 6 hours of practice, with two
  more months in hand for learners who need them. The three teaching phases build the skill and
  its real-world application; the finale month ships a capstone and sits the final exam.

  Q: How am I assessed? Is the certificate just for attending?
  A: No. Problem sets follow every class with written feedback, monthly reviews deliberately
  mix new material with earlier topics, each phase ends with a cumulative exam, and the course
  ends with a final exam: a practical build plus written questions from the whole syllabus.
  Passing earns the certificate; falling short earns focused revision and a free retest.

  Q: How is this different from your data analysis and AI/ML courses?
  A: Three different jobs. Data analysis is the business-facing craft: Excel, SQL, dashboards
  and clear answers to business questions. This data science course is the full modelling
  pipeline: statistics, machine learning and deep learning on top of that data craft. The AI/ML
  engineering course goes deepest into models and the systems that serve them. If you want the
  classic data scientist profile, this is the course; the other two are its neighbours.

  Q: Do I need strong maths before joining?
  A: No: school-level comfort with numbers is enough to start, and the statistics you need is
  taught inside the course, in code, on real data. What we do not do is hide the maths that
  matters: probability, distributions and evaluation metrics are taught properly because
  interviews and real work both reach for them.

  Q: Can I try a class before enrolling?
  A: Yes, a free demo class with no commitment: book at learn.modernagecoders.com/contact or
  message us on WhatsApp at +91 91233 66161. (Agent note: the free demo is a waiting list with
  no fixed date. The Priority Live Demo is a guaranteed class today or tomorrow, booked at
  https://learn.modernagecoders.com/priority-demo . Offer both, as RULE 3 says.)

  Q: Are classes live or recorded?
  A: Live, always: small groups with a real instructor reading your actual code, never
  pre-recorded videos.

To enrol, message Shivam Sir on +91 9123366161 or send the parent this link: https://learn.modernagecoders.com/courses/data-science-complete-masterclass-college
For a demo: the Priority Live Demo (guaranteed, today or tomorrow) is booked at https://learn.modernagecoders.com/priority-demo . The free demo is a waiting list with no fixed date.

==========

COURSE 54 OF 137: DATA SCIENCE FOR TEENS: PYTHON & YOUR FIRST ML MODELS

==========

Course link: https://learn.modernagecoders.com/courses/data-science-course-for-teens-python-data
Subject area: Data Science
Designed for: Teens
Who can join: Ages 14 to 18, basic Python required
Course length: 6 months (24 weeks)
Time needed: 2 live classes/week + 2-3 hours practice
Certificate: Certificate from Modern Age Coders, awarded on passing the final assessment

PRICE FOR THIS COURSE (quote only the one that applies to the person asking)
In India, per month: group Rs 1,499, mini batch Rs 2,999, one to one Rs 4,999
Outside India, per month: group $100, one to one $150
Classes: group and mini batch two live classes a week, eight a month; one to one in India one live class a week, four a month; one to one outside India two live classes a week, eight a month. Each class is one hour.

WHAT THIS COURSE IS

Live online data science course for teens (14-18): pandas, cleaning real datasets, matplotlib, statistics and your first ML models with scikit-learn.

In one line: Real datasets, honest charts, and a first machine learning model that the student can actually explain.

ABOUT THE PROGRAMME

Data science is the rare school-age subject where the professional tools are free and the real material, actual datasets about movies, sport, cities, and climate, is sitting in public archives waiting to be questioned. This 6-month live course teaches teens to do the real thing: load data with pandas, clean it honestly, chart it with matplotlib without lying, reason about it with statistics, and finally train first machine learning models with scikit-learn and understand what they did. The course is deliberately anti-hype. Students learn that most of data science is careful cleaning and honest questions, that a chart can mislead and how not to let it, and that a model is only as good as the data and the person reading its results. It ends with a data-story capstone: each student picks a question they care about, finds the data, does the analysis end to end, and presents a notebook that shows their reasoning. Basic Python is required; our Python for Teens course is the natural on-ramp for students who need it.

WHAT MAKES THIS COURSE DIFFERENT

- Real public datasets from the second month: movies, sports seasons, city open data, and climate records, not sanitized textbook tables
- A whole month on cleaning, because that is the actual job, and students learn to log every cleaning decision like professionals
- Honest charts are treated as an ethical skill: a full lesson on how visualizations mislead and how to avoid it
- Statistics taught for use, not for the exam: when the mean lies, what correlation does not prove
- Machine learning arrives late and lands properly: train-test splits and simple models the student can explain, not black-box demos
- The capstone is a question the student chose, answered end to end in a notebook they present and publish

THE LEARNING PATH, STEP BY STEP

Phase 1: Python tuned for data, then pandas: loading, filtering, grouping, and joining real datasets until table thinking is second nature
Phase 2: The craft: a full month cleaning genuinely messy data, then matplotlib and the discipline of charts that tell the truth
Phase 3: Statistics for judgment, first models with scikit-learn, and a capstone data story built from a question the student chose

WHAT A STUDENT NEEDS BEFORE STARTING

Python basics: Required: variables, loops, functions, and lists. Our Python for Teens course is the natural on-ramp if these are missing
Mathematics: Comfortable school maths. All statistics used is taught inside the course; no calculus is needed
Equipment: A computer with a modern browser and stable internet. Google Colab means nothing heavy is installed

Age: 14 to 18, matched to the reasoning and statistics content

WHO THIS COURSE IS FOR

Python graduates: Teens who finished a first Python course and want to apply it to something real rather than more syntax
Question askers: Students who argue from evidence and want the tools to find it themselves
Future stem students: Teens heading toward engineering, economics, or science degrees where this exact stack appears in year one
Sports and stats fans: Students who already read tables of standings and averages for fun and want to compute their own
Portfolio builders: Teens who want a published, defensible piece of analysis to show teachers and admissions offices

FULL CURRICULUM, WEEK BY WEEK

This is the complete teaching plan. Parents can ask about any week.

PHASE 1: PYTHON FOR DATA AND THE PANDAS TOOLKIT (MONTHS 1-2, WEEKS 1-8)

First the Python muscles data work leans on, retrained in notebooks. Then pandas, the tool that turns tables of raw data into answers.

Month 1: Python, Retuned for Data (Weeks 1-4)
Notebooks and the Python Refresh
Topics:
- Google Colab and Jupyter notebooks: why data work lives in cells, not scripts
- Refresh: variables, lists, and dictionaries through data-flavored exercises
- Refresh: loops and conditionals over collections of records
- Markdown cells: notes and reasoning next to code
- Notebook habits: run order, restarts, and the stale-state trap
- The course map: where pandas, charts, and models fit
Projects built:
- Class survey analysis, round one: collect a small class survey and answer three questions about it with plain Python
Practice: 12 refresh exercises on lists and dictionaries, all phrased as data questions
Functions and Files
Topics:
- Refresh: writing and calling functions that transform data
- Reading files: opening a CSV by hand with the csv module
- What a CSV actually is: rows, delimiters, and headers
- Building lists of dictionaries from raw rows
- Writing results back out to a file
- Why this manual work matters: understanding what pandas automates
Projects built:
- Hand-rolled report: read a 500-row CSV with plain Python and compute totals, averages, and a top-five list
Practice: Write three reusable functions: load a CSV, filter rows by a condition, summarize a column
Thinking in Tables
Topics:
- Rows as records, columns as variables: the table mental model
- Data types in the wild: numbers, text, dates, and categories
- First contact with messy data: a deliberately imperfect dataset
- Questions data can answer, and questions it cannot
- From question to query: translating curiosity into precise operations
- Sources of real data: open data portals and public archives, toured live
Projects built:
- Question workshop: pick a public dataset, write five precise questions about it, and classify which are answerable from the columns present
Practice: Find one dataset about something you personally care about and describe its rows, columns, and types
NumPy Essentials
Topics:
- Arrays vs lists: what NumPy is for
- Vectorized operations: arithmetic on whole columns at once
- Useful reductions: sum, mean, min, max, and where they mislead
- Boolean masks: selecting data with conditions, the idea pandas is built on
- A speed demonstration: the same computation with a loop and with NumPy
- Reading NumPy errors without panic
Projects built:
- Class survey analysis, round two: redo week 1's analysis in NumPy and compare the code side by side
Practice: 10 NumPy exercises: masks, reductions, and column arithmetic on a provided dataset
Assessment: Month 1 check: live notebook exercise combining functions, file reading, and NumPy on a fresh dataset

Month 2: pandas (Weeks 5-8)
DataFrames
Topics:
- Series and DataFrames: pandas's two shapes
- Loading CSVs with read_csv and its most useful options
- First-look tools: head, info, describe, and shape
- Selecting columns and rows: loc and iloc without the usual confusion
- Column arithmetic: creating new columns from old ones
- Saving your work: to_csv and keeping raw data untouched
Projects built:
- First pandas notebook: load a movies dataset and produce a profile of it, size, columns, types, and five first findings
Practice: Load three different datasets and write a three-line profile of each
Filtering and Sorting
Topics:
- Boolean masks in pandas: rows matching a condition
- Combining conditions: and, or, and the parentheses that matter
- isin, between, and string contains for readable filters
- Sorting by one and several columns
- nlargest and nsmallest: top-N questions answered directly
- Chaining operations without losing readability
Projects built:
- Movie interrogation: answer ten ranked questions about the movies dataset, best-rated per decade, longest, most profitable, each as a clean filtered result
Practice: Write and answer eight filter questions of your own on a sports dataset
Grouping and Aggregation
Topics:
- value_counts: the fastest first answer in pandas
- groupby: split, apply, combine, drawn before coded
- Aggregations: mean, sum, count, and multiple at once with agg
- Grouping by more than one column
- Sorting grouped results to find leaders and outliers
- Pivot tables, gently: the spreadsheet idea in pandas form
Projects built:
- Season in review: full statistical breakdown of a sports season, per team and per month, from a raw match-results dataset
Practice: Answer six groupby questions on a dataset of your choice and mark the most surprising result
Combining Datasets
Topics:
- concat: stacking datasets that share columns
- merge: joining tables on a shared key, with the four join types in pictures
- What gets lost in a join: rows that match nothing
- Checking a merge: row counts before and after
- Tidying column names and types after combining
- The month project workflow: load, join, group, answer
Projects built:
- Two-table analysis: join two related datasets, for example city populations with air quality readings, and answer three questions no single table could
Practice: Perform one merge on new data and write two sentences on rows that failed to match and why
Assessment: Month 2 check: timed pandas practical, six questions on an unseen dataset, filters through joins

---
PHASE 2: CLEANING REAL DATA AND CHARTING IT HONESTLY (MONTHS 3-4, WEEKS 9-16)

The craft phase. Real datasets arrive dirty, and most of data science is the disciplined work of fixing them, then showing results without distortion.

Month 3: Cleaning Real Datasets (Weeks 9-12)
Missing Values
Topics:
- Finding the holes: isna, counts, and missingness patterns
- Why data goes missing, and why the reason changes the fix
- Dropping rows or columns: when it is honest and when it hides too much
- Filling values: constants, means, medians, and the trade-offs of each
- The cleaning log: recording every decision and its justification
- Raw data stays raw: cleaned copies, never overwritten originals
Projects built:
- Missing-value audit: map the missingness of a real open dataset, choose treatments per column, and defend each in your cleaning log
Practice: Apply two different missing-value strategies to the same column and compare how the summary statistics move
Wrong Types and Dirty Strings
Topics:
- Numbers trapped in text: currency symbols, commas, and units
- String repair with .str methods: strip, replace, lower, split
- Dates done right: to_datetime and what it makes possible

- Categories with typos: Delhi, delhi, and DELHI as one value
- astype and coercion errors: reading what pandas is telling you
- A repair pipeline: ordered, rerunnable cleaning steps in one notebook section

Projects built:

- Type rescue: take a scraped price-and-date dataset where every column is text and restore true types, documenting each repair

Practice: Fix eight prepared dirty columns, one repair function each

Outliers, Duplicates, and Judgment Calls

Topics:

- Spotting outliers: sorting, describe, and quick plots
- Error or truth: the 190-year-old customer vs the genuine billionaire
- Duplicates: exact, partial, and the drop_duplicates decisions
- The ethics of cleaning: every removal changes the conclusion
- Documenting judgment calls so others can disagree with you fairly
- Sanity checks: totals and counts that must still make sense after cleaning

Projects built:

- Judgment file: on a dataset seeded with ambiguous outliers and duplicates, decide keep or remove case by case, with one-line justifications

Practice: Trade judgment files with a classmate and write where you disagreed and why

The Cleaning Project

Topics:

- A genuinely messy public dataset, start to finish
- Planning the clean: audit first, repair second, verify third
- Combining the month: missingness, types, strings, outliers, duplicates
- Writing the cleaning log as a professional document
- Before-and-after: quantifying what the clean changed
- Delivering an analysis-ready dataset someone else could trust

Projects built:

- Full cleaning project: raw city open data, for example street trees or road accidents, taken from download to documented, analysis-ready form

Practice: Run your cleaned dataset through five sanity checks and record the results

Assessment: Month 3 check: cleaning log review plus a defense of three judgment calls in a short viva

Month 4: Visualization with matplotlib (Weeks 13-16)

First Charts

Topics:

- The anatomy of a figure: axes, ticks, labels, title, legend
- Line charts: change over time, done cleanly
- Bar charts: comparing categories without clutter
- Scatter plots: two variables meeting for the first time
- Labeling as a duty: a chart must explain itself
- Plotting straight from pandas, and when to drop to matplotlib

Projects built:

- Three-chart notebook: one line, one bar, one scatter from your cleaned month 3 dataset, each fully labeled

Practice: Recreate two published charts from their underlying data as closely as you can

Distributions and the Right Chart

Topics:

- Histograms: seeing the shape of a column
- Bin sizes and how they change the story
- Box plots: medians, quartiles, and outliers at a glance
- Comparing groups: side-by-side boxes and grouped bars
- Choosing the chart from the question, not from habit
- The chart-choice checklist: comparison, trend, distribution, relationship

Projects built:

- Distribution study: profile three numeric columns with histograms and box plots, and write what each shape reveals

Practice: For six written questions, name the right chart type and justify it in one line each

Honest Charts and Polished Figures

Topics:

- How charts mislead: truncated axes, cherry-picked windows, and area tricks
- Fixing a misleading chart without hiding the real pattern
- Multi-panel figures with subplots
- Color with intent: highlighting one series, not decorating all of them
- Annotating the point: arrows and text that guide the reader
- Exporting print-quality figures

Projects built:

- Mislead and repair: take one truthful chart, make the most misleading legal version of it, then write the repair, a before-and-after pair

Practice: Find one misleading chart in real media and write a three-sentence critique

The Four-Chart Data Story

Topics:

- Narrative order: charts arranged as an argument
- One message per chart: trimming everything else
- Writing connective text between figures
- The takeaway figure: your single most important chart

- Presenting figures aloud: saying what to look at
- Peer review: reading a classmate's story cold

Projects built:
- Mini data story: a four-chart narrative on a dataset of your choice, presented live in five minutes

Practice: Revise your story after peer feedback and note the two changes that most improved it

Assessment: Month 4 check: data story presentation, graded on chart choice, honesty, and clarity

---

PHASE 3: STATISTICS, FIRST MODELS, AND THE CAPSTONE (MONTHS 5-6, WEEKS 17-24)

Statistics gives judgment, scikit-learn gives first models, and the capstone puts it all behind one question the student actually cares about.

Month 5: Statistics for Judgment, Then First Models (Weeks 17-20)

Describing Data Truthfully

Topics:
- Mean, median, and mode: three centers, three stories
- When the mean lies: income, house prices, and skew
- Spread: range, quartiles, and standard deviation as a feel, not a formula
- Percentiles: where a value really stands
- Summaries that hide things: same mean, wildly different data
- Writing statistical sentences that a non-technical reader cannot misread

Projects built:
- Two-summary exercise: describe the same real dataset once to flatter it and once to be fair, then annotate the tricks in the flattering version

Practice: Compute and interpret full summaries for three columns of your capstone-candidate dataset

Correlation and Its Traps

Topics:
- Correlation as a number: direction and strength on a scatter plot
- Computing correlations in pandas and reading a correlation matrix
- Correlation is not causation: the argument, with famous spurious examples
- Confounders: the hidden third variable, explained through cases
- When correlation is still useful despite the traps
- Reporting a relationship without overclaiming it

Projects built:
- Correlation hunt: find the three strongest relationships in a real dataset, then argue for each whether causation is even plausible

Practice: Find one spurious correlation in the wild or in the class archive and explain the likely confounder

First Machine Learning: Regression

Topics:
- What learning from data means, without mystique
- Features and targets: framing a prediction question
- The train-test split: why we grade models on unseen data
- Linear regression with scikit-learn: fit, predict, inspect
- Reading the model: coefficients as the story it learned
- Error metrics that mean something: how wrong is the model, in real units

Projects built:
- Price predictor: train a linear regression on a real housing or used-car dataset and report its typical error honestly

Practice: Add one feature to your model, remeasure the error, and write whether it earned its place

First Machine Learning: Classification

Topics:
- Classification vs regression: predicting a label instead of a number
- k-nearest neighbors: the friendliest first classifier
- Decision trees: models you can read as rules
- Accuracy and its limits: the imbalanced-classes trap
- The confusion matrix: seeing which mistakes the model makes
- Overfitting: memorizing vs learning, in one intuitive demonstration

Projects built:
- Penguin classifier: train and compare k-nearest neighbors and a decision tree on the Palmer Penguins dataset, with a confusion matrix for each

Practice: Break your classifier on purpose by shrinking training data, and chart accuracy against training size

Assessment: Month 5 check: statistics and modeling quiz plus a live reading of your own model's results

Month 6: The Capstone Data Story (Weeks 21-24)

The Question and the Data

Topics:
- Choosing a question you actually care about: sport, music, games, city, climate
- Dataset hunting: Kaggle, open data portals, and evaluating what you find
- Feasibility: does this data contain an answer to this question
- Scoping to six weeks of classes: the honest project plan

- Setting up the capstone notebook: sections for question, data, cleaning, analysis, conclusion
- Instructor sign-off on question, dataset, and plan

Projects built:
- Approved capstone plan: question, dataset, feasibility notes, and a week-by-week checklist

Practice: Complete the data audit of your chosen dataset: size, columns, types, missingness

Analysis Sprint

Topics:
- Cleaning your capstone data with a proper cleaning log
- Exploratory analysis: groupbys and filters chasing the question
- First figures: charting what the exploration surfaces
- Mid-sprint review with the instructor: findings so far, gaps remaining
- Following surprises: when the data disagrees with your hunch
- Keeping the notebook readable while you work fast

Projects built:
- Capstone core analysis: cleaned data, exploratory findings, and first draft figures in the notebook

Practice: Write your three strongest preliminary findings, each backed by one figure

The Optional Model and the Narrative

Topics:
- Deciding whether a model helps your question or just decorates it
- If modeling: framing, training, and honest error reporting
- Assembling the narrative: question, data, cleaning, findings, conclusion
- Limitations sections: what your analysis cannot claim, stated plainly
- Polishing figures to month 4 standard
- Dry-run presentations with peer feedback

Projects built:
- Complete capstone notebook: full narrative from question to conclusion, with a limitations section, model included only if it earns its place

Practice: Run your dry-run presentation for a family member and note the question that stumped you

Present and Publish

Topics:
- The final presentation: five minutes, the question, three findings, one takeaway figure
- Fielding questions about your own analysis
- Publishing the notebook to GitHub so it has a public address
- Writing the README: question, data source, and what you found
- Where this goes next: deeper ML, statistics, and college coursework
- Certificates and course close

Projects built:
- Published capstone: notebook live on GitHub, presented to the class and families

Practice: Send your published notebook to one teacher or mentor outside the course

Assessment: Capstone assessment: presentation, notebook quality, cleaning log, and honesty of claims

PROJECTS THE STUDENT BUILDS AND KEEPS

- Class survey analysis, done twice: plain Python, then NumPy
- Movie dataset interrogation: ten ranked questions, ten clean answers
- Sports season statistical review with groupby
- Two-table join analysis across related datasets
- Full cleaning project on raw city open data, with a professional cleaning log
- Mislead-and-repair chart pair: the same data, dishonest then honest
- Four-chart data story presented live
- Housing price regression with honestly reported error
- Penguin species classifier with confusion matrices
- The capstone: a published notebook answering a question the student chose

Total projects: 12+ analysis projects, ending with a published capstone notebook on GitHub

SKILLS THE STUDENT WILL HAVE AT THE END

- pandas fluency: loading, filtering, grouping, and joining real datasets with confidence
- Data cleaning: missing values, broken types, outliers, and duplicates handled with documented judgment
- Visualization: matplotlib figures chosen for the question and built to tell the truth
- Statistics for judgment: centers, spread, and correlation used without overclaiming
- First machine learning: regression and classification with scikit-learn, evaluated honestly on unseen data
- The analyst's workflow: notebooks, cleaning logs, limitations sections, and presenting findings aloud

HOW A TYPICAL WEEK IS SPLIT

Live classes: 2 live one-hour classes per week, working in notebooks alongside the instructor

Practice: 2-3 hours of dataset exercises and project work between classes

Review: Notebooks reviewed with written feedback, with special attention to honest claims and clean reasoning

Homework: A task or problem set after every class, and a monthly mixed-review assignment that

deliberately folds in earlier topics

SUPPORT INCLUDED

Doubt support: WhatsApp doubt support between classes for stuck code and confusing datasets
Progress updates: Regular progress notes to parents: skills covered, projects completed, and what needs practice

CERTIFICATION DETAIL

Completion: Certificate from Modern Age Coders, awarded on passing the final assessment. Fall short and there is focused revision and a free retest: the certificate certifies real learning, not attendance

WHERE THIS CAN LEAD

- Our AI and machine learning courses, which pick up exactly where the scikit-learn month ends
- Deeper Python engineering through our advanced Python and data structures courses
- School science fairs and economics or statistics projects, now backed by real analysis skills
- College coursework in data science, economics, and the sciences with a working head start
- Independent analysis projects: the student now owns the full stack from raw CSV to published notebook

COMMON QUESTIONS ABOUT THIS COURSE

For anything about cost, use PART 4 and RULE 1. Do not quote two regions.

Q: Does my teen need to know Python before this course?
A: Yes, the basics: variables, loops, functions, and lists. Month 1 includes a structured refresh, but it assumes prior exposure rather than teaching Python from zero. Students without that background should take our Python for Teens course first; it is the natural on-ramp, and many students move straight from one into the other.

Q: How much mathematics does the course require?
A: Comfortable school maths is enough. Every statistical idea the course uses, means and medians, spread, percentiles, correlation, is taught inside the course with real data, and there is no calculus anywhere. The emphasis is on judgment: knowing when an average misleads matters far more here than deriving formulas.

Q: Is this real machine learning or just a demo?
A: Real, at an honest first level. Students train linear regression and classification models on real datasets with scikit-learn, use proper train-test splits, read confusion matrices, and meet overfitting directly. What we deliberately avoid is black-box theatre: no pasting magic code that scores well unexplained. A student finishing this course can tell you what their model learned and how wrong it typically is, which is more than many adults using these tools can.

Q: What datasets will my teen work with?
A: Real public data throughout: movie databases, sports seasons, city open data such as street trees and road accidents, climate records, and the Palmer Penguins dataset for classification. From month 3 the data arrives genuinely messy on purpose, because cleaning real data is the core professional skill. For the capstone, students choose their own dataset around a question they care about.

Q: What does the capstone involve?
A: Each student picks a question, finds a suitable public dataset, and does the whole job: cleaning with a documented log, exploratory analysis, honest figures, an optional model if it genuinely helps, and a written conclusion with a limitations section. The finished notebook is published to GitHub and presented live. It is a genuine piece of analysis with a public address, not a classroom-only exercise.

Q: How am I assessed, and is the certificate just for showing up?
A: No. A task follows every class with feedback, monthly reviews deliberately mix new material with earlier topics so nothing is forgotten, and the course ends with a final exam covering the whole course. Passing earns the certificate; falling short earns focused revision and a free retest. We measure real learning, not attendance.

Q: How are the classes taught?
A: Live one-hour online classes, twice a week, in groups capped at 20 students. Students work in their own notebooks during class rather than watching, and homework notebooks come back with written feedback. Mini-batch (up to 6 students) and personal 1-on-1 options are available for students who want closer attention.

Q: Where does a teen go after this course?
A: The most common next step is our AI and machine learning track, which starts exactly where the scikit-learn month ends. Students leaning toward engineering deepen their Python with our advanced courses, and many put the skills straight to work in school science fairs and statistics projects. The capstone notebook also carries weight on its own as evidence of real analytical work for college applications.

To enrol, message Shivam Sir on +91 9123366161 or send the parent this link: https://learn.modernagecoders.com/courses/data-science-course-for-teens-python-data

For a demo: the Priority Live Demo (guaranteed, today or tomorrow) is booked at https://learn.modernagecoders.com/priority-demo . The free demo is a waiting list with no fixed date.

==========

COURSE 55 OF 137: DATA STRUCTURES & ALGORITHMS COURSE: INTERVIEW-READY DSA

==========

Course link: https://learn.modernagecoders.com/courses/data-structures-algorithms-masterclass-college
Subject area: Programming
Designed for: College students
Who can join: Complete beginner (18+); college students, graduates and working professionals
Course length: 10-12 months (44-52 weeks)
Time needed: 2 live classes/week + 4-6 hours practice
Certificate: Certificate from Modern Age Coders, awarded on passing the final exam

PRICE FOR THIS COURSE (quote only the one that applies to the person asking)

In India, per month: group Rs 1,499, mini batch Rs 2,999, one to one Rs 4,999

Outside India, per month: group $100, one to one $150

Classes: group and mini batch two live classes a week, eight a month; one to one in India one live class a week, four a month; one to one outside India two live classes a week, eight a month. Each class is one hour.

WHAT THIS COURSE IS

Data structures and algorithms course for college students and professionals: arrays to graphs to dynamic programming, then company-style interview mastery, in 10-12 months of live classes.

In one line: The skill every serious coding interview tests, built the only way it sticks: patterns understood, hundreds of problems solved, explained out loud under time.

ABOUT THE PROGRAMME

DSA is the great filter of technical hiring: the same topics appear in every serious interview, and the gap between having seen a problem and being able to solve a new one live is exactly what interviewers probe. This live online masterclass closes that gap the honest way, no memorized solution lists. It builds the full canon in order: complexity analysis and linear structures, searching, sorting and hashing, trees, heaps and graphs, then the hard middle, shortest paths, network flow, dynamic programming to real depth, greedy and backtracking, then interview mastery: company-style problem sets, timed simulations, and explaining your reasoning aloud the way the room demands. A finale month runs a mock-interview gauntlet and sits the final exam. The pace is honest: ten teaching months at two live classes a week plus four to six hours of problem-solving, with two more in hand. Problem sets after every class, monthly mixed reviews, phase exams, and a final exam that decides the certificate with a free retest.

WHAT MAKES THIS COURSE DIFFERENT

- Patterns, not memorization: you learn to solve unseen problems, which is the actual test
- Explaining aloud is trained, not assumed: interviews score communication too
- Dynamic programming taught until it clicks, the topic that breaks most candidates
- Company-style problem sets and timed mock interviews, honestly framed as practice
- An honest 10-month arc with 2 months in hand
- Real assessment: weekly problem sets, monthly mixed reviews, phase exams and a final exam with a free retest

THE LEARNING PATH, STEP BY STEP

Phase 1: Core structures (Months 1-3): complexity, arrays to trees, heaps and hashing

Phase 2: Hard algorithms (Months 4-6): graphs, shortest paths, dynamic programming, greedy and backtracking

Phase 3: Interview mastery (Months 7-9): company-style sets, timed simulations, communication

Phase 4: The finale (Month 10): a mock-interview gauntlet and the final exam

WHAT A STUDENT NEEDS BEFORE STARTING

Coding experience: None. Everything is taught from the first line

Equipment: Any computer with a stable internet connection; every tool used is free

Age: 18+; college students, graduates and working professionals

Time commitment: 2 live classes plus 4-6 hours of practice a week

WHO THIS COURSE IS FOR

College students: Students whose placements will live or die on DSA rounds

Career switchers: Professionals targeting product-company roles that test algorithms

Self taught: Coders who can build but freeze on algorithmic interview problems
Working engineers: Engineers preparing to switch companies through the interview gauntlet
Strengthening: Anyone who wants problem-solving depth that outlasts any single language

FULL CURRICULUM, WEEK BY WEEK

This is the complete teaching plan. Parents can ask about any week.

PHASE 1: FOUNDATION & CORE DATA STRUCTURES (MONTHS 1-2, WEEKS 1-8)

Build rock-solid foundations with basic data structures, complexity analysis, and fundamental algorithms.

Month 1: Foundations & Linear Data Structures (Weeks 1-5)
Programming Fundamentals & Complexity Analysis
Topics:
- Course introduction and roadmap
- Setting up coding environment (VS Code, online judges)
- Introduction to problem-solving approach
- Time complexity and Big O notation
- Space complexity analysis
- Best, average, and worst case analysis
- Common complexity classes: O(1), O(log n), O(n), O(n log n), O(n²)
- Analyzing nested loops
- Recursion complexity analysis
- Amortized analysis basics
- Trade-offs: time vs space
- How to approach a problem systematically
Projects built:
- Complexity analyzer tool
- Problem-solving template creator
- Personal progress tracker
Practice: Analyze complexity of 50 code snippets
Arrays & Strings Mastery
Topics:
- Static vs dynamic arrays
- Array operations and complexity
- Two-pointer technique
- Sliding window technique
- Prefix sum arrays
- Kadane's algorithm
- Moore's voting algorithm
- String manipulation techniques
- String matching algorithms
- KMP algorithm basics
- Rabin-Karp algorithm
- Character encoding and Unicode
Projects built:
- Array manipulation library
- String utilities toolkit
- Pattern matching visualizer
Practice: Solve 40 array/string problems
Linked Lists & Recursion
Topics:
- Singly linked list implementation
- Doubly linked list
- Circular linked list
- Fast and slow pointer technique
- Floyd's cycle detection
- Linked list reversal (iterative and recursive)
- Merge operations on linked lists
- Recursion fundamentals
- Base case and recursive case
- Call stack and memory
- Tail recursion optimization
- Recursion tree analysis
Projects built:
- Linked list library from scratch
- Recursion visualizer
- Memory stack simulator
Practice: Implement 25 linked list operations
Stacks & Queues
Topics:
- Stack implementation using array and linked list
- Stack applications: expression evaluation, parentheses matching
- Infix to postfix conversion
- Queue implementation: array-based and linked list
- Circular queue implementation

- Deque (double-ended queue)
- Priority queue basics
- Monotonic stack patterns
- Monotonic queue patterns
- Stack and queue in recursion
- BFS and DFS preview
- Real-world applications

Projects built:
- Expression evaluator
- Browser history simulator
- Task scheduler with priority queue

Practice: Build 20 stack/queue applications

Month 2: Searching, Sorting & Hashing (Weeks 6-9)

Searching Algorithms

Topics:
- Linear search and optimizations
- Binary search deep dive
- Binary search on answer
- Search in rotated sorted array
- Finding boundaries with binary search
- Ternary search
- Exponential search
- Jump search
- Interpolation search
- Search in 2D matrices
- Finding peak elements
- Search space reduction techniques

Projects built:
- Search algorithm visualizer
- Binary search template library
- Search complexity analyzer

Practice: Solve 30 binary search problems

Sorting Algorithms Mastery

Topics:
- Bubble sort and optimizations
- Selection sort analysis
- Insertion sort and when to use
- Merge sort implementation
- Quick sort and partitioning
- Randomized quick sort
- Heap sort preview
- Counting sort for integers
- Radix sort implementation
- Bucket sort technique
- Stability in sorting
- External sorting for large data

Projects built:
- Sorting visualizer application
- Hybrid sorting algorithm
- Performance comparison tool

Practice: Implement all sorting algorithms

Hashing & Hash Tables

Topics:
- Hash function design
- Collision resolution: chaining vs open addressing
- Load factor and rehashing
- Hash table implementation from scratch
- Hash map vs hash set
- Rolling hash technique
- Consistent hashing basics
- Bloom filters introduction
- Hash table patterns in problems
- Two-sum pattern and variations
- Frequency counting with hash maps
- Hash table optimization techniques

Projects built:
- Custom hash table implementation
- LRU cache implementation
- Distributed hash table simulator

Practice: Solve 35 hashing problems

Bit Manipulation & Mathematics

Topics:
- Binary number system review
- Bitwise operators: AND, OR, XOR, NOT
- Left shift and right shift
- Bit manipulation tricks
- Setting, clearing, toggling bits
- Counting set bits

```
      - Power of 2 checks
      - XOR properties and applications
      - Bit masking techniques
      - GCD and LCM algorithms
      - Prime number algorithms
      - Modular arithmetic basics
    Projects built:
      - Bit manipulation toolkit
      - Number theory library
      - Cryptography basics implementation
    Practice: Master 25 bit manipulation techniques

Month 3: Trees, Heaps & Graphs (Weeks 10-13)
  Binary Trees Fundamentals
    Topics:
      - Tree terminology and properties
      - Binary tree representation
      - Tree traversals: inorder, preorder, postorder
      - Level order traversal (BFS)
      - Recursive vs iterative traversals
      - Morris traversal (O(1) space)
      - Tree construction from traversals
      - Diameter, height, and width of tree
      - Path sum problems
      - Lowest Common Ancestor (LCA)
      - Serialize and deserialize trees
      - Tree isomorphism
    Projects built:
      - Binary tree visualizer
      - Tree traversal animator
      - Tree problem solver toolkit
    Practice: Solve 40 binary tree problems
  Binary Search Trees & Balanced Trees
    Topics:
      - BST properties and operations
      - BST insertion and deletion
      - BST validation and searching
      - Inorder successor and predecessor
      - Convert sorted array to BST
      - Self-balancing trees introduction
      - AVL tree rotations
      - AVL tree implementation
      - Red-Black tree basics
      - B-trees and B+ trees overview
      - Segment trees introduction
      - Binary Indexed Tree (Fenwick Tree)
    Projects built:
      - BST implementation with all operations
      - AVL tree from scratch
      - Range query data structure
    Practice: Implement 20 BST operations
  Heaps & Priority Queues
    Topics:
      - Heap properties: min-heap and max-heap
      - Heap implementation using array
      - Heapify operation and complexity
      - Heap sort implementation
      - Priority queue operations
      - Binary heap vs Fibonacci heap
      - K-way merge using heaps
      - Median finding with two heaps
      - Top K elements pattern
      - Heap applications in algorithms
      - Dijkstra's algorithm preview
      - Custom comparators in heaps
    Projects built:
      - Heap implementation from scratch
      - Task scheduler with priority
      - Real-time median finder
    Practice: Master 25 heap problems
  Tries & Advanced Trees
    Topics:
      - Trie data structure implementation
      - Trie insertion, search, and deletion
      - Prefix matching with tries
      - Auto-complete functionality
      - Word search in matrix using trie
      - Suffix trees and arrays basics
      - N-ary tree operations
```

- Quad trees and Oct trees
- K-d trees for spatial data
- Disjoint Set Union (DSU/Union-Find)
- Path compression and union by rank
- Applications of DSU

Projects built:
- Autocomplete system
- Spell checker implementation
- Contact list with search

Practice: Build 15 trie applications

Assessment: Phase 1 exam: a practical build defended live, plus a written paper mixing this phase with everything before it

---

PHASE 2: GRAPHS & ADVANCED ALGORITHMS (MONTHS 3-4, WEEKS 9-17)

Master graph algorithms, advanced problem-solving patterns, and complex algorithmic techniques.

Month 4: Graph Algorithms Mastery (Weeks 14-19)

Graph Fundamentals & Traversals

Topics:
- Graph representations: adjacency matrix vs list
- Directed vs undirected graphs
- Weighted vs unweighted graphs
- Graph properties: connected, cyclic, bipartite
- Depth-First Search (DFS) implementation
- Breadth-First Search (BFS) implementation
- DFS applications: cycle detection, topological sort
- BFS applications: shortest path, level order
- Connected components finding
- Strongly connected components (Kosaraju's, Tarjan's)
- Bridges and articulation points
- Graph coloring basics

Projects built:
- Graph visualizer with traversals
- Social network analyzer
- Maze solver with BFS/DFS

Practice: Solve 35 graph traversal problems

Shortest Path Algorithms

Topics:
- Dijkstra's algorithm implementation
- Dijkstra's with priority queue
- Bellman-Ford algorithm
- Negative weight cycles detection
- Floyd-Warshall algorithm
- A* search algorithm basics
- Shortest path in DAG
- Single source vs all pairs
- Path reconstruction techniques
- Multi-source BFS
- 0-1 BFS technique
- Bidirectional search

Projects built:
- Route finder application
- Navigation system simulator
- Network routing optimizer

Practice: Implement all shortest path algorithms

Minimum Spanning Trees & Network Flow

Topics:
- Minimum Spanning Tree (MST) concept
- Kruskal's algorithm with DSU
- Prim's algorithm implementation
- Applications of MST
- Network flow introduction
- Ford-Fulkerson method
- Maximum flow problem
- Minimum cut theorem
- Bipartite matching
- Hungarian algorithm basics
- Stable marriage problem
- Assignment problems

Projects built:
- Network designer tool
- Resource allocation system
- Matching algorithm implementation

Practice: Solve 20 MST and flow problems

Advanced Graph Patterns

Topics:

```
      - Topological sorting variations
      - Cycle detection in directed/undirected graphs
      - Bipartite graph checking and coloring
      - Eulerian path and circuit
      - Hamiltonian path problem
      - Graph dynamic programming
      - Tree DP on graphs
      - Centroid decomposition basics
      - Heavy-light decomposition intro
      - Graph compression techniques
      - Parallel BFS/DFS
      - Graph optimization problems
    Projects built:
      - Dependency resolver
      - Circuit board router
      - Tournament scheduler
    Practice: Master 25 advanced graph patterns
  String Algorithms Advanced
    Topics:
      - KMP algorithm implementation
      - Z-algorithm for pattern matching
      - Rabin-Karp with rolling hash
      - Boyer-Moore algorithm
      - Suffix arrays construction
      - Longest Common Prefix array
      - Manacher's algorithm for palindromes
      - Edit distance algorithms
      - Longest common subsequence/substring
      - String hashing techniques
      - Suffix automaton basics
      - Aho-Corasick algorithm
    Projects built:
      - Text editor with find/replace
      - Plagiarism detector
      - DNA sequence analyzer
    Practice: Implement 15 string algorithms

Month 5: Dynamic Programming Mastery (Weeks 20-24)
  Dynamic Programming Fundamentals
    Topics:
      - Introduction to dynamic programming
      - Recursion to DP transition
      - Memoization techniques
      - Top-down vs bottom-up approach
      - 1D DP patterns
      - State definition in DP
      - Fibonacci variations
      - Climbing stairs variations
      - House robber pattern
      - Jump game problems
      - Decode ways pattern
      - DP space optimization
    Projects built:
      - DP visualizer tool
      - Recursion tree analyzer
      - DP pattern identifier
    Practice: Solve 40 basic DP problems
  2D Dynamic Programming
    Topics:
      - 2D DP table construction
      - Grid-based DP problems
      - Path counting in grids
      - Longest common subsequence
      - Edit distance problem
      - 0/1 Knapsack problem
      - Unbounded knapsack
      - Subset sum problems
      - Matrix chain multiplication
      - Palindrome partitioning
      - Regular expression matching
      - Wildcard matching
    Projects built:
      - Sequence alignment tool
      - Knapsack optimizer
      - Pattern matcher implementation
    Practice: Master 35 2D DP problems
  Advanced DP Patterns
    Topics:
      - State machine DP
```

- DP on trees
- DP with bitmasking
- Digit DP technique
- Probability DP
- Game theory and DP
- Interval DP pattern
- String DP problems
- DP optimization techniques
- Convex hull trick
- Divide and conquer optimization
- Knuth-Yao speedup

Projects built:
- Stock trading simulator with DP
- Game AI using minimax
- Optimal strategy finder

Practice: Solve 30 advanced DP problems

Greedy Algorithms & Optimization

Topics:
- Greedy algorithm principles
- When greedy works: proof techniques
- Activity selection problem
- Huffman coding
- Fractional knapsack
- Job scheduling problems
- Interval scheduling maximization
- Minimum platforms problem
- Gas station circuit problem
- Jump game greedy approach
- Greedy vs DP comparison
- Exchange argument proof

Projects built:
- Task scheduler optimizer
- Huffman compression tool
- Resource allocator

Practice: Master 25 greedy problems

Backtracking & Branch and Bound

Topics:
- Backtracking fundamentals
- State space tree
- N-Queens problem
- Sudoku solver
- Subset generation
- Permutation generation
- Combination sum problems
- Word search in grid
- Graph coloring with backtracking
- Branch and bound technique
- Pruning strategies
- Optimization in backtracking

Projects built:
- Sudoku solver application
- N-Queens visualizer
- Constraint satisfaction solver

Practice: Implement 20 backtracking solutions

Month 6: Advanced Topics & Interview Preparation (Weeks 25-26)

Advanced Algorithms

Topics:
- Divide and conquer mastery
- Master theorem for recurrence
- Fast Fourier Transform basics
- Karatsuba multiplication
- Strassen's matrix multiplication
- Closest pair of points
- Convex hull algorithms
- Line sweep technique
- Mo's algorithm basics
- Square root decomposition
- Heavy-light decomposition
- Centroid decomposition

Projects built:
- Computational geometry library
- Big integer calculator
- Algorithm complexity analyzer

Practice: Implement 15 advanced algorithms

System Design Basics for Interviews

Topics:
- System design interview approach
- Scalability basics

- Load balancing concepts
- Caching strategies
- Database design basics
- SQL vs NoSQL
- Microservices overview
- API design principles
- Rate limiting algorithms
- Consistent hashing
- Distributed systems basics
- CAP theorem introduction

Projects built:
- URL shortener design
- Rate limiter implementation
- Simple cache system

Practice: Design 10 systems

Assessment: Phase 2 exam: a practical build defended live, plus a written paper mixing this phase with everything before it

---

PHASE 3: INTERVIEW MASTERY (MONTHS 7-9, WEEKS 27-39)

Master interview skills, tackle company-specific problems, and launch your tech career.

Months 7-8: Company-Specific Preparation (Weeks 27-35)

Google Interview Preparation

Topics:
- Google interview process overview
- Google's evaluation criteria
- Googliness and Leadership
- Common Google problem patterns
- Array and string manipulation focus
- Graph algorithms emphasis
- Dynamic programming at Google
- System design at Google scale
- Google coding style guide
- Time complexity requirements
- Follow-up questions handling
- Google behavioral questions

Projects built:
- Google-style problem solver
- MapReduce implementation
- PageRank algorithm

Practice: Solve 50 Google tagged problems

Amazon Interview Preparation

Topics:
- Amazon interview process
- Leadership Principles deep dive
- Amazon problem-solving approach
- Object-oriented design at Amazon
- Scalability focus
- Two-pointer and sliding window emphasis
- Tree and graph problems
- Amazon system design topics
- Working backwards methodology
- Bar raiser round preparation
- Amazon behavioral questions
- STAR format examples

Projects built:
- E-commerce system design
- Recommendation engine
- Warehouse robot pathfinding

Practice: Solve 50 Amazon tagged problems

Meta (Facebook) Preparation

Topics:
- Meta interview structure
- Ninja, Pirate, Jedi expectations
- Meta's focus areas
- Array and string heavy problems
- BFS/DFS variations
- Dynamic programming patterns
- Design Facebook features
- Meta's behavioral assessment
- Move fast philosophy
- Impact-focused answers
- Coding signal importance
- System design for social networks

Projects built:
- Social network features
- News feed algorithm

```
      - Friend recommendation system
    Practice: Solve 50 Meta tagged problems
  Microsoft & Apple Preparation
    Topics:
      - Microsoft interview approach
      - Problem-solving communication
      - Microsoft stack questions
      - Linked list and tree focus
      - String manipulation problems
      - Apple interview process
      - Quality and attention to detail
      - iOS/macOS specific questions
      - Design patterns emphasis
      - Both companies' behavioral focus
      - Growth mindset demonstration
      - Innovation and creativity
    Projects built:
      - Operating system scheduler
      - File system design
      - Music streaming service
    Practice: Solve 40 MS/Apple problems
  Startup & Unicorn Preparation
    Topics:
      - Startup interview differences
      - Full-stack expectations
      - Practical coding tests
      - Take-home assignments
      - System design for startups
      - Real-world problem solving
      - API design and implementation
      - Database design questions
      - DevOps and deployment
      - Startup culture fit
      - Ownership and initiative
      - Rapid iteration mindset
    Projects built:
      - MVP product design
      - Real-time collaboration tool
      - Payment processing system
    Practice: Complete 3 take-home projects

Month 9: Final Polish & Interview Simulation (Weeks 36-39)
  Advanced Problem Patterns
    Topics:
      - Multi-threaded programming problems
      - Concurrency and locks
      - Design patterns in problems
      - Object-oriented design problems
      - Database query problems
      - SQL in interviews
      - Machine learning basics for interviews
      - Security-related problems
      - Cryptography basics
      - Blockchain basic problems
      - Mobile-specific problems
      - Real-time system problems
    Projects built:
      - Thread-safe data structures
      - Distributed lock manager
      - Real-time chat system
    Practice: Solve 30 advanced mixed problems
  Interview Week Simulation
    Topics:
      - Full day interview simulation
      - Multiple rounds back-to-back
      - Phone screen practice
      - Technical rounds practice
      - System design rounds
      - Behavioral rounds
      - Hiring manager rounds
      - Lunch interview practice
      - Stress management techniques
      - Energy management
      - Recovery between rounds
      - End-of-day strategies
    Projects built:
      - Complete interview portfolio
      - Problem solution database
      - Personal story bank
```

```
      Practice: 5 full interview simulations
    Soft Skills & Communication
      Topics:
        - Technical communication skills
        - Explaining complex concepts simply
        - Asking clarifying questions
        - Requirements gathering
        - Trade-off discussions
        - Collaborative problem solving
        - Handling hints effectively
        - Dealing with stuck situations
        - Time management during interviews
        - Body language and confidence
        - Virtual interview best practices
        - Follow-up communication
      Projects built:
        - Technical presentation
        - Code review exercise
        - Team project simulation
      Practice: Record and review 10 problem explanations
    Career Strategy & Negotiation
      Topics:
        - Job search strategies
        - Resume optimization for ATS
        - LinkedIn profile optimization
        - Cover letter writing
        - Portfolio website creation
        - GitHub profile enhancement
        - Networking strategies
        - Referral seeking techniques
        - Offer evaluation framework
        - Salary negotiation tactics
        - Benefits comparison
        - Career growth planning
      Projects built:
        - Professional portfolio website
        - Optimized resume versions
        - LinkedIn article publishing
      Practice: Apply to 20 positions strategically
      Assessment: Phase 3 exam: a practical build defended live, plus a written paper mixing
      this phase with everything before it

----------------------------------------------------------------
PHASE 4: THE FINALE (MONTH 10, WEEKS 40-44)
----------------------------------------------------------------
The capstone month: spec, build, ship and defend, then the final exam that decides the
certificate.

  Month 10: Capstone and the Final Exam (Weeks 40-44)
    Capstone Spec and Setup
      Topics:
        - Choosing the capstone: a full mock-interview gauntlet plus a solved-problem portfolio
          spanning every pattern
        - A one-page spec: scope, milestones, stack
        - Repository and skeleton ready on day one
        - Instructor sign-off before the build begins
      Projects built:
        - Approved capstone spec plus the running skeleton
      Practice: Pitch the spec to the batch and absorb one hard question
    Capstone Build
      Topics:
        - Two focused weeks in vertical slices
        - Instructor checkpoints and honest scope cuts
        - Using the whole course: every structure and algorithm, under interview-style time pressure
          with reasoning spoken aloud
        - Daily commits and an always-working build
      Projects built:
        - The capstone, feature-complete with version control
      Practice: A working build at the end of every session
    Ship and Polish
      Topics:
        - The finishing pass: edge cases, errors, documentation
        - Clean, optimal, explained: solutions that are correct, efficient and communicated well
        - A README worth reading and a demo worth watching
        - A full-course spiral review before the exam
      Projects built:
        - The capstone shipped, documented and rehearsed
      Practice: Two mock demos, each tighter than the last
    Demo Day and the Final Exam
```

Topics:
- Presenting the capstone: live demo plus the hardest bug story
- The honest map of next roads: placement interviews, competitive programming, or system design depth
- Where our other courses continue the journey

Projects built:
- Demo day presentation delivered to the batch

Assessment: FINAL EXAM: a practical build plus a written paper with questions mixed from every phase. Passing earns the certificate; falling short earns a focused revision plan and a free retest

PROJECTS THE STUDENT BUILDS AND KEEPS

- Phase 1: implementations of every core structure, from scratch
- Phase 2: graph, DP and backtracking solution sets on hard problems
- Phase 3: company-style problem sets and timed mock interviews
- Phase 4: the mock-interview gauntlet and final solved-problem portfolio

Total projects: 300+ problems solved and every core structure implemented, crowned by a mock-interview gauntlet

SKILLS THE STUDENT WILL HAVE AT THE END

- Complexity analysis: reasoning about time and space by instinct
- Every core structure implemented and understood: arrays to graphs
- The hard algorithms: shortest paths, network flow, dynamic programming
- Problem-solving patterns that transfer to unseen problems
- Interview communication: explaining an optimal solution under time

HOW A TYPICAL WEEK IS SPLIT

Live classes: 2 live one-hour classes per week, coding along with the instructor
Homework: A problem set after every class, and a mixed-review assignment at the end of every month
Practice: 4-6 hours of building between classes
Review: Every submission reviewed with written feedback; recurring gaps reopened in class

SUPPORT INCLUDED

Doubt support: WhatsApp doubt support between classes
Progress updates: Honest monthly progress reviews: what is solid, what is wobbly, and the plan for the wobble

CERTIFICATION DETAIL

Completion: Certificate from Modern Age Coders, awarded on passing the final exam. Fall short and there is focused revision and a free retest: the certificate certifies knowledge, not attendance

WHERE THIS CAN LEAD

- Placement and product-company interviews: this is the round they weight most
- Our competitive programming course for contest-level speed and technique
- System design study for senior interview rounds
- Any language course here pairs naturally with this problem-solving spine

EARNING POTENTIAL (share only if asked, and never promise it)

Market context: The ranges below are general market salary bands for these roles in India and abroad, drawn from public industry data. They are shown for career context only and are not a promise or guarantee of income. Actual pay depends on your skills, experience, location, and the job market.
Early career roles: Ready for Rs 5-10 LPA roles; Ready for Rs 10-20 LPA roles
Growing roles: Ready for Rs 15-40+ LPA roles
Other roles: Rs 25-60+ LPA packages
International: $100k-250k+ USD

COMMON QUESTIONS ABOUT THIS COURSE

For anything about cost, use PART 4 and RULE 1. Do not quote two regions.

Q: What does this DSA course cover?
A: The full interview canon in order: complexity analysis, arrays, strings, linked lists, recursion, stacks and queues, searching, sorting, hashing, trees, heaps, tries and graphs; then the hard algorithms, shortest paths, minimum spanning trees, network flow, dynamic programming to real depth, greedy and backtracking; then interview mastery with company-style problem sets, timed simulations and communication practice. A finale month runs a mock-interview gauntlet and sits the final exam.

Q: How long does it take to learn data structures and algorithms properly?

A: Ten months of teaching at 2 live classes a week plus 4 to 6 hours of practice, with two more months in hand for learners who need them. The three teaching phases build the skill and its real-world application; the finale month ships a capstone and sits the final exam.

Q: How am I assessed? Is the certificate just for attending?
A: No. Problem sets follow every class with written feedback, monthly reviews deliberately mix new material with earlier topics, each phase ends with a cumulative exam, and the course ends with a final exam: a practical build plus written questions from the whole syllabus. Passing earns the certificate; falling short earns focused revision and a free retest.

Q: Which language is used for DSA here?
A: You solve in the language you will interview in, most commonly C++, Java or Python, and the instructor supports all three. DSA is language-agnostic at heart: the patterns matter more than the syntax, and we make sure your chosen language never gets in the way of the thinking.

Q: Will this course guarantee me a job?
A: No honest course can, and we will not pretend otherwise. What this course guarantees is genuine problem-solving ability, the specific skill interviews test, built through hundreds of solved problems and real mock interviews. We prepare you to earn the offer; we do not sell the offer.

Q: Can I try a class before enrolling?
A: Yes, a free demo class with no commitment: book at learn.modernagecoders.com/contact or message us on WhatsApp at +91 91233 66161. (Agent note: the free demo is a waiting list with no fixed date. The Priority Live Demo is a guaranteed class today or tomorrow, booked at https://learn.modernagecoders.com/priority-demo . Offer both, as RULE 3 says.)

Q: Are classes live or recorded?
A: Live, always: small groups with a real instructor reading your actual code, never pre-recorded videos.

To enrol, message Shivam Sir on +91 9123366161 or send the parent this link: https://learn.modernagecoders.com/courses/data-structures-algorithms-masterclass-college
For a demo: the Priority Live Demo (guaranteed, today or tomorrow) is booked at https://learn.modernagecoders.com/priority-demo . The free demo is a waiting list with no fixed date.

==========

COURSE 56 OF 137: EARLY MATH FOUNDATIONS: PLAYFUL, CONCRETE MATH (AGES 4-7)

==========

Course link: https://learn.modernagecoders.com/courses/early-math-foundations
Subject area: Elementary Mathematics
Designed for: Elementary school
Who can join: Ages 4-7 (kindergarten to grade 2), all starting points
Course length: 12 months (52 weeks)
Time needed: 2 live one-hour classes per week (structured as playful segments) + everyday math play at home
Certificate: Certificate from Modern Age Coders, awarded on passing the final assessment

PRICE FOR THIS COURSE (quote only the one that applies to the person asking)
In India, per month: group Rs 1,499, mini batch Rs 2,999, one to one Rs 4,999
Outside India, per month: group $100, one to one $150
Classes: group and mini batch two live classes a week, eight a month; one to one in India one live class a week, four a month; one to one outside India two live classes a week, eight a month. Each class is one hour.

WHAT THIS COURSE IS

Live online early math course for ages 4-7: counting, number bonds, shapes and measurement taught concrete-first in short, joyful classes. Free demo first.

In one line: The years that decide whether math becomes a friend. We make it one.

ABOUT THE PROGRAMME

A 12-month live program for children aged 4-7, the years when a child's whole relationship with mathematics is quietly decided. Early math done right is not worksheets; it is counting that means something, quantities seen and handled, patterns spotted, shapes built and stories solved. Our mentors teach concrete-first in genuinely interactive classes structured as short playful segments that respect young attention spans: real objects, ten-frames, games and math talk, with the child doing and explaining rather than watching. Children leave this course fluent in early number, confident in their own thinking, and, the part parents notice most, actually liking math.

WHAT MAKES THIS COURSE DIFFERENT

- Concrete before abstract, always: quantities are handled, drawn, and only then written as symbols

- Classes built for young attention: an hour of varied segments, games, movement, building, story problems, never an hour of sitting still
- Counting taught with meaning: one-to-one correspondence, cardinality and the ideas most programs skip straight past
- Number bonds and part-whole thinking started early, gently, the foundation everything to age 18 stands on
- Math talk from day one: even five-year-olds explain their thinking here, in their own words
- One dedicated mentor who knows the child, their pace and their spark
- Parents equipped too: simple everyday math-play prompts, because kitchens teach more than worksheets
- The honest opposite of drill academies, no pressure, no rankings, no tears

THE LEARNING PATH, STEP BY STEP

Phase 1: Counting with meaning, comparing quantities, and the first part-whole ideas, through objects and games
Phase 2: Addition and subtraction as stories, bonds to 10, place value beginnings and the teen numbers demystified
Phase 3: Numbers to 100 and beyond, early measurement, shapes and data, plus problem-solving courage and grade-2 readiness

WHAT A STUDENT NEEDS BEFORE STARTING

Education: Ages 4-7; no academic prerequisites whatsoever
Math background: None, this course IS the foundation
Equipment: Computer or tablet with stable internet; everyday objects (blocks, buttons, spoons) as materials
Time commitment: 2 live hours plus everyday math play
English: Course taught in English
Parent role: Nearby for the youngest children in early weeks; cheering thereafter

WHO THIS COURSE IS FOR

First steps: Ages 4-5 taking their very first structured math steps, playfully
K 2 students: Kindergarten to grade 2 children whose school math needs a stronger foundation underneath
Eager minds: Young children already fascinated by numbers who deserve real food for it
Worried starts: Children whose first school math experiences created tears, reversible at this age, quickly
Planning parents: Families who want the foundation laid right the first time, before gaps exist

FULL CURRICULUM, WEEK BY WEEK

This is the complete teaching plan. Parents can ask about any week.

PHASE 1: COUNTING THAT MEANS SOMETHING (MONTHS 1-4)

Counting looks simple and hides deep ideas: one number per object, the last number telling the total, quantities compared and conserved. This phase builds those ideas properly through objects, movement and games, the difference between reciting numbers and understanding them.

Month 1: Numbers as Quantities (Weeks 1-4)
A Playful First Look
Topics:
- Counting objects to see how far counting flows
- Comparing two small groups for more or fewer
- Copying and continuing a simple pattern
- Noticing how the child talks about numbers
- Spotting counting habits gently, without correcting
- Finding a warm, happy starting point
Practice: Line up a few toys and ask your child to count them and tell you which pile has more, keeping it a game and not a test.
Detail: Playful diagnostic disguised as games: counting, comparing and pattern instincts observed
One Number for Each Thing
Topics:
- Touching each object once while saying one number
- Matching one number word to one thing
- Understanding the last number tells the total
- Counting a group and answering how many
- Recounting a moved group to see the total stays the same
- Slowing down to count carefully
Practice: Count the stairs together as you climb, touching each step and cheering the final number as the total.
Detail: One-to-one counting with real objects; the cardinality idea, the last number IS the amount
Seeing Small Numbers Instantly

    Topics:
      - Recognising 1, 2 and 3 without counting
      - Seeing 4 and 5 as quick patterns
      - Reading dice dots at a glance
      - Showing numbers fast with fingers
      - Naming flashed dot cards instantly
      - Talking about how the amount was seen
    Practice: Flash some fingers for a second, hide them, and ask how many your child saw, taking turns being the flasher.
    Detail: Subitizing: seeing 3, 4 and 5 without counting, dice, dots and finger patterns
  More, Fewer, or the Same?
    Topics:
      - Comparing two groups for more or fewer
      - Matching items one to one to compare fairly
      - Recognising when two groups are the same
      - Using the words more, fewer and equal
      - Explaining how you know which has more
      - Making two groups equal by adding or taking away
    Practice: Put out two rows of buttons and ask your child to line them up in pairs to prove which row has more, or whether they match.
    Detail: Comparing quantities: more, fewer, same, justified with matching, not guessing

Months 2-3: The Number World to 10 (Weeks 5-12)
  Number Symbols and Counting Both Ways
    Topics:
      - Matching the written numeral to its quantity
      - Recognising the numerals 0 to 10
      - Counting forwards to ten smoothly
      - Counting backwards from ten like a rocket
      - Placing a numeral card beside the right group
      - Writing or tracing numerals playfully
    Practice: Do a rocket countdown from 10 to 0 before a jump or a tickle, then count back up to ten together.
    Detail: Numerals connected to quantities; counting forwards and backwards as a game
  The Ten-Frame as Home Base
    Topics:
      - Filling a ten-frame from left to right
      - Seeing a full row of five
      - Reading 7 as five and two more
      - Spotting how many empty spaces are left
      - Seeing numbers hidden inside bigger numbers
      - Knowing how far a number is from ten
    Practice: Draw a two-by-five grid and let your child place counters to show a number like 8, then say it as five and three more.
    Detail: Ten-frames as home base: five-and-some structure, seeing numbers inside numbers
  Breaking Numbers into Parts
    Topics:
      - Splitting a small group into two parts
      - Seeing 5 as 2 and 3, or 4 and 1
      - Finding different ways to make the same number
      - Putting the two parts back into the whole
      - Using two hands to hold the two parts
      - Talking about the parts out loud
    Practice: Hide 5 counters behind your back in two hands, show one hand, and let your child work out how many are hiding in the other.
    Detail: Part-whole play: 5 is 2-and-3, 4-and-1, decomposition as a toy, years before it is a technique
  First, Second, Third and Where Things Sit
    Topics:
      - Using first, second, third and last
      - Describing position with in front, behind and between
      - Walking along a number line as a path
      - Finding which number comes before or after
      - Ordering a small line of toys
      - Naming who is in each place in a line
    Practice: Line up soft toys and ask playful questions like which one is third, or who is between the first and the fourth.
    Detail: Ordinal numbers, position words and the number line met as a walking game

Month 4: Patterns and Sorting + Stage Checkpoint (Weeks 13-16)
  Patterns That Repeat
    Topics:
      - Copying a simple repeating pattern
      - Continuing a pattern by what comes next
      - Creating a brand new pattern of your own
      - Naming the repeating unit, like red blue red blue
      - Spotting patterns in colours, shapes and sounds
      - Fixing a pattern with a deliberate mistake in it
    Practice: Start a pattern with household items, like spoon fork spoon fork, and ask

what comes next, then let your child build one for you.
Detail: Repeating patterns: copy, extend, create, the beginnings of algebraic thinking
Sorting by How Things Are Alike
Topics:
- Sorting objects into groups by colour, size or shape
- Choosing your own rule for sorting
- Explaining the rule you used
- Noticing an object that does not belong
- Sorting the same set a second, different way
- Describing groups with words like all and none
Practice: Tip out a box of toys or socks and ask your child to sort them, then guess the rule they chose before they tell you.
Detail: Sorting and classifying by attributes; explaining the rule you sorted by
Patterns That Grow
Topics:
- Seeing a pattern that gets bigger each step
- Working out what comes next in a growing pattern
- Building steps like 1, then 2, then 3 blocks
- Describing how the pattern changes
- Predicting a later step in the pattern
- Comparing repeating and growing patterns
Practice: Build a staircase of blocks that grows by one each time and ask your child how many blocks the next step needs.
Detail: Growing patterns and what-comes-next reasoning
Phase One Check Through Play
Topics:
- Counting a group and telling the total
- Comparing quantities with more and fewer
- Showing a number on a ten-frame
- Copying and extending a pattern
- Explaining thinking out loud
- Teaching a skill to a toy or a parent
Practice: Let your child teach a teddy how to count a small group and spot which pile has more, while you happily listen in.
Assessment: A gentle play-based check of counting, comparing, ten-frames and patterns, where the child shows a skill, says how it works, and teaches it to a toy, with no pressure.
Detail: Stage mastery check through play: show it, say it, teach it to your bear

---
PHASE 2: STORIES, BONDS AND THE TEEN NUMBERS (MONTHS 5-8)

Addition and subtraction arrive as stories acted out with objects, joining, separating, comparing, long before symbols carry them. Bonds to 10 grow toward automaticity through games, and the famously confusing teen numbers get demystified with place-value materials.

Month 5: Addition and Subtraction as Stories (Weeks 17-20)
Adding and Taking Away as Stories
Topics:
- Acting out a joining story with objects
- Acting out a taking-away story
- Meeting the plus sign as and more
- Meeting the minus sign as take away
- Reading a simple number story as a picture
- Telling the story back in your own words
Practice: Tell a tiny story with toys, like three ducks and two more join them, and let your child act it out and say how many altogether.
Detail: Joining and separating stories acted with objects; the plus and minus symbols as story shorthand
Counting On and Counting Back
Topics:
- Starting from the bigger number and counting on
- Not going back to one every time
- Counting back to take away
- Using fingers to count on a few more
- Playing the hidden-in-the-hand take-away game
- Choosing to count on or count back
Practice: Hold some counters in a closed hand, say the number inside, add a couple on top, and let your child count on from the hidden number.
Detail: Counting on (not starting over) and counting back; the empty-hand subtraction game

Month 6: Bonds of 10 and Fact Families (Weeks 21-24)
The Pairs That Make Ten
Topics:
- Finding two parts that make ten
- Learning pairs like 6 and 4, 7 and 3
- Filling a ten-frame to see the missing part
- Answering the partner of a number quickly

- Playing many games to make the pairs stick
- Feeling how ten is a friendly whole

Practice: Play friends of ten: hold up some fingers on one hand and ask how many more make ten, then swap hands.

Detail: Bonds of 10 through every game we know, the single most valuable fact set in mathematics

One Number Trio, Four Facts

Topics:

- Seeing three numbers that belong together
- Making two addition facts from the trio
- Making two subtraction facts from the trio
- Understanding adding and taking away as linked
- Using one known fact to find the others
- Building the whole fact family from a picture

Practice: Give your child three numbers like 2, 8 and 10 and see how many facts they can say using all three.

Detail: Fact families: 3+7, 7+3, 10-7, 10-3 as one idea seen four ways

Month 7: Teen Numbers and Place Value Beginnings (Weeks 25-28)

Teen Numbers Are Ten and Some More

Topics:

- Building a teen number as one ten and some ones
- Seeing 14 as ten and four
- Grouping ten small items into one bundle
- Reading teen numbers correctly
- Understanding where place value begins
- Matching the numeral to the ten-and-ones picture

Practice: Bundle ten straws or sticks with a band, add a few loose ones, and ask your child to name the teen number you made.

Detail: Teens demystified: 14 as ten-and-four, built with materials, where place value actually starts

All the Way to Twenty

Topics:

- Counting forwards and backwards to 20
- Comparing two numbers up to 20
- Ordering numbers up to 20
- Filling a second ten-frame past ten
- Previewing the make-ten bridge as a game
- Spotting the ten inside a teen number

Practice: Count a bigger pile of objects, like 16 pasta pieces, into two ten-frames, then ask which of two numbers up to 20 is bigger.

Detail: Numbers to 20: counting, comparing, and bridging-through-10 previewed as a game

Month 8: Story Problems and the Explain Habit (Weeks 29-32)

Act It, Draw It, Write It

Topics:

- Acting out a word problem with objects
- Drawing a simple picture of the story
- Writing the matching number sentence
- Finding the question hidden in the story
- Deciding whether to join or take away
- Checking the answer against the story

Practice: Make up a little story, such as five apples and two eaten, and guide your child to act it, draw it, then write the number sentence.

Detail: Word problems as theatre: act it, draw it, then write it, the three-step that prevents future word-problem fear

Missing Numbers and Phase Two Check

Topics:

- Finding a missing number in a simple sentence
- Thinking backwards from an answer
- Using fact families to fill the gap
- Reviewing story problems and bonds of ten
- Explaining how a puzzle was solved
- Showing teen numbers as ten and ones

Practice: Pose a gentle puzzle like something plus 3 makes 7 using counters, and let your child find the missing amount.

Assessment: A relaxed play-based check of story problems, bonds of ten, fact families and teen numbers, where the child solves a puzzle and explains the thinking, with no pressure.

Detail: Missing-number puzzles and both-ways thinking; stage mastery check through play

---

PHASE 3: TO 100 AND INTO THE WORLD (MONTHS 9-12)

The number world expands to 100 with place-value understanding, and math steps into the child's world: measuring, money, time, shapes and simple data. The course closes with problem-solving courage and a confident handoff to grade-level mathematics.

Month 9: The Road to 100 (Weeks 33-36)

  Building Numbers from Tens and Ones
    Topics:
      - Building a two-digit number from tens and ones
      - Bundling tens and counting the leftover ones
      - Reading a number like 34 as three tens and four
      - Comparing two two-digit numbers
      - Ordering several numbers from small to big
      - Matching the numeral to the tens-and-ones model
    Practice: Use grouped straws or blocks to build a number like 27, then build another and ask your child which is bigger and why.
    Detail: Tens and ones with materials: building two-digit numbers, comparing and ordering them
  Skip Counting and the Hundred Square
    Topics:
      - Skip counting by 10s to one hundred
      - Skip counting by 5s and by 2s
      - Hearing skip counting as a rhythm
      - Finding patterns on the hundred square
      - Moving up, down and across the hundred square
      - Spotting the tens column and its counting patterns
    Practice: Chant counting by tens up to a hundred on a walk, then try by fives, clapping to keep the rhythm.
    Detail: Skip counting by 2s, 5s and 10s as rhythm and pattern; the 100-square explored like a map

Month 10: Two-Digit Confidence (Weeks 37-40)
  Adding Two-Digit Numbers
    Topics:
      - Adding two numbers using tens and ones blocks
      - Combining the tens, then the ones
      - Moving from blocks to picturing the jump
      - Adding a whole ten to a number
      - Solving sums like 23 plus 14
      - Checking the answer with the materials
    Practice: Set out blocks for a sum like 22 plus 13 and let your child join the tens and the ones, then say the total.
    Detail: Adding tens, adding ones: two-digit addition with materials first, mental jumps second
  Ten More and Ten Less
    Topics:
      - Finding ten more than a number quickly
      - Finding ten less than a number
      - Using the hundred square to jump by ten
      - Noticing only the tens digit changes
      - Meeting friendly round numbers
      - Jumping to the next friendly ten
    Practice: Say a number like 34 and ask for ten more, then ten less, using the hundred square to check each jump.
    Detail: Ten-more ten-less fluency; friendly-number thinking previewed gently

Month 11: Measurement, Money and Time (Weeks 41-44)
  Measuring and Guessing
    Topics:
      - Comparing lengths as longer and shorter
      - Comparing weights as heavier and lighter
      - Comparing capacity as holds more or less
      - Measuring with repeated units like paper clips
      - Guessing a measurement, then checking it
      - Using words like longest, heaviest and full
    Practice: Guess how many hand-spans long the table is, then measure together to see how close the guess was.
    Detail: Length, weight and capacity by comparing and then by counting units; estimation as a guessing game with feedback
  Money and Telling the Time
    Topics:
      - Recognising a few common coins
      - Paying for small pretend items
      - Counting a small amount of money
      - Reading o'clock on a real clock
      - Reading half-past on a real clock
      - Linking times to parts of the day
    Practice: Play shop with real coins for a few priced items, then check what o'clock it is on a real clock together.
    Detail: Coins and simple shopping play; o'clock and half-past on real clocks

Month 12: Shapes, Data and Graduation (Weeks 45-52)
  Shapes and Fair Shares
    Topics:
      - Naming flat shapes like circle, square and triangle

- Naming solid shapes like cube, sphere and cone
- Building and hunting for shapes at home
- Describing shapes by their sides and corners
- Sharing something fairly into halves
- Sharing into quarters as four equal parts

Practice: Go on a shape hunt around the house, then share a snack or a drawing fairly into halves and quarters.
Detail: 2D and 3D shapes built, named and hunted at home; halves and quarters as fair sharing, fractions met kindly

Graphs, Graduation and the Road Ahead
Topics:
- Asking a simple survey question
- Collecting answers from family or class
- Drawing a picture graph of the results
- Reading which answer had the most
- Teaching a favourite math game to others
- Looking ahead to grade-level math

Practice: Help your child survey the family on a fun question, like favourite fruit, and draw a little picture graph of the answers.
Assessment: A gentle final celebration where the child makes a simple pictograph, teaches a favourite math game, and revisits the year's ideas, with a friendly road-ahead plan instead of a test.
Detail: Simple pictographs from the child's own surveys; graduation project, the child teaches their favourite math game, and the road-ahead plan into grade-level math

PROJECTS THE STUDENT BUILDS AND KEEPS

- The child's own counting museum: collections photographed and counted
- Pattern gallery: repeating and growing patterns the child created
- Shape hunt portfolio from around the home
- The child's first survey and pictograph
- Graduation game: the child teaches their favourite math game

Total projects: A year of playful artifacts the child is proud of

SKILLS THE STUDENT WILL HAVE AT THE END

- Counting with one-to-one correspondence and cardinality
- Subitizing and quantity comparison
- Part-whole thinking and bonds of 10
- Addition and subtraction as stories, then facts
- Teen numbers and place-value beginnings
- Numbers to 100 with tens-and-ones understanding
- Early measurement, money, time and shapes
- Explaining mathematical thinking aloud

HOW A TYPICAL WEEK IS SPLIT

Live classes: 2 one-hour live classes in short playful segments
Home play: Everyday math prompts for parents, minutes, not worksheets
Materials: Household objects as manipulatives; printable ten-frames provided
Total per week: About 2.5 gentle hours
Homework: A problem set after every class, and a monthly mixed-review assignment that deliberately folds in earlier topics

SUPPORT INCLUDED

Live sessions: 8 live classes every month, 2 per week
Mentorship: One dedicated mentor who knows the child's stage and spark
Recordings: Every class recorded
Progress tracking: Stage mastery notes shared with parents
Flexibility: Slots move around naps, school and family life

CERTIFICATION DETAIL

Completion: Certificate from Modern Age Coders, awarded on passing the final assessment. Fall short and there is focused revision and a free retest: the certificate certifies mastery, not attendance

WHERE THIS CAN LEAD

- Ready for Mental Maths Mastery with the bonds already forming
- Ready for the Elementary Mathematics Masterclass, arriving confident
- A child who enters grade 3 liking math, the outcome that compounds for a decade
- Early access to the maths-and-coding world for the builder types

COMMON QUESTIONS ABOUT THIS COURSE

For anything about cost, use PART 4 and RULE 1. Do not quote two regions.

Q: Can a 4-year-old really learn in online classes?
A: Yes, with the right design, which is the whole craft here. Classes run as short, varied playful segments: a counting game, a building challenge, a story problem, a movement break with skip counting. The mentor works with real objects the child holds up to the camera, and parents of our youngest students sit nearby for the first weeks. The free demo shows you exactly how it works with your child. (Agent note: the free demo is a waiting list with no fixed date. The Priority Live Demo is a guaranteed class today or tomorrow, booked at https://learn.modernagecoders.com/priority-demo . Offer both, as RULE 3 says.)

Q: Isn't this age too early for structured math?
A: It is exactly the right age for the right kind: playful, concrete, talk-rich mathematics. Research on early number sense is unambiguous, the part-whole and counting ideas built at 4-7 predict mathematics success for years. What would be wrong at this age is worksheets and drilling, which is why we do neither.

Q: How is this different from apps like Khan Kids or busy-work workbooks?
A: Apps entertain and practice; they cannot listen. The engine of early math learning is math talk, a child explaining 'I saw 5 because 4-and-1' to a person who responds. Our mentors have that conversation twice a week, notice exactly which ideas have landed, and adjust in real time. No app does that.

Q: My child already loves numbers. Will this stretch them?
A: Happily, the mentor teaches to stage, not age. A number-loving five-year-old might race into part-whole play and early place value while a classmate consolidates counting. Small groups and 1-on-1 make that flexibility real.

Q: What do parents need to do at home?
A: Kitchens and car rides teach more early math than worksheets ever did, and we show you how to use them.

Q: What comes after this course?
A: Graduates flow into Mental Maths Mastery (for fluency depth) or the Elementary Mathematics Masterclass (the full grades 1-5 program) with the same mentor where possible, arriving with the foundation those courses quietly assume.

Q: How is my child assessed, and is the certificate just for attending?
A: No. A problem set follows every class with written feedback, monthly reviews deliberately mix new material with earlier topics so nothing is forgotten, and the course ends with a final assessment (a friendly, low-pressure check of the whole year). Passing earns the certificate; falling short earns focused revision and a free retest. We measure real understanding, not attendance.

Q: Can we try it before paying?
A: Yes. Every child starts with a free live demo class that doubles as the playful diagnostic, no card details, no obligation, and you will know within the hour whether your child lights up.

To enrol, message Shivam Sir on +91 9123366161 or send the parent this link: https://learn.modernagecoders.com/courses/early-math-foundations
For a demo: the Priority Live Demo (guaranteed, today or tomorrow) is booked at https://learn.modernagecoders.com/priority-demo . The free demo is a waiting list with no fixed date.

==========
COURSE 57 OF 137: ELEMENTARY MATHS FOR GRADES 1-5: LIVE ONLINE CLASSES
==========

Course link: https://learn.modernagecoders.com/courses/elementary-mathematics-complete-masterclass
Subject area: School Mathematics
Designed for: Elementary school, Girls only batches
Who can join: Grades 1-5; every child is placed by grade and a short placement check
Course length: 10-12 months per level (3 levels, Grades 1-5)
Time needed: 2 live classes/week + 20-30 minutes daily practice
Certificate: Level certificate from Modern Age Coders, awarded on passing each level exam

PRICE FOR THIS COURSE (quote only the one that applies to the person asking)
In India, per month: group Rs 1,499, mini batch Rs 2,999, one to one Rs 4,999
Outside India, per month: group $100, one to one $150
Classes: group and mini batch two live classes a week, eight a month; one to one in India one live class a week, four a month; one to one outside India two live classes a week, eight a month. Each class is one hour.

WHAT THIS COURSE IS

Elementary maths classes for Grades 1-5, live and online: placement by grade into three school-year levels, from counting to fractions, geometry and pre-algebra.

In one line: Three honest school-year levels instead of one endless course: your child is placed where they are, and finishes each

level actually owning it.

ABOUT THE PROGRAMME

Primary maths is where number confidence is either built or broken, and it cannot be rushed. That is why this program is structured the way good schools structure it: three levels, each one school year long. Level A builds Grades 1-2: counting, place value, addition and subtraction, shapes, time and money. Level B builds Grades 3-4: multiplication and division fluency, fractions, decimals, data and real geometry. Level C completes Grade 5 and builds the bridge to middle school: advanced fractions, ratios, percentages, circle geometry, first algebra and probability. Every child starts with a short, friendly placement check and joins the level that fits, never the one their age assumes. Classes are live and small, and the method is the one the strongest primary curricula in the world use: concrete first (objects and drawings), then pictorial, then abstract. Practice is 20 to 30 minutes daily rather than marathon sessions, because at this age consistency beats intensity every single time. Each level runs 10 months of teaching at two live classes a week, with up to 12 months for children who need more repetition, the pace adapts, never the standard. Learning is checked the honest way: homework after every class, weekly mixed practice that deliberately revisits earlier topics, a mid-level check, and a level exam at the end. Passing earns the level certificate and promotion; a child who falls short gets focused revision and a free retest. Real knowledge, real work, depth over dopamine.

WHAT MAKES THIS COURSE DIFFERENT

- Placement by level, not by age: a short friendly check decides where your child starts, so nothing is skipped and nothing is repeated
- Concrete, pictorial, abstract: every concept starts with objects and pictures before symbols, the sequence the world's best primary curricula use
- Spiral revision is built in: weekly practice deliberately mixes older topics with new ones, so skills stop fading between terms
- 20-30 minutes of daily practice, not marathon sessions: at this age consistency beats intensity
- Real assessment, gently done: a mid-level check and a level exam decide the certificate, with focused revision and a free retest when needed
- Parents stay in the loop: regular written notes on what was learned, what is next, and exactly how to help at home

THE LEARNING PATH, STEP BY STEP

Phase 1: Level A, Grades 1-2 (one school year): counting and place value, addition and subtraction, first multiplication, shapes, time, money and measurement
Phase 2: Level B, Grades 3-4 (one school year): multiplication and division fluency, fractions, decimals, data and graphing, geometry, area and perimeter
Phase 3: Level C, Grade 5 (one school year): large numbers, advanced fractions, ratios and percentages, circle geometry, first algebra, probability and money maths

WHAT A STUDENT NEEDS BEFORE STARTING

Maths background: None. Level A starts at counting; placement decides the right entry point
Reading: Basic reading helps from Grade 2 up; Level A supports early readers with visual instructions
Equipment: A computer or tablet with a stable internet connection; a notebook and pencil matter more than any app
Age: Grades 1-5 (roughly ages 6-11). Placement is by a short friendly check, never age alone
Time commitment: 2 live classes plus 20-30 minutes of practice a day

WHO THIS COURSE IS FOR

Building foundations: Children in Grades 1-2 whose parents want the foundation laid properly the first time
Catching up: Children in Grades 3-5 with gaps that classroom pace never allows anyone to go back and fix
Moving ahead: Confident children who finish school worksheets early and are hungry for more
Anxious students: Children who have started saying they hate maths, usually one patient level away from changing their mind
Structure seekers: Families who want a real syllabus, real checks and real certificates, not an endless app subscription

FULL CURRICULUM, WEEK BY WEEK

This is the complete teaching plan. Parents can ask about any week.

PHASE 1: LEVEL A FOR GRADES 1-2 (ONE SCHOOL YEAR)

The foundation year(s): numbers, place value, addition and subtraction, first multiplication, shapes, time, money and measurement, all learned with objects and pictures before symbols.

Months 1-2: Numbers and Counting (Weeks 1-8)

Introduction to Numbers and Counting
  Topics:
    - What are numbers? History and importance
    - Counting 1-20: objects, fingers, visual aids
    - Number recognition and writing practice
    - Number words: spelling one to twenty
    - Before, after, and between numbers
    - Counting forward and backward
    - Skip counting by 2s introduction
    - Zero concept and its importance
    - One-to-one correspondence
    - Greater than, less than concepts
    - Equal to understanding
    - Number line introduction 0-20
  Projects built:
    - Create number book with illustrations
    - Number hunt around the house
    - Build counting games with everyday objects
  Practice: 20-30 minutes of playful counting practice a day
Numbers to 100 and Place Value
  Topics:
    - Counting 21-100 systematically
    - Tens and ones concept introduction
    - Place value understanding with blocks
    - Writing numbers in expanded form
    - Number patterns in 100 chart
    - Skip counting by 2s, 5s, and 10s
    - Even and odd numbers introduction
    - Comparing two-digit numbers
    - Ordering numbers from least to greatest
    - Number bonds to 10
    - Introduction to estimation
    - Rounding to nearest 10
  Projects built:
    - 100 chart coloring patterns
    - Place value manipulative games
    - Create skip counting songs
  Practice: Master place value with 50 daily exercises
Basic Addition (Single Digit)
  Topics:
    - Addition concept: combining sets
    - Plus sign and equals sign meaning
    - Addition sentences and vocabulary
    - Adding with objects and pictures
    - Addition on number line
    - Addition facts 0-5
    - Addition facts 6-10
    - Doubles facts (1+1, 2+2, etc.)
    - Near doubles strategy
    - Making 10 strategy
    - Commutative property (turn-around facts)
    - Zero property of addition
  Projects built:
    - Addition fact family houses
    - Create addition story problems book
    - Design addition board game
  Practice: Master 100 addition facts through games and drills
Basic Subtraction (Single Digit)
  Topics:
    - Subtraction as taking away
    - Subtraction as finding difference
    - Minus sign understanding
    - Subtraction sentences
    - Subtraction with objects and pictures
    - Subtraction on number line
    - Subtraction facts 0-10
    - Fact families: addition and subtraction
    - Related facts connection
    - Counting back strategy
    - Counting up strategy
    - Think addition to subtract
  Projects built:
    - Subtraction story problems collection
    - Fact family triangles craft
    - Subtraction bowling game
  Practice: Master subtraction facts through 10
  Assessment: Months 1-2 check: a friendly mixed quiz over everything so far, plus a
  take-home challenge sheet

Months 3-4: Bigger Numbers and First Multiplication (Weeks 9-17)
  Two-Digit Addition
    Topics:
      - Adding multiples of 10
      - Adding two-digit numbers without regrouping
      - Vertical addition alignment
      - Adding ones, then tens strategy
      - Breaking apart numbers to add
      - Addition with regrouping introduction
      - Carrying concept explanation
      - Using base-10 blocks for regrouping
      - Addition with multiple addends
      - Checking addition with subtraction
      - Mental math strategies for addition
      - Estimating sums
    Projects built:
      - Shopping mall addition game
      - Create addition puzzle cards
      - Design digital addition calculator
    Practice: Solve 200 two-digit addition problems
  Two-Digit Subtraction
    Topics:
      - Subtracting multiples of 10
      - Two-digit subtraction without regrouping
      - Vertical subtraction setup
      - Subtract ones, then tens
      - Subtraction with regrouping introduction
      - Borrowing/regrouping concept
      - Using manipulatives for regrouping
      - Checking subtraction with addition
      - Subtraction across zeros
      - Mental math for subtraction
      - Estimating differences
      - Problem-solving with subtraction
    Projects built:
      - Subtraction treasure hunt
      - Create subtraction word problem cards
      - Build subtraction machine model
    Practice: Master 200 two-digit subtraction problems
  Introduction to Multiplication
    Topics:
      - Multiplication as repeated addition
      - Groups and arrays understanding
      - Times sign and multiplication vocabulary
      - Multiplication sentences
      - Skip counting connection
      - Multiplication by 0 and 1
      - Multiplication by 2 and 5
      - Multiplication by 10
      - Doubles in multiplication
      - Using arrays to multiply
      - Commutative property of multiplication
      - Building multiplication tables
    Projects built:
      - Multiplication array art
      - Times tables wheel craft
      - Create multiplication story book
    Practice: Learn multiplication facts 0-5
  Geometry Basics: 2D Shapes
    Topics:
      - Circle: properties and examples
      - Triangle: types and properties
      - Square vs rectangle comparison
      - Pentagon, hexagon, octagon
      - Sides and vertices counting
      - Straight vs curved lines
      - Open vs closed shapes
      - Symmetry introduction
      - Lines of symmetry
      - Creating patterns with shapes
      - Combining shapes to make pictures
      - Shape sorting and classification
    Projects built:
      - Shape collage artwork
      - Geometry in nature scavenger hunt
      - Build shapes with craft sticks
    Practice: Identify and draw 50 different shapes
  Mid-Level Review
    Topics:

- Operations review
- Problem-solving strategies review
- Mental math techniques
- Geometry concepts recap
- Real-world applications

Projects built:

- Create math game combining all concepts
- Design math puzzle book
- Build interactive math display

Assessment: Mid-level check: mixed questions from months 1-4, so earlier skills are proven, not assumed

Months 5-6: Time, Money and Measurement (Weeks 18-26)

Time and Calendar

Topics:

- Clock reading: hour hand understanding
- Clock reading: minute hand understanding
- Reading time to the hour
- Reading time to the half hour
- Quarter past and quarter to
- Reading time to 5 minutes
- AM and PM understanding
- Days of the week sequence
- Months of the year
- Reading calendar dates
- Yesterday, today, tomorrow
- Elapsed time simple problems

Projects built:

- Create personal daily schedule
- Build paper plate clock
- Design calendar for the year

Practice: Read 100 different clock times

Money and Financial Literacy

Topics:

- Coin identification and values
- Penny, nickel, dime, quarter
- Dollar bills introduction
- Counting coins same type
- Counting mixed coins
- Making change basics
- Dollar and cents notation
- Adding money amounts
- Subtracting money amounts
- Word problems with money
- Needs vs wants concept
- Simple budgeting introduction

Projects built:

- Classroom store simulation
- Create money math workbook
- Design piggy bank savings tracker

Practice: Solve 100 money word problems

Length and Height Measurement

Topics:

- Non-standard units measurement
- Introduction to ruler use
- Inches and feet
- Centimeters and meters
- Measuring classroom objects
- Comparing lengths
- Ordering by length
- Estimating lengths
- Perimeter introduction
- Measuring curved lines
- Height measurement
- Distance concepts

Projects built:

- Measurement scavenger hunt
- Create measurement book
- Build measuring tools

Practice: Measure 50 objects accurately

Weight and Capacity

Topics:

- Heavy and light comparison
- Balance scale understanding
- Pounds and ounces introduction
- Kilograms and grams basics
- Weighing common objects
- Capacity: full, empty, half
- Cups, pints, quarts, gallons

- Liters and milliliters
- Comparing capacities
- Estimating weight and capacity
- Temperature introduction
- Reading thermometer

Projects built:
- Kitchen measurement experiments
- Create weight comparison chart
- Design capacity containers game

Practice: Complete 50 measurement activities

Level A Exam and Celebration

Topics:
- Integration of all Phase 1 concepts
- Real-world problem solving
- Project presentation skills
- Mathematical communication
- Reflection on learning

Projects built:
- A proud portfolio of the year's best work, shown to parents

Assessment: LEVEL A EXAM: a friendly written paper plus a short viva, with questions mixed from the whole level. Passing earns the Level A certificate and promotion to Level B; a child who falls short gets focused revision and a free retest

---

PHASE 2: LEVEL B FOR GRADES 3-4 (ONE SCHOOL YEAR)

The fluency year(s): multiplication and division mastered properly, fractions and decimals understood instead of memorized, plus data, geometry, area and perimeter.

Months 1-2: Multiplication and Division Mastery (Weeks 1-9)

Advanced Multiplication Facts

Topics:
- Multiplication facts 6-9
- Square numbers understanding
- Patterns in multiplication table
- Tricks for 9s facts
- Multiplication by 11 and 12
- Distributive property introduction
- Breaking apart to multiply
- Doubling and halving strategy
- Multiplication fact fluency drills
- Timed multiplication tests
- Multiplication games and competitions
- Real-world multiplication applications

Projects built:
- Multiplication facts championship
- Create multiplication tricks book
- Design multiplication app prototype

Practice: Master all multiplication facts 0-12

Multi-Digit Multiplication

Topics:
- Multiplying by 10, 100, 1000
- Two-digit by one-digit multiplication
- Partial products method
- Standard algorithm introduction
- Area model for multiplication
- Lattice multiplication method
- Three-digit by one-digit
- Two-digit by two-digit basics
- Estimating products
- Checking multiplication with division
- Word problems with multiplication
- Multi-step problems

Projects built:
- Area model visual guide
- Multiplication method comparison
- Create multiplication story problems

Practice: Solve 200 multi-digit multiplication problems

Introduction to Division

Topics:
- Division as sharing equally
- Division as repeated subtraction
- Division symbol and vocabulary
- Dividend, divisor, quotient
- Division facts related to multiplication
- Dividing by 1 and itself
- Division by 2, 5, and 10
- Using multiplication to divide
- Fact families with multiplication/division

```
      - Remainders introduction
      - Division on number line
      - Array model for division
    Projects built:
      - Division fact family houses
      - Create division story book
      - Design fair sharing game
    Practice: Master basic division facts
  Long Division
    Topics:
      - Long division setup
      - Divide, multiply, subtract, bring down
      - Two-digit divided by one-digit
      - Handling remainders
      - Checking division with multiplication
      - Three-digit divided by one-digit
      - Zeros in quotient
      - Estimating quotients
      - Division word problems
      - Interpreting remainders in context
      - Mental math division strategies
      - Division patterns
    Projects built:
      - Long division step-by-step guide
      - Division problem generator
      - Create division board game
    Practice: Complete 150 long division problems
  Problem-Solving with Operations
    Topics:
      - Choosing the correct operation
      - Multi-step word problems
      - Working backward strategy
      - Guess and check method
      - Drawing diagrams to solve
      - Making tables strategy
      - Finding patterns in problems
      - Writing equations from words
      - Checking reasonableness
      - Problem-solving plan steps
      - Creating own word problems
      - Real-world applications
    Projects built:
      - Problem-solving strategy poster
      - Word problem collection book
      - Math detective game
    Practice: Solve 100 multi-step word problems
    Assessment: Months 1-2 check: mixed word problems using all four operations, reaching
    back to Level A skills

Months 3-4: Fractions and Decimals (Weeks 10-18)
  Understanding Fractions
    Topics:
      - Fraction as part of whole
      - Numerator and denominator meaning
      - Unit fractions understanding
      - Halves, thirds, fourths
      - Fifths, sixths, eighths
      - Fractions on number line
      - Comparing fractions same denominator
      - Comparing fractions same numerator
      - Equivalent fractions with models
      - Simplest form introduction
      - Mixed numbers introduction
      - Improper fractions basics
    Projects built:
      - Fraction pizza party
      - Fraction art with paper folding
      - Create fraction manipulatives
    Practice: Short daily practice sets, checked and celebrated in class
  Operations with Fractions
    Topics:
      - Adding fractions same denominator
      - Subtracting fractions same denominator
      - Adding mixed numbers simple
      - Subtracting mixed numbers simple
      - Finding common denominators
      - Adding unlike fractions basics
      - Subtracting unlike fractions basics
      - Multiplying fraction by whole number
```

- Fraction of a set
- Word problems with fractions
- Estimating with fractions
- Fractions in measurement

Projects built:

- Fraction operations cookbook
- Fraction calculator design
- Fraction word problem collection

Practice: Complete 150 fraction operations

Introduction to Decimals

Topics:

- Decimal point meaning
- Tenths place understanding
- Hundredths place understanding
- Reading decimal numbers
- Writing decimals in words
- Decimals on number line
- Comparing decimals
- Ordering decimals
- Rounding decimals to whole
- Rounding to nearest tenth
- Fractions to decimals (tenths, hundredths)
- Money as decimals

Projects built:

- Decimal place value chart
- Decimal number line display
- Create decimal comparison game

Practice: Short daily practice sets, checked and celebrated in class

Decimal Operations

Topics:

- Adding decimals with same places
- Subtracting decimals same places
- Adding decimals different places
- Lining up decimal points
- Adding money with decimals
- Subtracting money with decimals
- Multiplying decimals by 10, 100
- Multiplying decimal by whole number
- Estimating with decimals
- Word problems with decimals
- Decimals in measurement
- Calculator use with decimals

Projects built:

- Decimal shopping simulation
- Create decimal workbook
- Design decimal maze game

Practice: Solve 150 decimal problems

Data and Graphing

Topics:

- Collecting and organizing data
- Tally charts and frequency tables
- Pictographs reading and creating
- Bar graphs horizontal and vertical
- Line plots introduction
- Reading and interpreting graphs
- Finding range, mode, median
- Mean (average) introduction
- Creating surveys
- Double bar graphs
- Making predictions from data
- Data in real world

Projects built:

- Class survey project
- Create graphing portfolio
- Design data collection app

Practice: Create and interpret 30 different graphs

Assessment: Months 3-4 check: a mixed fractions-and-decimals paper with a data question, plus revision of months 1-2

Months 5-6: Geometry, Area and the Level Exam (Weeks 19-26)

Advanced 2D Geometry

Topics:

- Types of angles: acute, right, obtuse
- Measuring angles with protractor
- Drawing angles
- Parallel and perpendicular lines
- Types of triangles by sides
- Types of triangles by angles
- Quadrilaterals classification

```
    - Properties of rectangles, squares
    - Rhombus and parallelogram
    - Trapezoid properties
    - Congruent shapes
    - Similar shapes basics
  Projects built:
    - Geometry art portfolio
    - Angle measurement tools
    - Create geometry handbook
  Practice: Complete 100 geometry exercises
3D Shapes and Volume
  Topics:
    - 3D shapes: cube, rectangular prism
    - Sphere, cylinder, cone
    - Pyramid types
    - Faces, edges, vertices counting
    - Nets of 3D shapes
    - Building 3D shapes from nets
    - Volume as counting cubes
    - Volume of rectangular prism
    - Surface area introduction
    - Real-world 3D shapes
    - Cross-sections basics
    - 3D shape sorting
  Projects built:
    - 3D shape construction kit
    - Volume exploration lab
    - Create 3D shape museum
  Practice: Build and analyze 30 3D shapes
Area and Perimeter
  Topics:
    - Perimeter of polygons
    - Perimeter word problems
    - Area by counting squares
    - Area of rectangle formula
    - Area of square
    - Area of triangle introduction
    - Area of parallelogram
    - Composite figures area
    - Perimeter of composite figures
    - Area vs perimeter understanding
    - Real-world area problems
    - Estimating area and perimeter
  Projects built:
    - Design dream bedroom with area
    - Perimeter and area games
    - Create area/perimeter reference
  Practice: Solve 100 area/perimeter problems
Coordinate Geometry
  Topics:
    - Coordinate plane introduction
    - X-axis and y-axis
    - Ordered pairs (x, y)
    - Plotting points on grid
    - Reading coordinates
    - First quadrant focus
    - Creating pictures with coordinates
    - Distance between points (horizontal/vertical)
    - Simple transformations: slides
    - Reflections across axes
    - Coordinate battleship game
    - Real-world coordinate uses
  Projects built:
    - Coordinate art gallery
    - Treasure map with coordinates
    - Design coordinate game
  Practice: Plot and identify 100 coordinate points
Level B Exam and Celebration
  Topics:
    - Integration of Phase 2 concepts
    - Complex problem-solving
    - Mathematical reasoning
    - Project presentation
    - Self-assessment and reflection
  Projects built:
    - A geometry-and-fractions portfolio of the year's best work
  Assessment: LEVEL B EXAM: a written paper plus a short viva, with questions mixed from
  the whole level and a few reaching back to Level A. Passing earns the Level B
  certificate and promotion to Level C; a child who falls short gets focused revision and
```

      a free retest

PHASE 3: LEVEL C FOR GRADE 5 (ONE SCHOOL YEAR)

The bridge year: large numbers, advanced fractions, ratios and percentages, circle geometry,
first algebra, probability and money maths, everything middle school assumes.

  Months 1-2: Numbers and Fractions Mastery (Weeks 1-8)
    Large Numbers and Place Value
      Topics:
        - Numbers to millions
        - Place value to millions
        - Reading and writing large numbers
        - Expanded form to millions
        - Comparing large numbers
        - Ordering large numbers
        - Rounding to any place value
        - Scientific notation introduction
        - Powers of 10 understanding
        - Number patterns in large numbers
        - Estimation with large numbers
        - Real-world large numbers
      Projects built:
        - Large number reference book
        - Population studies project
        - Create million visualization
      Practice: Short daily practice sets, checked and celebrated in class
    Factors and Multiples
      Topics:
        - Factors definition and finding
        - Factor pairs
        - Prime and composite numbers
        - Prime factorization
        - Factor trees
        - Greatest Common Factor (GCF)
        - Multiples and common multiples
        - Least Common Multiple (LCM)
        - Using GCF and LCM
        - Divisibility rules 2, 3, 5, 9, 10
        - Perfect squares
        - Square roots introduction
      Projects built:
        - Factor and multiple game
        - Prime number sieve activity
        - Create divisibility rule guide
      Practice: Find factors and multiples of 100 numbers
    Complex Fraction Operations
      Topics:
        - Adding mixed numbers with regrouping
        - Subtracting mixed numbers with borrowing
        - Finding least common denominator
        - Adding three or more fractions
        - Fraction multiplication understanding
        - Multiplying fractions by fractions
        - Multiplying mixed numbers
        - Reciprocals introduction
        - Division of fractions basics
        - Dividing whole numbers by fractions
        - Complex fraction word problems
        - Fractions in recipes and scaling
      Projects built:
        - Fraction operations cookbook
        - Fraction calculator model
        - Create fraction game show
      Practice: Master 200 complex fraction problems
    Advanced Decimal Operations
      Topics:
        - Multiplying decimals by decimals
        - Division with decimals as divisor
        - Repeating decimals introduction
        - Terminating vs repeating
        - Converting fractions to decimals
        - Converting decimals to fractions
        - Percent as special decimal
        - Scientific notation with decimals
        - Significant figures basics
        - Decimal word problems complex
        - Decimals in science contexts

- Calculator strategies with decimals
Projects built:
- Decimal conversion chart
- Scientific measurement project
- Design decimal Olympics
Practice: Complete 200 decimal operations
Assessment: Months 1-2 check: mixed numbers-and-fractions paper, with revision questions from Level B

Months 3-4: Proportional Thinking and Geometry (Weeks 9-16)
Ratios and Proportions
Topics:
- Ratio concept and notation
- Writing ratios three ways
- Equivalent ratios
- Simplifying ratios
- Ratio tables
- Rates and unit rates
- Price per unit calculations
- Proportion definition
- Solving proportions
- Cross multiplication
- Scale drawings and maps
- Similar figures and ratios
Projects built:
- Recipe scaling project
- Map scale investigation
- Create ratio/proportion game
Practice: Solve 150 ratio and proportion problems
Percentages
Topics:
- Percent meaning and symbol
- Percent as per hundred
- Converting percent to decimal
- Converting percent to fraction
- Finding percent of a number
- Mental math with percentages
- 10%, 25%, 50%, 75% shortcuts
- Percent increase introduction
- Percent decrease introduction
- Sales tax calculations
- Discount calculations
- Tips and gratuity
Projects built:
- Shopping with percentages
- Create percent reference guide
- Design discount calculator
Practice: Master 150 percentage problems
Advanced Angle Relationships
Topics:
- Complementary angles
- Supplementary angles
- Vertical angles
- Adjacent angles
- Angles in triangles sum to 180°
- Finding missing angles
- Angles in quadrilaterals
- Interior angles of polygons
- Exterior angles basics
- Angle bisectors
- Perpendicular bisectors
- Constructions with compass
Projects built:
- Angle relationship poster
- Geometric construction kit
- Create angle puzzle game
Practice: Solve 100 angle problems
Circle Geometry
Topics:
- Circle vocabulary: radius, diameter
- Chord and arc definitions
- Center, circumference understanding
- Pi introduction and history
- Circumference formula C = πd
- Circumference formula C = 2πr
- Area of circle A = πr²
- Finding radius from circumference
- Finding radius from area
- Semicircles and quarter circles

- Composite figures with circles
- Real-world circle problems

Projects built:

- Pi Day celebration materials
- Circle measurement lab
- Design circular art project

Practice: Solve 100 circle problems

Assessment: Months 3-4 check: ratios, percentages and geometry mixed together, the way real problems arrive

Months 5-6: First Algebra, Data and the Level Exam (Weeks 17-26)

Variables and Expressions

Topics:

- Variable as unknown number
- Writing algebraic expressions
- Translating words to algebra
- Evaluating expressions
- Substitution method
- Terms and coefficients
- Like terms identification
- Combining like terms
- Distributive property with variables
- Simplifying expressions
- Expression word problems
- Creating expressions from patterns

Projects built:

- Algebra translation dictionary
- Expression puzzle cards
- Create algebra game

Practice: Write and evaluate 30 expressions over the fortnight, a few each day

Simple Equations

Topics:

- Equation vs expression
- Solving one-step addition equations
- Solving one-step subtraction equations
- Solving one-step multiplication equations
- Solving one-step division equations
- Inverse operations concept
- Checking solutions
- Two-step equations introduction
- Equations with fractions basics
- Equations with decimals basics
- Word problems to equations
- Real-world equation applications

Projects built:

- Equation solving guide
- Balance scale demonstrations
- Create equation puzzle book

Practice: Short daily practice sets, checked and celebrated in class

Advanced Data Analysis

Topics:

- Mean, median, mode review
- Range and outliers
- Quartiles introduction
- Box-and-whisker plots
- Stem-and-leaf plots
- Frequency distributions
- Histograms
- Circle graphs (pie charts)
- Choosing appropriate graphs
- Misleading graphs identification
- Data collection methods
- Surveys and sampling basics

Projects built:

- Statistical investigation project
- Data visualization portfolio
- Create statistics infographic

Practice: Analyze 50 data sets

Probability Fundamentals

Topics:

- Probability as likelihood
- Probability scale 0 to 1
- Certain, likely, unlikely, impossible
- Experimental probability
- Theoretical probability
- Favorable outcomes
- Sample space
- Simple probability calculations
- Probability with dice

- Probability with cards
- Probability with spinners
- Compound events introduction

Projects built:
- Probability experiment lab
- Design probability games
- Create probability reference

Practice: Calculate 100 probabilities

Money Maths, Review and the Level C Exam

Topics:
- Simple interest calculation
- Compound interest introduction
- Savings and investments basics
- Budget creation and management
- Profit and loss
- Markup and markdown
- Commission calculations
- Tax calculations advanced
- Unit price comparisons
- Best buy problems
- Currency exchange basics
- Financial planning introduction
- Full-course spiral review: the greatest hits of all three levels
- Exam technique for children: reading twice, showing working, checking once

Projects built:
- A real family budget project, planned and presented
- The Level C portfolio: the year's best work

Practice: Daily mixed revision sets in the final fortnight

Assessment: LEVEL C EXAM: a written paper plus a short viva, with questions mixed from the whole level and earlier ones. Passing earns the Level C certificate, completing the elementary program ready for middle school; a child who falls short gets focused revision and a free retest

PROJECTS THE STUDENT BUILDS AND KEEPS

- Level A: number books, counting games, shape art, time and money projects, a measurement lab at home
- Level B: multiplication championships, fraction cookbooks, decimal shopping games, geometry portfolios
- Level C: percentage shopping challenges, circle geometry art, algebra puzzle cards, probability experiments, a family budget project

Total projects: 60+ hands-on maths projects and games across the three levels

SKILLS THE STUDENT WILL HAVE AT THE END

- Number sense: counting, place value, mental strategies and the confidence to estimate
- Operations: addition, subtraction, multiplication and division to real fluency
- Fractions and decimals: understood with models first, then mastered in operations
- Measurement and money: time, length, weight, capacity and practical money maths
- Geometry: 2D and 3D shapes, angles, symmetry, circles, area and perimeter
- Data and probability: reading, drawing and questioning graphs, first probability
- First algebra: variables, expressions and simple equations, the middle-school bridge
- Problem solving: bar models, working backwards, and explaining the why out loud

HOW A TYPICAL WEEK IS SPLIT

Live classes: 2 live classes per week, small groups, taught with objects and visuals before symbols

Homework: A short homework sheet after every class, and weekly mixed practice that revisits earlier topics

Practice: 20-30 minutes of daily practice, structured as games and challenge sets

Review: Every sheet checked with written feedback; wobbly topics reopened in class before they become gaps

SUPPORT INCLUDED

Doubt support: WhatsApp doubt support between classes, for the homework question that turns into tears

Progress updates: Regular written notes to parents: what was learned, what comes next, and exactly how to help at home

CERTIFICATION DETAIL

Completion: A level certificate at the end of each level, awarded on passing the level exam (a written paper plus a friendly viva). Fall short and there is focused revision and a free retest: the certificate certifies knowledge, not attendance

WHERE THIS CAN LEAD

- Middle School Mathematics: the direct continuation, entered with a tested foundation
- Mental Maths Mastery: speed and number sense built alongside or after any level
- Olympiad and competition maths: for Level C graduates who found the puzzles delicious
- Maths Through Coding: where the numbers start moving on screen
- School confidence, immediately: the level system mirrors and reinforces classroom maths all year

COMMON QUESTIONS ABOUT THIS COURSE

For anything about cost, use PART 4 and RULE 1. Do not quote two regions.

Q: Which level will my child join?
A: A short, friendly placement check decides, never age alone. Level A builds Grades 1-2 (counting to first multiplication, time, money), Level B builds Grades 3-4 (multiplication and division fluency, fractions, decimals, geometry), and Level C completes Grade 5 (ratios, percentages, first algebra, probability). Most children join the level matching their grade; children with gaps start where the gaps are, because skipping holes in maths only buries them.

Q: How long does each level take?
A: Each level is one school year: 10 months of teaching at 2 live classes a week, with up to 12 months for children who need more repetition. That margin is deliberate, at this age the pace adapts to the child, never the other way around. A child who starts in Level A and continues through Level C finishes elementary maths genuinely owned, not skimmed.

Q: How is my child assessed? Is the certificate just for attending?
A: No. There is classwork in every session, a short homework sheet after every class, weekly mixed practice that deliberately revisits earlier topics, a friendly quiz at each month-pair, a mid-level check, and a level exam at the end: a written paper plus a short viva. Passing earns the level certificate and promotion; a child who falls short gets focused revision and a free retest. Gentle in tone, real in standard.

Q: My child struggles with maths anxiety. How does this course help?
A: By removing the two causes: gaps and pace. Placement starts the child where their gaps actually are, and every concept begins with objects and pictures before symbols, so understanding always precedes speed. Classes are small, wins are celebrated, and practice is 20 to 30 minutes daily rather than exhausting marathons. Most anxious children change their mind about maths within one level, because the anxiety was never about maths, it was about being lost.

Q: How is this different from school tuition?
A: Tuition usually chases this week's homework. This is a complete levelled curriculum with its own arc: placement, spiral revision, monthly checks and a level exam, so gaps get found and closed instead of papered over. It runs alongside any school board comfortably, CBSE, ICSE or international, because Grades 1-5 maths is the same mathematics everywhere.

Q: How much time does it take each week?
A: Two live classes a week plus 20 to 30 minutes of daily practice, usually structured as games and short challenge sets. At this age consistency beats intensity: twenty focused daily minutes outperform a two-hour weekend session every time, and it never becomes a fight at the kitchen table.

Q: Will this prepare my child for olympiads?
A: It builds the foundation olympiads stand on: real fluency, flexible problem solving and comfort with multi-step reasoning. Level C includes genuine puzzle work. Children who love that side graduate naturally into our dedicated olympiad mathematics courses, which train competition technique specifically.

Q: Is there a free trial class?
A: Yes, a free demo class with no commitment: book at learn.modernagecoders.com/contact or message us on WhatsApp at +91 91233 66161. The placement check can happen in the same week, and parents are welcome to sit in on both. (Agent note: the free demo is a waiting list with no fixed date. The Priority Live Demo is a guaranteed class today or tomorrow, booked at https://learn.modernagecoders.com/priority-demo . Offer both, as RULE 3 says.)

Q: Are classes live or recorded?
A: Every class is live: a small group with a real teacher who sees your child's working in real time, never a pre-recorded video. At this age the teacher's eyes matter most, catching the finger-counting, the reversed digits, the guess dressed as an answer, and fixing each gently before it becomes a habit.

To enrol, message Shivam Sir on +91 9123366161 or send the parent this link: https://learn.modernagecoders.com/courses/elementary-mathematics-complete-masterclass
For a demo: the Priority Live Demo (guaranteed, today or tomorrow) is booked at https://learn.modernagecoders.com/priority-demo . The free demo is a waiting list with no fixed date.

==========

COURSE 58 OF 137: ETHICAL HACKING COURSE: AUTHORIZED PENTESTING, ZERO TO PRO
==========

Course link: https://learn.modernagecoders.com/courses/ethical-hacking-masterclass-complete
Subject area: Cybersecurity
Designed for: College students
Who can join: Complete beginner (18+); college students, graduates and working professionals
Course length: 10-12 months (44-52 weeks)
Time needed: 2 live classes/week + 4-6 hours practice
Certificate: Certificate from Modern Age Coders, awarded on passing the final exam

PRICE FOR THIS COURSE (quote only the one that applies to the person asking)
  In India, per month: group Rs 1,499, mini batch Rs 2,999, one to one Rs 4,999
  Outside India, per month: group $100, one to one $150
  Classes: group and mini batch two live classes a week, eight a month; one to one in India one live class a week, four a month; one to one outside India two live classes a week, eight a month. Each class is one hour.

WHAT THIS COURSE IS

  Ethical hacking and cybersecurity course for adults: networking and Linux, authorized penetration testing, web and network exploitation, red and blue team skills, and professional reporting, taught legally and ethically, in 10-12 months.

  In one line: Break in so you can defend: authorized penetration testing taught the professional way, from networking and Linux to red team operations and reports that get vulnerabilities fixed.

ABOUT THE PROGRAMME

  Ethical hacking is authorized, legal security testing done to find and fix weaknesses before criminals do, and the emphasis in this course is on the word ethical. It is built for people who want a real cybersecurity career, penetration tester, security analyst, red or blue team engineer, and it starts every offensive skill from a foundation of authorization, scope and law. The path is complete and in order: networking, Linux and programming for security, reconnaissance and scanning, then core exploitation, web and network attacks, Metasploit, the OWASP Top 10, post-exploitation, all practised only in lab environments and authorized ranges, then advanced work: buffer overflows and mitigation bypasses, cryptography, red team operations, and the defensive side, DevSecOps, threat hunting, incident response and forensics, so you understand both attack and defence. A finale month runs a full authorized penetration test of a lab and writes the professional report, then sits the final exam. The pace is honest: ten teaching months at two live classes a week plus four to six hours of lab practice, with two more in hand. Problem sets, monthly mixed reviews, phase exams, and a final exam that decides the certificate with a free retest.

WHAT MAKES THIS COURSE DIFFERENT

  - Ethics and authorization first, not as a footnote: scope, consent and law frame every technique
  - Everything practised in labs and authorized ranges only, never against systems you do not own
  - Both sides taught: offensive skills and the defensive DevSecOps, threat-hunting and forensics response
  - Professional reporting is a core skill: findings that actually get fixed, not just exploits
  - An honest 10-month arc with 2 months in hand
  - Real assessment: weekly problem sets, monthly mixed reviews, phase exams and a final exam with a free retest

THE LEARNING PATH, STEP BY STEP

  Phase 1: Foundations and recon (Months 1-3): networking, Linux, programming, ethics, OSINT and scanning
  Phase 2: Core exploitation (Months 4-6): system, web and network attacks, post-exploitation, advanced domains
  Phase 3: Advanced and defensive (Months 7-9): exploit development, red team, DevSecOps, threat hunting, forensics
  Phase 4: The finale (Month 10): a full authorized lab pentest, the professional report, and the final exam

WHAT A STUDENT NEEDS BEFORE STARTING

  Coding experience: None. Everything is taught from the first line
  Equipment: Any computer with a stable internet connection; every tool used is free
  Age: 18+; college students, graduates and working professionals
  Time commitment: 2 live classes plus 4-6 hours of practice a week

WHO THIS COURSE IS FOR

  Aspiring pentesters: Adults who want a real penetration-testing or security career
  It professionals: IT and network staff moving into security
  Developers: Developers who want to build and test secure systems

Soc bound: Future SOC analysts who need to understand attacks to defend against them
Cert seekers: Learners preparing for CEH, OSCP and similar certifications

FULL CURRICULUM, WEEK BY WEEK

This is the complete teaching plan. Parents can ask about any week.

PHASE 1: FOUNDATIONS, ETHICS AND RECONNAISSANCE (MONTHS 1-3, WEEKS 1-13)

Build rock-solid networking and Linux foundations essential for ethical hacking. Master TCP/IP, operating systems, programming basics, and security fundamentals.

Months 1-2: Networking & Linux Fundamentals (Weeks 1-8)

Introduction to Ethical Hacking & Networking Basics

Topics:

- What is ethical hacking and why it matters
- Legal considerations and ethical guidelines
- Hacking methodology: reconnaissance to reporting
- Setting up hacking lab environment safely
- VirtualBox/VMware installation and configuration
- Kali Linux installation and initial setup
- OSI model deep dive: all 7 layers
- TCP/IP protocol suite fundamentals
- IP addressing and subnetting mastery
- IPv4 vs IPv6 differences and implications
- MAC addresses and ARP protocol
- Network devices: routers, switches, firewalls
- DNS fundamentals and exploitation basics
- HTTP/HTTPS protocol analysis
- Common ports and services

Projects built:

- Complete hacking lab setup with multiple VMs
- Network topology design and implementation
- Subnet calculator tool development
- Protocol analyzer using Wireshark

Practice: Configure 10 different network scenarios, analyze 50 packet captures

Linux Mastery for Hackers

Topics:

- Linux file system hierarchy
- Essential Linux commands for hackers
- File permissions and ownership
- User and group management
- Process management and monitoring
- Package management (apt, yum, dpkg)
- Shell scripting fundamentals
- Bash scripting for automation
- Text manipulation: grep, sed, awk
- Network commands: netstat, ss, lsof
- Service management with systemctl
- Log file analysis and monitoring
- Cron jobs and task scheduling
- SSH configuration and hardening
- Linux security basics

Projects built:

- Automation scripts for reconnaissance
- Custom security monitoring dashboard
- Log analysis automation tool
- Linux hardening checklist implementation

Practice: Complete 100 Linux challenges, write 20 bash scripts

Programming for Hackers - Python & Web Basics

Topics:

- Python fundamentals for security
- Socket programming in Python
- Network programming with Scapy
- Web scraping with BeautifulSoup
- Requests library for HTTP interactions
- Regular expressions for pattern matching
- HTML, CSS, JavaScript basics
- Understanding web application architecture
- Client-server communication model
- RESTful APIs and JSON
- SQL fundamentals and injection basics
- XML and XXE vulnerability basics
- Encoding and encryption basics
- Hashing algorithms and their weaknesses
- Cryptography fundamentals

Projects built:

- Port scanner in Python

```
      - Password cracker for weak hashes
      - Web crawler for reconnaissance
      - Network packet sniffer
      - Simple vulnerability scanner
    Practice: Write 30 security tools in Python
  Information Gathering & OSINT
    Topics:
      - Open Source Intelligence (OSINT) fundamentals
      - Google dorking and advanced search operators
      - Social media reconnaissance techniques
      - Email harvesting and verification
      - DNS enumeration and zone transfers
      - Subdomain discovery techniques
      - WHOIS and domain information gathering
      - Shodan for device discovery
      - Censys and other search engines
      - Metadata extraction from documents
      - Website technology identification
      - Company and employee reconnaissance
      - Physical location information gathering
      - Dark web basics for intelligence
      - OSINT frameworks and automation
    Projects built:
      - Complete OSINT profile builder
      - Automated reconnaissance framework
      - Company security assessment report
      - Social engineering information gatherer
      - Custom OSINT tool development
    Practice: Perform OSINT on 20 targets (legally and ethically)

Month 3: Scanning & Enumeration (Weeks 9-13)
  Network Scanning & Enumeration
    Topics:
      - Network scanning methodology
      - Nmap fundamentals and advanced techniques
      - TCP connect and SYN stealth scanning
      - UDP scanning challenges and techniques
      - Service version detection
      - Operating system fingerprinting
      - Nmap Scripting Engine (NSE)
      - Vulnerability scanning with Nessus
      - OpenVAS configuration and usage
      - Banner grabbing techniques
      - SNMP enumeration
      - SMB/NetBIOS enumeration
      - LDAP enumeration
      - NFS enumeration
      - Database enumeration
    Projects built:
      - Network mapping automation tool
      - Vulnerability assessment report generator
      - Custom Nmap scripts development
      - Enumeration framework creation
      - Automated scanning pipeline
    Practice: Scan and enumerate 30 different networks/systems
  Web Application Scanning
    Topics:
      - Web application architecture review
      - Burp Suite Professional setup
      - Proxy configuration and SSL handling
      - Spidering and crawling applications
      - Directory and file brute forcing
      - Parameter discovery and fuzzing
      - Technology stack identification
      - Web application firewalls (WAF) detection
      - API endpoint discovery
      - JavaScript analysis for endpoints
      - Source code review basics
      - Automated scanning with Burp Scanner
      - OWASP ZAP usage and automation
      - Nikto and dirb for web scanning
      - Custom wordlist creation
    Projects built:
      - Web application reconnaissance tool
      - API endpoint discovery framework
      - WAF detection and bypass tool
      - Custom web fuzzer development
      - Automated web scanning report
    Practice: Scan 25 web applications, find 100 endpoints
```

```
    Vulnerability Assessment
      Topics:
        - Vulnerability assessment methodology
        - CVSS scoring understanding
        - CVE database navigation
        - Exploit database usage
        - Manual vulnerability verification
        - False positive identification
        - Risk assessment and prioritization
        - Vulnerability chaining concepts
        - Patch management basics
        - Compliance scanning (PCI DSS, HIPAA)
        - Creating vulnerability matrices
        - Remediation recommendations
        - Phase 1 comprehensive review
      Projects built:
        - PHASE 1 CAPSTONE: Complete Security Assessment
        - Target: Vulnerable VM (Metasploitable, DVWA)
        - Tasks: Full recon, scanning, enumeration, vulnerability assessment, professional report
      Assessment: Phase 1 exam: a practical build defended live, plus a written paper mixing
      this phase with everything before it

------------------------------------------------------------
PHASE 2: CORE EXPLOITATION AND ADVANCED DOMAINS (MONTHS 4-6, WEEKS 14-26)
------------------------------------------------------------
Master system hacking, web application attacks, exploitation frameworks, and
post-exploitation techniques.

  Month 4: System Hacking & Exploitation (Weeks 14-18)
    System Hacking & Password Attacks
      Topics:
        - Windows architecture and vulnerabilities
        - Linux privilege escalation techniques
        - Password attack methodology
        - Rainbow tables and time-memory trade-off
        - John the Ripper mastery
        - Hashcat for GPU cracking
        - Hydra for online attacks
        - Pass-the-hash attacks
        - Kerberoasting and ASREPRoasting
        - Credential dumping with Mimikatz
        - SAM and SYSTEM file extraction
        - Keyloggers and screenshot capture
        - Password policy bypassing
        - Multi-factor authentication bypasses
        - Physical access attacks
      Projects built:
        - Password cracking framework
        - Credential harvesting tool
        - Windows privilege escalation script
        - Linux privilege escalation checklist
        - Custom keylogger development
      Practice: Crack 50 passwords, escalate privileges on 20 systems
    Metasploit Framework & Exploitation
      Topics:
        - Metasploit architecture and components
        - MSFconsole navigation and usage
        - Exploit selection and configuration
        - Payload types and encoding
        - Meterpreter advanced features
        - Post-exploitation with Metasploit
        - Persistence mechanisms
        - Pivoting through compromised hosts
        - Port forwarding and tunneling
        - Custom exploit development basics
        - Ruby for Metasploit modules
        - Evasion techniques and encoding
        - Anti-virus bypass methods
        - Exploit chaining strategies
        - Manual exploitation techniques
      Projects built:
        - Custom Metasploit module
        - Automated exploitation framework
        - Post-exploitation toolkit
        - Persistence mechanism generator
        - AV evasion payload creator
        - Exploit chain automation
        - Pivoting lab setup
      Practice: Exploit 30 vulnerable systems, develop 10 custom payloads
```

```
  Web Application Hacking - OWASP Top 10
    Topics:
      - SQL Injection: union, blind, time-based
      - SQLMap advanced usage
      - Cross-Site Scripting (XSS): reflected, stored, DOM
      - XSS filter bypasses and polyglots
      - Cross-Site Request Forgery (CSRF)
      - XML External Entity (XXE) attacks
      - Server-Side Request Forgery (SSRF)
      - Insecure Deserialization exploitation
      - Command injection techniques
      - Directory traversal and LFI/RFI
      - File upload vulnerabilities
      - Authentication and session flaws
      - Broken access control exploitation
      - Security misconfiguration attacks
      - Using Burp Suite for exploitation
    Projects built:
      - SQL injection automation tool
      - XSS payload generator
      - Web shell development
      - Session hijacking tool
      - Automated OWASP scanner
      - Custom Burp extension
      - Web exploitation framework
    Practice: Exploit 50 web vulnerabilities across all OWASP Top 10
  Advanced Web Attacks & API Security
    Topics:
      - Modern JavaScript framework vulnerabilities
      - React, Angular, Vue.js security issues
      - WebSocket vulnerabilities
      - GraphQL injection and attacks
      - REST API vulnerabilities
      - JWT token manipulation
      - OAuth and SAML attacks
      - Race conditions and TOCTOU
      - Cache poisoning attacks
      - HTTP request smuggling
      - Subdomain takeover techniques
      - CORS misconfiguration exploitation
      - Business logic vulnerabilities
      - Payment gateway bypasses
      - Two-factor authentication bypasses
    Projects built:
      - API security testing framework
      - JWT token manipulation tool
      - Race condition exploit tool
      - Business logic flaw detector
      - Modern web app scanner
    Practice: Test 20 APIs, find 30 logic flaws
  Database Hacking & NoSQL Injection
    Topics:
      - Database architecture and weaknesses
      - Advanced SQL injection techniques
      - Oracle, MySQL, PostgreSQL specific attacks
      - MongoDB injection attacks
      - Redis exploitation techniques
      - Elasticsearch vulnerabilities
      - Database privilege escalation
      - Data exfiltration techniques
      - Blind injection automation
      - Time-based extraction optimization
      - NoSQL injection payloads
      - GraphQL database attacks
      - ORM injection vulnerabilities
    Projects built:
      - Database exploitation framework
      - NoSQL injection scanner
      - Blind injection optimizer
      - Data exfiltration tool
      - Database security assessment tool
    Practice: Exploit 25 database vulnerabilities

Month 5: Network Attacks & Post-Exploitation (Weeks 19-22)
  Network Attacks & Man-in-the-Middle
    Topics:
      - ARP poisoning and spoofing
      - DNS spoofing and hijacking
      - DHCP starvation attacks
```

    - VLAN hopping techniques
    - STP manipulation
    - BGP hijacking basics
    - SSL/TLS vulnerabilities
    - SSL stripping attacks
    - Evil twin attacks
    - Rogue access points
    - SMB relay attacks
    - LLMNR/NBT-NS poisoning
    - Responder tool usage
    - IPv6 attack vectors
    - Network sniffing at scale
  Projects built:
    - MITM attack framework
    - Network poisoning toolkit
    - SSL stripping tool
    - Rogue DHCP server
    - Traffic manipulation proxy
    - Network attack automation
  Practice: Perform 30 network attacks in lab environment
Wireless Network Hacking
  Topics:
    - Wireless networking fundamentals
    - 802.11 protocol weaknesses
    - Monitor mode and packet injection
    - WEP cracking techniques
    - WPA/WPA2 handshake capture
    - WPA2 cracking with hashcat
    - WPS attacks with Reaver/Bully
    - PMKID attack methodology
    - Evil twin and karma attacks
    - Captive portal bypassing
    - Bluetooth hacking basics
    - Software Defined Radio (SDR) basics
    - RFID and NFC hacking
    - Wireless IDS/IPS evasion
    - Creating custom rogue APs
  Projects built:
    - Automated WiFi cracking tool
    - Handshake capture framework
    - Rogue AP with captive portal
    - Bluetooth exploitation tool
    - Wireless security assessment kit
  Practice: Crack 20 wireless networks, create 10 rogue APs
Post-Exploitation & Lateral Movement
  Topics:
    - Post-exploitation methodology
    - Maintaining access techniques
    - Backdoor installation methods
    - Rootkit basics and detection
    - Living off the land (LOLBins)
    - PowerShell for post-exploitation
    - Windows privilege escalation
    - Linux privilege escalation
    - Lateral movement strategies
    - Pass-the-hash/ticket attacks
    - Kerberos attacks in depth
    - Active Directory exploitation
    - Domain dominance techniques
    - Data exfiltration methods
    - Covering tracks and log cleaning
  Projects built:
    - Post-exploitation framework
    - Persistence toolkit
    - Lateral movement automation
    - AD exploitation toolkit
    - Data exfiltration tool
    - Anti-forensics toolkit
  Practice: Complete 20 post-exploitation scenarios
Malware Analysis & Reverse Engineering Basics
  Topics:
    - Malware types and categories
    - Static malware analysis
    - Dynamic malware analysis
    - Sandboxing and VM detection
    - Basic assembly language
    - x86/x64 architecture basics
    - Debugging with OllyDbg/x64dbg
    - IDA Pro basics

```
      - Ghidra for reverse engineering
      - Packing and unpacking
      - Anti-analysis techniques
      - Behavioral analysis
      - Network traffic analysis
      - Memory forensics basics
      - Indicators of Compromise (IoCs)
    Projects built:
      - Malware analysis lab setup
      - Simple malware analyzer
      - Unpacker tool development
      - Behavioral analysis framework
      - IoC extraction tool
    Practice: Analyze 15 malware samples safely

Month 6: Advanced Domains: Active Directory, Mobile and Cloud (Weeks 23-26)
  Active Directory Attacks
    Topics:
      - Active Directory fundamentals
      - Domain enumeration with PowerView
      - BloodHound for AD mapping
      - Kerberoasting deep dive
      - ASREPRoasting techniques
      - Golden ticket attacks
      - Silver ticket attacks
      - DCSync attacks
      - Trust relationship abuse
      - Group Policy exploitation
      - LAPS bypass techniques
      - Constrained delegation abuse
      - Forest compromise strategies
      - Azure AD attacks
      - Hybrid environment exploitation
    Projects built:
      - AD enumeration toolkit
      - Kerberos attack framework
      - BloodHound custom queries
      - Domain persistence toolkit
      - Azure AD exploitation tool
    Practice: Compromise 10 Active Directory environments
  Mobile Application Security
    Topics:
      - Android architecture and security
      - iOS security model
      - Mobile app reverse engineering
      - APK decompilation and analysis
      - Smali/baksmali usage
      - Frida for dynamic analysis
      - SSL pinning bypass
      - Root/jailbreak detection bypass
      - Mobile app traffic interception
      - Insecure data storage
      - Weak cryptography in mobile apps
      - Intent vulnerabilities
      - Deep link exploitation
      - Mobile malware basics
      - MDM bypass techniques
    Projects built:
      - Mobile app security scanner
      - APK analysis automation
      - Frida script collection
      - SSL pinning bypass tool
      - Mobile pentest framework
    Practice: Test 20 mobile applications
  Cloud Security & Container Hacking
    Topics:
      - Cloud security fundamentals
      - AWS security and exploitation
      - S3 bucket misconfigurations
      - IAM privilege escalation
      - Lambda function attacks
      - Azure security issues
      - GCP vulnerabilities
      - Kubernetes security
      - Docker escape techniques
      - Container image vulnerabilities
      - Secrets management issues
      - Terraform security
      - CI/CD pipeline attacks
```

- Serverless security
- Cloud metadata exploitation

Projects built:
- Cloud security assessment tool
- S3 bucket scanner
- Container escape toolkit
- Kubernetes exploitation framework
- Cloud misconfiguration scanner

Practice: Assess 15 cloud environments

Physical Security & Social Engineering

Topics:
- Physical security assessments
- Lock picking basics
- RFID/NFC cloning
- Badge cloning techniques
- Tailgating and piggybacking
- Social engineering principles
- Pretexting techniques
- Phishing campaign creation
- Vishing and smishing
- Spear phishing strategies
- Watering hole attacks
- USB drop attacks
- Evil maid attacks
- Dumpster diving value
- OSINT for social engineering

Projects built:
- Phishing framework setup
- Social engineering toolkit usage
- Physical security checklist
- USB payload generator
- SE campaign automation

Practice: Design 10 social engineering scenarios

Assessment: Phase 2 exam: a practical build defended live, plus a written paper mixing this phase with everything before it

---

PHASE 3: ADVANCED OFFENSIVE AND DEFENSIVE SECURITY (MONTHS 7-9, WEEKS 27-39)

Master advanced exploitation, zero-day research, exploit development, and specialized security domains.

Month 7: Advanced Exploitation & Zero Days (Weeks 27-31)

Buffer Overflow Exploitation

Topics:
- Memory layout and stack structure
- Buffer overflow theory
- Stack-based buffer overflows
- EIP/RIP control
- Shellcode development
- NOP sleds and reliability
- Bad character analysis
- Return-to-libc attacks
- Heap overflow basics
- Format string vulnerabilities
- Integer overflows
- Off-by-one errors
- Fuzzing fundamentals
- Exploit development with Python
- Debugging exploits with GDB

Projects built:
- Custom shellcode development
- Buffer overflow exploit framework
- Fuzzer development
- Exploit reliability enhancer
- ROP chain generator
- Heap exploitation tool
- Format string exploit builder

Practice: Develop 20 working exploits from scratch

Modern Exploit Mitigation Bypasses

Topics:
- ASLR bypass techniques
- DEP/NX bypass methods
- Stack canaries bypass
- Return-oriented programming (ROP)
- ROP chain construction
- Gadget finding tools
- SEHOP bypass
- Control Flow Guard (CFG) bypass

    - Kernel exploitation basics
    - Use-after-free vulnerabilities
    - Race condition exploitation
    - Sandbox escapes
    - Browser exploitation basics
    - 0-day research methodology
    - Responsible disclosure
  Projects built:
    - ASLR bypass exploit
    - ROP chain automation tool
    - Kernel exploit development
    - Browser exploit PoC
    - Sandbox escape framework
  Practice: Bypass 15 different security mitigations
Web Application Firewall Bypasses
  Topics:
    - WAF detection techniques
    - Common WAF products and weaknesses
    - Encoding and obfuscation techniques
    - Unicode and UTF-8 bypasses
    - HTTP parameter pollution
    - HTTP verb tampering
    - Case variation attacks
    - Comment injection techniques
    - White space variations
    - SQL injection WAF bypasses
    - XSS filter evasion
    - XXE WAF bypasses
    - Rate limiting bypasses
    - IP rotation techniques
    - CDN and reverse proxy bypasses
  Projects built:
    - WAF fingerprinting tool
    - Automated bypass generator
    - Payload obfuscation framework
    - WAF testing methodology
    - Custom evasion toolkit
  Practice: Bypass 20 different WAF configurations
Cryptography & Cryptanalysis
  Topics:
    - Cryptography fundamentals review
    - Symmetric encryption algorithms
    - Asymmetric encryption systems
    - Hashing algorithms and collisions
    - Digital signatures and certificates
    - PKI infrastructure attacks
    - SSL/TLS vulnerabilities deep dive
    - Padding oracle attacks
    - CBC bit flipping
    - ECB mode vulnerabilities
    - Weak random number generators
    - Side-channel attacks
    - Timing attacks
    - Quantum computing threats
    - Blockchain security basics
  Projects built:
    - Padding oracle exploit tool
    - Certificate pinning bypass
    - Weak crypto detector
    - Hash collision finder
    - Timing attack framework
    - Blockchain vulnerability scanner
  Practice: Break 25 weak cryptographic implementations
Red Team Operations
  Topics:
    - Red team vs penetration testing
    - Adversary simulation
    - MITRE ATT&CK framework
    - Threat actor emulation
    - Command and control (C2) setup
    - Cobalt Strike usage
    - Empire framework
    - Covenant C2 platform
    - Infrastructure setup and management
    - Domain fronting
    - Operational security (OPSEC)
    - Anti-forensics techniques
    - Long-term persistence
    - Data staging and exfiltration

```
      - Purple team exercises
    Projects built:
      - Custom C2 framework
      - Red team infrastructure automation
      - OPSEC checklist implementation
      - Adversary emulation playbook
      - Purple team exercise design
    Practice: Complete 5 red team scenarios

Month 8: DevSecOps & Automation (Weeks 32-36)
  DevSecOps & CI/CD Security
    Topics:
      - DevSecOps principles and practices
      - Shift-left security approach
      - SAST tools and implementation
      - DAST in CI/CD pipelines
      - IAST and RASP technologies
      - Container security scanning
      - Infrastructure as Code security
      - Secrets management in CI/CD
      - Git security and secret scanning
      - Jenkins security hardening
      - GitLab CI/CD security
      - GitHub Actions security
      - Supply chain security
      - SBOM generation and analysis
      - Compliance as code
    Projects built:
      - Secure CI/CD pipeline
      - Automated security testing framework
      - Container security scanner integration
      - IaC security validator
      - Secret scanning automation
    Practice: Secure 10 CI/CD pipelines
  Security Automation & Orchestration
    Topics:
      - Security orchestration platforms
      - SOAR implementation
      - Playbook development
      - Automated incident response
      - Threat intelligence integration
      - API security automation
      - Vulnerability management automation
      - Compliance automation
      - Security metrics and KPIs
      - Dashboard creation
      - Alerting and notification systems
      - Integration with ticketing systems
      - Automated reporting
      - Machine learning for security
      - AI-powered threat detection
    Projects built:
      - SOAR platform setup
      - Automated incident response system
      - Security metrics dashboard
      - Threat intelligence aggregator
      - ML-based anomaly detector
    Practice: Automate 20 security workflows
  Threat Hunting & Intelligence
    Topics:
      - Threat hunting methodology
      - Hypothesis-driven hunting
      - Threat intelligence lifecycle
      - OSINT for threat intelligence
      - Dark web monitoring
      - Threat actor tracking
      - IOC and YARA rules
      - SIGMA rules creation
      - Threat hunting with Splunk
      - ELK stack for security
      - Network flow analysis
      - Endpoint detection techniques
      - Memory analysis for threats
      - Threat intelligence platforms
      - Information sharing (STIX/TAXII)
    Projects built:
      - Threat hunting playbook
      - YARA rule repository
      - Threat intelligence platform
```

```
      - Automated threat hunter
      - IOC extraction framework
    Practice: Hunt for threats in 15 environments
  Incident Response & Forensics
    Topics:
      - Incident response methodology
      - NIST incident response framework
      - Evidence collection and preservation
      - Chain of custody
      - Disk forensics and imaging
      - File system analysis
      - Memory forensics with Volatility
      - Network forensics
      - Timeline analysis
      - Windows forensics artifacts
      - Linux forensics artifacts
      - macOS forensics basics
      - Mobile device forensics
      - Cloud forensics challenges
      - Forensics report writing
    Projects built:
      - Incident response toolkit
      - Automated evidence collector
      - Memory analysis framework
      - Timeline generator
      - Forensics report template
    Practice: Investigate 15 security incidents
  Compliance & Governance
    Topics:
      - Security frameworks overview
      - NIST Cybersecurity Framework
      - ISO 27001/27002
      - PCI DSS requirements
      - GDPR and privacy
      - HIPAA compliance
      - SOC 2 requirements
      - Risk assessment methodologies
      - Business impact analysis
      - Security policies and procedures
      - Security awareness training
      - Vendor risk management
      - Security metrics and reporting
      - Audit preparation
    Projects built:
      - Compliance assessment tool
      - Risk assessment framework
      - Policy template library
      - Compliance dashboard
      - Audit checklist generator
    Practice: Perform 5 compliance assessments

Month 9: Emerging Security Domains (Weeks 37-39)
  Zero Trust Architecture
    Topics:
      - Zero trust principles
      - Identity-centric security
      - Microsegmentation strategies
      - Software-defined perimeter
      - Identity and access management
      - Privileged access management
      - Multi-factor authentication
      - Conditional access policies
      - Device trust and compliance
      - Network access control
      - Zero trust network access
      - Application segmentation
      - Data classification and protection
      - Zero trust monitoring
      - Migration strategies
    Projects built:
      - Zero trust assessment tool
      - Microsegmentation design
      - Identity verification system
      - Device trust validator
      - Zero trust roadmap
    Practice: Design 5 zero trust architectures
  Blockchain & Smart Contract Security
    Topics:
      - Blockchain technology overview
```

- Cryptocurrency security
- Smart contract basics
- Solidity security issues
- Reentrancy attacks
- Integer overflow/underflow
- Access control issues
- Front-running attacks
- Flash loan attacks
- Oracle manipulation
- Smart contract auditing
- Web3 security
- Wallet security
- DeFi protocol risks
- NFT security considerations

Projects built:

- Smart contract scanner
- Blockchain security toolkit
- DeFi vulnerability finder
- Smart contract fuzzer
- Web3 security framework

Practice: Audit 10 smart contracts

AI/ML Security

Topics:

- ML model security threats
- Adversarial attacks on ML
- Data poisoning attacks
- Model extraction attacks
- Privacy attacks on ML models
- Backdoor attacks in ML
- Evasion attacks
- Model inversion attacks
- Membership inference
- Differential privacy
- Federated learning security
- Secure multi-party computation
- AI ethics and bias
- Explainable AI for security
- ML for cybersecurity

Projects built:

- Adversarial example generator
- Model security scanner
- Privacy-preserving ML tool
- ML attack framework
- AI security assessment

Practice: Attack and defend 10 ML models

Assessment: Phase 3 exam: a practical build defended live, plus a written paper mixing this phase with everything before it

---

PHASE 4: THE FINALE (MONTH 10, WEEKS 40-44)

The capstone month: spec, build, ship and defend, then the final exam that decides the certificate.

Month 10: Capstone and the Final Exam (Weeks 40-44)

Capstone Spec and Setup

Topics:

- Choosing the capstone: a full authorized penetration test of a provided lab environment, from reconnaissance to a professional report
- A one-page spec: scope, milestones, stack
- Repository and skeleton ready on day one
- Instructor sign-off before the build begins

Projects built:

- Approved capstone spec plus the running skeleton

Practice: Pitch the spec to the batch and absorb one hard question

Capstone Build

Topics:

- Two focused weeks in vertical slices
- Instructor checkpoints and honest scope cuts
- Using the whole course: the whole methodology, offensive and defensive, under authorized and documented conditions
- Daily commits and an always-working build

Projects built:

- The capstone, feature-complete with version control

Practice: A working build at the end of every session

Ship and Polish

Topics:

- The finishing pass: edge cases, errors, documentation
- A professional pentest report: findings, evidence, severity ratings and remediation advice

- A README worth reading and a demo worth watching
- A full-course spiral review before the exam

Projects built:

- The capstone shipped, documented and rehearsed

Practice: Two mock demos, each tighter than the last

Demo Day and the Final Exam

Topics:

- Presenting the capstone: live demo plus the hardest bug story
- The honest map of next roads: penetration tester, security analyst, red or blue team roles, and certifications like CEH and OSCP
- Where our other courses continue the journey

Projects built:

- Demo day presentation delivered to the batch

Assessment: FINAL EXAM: a practical build plus a written paper with questions mixed from every phase. Passing earns the certificate; falling short earns a focused revision plan and a free retest

PROJECTS THE STUDENT BUILDS AND KEEPS

- Phase 1: recon, scanning and vulnerability-assessment labs on authorized ranges
- Phase 2: exploitation, web-attack and post-exploitation labs, all in controlled environments
- Phase 3: exploit-development, red-team and blue-team defensive labs
- Phase 4: the full authorized lab pentest and its professional report

Total projects: 20+ lab-based engagements, crowned by a full authorized penetration test and report

SKILLS THE STUDENT WILL HAVE AT THE END

- The legal and ethical foundation: authorization, scope, disclosure and law
- Reconnaissance, scanning and vulnerability assessment
- Exploitation: system, web (OWASP Top 10), network and post-exploitation
- Advanced offensive: exploit development, mitigation bypasses, red team operations
- Defensive security: DevSecOps, threat hunting, incident response and forensics
- Professional penetration-test reporting

HOW A TYPICAL WEEK IS SPLIT

Live classes: 2 live one-hour classes per week, coding along with the instructor
Homework: A problem set after every class, and a mixed-review assignment at the end of every month
Practice: 4-6 hours of building between classes
Review: Every submission reviewed with written feedback; recurring gaps reopened in class

SUPPORT INCLUDED

Doubt support: WhatsApp doubt support between classes
Progress updates: Honest monthly progress reviews: what is solid, what is wobbly, and the plan for the wobble

CERTIFICATION DETAIL

Completion: Certificate from Modern Age Coders, awarded on passing the final exam. Fall short and there is focused revision and a free retest: the certificate certifies knowledge, not attendance

WHERE THIS CAN LEAD

- Penetration tester, security analyst and red or blue team roles
- Certifications: this course prepares the ground for CEH and OSCP
- Specializations: web, cloud, mobile or ICS security
- Defensive tracks: SOC, threat hunting and incident response

EARNING POTENTIAL (share only if asked, and never promise it)

Market context: The ranges below are general market salary bands for these roles in India and abroad, drawn from public industry data. They are shown for career context only and are not a promise or guarantee of income. Actual pay depends on your skills, experience, location, and the job market.
Early career roles: Rs 3-6 LPA (Junior Security Analyst, SOC Analyst L1)
Growing roles: Rs 6-12 LPA (Ethical Hacker, SOC Analyst L2, VAPT Analyst); Rs 10-20 LPA (Penetration Tester, Security Engineer)
Experienced roles: Rs 18-30 LPA (Senior Ethical Hacker, Red Team Engineer); Rs 25-45 LPA (Lead Security Engineer, Security Consultant)
Other roles: Rs 8-20 LPA (Cyber Crime, CERT-In, Defense contractors); Rs 15-40 LPA (Big4, Security MNCs, Product-based firms); Rs 2-15 Lakhs per valid vulnerability (platform & severity dependent); Rs 40-90 LPA at senior level
Freelance consulting: Rs 2,500-12,000/hour based on skills and certifications

COMMON QUESTIONS ABOUT THIS COURSE

For anything about cost, use PART 4 and RULE 1. Do not quote two regions.

Q: What does this ethical hacking course cover?
A: The full authorized-pentesting path in order: networking, Linux and programming for security, reconnaissance and OSINT, scanning and vulnerability assessment; then core exploitation, system, web (OWASP Top 10) and network attacks, Metasploit, post-exploitation and advanced domains like Active Directory, mobile and cloud; then advanced offensive work (exploit development, mitigation bypasses, red team) and the defensive side (DevSecOps, threat hunting, incident response, forensics). A finale month runs a full authorized lab pentest, writes the professional report and sits the final exam. Everything is practised only in labs and authorized ranges.

Q: How long does it take to learn ethical hacking properly?
A: Ten months of teaching at 2 live classes a week plus 4 to 6 hours of practice, with two more months in hand for learners who need them. The three teaching phases build the skill and its real-world application; the finale month ships a capstone and sits the final exam.

Q: How am I assessed? Is the certificate just for attending?
A: No. Problem sets follow every class with written feedback, monthly reviews deliberately mix new material with earlier topics, each phase ends with a cumulative exam, and the course ends with a final exam: a practical build plus written questions from the whole syllabus. Passing earns the certificate; falling short earns focused revision and a free retest.

Q: Is ethical hacking legal, and is this course legal to take?
A: Ethical hacking is legal precisely because it is authorized: you test only systems you own or have written permission to test, within an agreed scope. That principle is taught from the first week and enforced throughout, and all practical work happens in dedicated lab environments and authorized ranges we provide.

Q: Do I need prior experience to start?
A: No. The course begins with networking, Linux and programming foundations and builds from there. What matters most is genuine curiosity, patience for problem-solving, and a commitment to using these skills legally and ethically. It is an adult course aimed at serious career-changers and IT professionals.

Q: Will this get me a certification like CEH or OSCP?
A: This course is not an exam voucher for CEH or OSCP, and we are honest about that: it teaches the skills those certifications test and prepares you thoroughly to pursue them next. You earn a Modern Age Coders certificate here by passing the final exam, which includes a real authorized lab pentest and its report, exactly the kind of work the industry certifications and employers care about.

Q: Can I try a class before enrolling?
A: Yes, a free demo class with no commitment: book at learn.modernagecoders.com/contact or message us on WhatsApp at +91 91233 66161. (Agent note: the free demo is a waiting list with no fixed date. The Priority Live Demo is a guaranteed class today or tomorrow, booked at https://learn.modernagecoders.com/priority-demo . Offer both, as RULE 3 says.)

Q: Are classes live or recorded?
A: Live, always: small groups with a real instructor reading your actual code, never pre-recorded videos.

To enrol, message Shivam Sir on +91 9123366161 or send the parent this link: https://learn.modernagecoders.com/courses/ethical-hacking-masterclass-complete
For a demo: the Priority Live Demo (guaranteed, today or tomorrow) is booked at https://learn.modernagecoders.com/priority-demo . The free demo is a waiting list with no fixed date.

==========

COURSE 59 OF 137: FLUTTER COURSE: DART TO REAL CROSS-PLATFORM APPS

==========

Course link: https://learn.modernagecoders.com/courses/complete-flutter-app-development-masterclass-college
Subject area: App Development
Designed for: College students
Who can join: Complete beginner (18+); college students, graduates and working professionals
Course length: 10-12 months (44-52 weeks)
Time needed: 2 live classes/week + 4-6 hours practice
Certificate: Certificate from Modern Age Coders, awarded on passing the final exam

PRICE FOR THIS COURSE (quote only the one that applies to the person asking)
In India, per month: group Rs 1,499, mini batch Rs 2,999, one to one Rs 4,999
Outside India, per month: group $100, one to one $150
Classes: group and mini batch two live classes a week, eight a month; one to one in India one live class a week, four a month; one to one outside India two live classes a week, eight a month. Each class is one hour.

WHAT THIS COURSE IS

Flutter course for college students and professionals: Dart, Flutter UI, state management, Firebase and production habits, one codebase for Android and iOS, in 10-12 months.

In one line: One codebase, both app stores: Dart and Flutter learned properly, from first widget to production-shaped apps with Firebase.

ABOUT THE PROGRAMME

Flutter delivers the honest cross-platform promise: one Dart codebase producing genuinely native-feeling apps on Android and iOS, and it has the production adoption to prove it. This live online masterclass builds it in order: Dart as a real language first, then Flutter the widget way, layouts, navigation and UI that feels native on both platforms, then the layer that separates apps from demos: state management chosen with judgment, architecture that survives features, Firebase for auth and data, offline behavior, testing and release discipline. A finale month ships a capstone app and sits the final exam. The pace is honest: ten teaching months at two live classes a week plus four to six hours of practice, with two more in hand. Problem sets, monthly mixed reviews, phase exams, and a final exam that decides the certificate with a free retest.

WHAT MAKES THIS COURSE DIFFERENT

- Dart first as a real language: Flutter without Dart depth is widget soup
- The widget mental model taught until it clicks: composition all the way down
- State management with judgment: the options mapped honestly, one mastered
- Production habits: offline behavior, testing and release discipline included
- An honest 10-month arc with 2 months in hand
- Real assessment: weekly problem sets, monthly mixed reviews, phase exams and a final exam with a free retest

THE LEARNING PATH, STEP BY STEP

Phase 1: Dart and Flutter foundations (Months 1-3): the language, then widgets, layouts and navigation
Phase 2: State and architecture (Months 4-6): state management with judgment and structure that survives
Phase 3: Production features (Months 7-9): Firebase, offline behavior, testing and release discipline
Phase 4: The finale (Month 10): the capstone app on both platforms, and the final exam

WHAT A STUDENT NEEDS BEFORE STARTING

Coding experience: None. Everything is taught from the first line
Equipment: Any reasonably recent computer; Flutter, the emulators and every tool used are free. iOS device builds require a Mac at release time, stated honestly, Android covers the full learning journey
Age: 18+; college students, graduates and working professionals
Time commitment: 2 live classes plus 4-6 hours of practice a week

WHO THIS COURSE IS FOR

App builders: Builders who want both app stores from one codebase
College students: Students who want a demonstrable, shippable specialization
Startup minded: Product people who need mobile speed without two teams
Career switchers: Professionals entering mobile with the fastest honest route to both platforms
Web developers: Developers adding mobile without abandoning their declarative instincts

FULL CURRICULUM, WEEK BY WEEK

This is the complete teaching plan. Parents can ask about any week.

PHASE 1: FOUNDATION & CORE FLUTTER + DART SKILLS (MONTHS 1-3, WEEKS 1-13)

Build rock-solid programming and Flutter fundamentals. Learn Dart, understand Flutter's widget tree, layout system, and create your first interactive cross-platform apps.

Months 1-2: Dart Fundamentals & Flutter Basics (Weeks 1-8)

Introduction to Flutter, Dart & Development Environment Setup

Topics:

- What is Flutter? History, features, and why it's popular
- Single codebase for Android, iOS, Web, Desktop
- Flutter architecture overview: Engine, Framework, Widgets
- Dart language introduction and why Flutter uses Dart
- Installing Flutter SDK on Windows/Mac/Linux
- Setting up Android Studio, VS Code, and Xcode (for macOS)
- Configuring device emulators and real devices
- Understanding Flutter project structure: lib, pubspec.yaml, android, ios, web

- Your first Flutter app: counter & Hello World
- main() function, runApp(), MaterialApp, Scaffold, AppBar, Body
- Hot reload vs hot restart vs full restart
- Understanding widget tree and composition
- StatelessWidget vs StatefulWidget basics
- DartPad and Flutter web previews
- Code style, formatting (dartfmt), and basic conventions

Projects built:
- Hello Flutter app with personalized welcome screen
- Digital visiting card app (name, role, contact info)
- Simple profile screen with image, text and icons
- Two-screen mini app using basic navigation
- Kids track variant: Colorful "My Favorite Things" app

Practice: Daily: 30-45 min Dart & Flutter basics; reproduce 3-5 simple screens from design snapshots

Dart Basics, Variables, Data Types & Operators

Topics:
- Dart program structure: main(), imports, packages
- Variables: var, final, const, late
- Primitive-like types in Dart: int, double, String, bool
- num type and type inference
- Dynamic vs static typing, dynamic keyword use-cases
- Type conversion and parsing: int.parse, double.parse, toString
- Collections overview: List, Set, Map (intro only)
- Operators: arithmetic, relational, logical, assignment
- Null safety in Dart: non-nullable & nullable types (int vs int?)
- Null-aware operators: ?, ??, ??=, !
- String interpolation and multi-line strings
- String methods: length, substring, contains, split
- Basic console apps in Dart (for logic practice)
- Using dartpad.dev to practice Dart snippets

Projects built:
- Simple console calculator (add, subtract, multiply, divide)
- Tip & bill split calculator (per person amount)
- Age & birthday countdown calculator
- Unit converters: temperature, length, weight
- Kids variant: Score tracker for a simple game

Practice: Solve 30+ problems on variables, strings, calculations and null-safety handling

Control Flow, Functions & Basic Collections

Topics:
- Control flow: if, else if, else
- Switch-case in Dart, enums introduction
- Loops: for, while, do-while, for-in
- break and continue, labeled statements
- Functions: definition, parameters (positional, named, optional), return types
- Arrow functions (fat arrow syntax)=>
- Scope rules and variable lifetime
- Intro to collections: List, Set, Map basics
- Iterating collections with for, for-in, forEach
- Basic algorithm building: searching & counting
- Introduction to error handling: try, catch, finally

Projects built:
- Number guessing game (console or Flutter dialog-based)
- Grade calculator with letter-grade output
- To-do list data model (List operations) with console UI
- Simple quiz logic engine (questions and scoring)
- Kids variant: Multiplication practice generator

Practice: Solve 40+ problems covering loops, branching, and simple collection manipulations

Core Flutter Widgets & Layout Basics

Topics:
- Flutter widget philosophy: everything is a widget
- Understanding build() method and widget lifecycle (overview)
- Basic display widgets: Text, Icon, Image, Container
- Layout widgets: Row, Column, Expanded, SizedBox
- Alignment & positioning: MainAxisAlignment, CrossAxisAlignment, Center, Align
- Styling text with TextStyle, GoogleFonts (package intro)
- Colors, ThemeData, Material 3 basics
- Buttons: ElevatedButton, TextButton, OutlinedButton, IconButton
- Input widgets: TextField basics
- Using Scaffold: appBar, body, floatingActionButton, bottomNavigationBar (intro)
- SingleChildScrollView and ListView (intro)
- Working with pubspec.yaml: adding assets (images, fonts)
- Asset management & responsive basics (MediaQuery)
- Debugging layout issues with Flutter DevTools & debugPrint

Projects built:
- Personal profile card app with images & icons
- Single-page product detail UI (static)

- Simple landing screen for a fictional app (hero image, CTA button)
- Basic contact form UI (no backend yet)
- Kids variant: "My Pet" info card with big images & fun fonts

Practice: Recreate 6-10 simple UI screens from given Figma/Dribbble screenshots

Month 3: Object-Oriented Programming with Dart & Stateful Widgets (Weeks 9-13)

Dart Classes, Objects & OOP Basics

Topics:

- OOP paradigm in Dart
- Defining classes & creating objects
- Fields, constructors (default, named, optional)
- Named constructors and factory constructors (intro)
- this keyword, initializer lists
- Encapsulation: private members with _ prefix
- Getters & setters (explicit, shorthand syntax)
- Static variables and methods
- Basic toString() overrides
- Intro to enums for modeling states
- Model classes for Flutter apps (e.g., User, Product, Task)

Projects built:

- User profile model and display widget
- Product class used in a simple catalog list
- Task/Todo model with computed properties (e.g. isOverdue)
- Simple contact model and list
- Kids variant: Character class for a mini game inventory

Practice: Create 15+ different model classes to represent real-world entities used in apps

Inheritance, Polymorphism & Flutter Stateful Widgets

Topics:

- Inheritance in Dart: extends keyword
- Abstract classes and methods (intro)
- Method overriding & polymorphism
- Mixins: with keyword, when and how to use
- Interfaces via abstract classes & implicit interfaces
- Intro to composition vs inheritance
- StatefulWidget and State classes in Flutter
- setState(), rebuilding the UI, performance considerations
- Managing widget state vs app state (conceptual intro)
- TextField controllers and input handling
- Forms: Form, GlobalKey, basic validation
- GestureDetector and InkWell for taps & gestures
- Basic animations with AnimatedContainer and AnimatedOpacity (preview)

Projects built:

- Interactive counter app with custom logic
- Simple login form with validation and error messages
- Like/favorite button with animation
- Basic habit tracker with toggling state
- Kids variant: Tap-to-change-color playground app

Practice: Implement 20+ stateful interactions (toggles, counters, forms, sliders, etc.)

Abstraction, Interfaces & PHASE 1 Mini Capstone

Topics:

- Deeper look at abstract classes & interfaces in Dart
- Strategy-like patterns using abstract classes
- Separation of concerns: UI vs business logic vs data models
- Organizing Flutter code: folders (models, widgets, screens, services)
- Intro to simple service classes for data handling
- Preparing for larger apps: reusability & modular widgets

Projects built:

- Reusable UI components library (buttons, cards, chips)
- Simple theme manager (light/dark mode toggle using inherited widget pattern - conceptual)
- PHASE 1 MINI CAPSTONE: Multi-Screen Personal Productivity App (Tasks + Notes + Reminders)
- Features: Home screen, list views, detail pages, basic persistence via in-memory lists, clean UI

Practice: Refactor earlier projects to use cleaner OOP and reusable widgets

Assessment: Phase 1 exam: a practical build defended live, plus a written paper mixing this phase with everything before it

---

PHASE 2: INTERMEDIATE FLUTTER, STATE MANAGEMENT & APP ARCHITECTURE (MONTHS 4-6, WEEKS 14-26)

Master advanced Dart, state management patterns, navigation, forms, local storage, and start building real-world, offline-capable Flutter apps.

Month 4: Advanced Dart, Layouts & State Management Foundations (Weeks 14-18)

Advanced Dart, Collections & Async Programming

Topics:

- Deep dive into Lists, Sets, Maps
- Higher-order functions: map, where, reduce, fold
- Collection if and collection for in Dart

- Spread operator (...) and null-aware spread (...?)
- Immutable vs mutable collections
- Error handling in Dart: try-catch, on, finally, rethrow
- Custom exceptions
- Asynchronous programming: Future, async/await
- Streams: single subscription vs broadcast (intro)
- Stream transformations and listeners
- Using async code in Flutter (FutureBuilder, StreamBuilder basics)
- Using packages: http, intl and others
- Organizing business logic into service classes

Projects built:

- Data transformation utilities (filtering, sorting, grouping)
- HTTP client service (mock APIs) using http package
- Simple news/feed list using FutureBuilder (with mock JSON)
- Real-time counter/clock using StreamBuilder
- Kids variant: Random joke/quote generator using an API

Practice: Solve 35+ problems on collections & async patterns (Futures & Streams)

Flutter Navigation, Routing & App Structure

Topics:

- Navigator 1.0: push, pop, named routes
- Route arguments and passing data between screens
- Navigator 2.0 and Router (high-level intro, for advanced later)
- BottomNavigationBar and tab-based navigation
- Drawer navigation and custom side menus
- Nested navigation and navigation stacks
- App lifecycle basics: WidgetsBindingObserver, handling app states
- Splash screens and onboarding flows
- Handling back button and system navigation
- Routing best practices and route generators

Projects built:

- Multi-screen notes app with details and edit screens
- Onboarding flow with 3-4 intro pages
- Bottom navigation based mini app (Home / Search / Profile)
- Simple tabbed app with TabBar and TabBarView
- Kids variant: Storybook app with navigation between chapters

Practice: Implement routing and navigation in 6-8 mini applications

Forms, Validation & User Input Handling

Topics:

- Advanced TextField usage: controllers, focus nodes
- Form widget, FormState, and GlobalKey
- Synchronous and asynchronous validation
- Custom form field widgets
- Handling keyboard, focus traversal, and input submission
- DropdownButton, Checkbox, Radio, Switch, Slider widgets
- Date & time pickers
- Input formatting and masking
- Accessibility considerations for forms

Projects built:

- User registration form with full validation
- Feedback/contact form with submission success screen
- Settings screen with toggles, sliders, and dropdowns
- Profile edit form with local validation & previews
- Kids variant: Quiz creation form with multiple questions

Practice: Build and validate 10+ complex forms and input flows

Flutter Layout Mastery, Lists & Responsive Design

Topics:

- Advanced layout widgets: Stack, Positioned, Wrap, LayoutBuilder
- ListView.builder, ListView.separated
- GridView builder and dynamic grids
- Slivers overview: CustomScrollView, SliverAppBar, SliverList (intro)
- Responsive design principles in Flutter
- MediaQuery, LayoutBuilder and OrientationBuilder
- Creating adaptive UIs for phone/tablet/web
- Handling different screen densities and sizes
- Using Flutter's Flex and Expanded effectively

Projects built:

- E-commerce product list grid with responsive layout
- Photo gallery app with grid and full-screen viewer
- News feed with cards and SliverAppBar
- Responsive dashboard layout (phone vs tablet)
- Kids variant: Sticker board using Stack & Positioned

Practice: Rebuild 10+ real-world UI screens with responsive layouts

Intro to State Management Patterns

Topics:

- What is state management? Local vs global state
- Limitations of setState() for larger apps
- Lifting state up and prop drilling problems
- InheritedWidget and InheritedModel concept
- Provider package introduction

- ChangeNotifier and ChangeNotifierProvider
- Listening to changes with Consumer and context.watch/select
- Basic architecture: separating UI and logic using providers
- Simple global app state (theme, locale, auth status)

Projects built:

- Counter app rebuilt with Provider
- Theme toggler (light/dark mode) using Provider
- Cart management in a simple shopping UI
- Favorites list synced across multiple screens
- Kids variant: Global score/coins manager for a mini game

Practice: Create 10+ small apps using Provider for shared state

Month 5: Persistent Storage, Offline Apps & Advanced State (Weeks 19-22)

Local Storage: SharedPreferences, SQLite & Object Persistence

Topics:

- Why persistence? Saving user data locally
- Key-value storage with shared_preferences
- Simple settings & flags persistence
- SQLite basics and sqflite package
- Database schema design for small apps
- CRUD operations (create, read, update, delete)
- Using path_provider for file paths
- Storing JSON data locally
- Intro to Hive / Isar (NoSQL local DB) and when to use them
- Data serialization with jsonEncode/jsonDecode
- Basic repository pattern for data layer

Projects built:

- Persistent to-do list app with sqflite
- Settings/preferences manager using shared_preferences
- Offline notes app using Hive or Isar
- Simple expense tracker with SQLite
- Kids variant: Sticker collection app persisted locally

Practice: Build 12+ features requiring reading/writing persistent local data

State Management with Provider & Riverpod, Part 1

Topics:

- Revisiting Provider for larger apps
- Multiple providers and provider scopes
- Introduction to Riverpod: why & how it improves over Provider
- Provider types in Riverpod: Provider, StateProvider, StateNotifierProvider (intro)
- Using Riverpod for business logic & UI separation
- Immutability and state objects
- Error handling in async providers
- Refactoring existing apps to Riverpod

Projects built:

- News/feed app powered by Riverpod for state
- Weather app using async APIs with Riverpod
- Multi-tab app with shared state using Riverpod
- Theme + language switcher using Riverpod
- Kids variant: Simple quiz app with score using Riverpod

Practice: Refactor 5 existing apps from setState/Provider to Riverpod

Advanced State Management: Riverpod / BLoC, Part 2

Topics:

- StateNotifier & StateNotifierProvider with Riverpod
- Modeling complex state (loading, loaded, error) patterns
- BLoC pattern introduction (Cubit/BLoC) and when to use it
- Comparing Riverpod, Provider, and BLoC (pros/cons)
- Events, states, and BLoC logic (if using flutter_bloc)
- Using Freezed for immutable data classes & unions (intro)
- Folder structure for scalable apps (feature-first, layer-first)
- Practical guidelines for choosing a pattern per project size

Projects built:

- Authentication flow using Riverpod or BLoC
- Search with debounced queries and loading states
- Paginated list with infinite scroll
- Complex form with multi-step state management
- Kids variant: Multi-level quiz/game with progress state

Practice: Build 10+ flows using Riverpod/BLoC with loading/error handling

Flutter Animations & UX Polish

Topics:

- Implicit animations: AnimatedContainer, AnimatedOpacity, AnimatedAlign
- AnimatedCrossFade, AnimatedSwitcher
- Explicit animations: AnimationController, Tween, CurvedAnimation
- Using AnimatedBuilder and AnimatedWidget
- Hero animations between screens
- Page transitions and custom route animations
- Lottie animations integration
- Micro-interactions and motion design principles
- Performance considerations with animations

Projects built:

- Animated onboarding flow with Hero transitions
- Like/Bookmark micro-interactions with animations
- Expandable cards list with AnimatedContainer
- Custom page transition for navigation
- Kids variant: Animated "reward" screen with confetti

Practice: Implement 20+ small animations and transitions across apps

Month 6: Design Systems, APIs & Testing Foundations (Weeks 23-26)

Reusable Widgets, Design Systems & Theming

Topics:

- Creating reusable, composable widgets
- Building a design system: spacing, typography, colors
- Material 3 (Material You) theming in Flutter
- ThemeData and ColorScheme customization
- Dark theme and dynamic theme switching
- Global styles and app-wide configuration
- Localization basics: using flutter_localizations and intl
- Supporting multiple languages and locales
- Accessibility: font scaling, contrast, semantics

Projects built:

- Design system library for buttons, cards, inputs
- App-wide theming for a sample app (light/dark/custom)
- Two-language version of an existing app (e.g. English + Hindi)
- Custom theming for kids' learning app
- Reusable error/empty/loading state widgets

Practice: Implement a consistent design system in 3+ existing apps

Networking & REST API Integration - Fundamentals

Topics:

- HTTP basics: methods, status codes, headers, JSON
- Using http / dio packages for API calls
- GET, POST, PUT, DELETE requests
- Parsing JSON manually and with json_serializable (intro)
- Error handling for network failures & timeouts
- Showing loading, success, and error states in UI
- API pagination and infinite scroll
- Securing API keys and environment variables (conceptual)
- Handling connectivity changes (connectivity_plus intro)

Projects built:

- Public API driven list app (e.g. GitHub repos, movies, news)
- Search UI with remote filtering
- Paginated list with "Load more" and pull-to-refresh
- Simple CRUD client for a mock REST API
- Kids variant: Fun facts/animals viewer from an open API

Practice: Build 8+ screens powered by real or mock REST APIs

Intro to Testing Flutter Apps

Topics:

- Why testing matters for Flutter apps
- Types of tests: unit, widget, integration
- Dart test package basics
- Unit tests for Dart logic (services, utils)
- Widget tests: testing UI components and layouts
- Mocking services and repositories
- Introduction to golden tests (visual regression), concept
- Basic test-driven development (TDD) workflow
- Measuring coverage in Flutter projects

Projects built:

- Unit tests for validators and repository classes
- Widget tests for key widgets in a sample app
- Test suite for state management logic (Riverpod/BLoC)
- Simple golden tests for critical UI components
- Kids variant: Test coverage for a small game's logic

Practice: Write tests for at least 3 existing apps, targeting 60%+ coverage

Build Automation, Packages & Version Control

Topics:

- pubspec.yaml deep dive: dependencies, dev_dependencies
- Managing versions and package upgrades
- Creating and publishing your own Dart/Flutter package (concept)
- Build flavors (dev, staging, prod), overview
- Flutter build commands for Android, iOS, Web
- Introduction to Git with Flutter projects
- Git branching strategies (feature, develop, main)
- GitHub integration, PRs, code reviews
- CI basics using GitHub Actions for Flutter test/build

Projects built:

- Extract common widgets into a local package
- Git repository for all course projects (mono-repo or multi-repo)
- Simple GitHub Actions workflow for test+build
- Versioning and changelog for a sample app
- Kids variant: Visual Git intro via Git GUI tools

Practice: Convert all active projects to Git repos and set up basic CI for at least one
Assessment: Phase 2 exam: a practical build defended live, plus a written paper mixing this phase with everything before it

---

PHASE 3: BACKEND INTEGRATION, FIREBASE & PRODUCTION FEATURES (MONTHS 7-9, WEEKS 27-39)

Master building connected apps with Firebase and REST backends, implement authentication, payments, notifications, and solid application architecture.

Month 7: Firebase, Auth & Real-World Features (Weeks 27-32)

Firebase Fundamentals & Realtime Data

Topics:

- What is Firebase? Overview of its products
- Setting up a Firebase project
- Integrating Firebase with Flutter (firebase_core)
- Crashlytics and Analytics setup (overview)
- Realtime Database vs Firestore overview
- Cloud Firestore basics: collections, documents, queries
- Adding, reading, updating, deleting documents
- Realtime listeners and streams from Firestore
- Security rules overview and best practices
- Offline support and caching behavior

Projects built:

- Realtime chat room (basic text chat) using Firestore
- Live comments section on a sample post
- Collaborative to-do list shared between users
- Simple presence/online status indicator
- Kids variant: Shared drawing board (concept + simple implementation)

Practice: Build 6-8 small realtime features with Firestore streams

Authentication & User Management

Topics:

- Firebase Authentication overview
- Email/password sign up and login
- Password reset flow
- Social login (Google, Apple, Facebook, platform dependent)
- Persisting login state and auto-login
- Linking auth user to Firestore profile documents
- Protecting routes based on auth state
- Handling auth errors and edge cases
- Profile management and avatar uploads (intro to Storage)

Projects built:

- Complete auth flow: sign-up, login, logout, reset password
- User profile screen linked to Firestore user data
- Protected routes (e.g., only logged-in users see dashboard)
- Simple role-based protection (admin vs user)
- Kids variant: Simplified nickname-based login for child-friendly apps

Practice: Implement full auth flows in at least 2 different sample apps

Cloud Storage, Media & File Handling

Topics:

- Firebase Storage integration
- Uploading images/files from Flutter apps
- Picking images from gallery/camera (image_picker, file_picker)
- Displaying uploaded media in apps
- Managing download URLs and access controls
- Basic image caching for performance
- Handling upload progress and cancellation
- File size limits and optimization concepts

Projects built:

- User avatar upload & change profile picture feature
- Simple image gallery app powered by Firebase Storage
- Kids variant: Art gallery app where kids upload drawings
- Media feed with upload progress indicators

Practice: Add media upload/view features to at least 3 apps

Push Notifications & In-App Messaging

Topics:

- Firebase Cloud Messaging (FCM) integration
- Obtaining device tokens and sending test notifications
- Handling foreground, background, terminated notifications
- Notification customization (sound, icon, click actions)
- Topic-based and user-segment notifications
- In-app messaging basics (e.g., using Firebase In-App Messaging or custom implementation)
- Local notifications (flutter_local_notifications package)
- Scheduling notifications and reminders

Projects built:

- Push notification integration in existing habit tracker app
- Reminders/alerts app using local notifications
- Topic-based notifications (e.g., daily tips/news categories)
- In-app announcement banner system

- Kids variant: Reward reminder notifications for practice streaks
Practice: Implement both remote and local notifications across 2-3 apps
Advanced Firebase: Queries, Security & Performance
Topics:
- Advanced Firestore queries (compound, range, ordering)
- Indexes in Firestore for performance
- Optimizing read/write costs
- Security rules patterns and testing
- Multi-tenant data design (user-specific data separation)
- Cloud Functions for backend logic (overview, callable functions)
- Basic Cloud Functions triggered by Firestore events (concept)
- Monitoring Firebase usage and costs
Projects built:
- Search & filter features using advanced queries
- Role-based security rules for a sample app
- Server-triggered notifications (concept + small demo with Cloud Functions)
- Dashboard app with Firestore aggregate views
- Kids variant: Filtered content access based on age group
Practice: Design secure Firestore structures and rules for 2-3 different apps

Month 8: REST APIs, Payments & Robust Product Apps (Weeks 33-36)
Advanced REST APIs, Error Handling & Data Layers
Topics:
- Refining data layer with repositories & DTOs
- Handling complex JSON responses (nested, lists, maps)
- Code generation with json_serializable & build_runner
- Error modeling and mapping HTTP errors to UI states
- Retry policies and exponential backoff (concept + simple implementation)
- Network connectivity handling & offline-first strategies
- Logging and monitoring HTTP traffic (e.g., dio interceptors)
Projects built:
- Robust API-driven app with error handling and retries
- Offline-first news or blog reader (cache + network)
- Centralized API client service with interceptors
- Kids variant: Live quiz app using remote API data
- Refactor earlier REST apps to use repository pattern
Practice: Create 5+ robust REST clients with proper error and offline handling
In-App Purchases & Payment Gateway Integration
Topics:
- In-app purchases on Android & iOS (overview, in_app_purchase package)
- Using 3rd-party gateways like Razorpay, Stripe (concept + Flutter packages)
- Handling payment flows and callbacks
- Server verification of purchases (conceptual, minimal implementation)
- Unlocking premium content and features
- Compliance and security best practices (conceptual)
- Sandbox/test environment usage
Projects built:
- Premium upgrade flow for an existing app (e.g., remove ads/unlock features)
- Donation/payment screen integration with test gateway
- Subscription-like experience (locally simulated) with feature flags
- Kids variant: Parent-only purchase screen for unlocking content
- Designing a pricing & plans screen with clear UX
Practice: Integrate at least one payment-like flow in a demo app (test mode)
App Architecture in Depth: Clean Architecture & Large App Design
Topics:
- Revisiting Clean Architecture & MVVM in the context of bigger apps
- Domain layer: entities, use cases, business rules
- Data layer: models, DTOs, repositories, remote & local sources
- Presentation layer: views, controllers, state management (Riverpod/BLoC)
- Dependency injection basics (get_it, Riverpod providers)
- Feature modularization for scalable apps
- Working with multiple backends (REST + Firebase together)
- Documentation of architecture and data flow
Projects built:
- Architect one mid-size app using full Clean Architecture
- Combine local cache + remote data with repository pattern
- Implement dependency injection for services and repositories
- Architecture diagrams (UML, flow diagrams) for apps
- Kids variant: Simplified layered structure for a learning app
Practice: Re-architect one existing project using a full layered approach
Testing Connected Apps (REST + Firebase)
Topics:
- Unit testing repositories with mocked network/Firebase
- Widget tests for screens relying on async data
- Using fake clients, mocktail or Mockito for mocking
- Integration tests for sign-up/login flows
- Golden tests for critical UI screens
- Continuous testing with CI integration
- Measuring and improving test coverage for large apps

```
      Projects built:
        - Test suite for an authentication flow
        - Widget tests for list/detail pattern UI
        - Mocking Firestore/REST for offline tests
        - Regression test set for a capstone app
        - Kids variant: Test logic for a score/progress system
      Practice: Achieve 70%+ coverage on at least one sizable app; add essential tests to
      others

  Month 9: Production Hardening (Weeks 37-39)
    Performance Optimization & App Size Management
      Topics:
        - Performance profiling with Flutter DevTools
        - Identifying and fixing jank (frame drops)
        - Optimizing build methods and widget trees
        - Using const constructors and keys effectively
        - Image optimization and caching strategies
        - Lazy loading lists, pagination, and placeholders
        - Reducing app size: tree-shaking, splitting per ABI
        - Minimizing unnecessary rebuilds and re-renders
        - Monitoring performance in release builds
      Projects built:
        - Performance audit of capstone app
        - Implement skeleton loaders and shimmer effects
        - Optimize image-heavy screens
        - Reduce app bundle size for Android and iOS
        - Kids variant: Smooth animation showcase tuned for low-end devices
      Practice: Profile & optimize at least 3 screens per app; document improvements
    Error Reporting, Logging & Analytics
      Topics:
        - Structured logging in Flutter (logger packages, print vs log)
        - Crashlytics deep dive: capturing and analyzing crashes
        - Custom error handling and error boundaries (via widget tree)
        - In-app error reporting (send logs, feedback)
        - Using Firebase Analytics or other analytics tools
        - Key metrics: MAU, retention, funnels (conceptual)
        - Privacy and consent for analytics tracking
      Projects built:
        - Centralized error handling layer in an app
        - User-friendly error screens with retry & support links
        - Basic analytics events for core user flows
        - Feedback form that sends logs & device info (with consent)
        - Kids variant: Minimal analytics respecting child privacy
      Practice: Integrate logging & crash reporting into all capstone-level apps
    Security & Data Protection in Flutter Apps
      Topics:
        - Storing secrets securely (env files, platform secure storage)
        - Encrypted local storage (flutter_secure_storage, cryptography basics)
        - Protecting API keys and sensitive data
        - Secure communication: HTTPS/TLS verification (concept)
        - Obfuscation and code hardening (dart compile, proguard/R8 for Android)
        - Auth token management and refresh strategies
        - Basic OWASP considerations for mobile apps
      Projects built:
        - Secure token storage for an authenticated app
        - Secure notes/vault feature with local encryption (conceptual + basic implementation)
        - API key protection strategies demo
        - Kids variant: Content access locks and parental gate
        - Security checklist for all released apps
      Practice: Review and harden security for all apps handling user data
      Assessment: Phase 3 exam: a practical build defended live, plus a written paper mixing
      this phase with everything before it

---------------------------------------------------------------
PHASE 4: THE FINALE (MONTH 10, WEEKS 40-44)
---------------------------------------------------------------
The capstone month: spec, build, ship and defend, then the final exam that decides the
certificate.

  Month 10: Capstone and the Final Exam (Weeks 40-44)
    Capstone Spec and Setup
      Topics:
        - Choosing the capstone: a complete Flutter app with Firebase auth and data, running on Android
          and iOS
        - A one-page spec: scope, milestones, stack
        - Repository and skeleton ready on day one
        - Instructor sign-off before the build begins
      Projects built:
        - Approved capstone spec plus the running skeleton, deployed where applicable
```

Practice: Pitch the spec to the batch and absorb one hard question
Capstone Build
Topics:
- Two focused weeks in vertical slices
- Instructor checkpoints and honest scope cuts
- Using the whole course: Dart depth, widget craft, chosen state management, Firebase and tests
- Daily commits and an always-working build
Projects built:
- The capstone, feature-complete with version control
Practice: A working build at the end of every session
Ship and Polish
Topics:
- The finishing pass: edge cases, errors, documentation
- Both-platform pass: the app verified on Android and iOS with release checklists
- A README worth reading and a demo worth watching
- A full-course spiral review before the exam
Projects built:
- The capstone shipped, documented and rehearsed
Practice: Two mock demos, each tighter than the last
Demo Day and the Final Exam
Topics:
- Presenting the capstone: live demo plus the hardest bug story
- The honest map of next roads: mobile development roles, product building, or native specializations
- Where our other courses continue the journey
Projects built:
- Demo day presentation delivered to the batch
Assessment: FINAL EXAM: a practical build plus a written paper with questions mixed from every phase. Passing earns the certificate; falling short earns a focused revision plan and a free retest

PROJECTS THE STUDENT BUILDS AND KEEPS

- Phase 1: Dart programs and first Flutter apps with real layouts
- Phase 2: state-managed, well-architected applications
- Phase 3: Firebase-backed apps with offline behavior and tests
- Phase 4: the capstone on both platforms, defended at demo day

Total projects: 20+ real builds, crowned by a both-platform capstone app

SKILLS THE STUDENT WILL HAVE AT THE END

- Dart as a real language: types, async and the idioms Flutter assumes
- Widget craft: composition, layouts and UI that feels native
- State management chosen and mastered with judgment
- Firebase: auth, data and the honest limits
- Production habits: offline behavior, testing, release discipline

HOW A TYPICAL WEEK IS SPLIT

Live classes: 2 live one-hour classes per week, coding along with the instructor
Homework: A problem set after every class, and a mixed-review assignment at the end of every month
Practice: 4-6 hours of building between classes
Review: Every submission reviewed with written feedback; recurring gaps reopened in class

SUPPORT INCLUDED

Doubt support: WhatsApp doubt support between classes
Progress updates: Honest monthly progress reviews: what is solid, what is wobbly, and the plan for the wobble

CERTIFICATION DETAIL

Completion: Certificate from Modern Age Coders, awarded on passing the final exam. Fall short and there is focused revision and a free retest: the certificate certifies knowledge, not attendance

WHERE THIS CAN LEAD

- Mobile development roles: Flutter hiring has real momentum
- Product building: two stores, one codebase, real speed
- Native depth later: Kotlin or Swift courses when a platform demands it
- Our backend courses for the server half of app products

EARNING POTENTIAL (share only if asked, and never promise it)

Market context: The ranges below are general market salary bands for these roles in India and abroad, drawn from public industry data. They are shown for career context only and are not a

promise or guarantee of income. Actual pay depends on your skills, experience, location, and the job market.
Early career roles: Rs 3-5 LPA (Junior Flutter Developer / Mobile Intern with strong fundamentals)
Growing roles: Rs 5-9 LPA (Flutter Developer / Mobile App Developer with portfolio apps); Rs 8-15 LPA (Senior Flutter Developer / Lead Mobile Engineer in startups & agencies)
Experienced roles: Rs 12-25 LPA (Senior/Lead Flutter Developer or Mobile Architect in product companies); Rs 18-40 LPA (Lead Developer / Mobile Architect / Specialist Consultant)
Freelance: Rs 1,000-5,000/hour or $20-$100/hour based on expertise and client region
International usa: $80k-160k USD (Mobile / Flutter Developer to Senior roles, remote or onsite)
International europe: €50k-120k EUR based on country, role, and experience in Flutter/mobile dev

COMMON QUESTIONS ABOUT THIS COURSE

For anything about cost, use PART 4 and RULE 1. Do not quote two regions.

Q: What does this Flutter course cover?
A: Dart as a real language first, then Flutter properly: the widget mental model, layouts and navigation that feel native on both platforms, state management chosen with judgment, architecture that survives features, Firebase auth and data, offline behavior, testing and release discipline. A finale month ships a capstone app verified on Android and iOS and sits the final exam.

Q: How long does it take to learn Flutter properly?
A: Ten months of teaching at 2 live classes a week plus 4 to 6 hours of practice, with two more months in hand for learners who need them. The three teaching phases build the skill and its real-world application; the finale month ships a capstone and sits the final exam.

Q: How am I assessed? Is the certificate just for attending?
A: No. Problem sets follow every class with written feedback, monthly reviews deliberately mix new material with earlier topics, each phase ends with a cumulative exam, and the course ends with a final exam: a practical build plus written questions from the whole syllabus. Passing earns the certificate; falling short earns focused revision and a free retest.

Q: Flutter or React Native?
A: Both are honest cross-platform answers. Flutter wins on UI consistency and performance-by-default with one language (Dart); React Native wins for teams already deep in JavaScript. We teach both roads in different courses; this one is the Flutter road, chosen most by builders who want pixel-level control on both platforms.

Q: Do I need a Mac for this course?
A: Not for learning: Android covers the entire journey on any computer, and the iOS build step is taught honestly as a release-time requirement (Apple mandates a Mac there). Students shipping to the App Store later use a borrowed, used or cloud Mac at that point, stated upfront rather than discovered late.

Q: Can I try a class before enrolling?
A: Yes, a free demo class with no commitment: book at learn.modernagecoders.com/contact or message us on WhatsApp at +91 91233 66161. (Agent note: the free demo is a waiting list with no fixed date. The Priority Live Demo is a guaranteed class today or tomorrow, booked at https://learn.modernagecoders.com/priority-demo . Offer both, as RULE 3 says.)

Q: Are classes live or recorded?
A: Live, always: small groups with a real instructor reading your actual code, never pre-recorded videos.

To enrol, message Shivam Sir on +91 9123366161 or send the parent this link: https://learn.modernagecoders.com/courses/complete-flutter-app-development-masterclass-college
For a demo: the Priority Live Demo (guaranteed, today or tomorrow) is booked at https://learn.modernagecoders.com/priority-demo . The free demo is a waiting list with no fixed date.

==========
COURSE 60 OF 137: FRONTEND DEVELOPMENT FOR TEENS: CSS CRAFT TO REACT UI
==========

Course link: https://learn.modernagecoders.com/courses/frontend-development-masterclass-for-teens
Subject area: Web Development
Designed for: Teens
Who can join: Absolute beginner, ages 13 to 18
Course length: 9-11 months (36-44 weeks)
Time needed: 2 live classes/week + 3-4 hours practice
Certificate: Certificate from Modern Age Coders, awarded on passing the final exam

PRICE FOR THIS COURSE (quote only the one that applies to the person asking)
In India, per month: group Rs 1,499, mini batch Rs 2,999, one to one Rs 4,999
Outside India, per month: group $100, one to one $150

Classes: group and mini batch two live classes a week, eight a month; one to one in India one live class a week, four a month; one to one outside India two live classes a week, eight a month. Each class is one hour.

WHAT THIS COURSE IS

Frontend course for teens aged 13-18 with a design soul: CSS mastery, Tailwind, animations, JavaScript, React for UI and design systems, in 9-11 months.

In one line: The frontend course with a design soul: CSS mastered as a craft, interfaces that feel expensive, and React learned as a UI instrument.

ABOUT THE PROGRAMME

Every interface a teen admires, the smooth landing page, the app that feels expensive, is frontend craft, and craft is exactly what most courses skip on the way to frameworks. This live online course for ages 13 to 18 takes the design-forward road: HTML and CSS mastered properly, flexbox, grid, responsive discipline, then the styling craft layer, modern CSS, SASS architecture, Tailwind, and animations that make pages feel alive, on real JavaScript foundations. React arrives as a UI instrument: components, hooks, styling strategies and a design system built by the student. The final month adds accessibility and performance, the two marks of professional frontend, and ships a capstone with genuine polish. This course pairs with our React for Teens course rather than repeating it: React for Teens goes deeper into application logic and TypeScript; this course goes deeper into the visual craft, CSS depth, animation, design systems, that makes interfaces worth using. Ambitious students take both roads over time. The pace is honest: nine months at two live classes a week plus three to four hours of practice, with two more months in hand. Homework, monthly mixed reviews, phase exams, and a final exam that decides the certificate with a free retest. Real craft, real interfaces, depth over dopamine.

WHAT MAKES THIS COURSE DIFFERENT

- CSS as a craft, not a chore: modern CSS, SASS architecture, Tailwind and animation get real weeks
- Design systems built, not mentioned: the student ships a component library of their own
- Accessibility and performance as the finishing school: the two marks of professional frontend
- React taught as a UI instrument, complementing (not repeating) our React for Teens course
- Everything deploys: public URLs from the first phase
- Real assessment: weekly homework, monthly mixed reviews, and a final exam that decides the certificate, with a free retest

THE LEARNING PATH, STEP BY STEP

Phase 1: Foundations (Months 1-3): HTML, CSS, layouts, responsive discipline and first JavaScript
Phase 2: The styling craft (Months 4-6): DOM and APIs, modern CSS, SASS architecture, Tailwind and animation
Phase 3: React for UI builders (Months 7-8): components, hooks, styling strategies and a design system of your own
Phase 4: The finishing school (Month 9): accessibility, performance, and the polished capstone exam

WHAT A STUDENT NEEDS BEFORE STARTING

Coding experience: None. The course starts at the first tag
Computer skills: Comfortable typing and managing files
Equipment: A computer with a stable internet connection; every tool used is free
Age: 13 to 18. Batches are grouped by age and pace
Time commitment: 2 live classes plus 3-4 hours of practice a week

WHO THIS COURSE IS FOR

Design minded: Teens who notice spacing and motion everywhere and want to build what they admire
Complete beginners: Students starting from zero on the visual-craft road
React teens pairs: Students who took (or will take) React for Teens and want the UI-craft half
Portfolio builders: Teens who want deployed work that visibly looks better than average
Future designers: Students weighing design against engineering, building both muscles

FULL CURRICULUM, WEEK BY WEEK

This is the complete teaching plan. Parents can ask about any week.

PHASE 1: FOUNDATIONS (MONTHS 1-3, WEEKS 1-12)

HTML with meaning, CSS with discipline, layouts that survive every screen, and first JavaScript.

Month 1: Structure and Style (Weeks 1-4)
  Introduction to Web Development
    Topics:
      - How websites work: The magic behind Instagram and TikTok
      - Frontend vs Backend: What's the difference?
      - Browser DevTools: Your secret weapon
      - Setting up VS Code: Your coding workspace
      - Essential extensions and themes (make it look cool!)
      - HTML basics: The skeleton of websites
      - HTML tags: headers, paragraphs, links, images
      - Semantic HTML5: header, nav, main, footer
      - Creating your first webpage
      - Lists, tables, and organization
      - Forms and user input
      - Embedding videos, audio, and maps
    Projects built:
      - Personal introduction webpage
      - Favorite artist fan page
      - School project presentation site
      - Recipe collection page
    Practice: Daily: Create one new HTML page exploring different elements
  CSS Styling & Design
    Topics:
      - CSS: Making websites beautiful
      - Selectors: Targeting elements like a sniper
      - Colors and gradients: Creating stunning palettes
      - Typography: Fonts that make impact
      - Google Fonts and custom fonts
      - Box Model: The secret to layouts
      - Padding, margins, borders explained
      - Backgrounds: Images, patterns, videos
      - CSS animations: Making things move
      - Transitions: Smooth interactions
      - Hover effects that wow
      - Transform: Rotate, scale, skew
    Projects built:
      - Animated landing page
      - CSS art challenge
      - Interactive button collection
      - Photo gallery with effects
    Practice: Recreate 5 website sections from popular sites
    Assessment: Month 1 check: style a page live to match a design, plus a take-home mixing
    everything so far

Month 2: Layout Mastery (Weeks 5-8)
  Flexbox & Grid Layouts
    Topics:
      - Flexbox: The game-changer for layouts
      - Flex containers and items
      - Main axis vs cross axis
      - Justify-content: Horizontal alignment magic
      - Align-items: Vertical alignment made easy
      - Flex-wrap and responsive design
      - CSS Grid: Two-dimensional layouts
      - Grid template areas: Visual layout design
      - Auto-fit and auto-fill: Dynamic grids
      - Combining Flexbox and Grid
      - Building complex layouts easily
      - Common layout patterns
    Projects built:
      - Instagram-style photo grid
      - YouTube homepage layout
      - Discord server layout
      - Pinterest-style masonry
    Practice: Build 10 different layout challenges
  Responsive Design & Mobile First
    Topics:
      - Why mobile-first matters: Everyone's on phones
      - Media queries: Adapting to screen sizes
      - Breakpoints: Phone, tablet, desktop
      - Responsive units: rem, em, %, vw, vh
      - Responsive images and videos
      - Mobile navigation patterns
      - Hamburger menus and mobile UI
      - Touch-friendly design
      - Testing on real devices
      - Chrome DevTools device mode
      - Common responsive mistakes

- Performance on mobile
      Projects built:
- Fully responsive portfolio
- Mobile-first blog design
- Responsive e-commerce page
- App landing page
      Practice: Make all previous projects responsive
      Assessment: Month 2 check: build a responsive layout live from a wireframe, plus mixed review

  Month 3: First JavaScript (Weeks 9-12)
    JavaScript Basics
      Topics:
- JavaScript: Making websites interactive
- Variables: let, const, var explained
- Data types: Numbers, strings, booleans
- Arrays: Managing lists of data
- Objects: Organizing complex data
- Functions: Reusable code blocks
- Parameters and return values
- Arrow functions: Modern syntax
- Template literals: Dynamic strings
- Operators and comparisons
- Console methods for debugging
- Comments and code organization
      Projects built:
- Interactive calculator
- Quiz game with scoring
- Todo list application
- Random meme generator
      Practice: Complete 50 JavaScript exercises on CodeWars
    Control Flow & Logic
      Topics:
- If/else statements: Making decisions
- Switch statements: Multiple choices
- Ternary operators: Shorthand conditions
- Logical operators: AND, OR, NOT
- Truthy and falsy values
- For loops: Repeating actions
- While loops: Conditional repetition
- ForEach, map, filter, reduce
- Break and continue
- Try/catch: Error handling
- Debugging strategies
- Common logic patterns
- Deploying your best pages to public URLs
      Projects built:
- Password strength checker
- Grade calculator
- Text-based adventure game
- Data filtering dashboard
      Practice: Solve 30 algorithm challenges
      Assessment: Phase 1 exam: a styled interactive page built live, plus a written mixed paper

---
PHASE 2: THE STYLING CRAFT (MONTHS 4-6, WEEKS 13-24)

Where interfaces start feeling expensive: the DOM, live data, modern CSS, SASS architecture, Tailwind and animation.

  Month 4: Living Pages (Weeks 13-16)
    DOM Manipulation
      Topics:
- DOM: The bridge between HTML and JavaScript
- Selecting elements: querySelector magic
- Changing content dynamically
- Modifying styles with JavaScript
- Creating and removing elements
- Event listeners: Clicks, hovers, inputs
- Event bubbling and delegation
- Form handling and validation
- Local storage: Saving user data
- Keyboard and mouse events
- Scroll events and parallax
- Building interactive components
      Projects built:
- Dynamic theme switcher
- Interactive game (Tic-tac-toe)

```
      - Form with live validation
      - Infinite scroll gallery
    Practice: Build 15 interactive components
  Asynchronous JavaScript & APIs
    Topics:
      - Async JavaScript: Why it matters
      - Callbacks: The old way
      - Promises: The better way
      - Async/await: The modern way
      - Fetch API: Getting data from servers
      - Working with JSON data
      - Public APIs: Weather, movies, music
      - Error handling in async code
      - Loading states and spinners
      - API authentication basics
      - CORS and how to handle it
      - Building data-driven websites
    Projects built:
      - Weather app with live data
      - Movie search application
      - Spotify playlist viewer
      - GitHub profile viewer
    Practice: Integrate 10 different APIs
    Assessment: Month 4 check: an API-powered widget built live, plus mixed review

Month 5: Modern CSS and Architecture (Weeks 17-20)
  Modern CSS Techniques
    Topics:
      - CSS Custom Properties (variables)
      - CSS Grid advanced techniques
      - Container queries: The future of responsive
      - CSS nesting (native)
      - Logical properties for internationalization
      - Modern color functions: rgb(), hsl(), lab()
      - Aspect-ratio property
      - CSS scroll snap for carousels
      - Sticky positioning tricks
      - CSS counters for numbering
      - Print styles for web pages
      - Accessibility with CSS
    Projects built:
      - Magazine-style layout
      - Advanced dashboard design
      - Product showcase with filters
      - Interactive timeline
    Practice: Experiment with cutting-edge CSS features
  SASS/SCSS & CSS Architecture
    Topics:
      - SASS: CSS with superpowers
      - Variables, nesting, and mixins
      - Functions and calculations in SASS
      - Partials and imports
      - Extends and placeholders
      - BEM methodology: Organized CSS
      - CSS architecture patterns
      - Component-based styling
      - Utility-first CSS introduction
      - CSS-in-JS concepts
      - PostCSS and autoprefixer
      - Building a design system
    Projects built:
      - Design system with SASS
      - Themed website with variables
      - Component library
      - Multi-theme dashboard
    Practice: Refactor projects using SASS
    Assessment: Month 5 check: refactor a messy stylesheet live into clean architecture,
    plus mixed review

Month 6: Tailwind and Motion (Weeks 21-24)
  Tailwind CSS & Utility-First
    Topics:
      - Tailwind CSS: Why developers love it
      - Utility classes philosophy
      - Setting up Tailwind
      - Responsive utilities
      - Hover, focus, and state variants
      - Custom configuration
      - Extending Tailwind
```

- Component extraction
- Tailwind UI components
- JIT mode benefits
- Tailwind vs traditional CSS
- Building with Tailwind

Projects built:
- Landing page with Tailwind
- Admin dashboard UI
- E-commerce product page
- Social media feed clone

Practice: Rebuild projects with Tailwind

Animation: Interfaces That Feel Alive

Topics:
- CSS variables: Dynamic styling
- CSS calculations with calc()
- Advanced selectors and pseudo-elements
- CSS shapes and clip-path
- Filters and blend modes
- 3D transforms and perspective
- Keyframe animations
- Animation timing functions
- SVG animations
- Scroll-triggered animations
- Parallax scrolling effects
- Performance optimization
- Transitions with intent: feedback, hierarchy, delight
- Keyframes and scroll-linked effects, used with restraint
- Motion accessibility: respecting reduced-motion users

Projects built:
- Animated hero section
- Interactive infographic
- 3D card flip gallery
- Scroll storytelling site

Practice: Create animation library

Assessment: Phase 2 exam: an animated component set defended, plus a cumulative written paper

---

PHASE 3: REACT FOR UI BUILDERS (MONTHS 7-8, WEEKS 25-32)

React as a UI instrument: components, hooks, styling strategies, and the crowning project of the phase, a design system of your own.

Month 7: React Essentials (Weeks 25-28)

React Basics

Topics:
- Why React? Facebook, Instagram, Netflix use it
- Vite: Quick start
- JSX: HTML in JavaScript (weird but powerful)
- Components: Building blocks of React
- Functional vs Class components
- Props: Passing data down
- State: Component memory
- useState hook explained
- Event handling in React
- Conditional rendering
- Lists and keys
- Component lifecycle

Projects built:
- Instagram feed clone
- Interactive todo app
- Weather dashboard
- Movie gallery

Practice: Build 20 React components

React Hooks Deep Dive

Topics:
- useState: Managing component state
- useEffect: Side effects and lifecycle
- useContext: Avoiding prop drilling
- useReducer: Complex state logic
- useCallback: Optimizing functions
- useMemo: Expensive calculations
- useRef: DOM references and values
- Custom hooks: Reusable logic
- Rules of hooks
- Hook patterns and best practices
- Testing hooks
- Common hook mistakes

Projects built:

```
        - Chat application with hooks
        - Shopping cart with useReducer
        - Theme system with Context
        - Custom hooks library
      Practice: Create 10 custom hooks
      Assessment: Month 7 check: an interactive component built live, plus mixed review

  Month 8: Styling React and Design Systems (Weeks 29-32)
    Styling in React
      Topics:
        - CSS Modules in React
        - Styled-components introduction
        - Emotion CSS-in-JS
        - Tailwind with React
        - Material-UI (MUI) components
        - Chakra UI for rapid development
        - Ant Design components
        - Creating themed components
        - Animation libraries: Framer Motion
        - React Spring animations
        - Lottie animations in React
        - Building a design system
      Projects built:
        - Animated portfolio site
        - Dashboard with MUI
        - Landing page with animations
        - Custom component library
      Practice: Style apps with different approaches
    Your Own Design System
      Topics:
        - Design system principles
        - Design tokens
        - Component documentation
        - Storybook mastery
        - Component testing
        - Accessibility testing
        - Visual regression testing
        - Publishing to NPM
        - Versioning strategies
        - Monorepo management
        - Documentation sites
        - Team adoption
        - Documenting components so others could use them
      Projects built:
        - A personal design system: tokens, components and documentation, deployed
      Practice: Build professional component library
      Assessment: Phase 3 exam: the design system defended, plus a cumulative written paper

------------------------------------------------------------
PHASE 4: THE FINISHING SCHOOL (MONTH 9, WEEKS 33-36)
------------------------------------------------------------
The two marks of professional frontend, accessibility and performance, then the polished
capstone and the final exam.

  Month 9: Polish, Capstone, Demo Day (Weeks 33-36)
    Accessibility and SEO Basics
      Topics:
        - Web accessibility (a11y) importance
        - WCAG guidelines
        - Semantic HTML for accessibility
        - ARIA labels and roles
        - Keyboard navigation
        - Screen reader testing
        - Color contrast and vision
        - Focus management
        - SEO fundamentals
        - Meta tags and Open Graph
        - Structured data
        - SEO for SPAs
      Projects built:
        - Accessibility audit and fixes
        - Fully accessible form system
        - SEO-optimized blog
        - Accessible component library
      Practice: Make all projects accessible
    Performance: Measured, Then Fixed
      Topics:
        - Web performance metrics
        - Core Web Vitals
```

          - Lighthouse audits
          - Bundle size optimization
          - Code splitting strategies
          - Lazy loading components
          - Image optimization techniques
          - Font optimization
          - Caching strategies
          - Service workers basics
          - Progressive Web Apps
          - Performance monitoring
        Projects built:
          - Optimize slow application
          - PWA conversion
          - Performance dashboard
          - Speed optimization challenge
        Practice: Optimize all projects for performance
      Capstone Build
        Topics:
          - One focused week: an interface with visible craft
          - Using the design system you built
          - Responsive, accessible, animated with restraint
          - Instructor checkpoint and honest scope cuts
          - Deployment and the case-study README
        Projects built:
          - THE CAPSTONE: a polished, deployed interface built on your own design system
        Practice: A deployed build at the end of every session
      Demo Day and the Final Exam
        Topics:
          - Presenting the capstone: craft decisions explained
          - A full-course spiral review before the exam
          - Where each path leads: React for Teens for app logic, full-stack for the backend half
        Projects built:
          - Demo day presentation delivered to the batch and parents
        Assessment: FINAL EXAM: a practical build plus a written paper with questions mixed
        from every phase. Passing earns the certificate; a student who falls short gets a
        focused revision plan and a free retest

PROJECTS THE STUDENT BUILDS AND KEEPS

  - Phase 1: styled pages, responsive layouts and deployed first projects
  - Phase 2: API-powered widgets, refactored stylesheets, Tailwind builds and animated components
  - Phase 3: React UI projects and a personal design system, deployed and documented
  - Phase 4: an accessibility and performance pass, and the polished capstone at demo day

  Total projects: 20+ deployed interfaces, crowned by a design system and a polished capstone

SKILLS THE STUDENT WILL HAVE AT THE END

  - HTML and CSS to genuine depth: layout, responsive discipline and modern features
  - Styling craft: SASS architecture, Tailwind and animation with restraint
  - JavaScript and the DOM: living pages with real data
  - React for UI: components, hooks and styling strategies
  - Design systems: tokens, components and documentation
  - The professional marks: accessibility and measured performance

HOW A TYPICAL WEEK IS SPLIT

  Live classes: 2 live one-hour classes per week, building along with the instructor
  Homework: Homework after every class, and a mixed-review assignment at the end of every month
  Practice: 3-4 hours of building between classes
  Review: Every submission reviewed with written feedback; recurring gaps reopened in class

SUPPORT INCLUDED

  Doubt support: WhatsApp doubt support between classes, for the layout that collapses at 380
    pixels
  Progress updates: Regular progress notes to parents: what was built, what comes next, and
    where encouragement helps

CERTIFICATION DETAIL

  Completion: Certificate from Modern Age Coders, awarded on passing the final exam. Fall short
    and there is focused revision and a free retest: the certificate certifies knowledge, not
    attendance

WHERE THIS CAN LEAD

  - React for Teens: the application-logic half of frontend, TypeScript included
  - Full-stack web development: the backend half when ready

  - Canva and design courses: the pure-design road, entered with real CSS understanding
  - School and club sites that suddenly look professional
  - The taste advantage: every future tool is easier with craft underneath

COMMON QUESTIONS ABOUT THIS COURSE

  For anything about cost, use PART 4 and RULE 1. Do not quote two regions.

  Q: What will my teen build in this frontend course?
  A: More than 20 deployed interfaces across nine months: styled responsive pages, API-powered widgets, Tailwind builds, animated component sets, React UI projects, a personal design system with tokens and documentation, and a polished capstone interface presented at demo day. The visual craft is the point: work that visibly looks better than average.

  Q: How is this different from your React for Teens course?
  A: They are two halves of frontend, deliberately split. React for Teens goes deeper into application logic: state, TypeScript, data patterns and a product capstone. This course goes deeper into the visual craft: CSS mastery, SASS architecture, Tailwind, animation, design systems, accessibility and performance. Ambitious students take both roads over time; either order works.

  Q: How long does it take, and how is my teen assessed?
  A: Nine months at 2 live classes a week plus 3 to 4 hours of practice, with two more months in hand for students who need them. Homework follows every class, monthly assignments mix new questions with earlier topics, each phase ends with an exam, and a final exam, practical plus written, decides the certificate, with a free retest after revision.

  Q: Does this course cover Vue, Angular or Svelte?
  A: Honestly, no: framework tours produce students fluent in nothing. The craft taught here, CSS depth, component thinking, design systems, transfers to every framework in days, and React is included as the industry default UI instrument. A teen who owns this material picks up any alternative framework when a real project demands it.

  Q: Is frontend still a good skill in the AI era?
  A: More than ever, and specifically the craft half: AI tools generate average-looking interfaces in seconds, which makes above-average taste the differentiator. Judgment about spacing, motion, hierarchy and accessibility is exactly what this course trains, and exactly what tools cannot fake.

  Q: Is there a free trial class?
  A: Yes, a free demo class with no commitment: book at learn.modernagecoders.com/contact or message us on WhatsApp at +91 91233 66161. (Agent note: the free demo is a waiting list with no fixed date. The Priority Live Demo is a guaranteed class today or tomorrow, booked at https://learn.modernagecoders.com/priority-demo . Offer both, as RULE 3 says.)

  Q: Are classes live or recorded?
  A: Live, always: small groups with a real instructor critiquing real work, never pre-recorded videos. Craft is built through critique.

  To enrol, message Shivam Sir on +91 9123366161 or send the parent this link: https://learn.modernagecoders.com/courses/frontend-development-masterclass-for-teens
  For a demo: the Priority Live Demo (guaranteed, today or tomorrow) is booked at https://learn.modernagecoders.com/priority-demo . The free demo is a waiting list with no fixed date.

==
COURSE 61 OF 137: FULL STACK DEVELOPER COURSE: REACT, NODE.JS AND DEVOPS BASICS
==

Course link: https://learn.modernagecoders.com/courses/full-stack-web-development-masterclass-college
Subject area: Web Development
Designed for: College students
Who can join: Complete beginner; college students, graduates and career switchers (18+)
Course length: 12-14 months (48-56 weeks)
Time needed: 2 live classes/week + 4-6 hours practice
Certificate: Certificate from Modern Age Coders, awarded on passing the final exam

PRICE FOR THIS COURSE (quote only the one that applies to the person asking)
  In India, per month: group Rs 1,499, mini batch Rs 2,999, one to one Rs 4,999
  Outside India, per month: group $100, one to one $150
  Classes: group and mini batch two live classes a week, eight a month; one to one in India one live class a week, four a month; one to one outside India two live classes a week, eight a month. Each class is one hour.

WHAT THIS COURSE IS

  Full stack developer course for college students and career switchers: HTML to React, Node.js, SQL and MongoDB, Docker, CI/CD and AI features in 12-14 months.

In one line: The complete road from a first HTML tag to a deployed, tested, AI-capable application, walked at a professional pace in twelve months.

ABOUT THE PROGRAMME

Full stack development remains the most employable generalist skill in software: one person who can take an idea from empty folder to running product. This live online masterclass builds that person deliberately, from absolute zero, using the stack that dominates hiring in 2026: JavaScript and TypeScript, React and Next.js, Node and Express, MongoDB and PostgreSQL, with Docker, CI/CD and cloud fundamentals where employers expect them. The arc runs in four phases. Foundations first: HTML, CSS and JavaScript learned to real depth, including the asynchronous patterns most self-taught developers never quite trust. Then the modern frontend: TypeScript, React with hooks and honest state management, styling with Tailwind, and a production-grade frontend capstone. Then the backend: Express APIs designed properly, both database families (document and relational), authentication done safely, OWASP security and real-time features. The final phase is what separates course graduates from employable developers: testing, Next.js, performance, Docker, CI pipelines, cloud fundamentals, a system design introduction, AI features built with guardrails, and a capstone shipped like a product. The pace is honest: two live classes a week plus four to six hours of practice fits this in twelve months, and learners who need longer take up to fourteen, the batch adapts. Assessment is honest too: homework after every class, monthly assignments that mix new questions with earlier topics, cumulative phase exams, and a final exam that decides the certificate. Real knowledge, real work, real projects, depth over dopamine.

WHAT MAKES THIS COURSE DIFFERENT

- One coherent stack learned to depth: JavaScript, TypeScript, React, Node, both SQL and MongoDB, the combination hiring actually asks for
- Professional habits are the syllabus, not a bonus: Git workflow, testing, code review, CI, Docker and deployment run through the course
- Everything ships: projects live on public URLs from month 3, ending in a deployed, tested capstone
- AI features built properly: server-side model calls, streaming, retrieval over your own data, guardrails and cost control
- An honest 12-month arc with 2 months of margin built in: learners who need more practice take up to 14, nobody is rushed
- Real assessment: weekly homework, mixed-review assignments every month, and a final exam that decides the certificate, with focused revision and a free retest for those who fall short

THE LEARNING PATH, STEP BY STEP

Phase 1: Foundations (Months 1-3): HTML, CSS, layouts, then JavaScript to real depth, DOM, events and async, ending deployed
Phase 2: Modern frontend (Months 4-6): ES6+ mastery, OOP and functional patterns, TypeScript, React, state management and a frontend capstone
Phase 3: Backend engineering (Months 7-9): Node, Express, REST design, MongoDB and PostgreSQL, auth, security and real-time
Phase 4: Production (Months 10-12): testing, Next.js, performance, Docker, CI/CD, cloud fundamentals, system design intro, AI features and the final capstone

WHAT A STUDENT NEEDS BEFORE STARTING

Coding experience: None. The course starts from how computers and the web actually work
Computer skills: Comfortable installing software and managing files
Equipment: A computer with a stable internet connection; every tool used in the course is free
Age: 18+. College students, recent graduates and working professionals switching careers
Time commitment: 2 live classes plus 4-6 hours of practice a week

WHO THIS COURSE IS FOR

College students: Students who want employable, portfolio-proven skills alongside the degree
Career switchers: Professionals from any field ready to move into software properly, not through shortcuts
Self taught stuck: Self-taught learners with tutorial miles but no structure, who need the gaps closed
Builders: People with a product idea who want the ability to build it end to end
Ai curious: Developers-to-be who want AI features as a working skill, not a buzzword

FULL CURRICULUM, WEEK BY WEEK

This is the complete teaching plan. Parents can ask about any week.

PHASE 1: FOUNDATIONS (MONTHS 1-3, WEEKS 1-12)

Computing, HTML, CSS and JavaScript built to real depth. The phase ends with an interactive, API-powered project deployed to a public URL.

Month 1: How the Web Is Built (Weeks 1-4)
  Computing, the Web and Your Toolkit
    Topics:
      - How computers work: CPU, Memory, Storage
      - Binary, data representation, and encoding
      - Operating systems basics (Windows, Mac, Linux)
      - Internet fundamentals: How the web works
      - Client-server architecture explained
      - IP addresses, DNS, and HTTP basics
      - Development environment setup
      - VS Code installation and configuration
      - Terminal/Command Line basics
      - Git installation and first commands
      - Creating your first GitHub account
      - Introduction to HTML: What is markup?
    Projects built:
      - Set up complete development environment
      - Create first GitHub repository
      - Write 'About Me' HTML page
    Practice: Daily: 30 min terminal practice, 1 hour HTML basics
  HTML5 Done Properly
    Topics:
      - HTML document structure and anatomy
      - Semantic HTML5 elements (header, nav, main, section, article, aside, footer)
      - Text elements: headings, paragraphs, lists, quotes
      - Links and navigation (absolute vs relative URLs)
      - Images: img tag, srcset, responsive images
      - Tables: structure, accessibility, styling
      - Forms: input types, labels, validation
      - Form elements: textarea, select, radio, checkbox
      - HTML5 APIs: audio, video, canvas basics
      - Meta tags and SEO fundamentals
      - Accessibility basics: ARIA labels, semantic structure
      - HTML best practices and code organization
    Projects built:
      - Personal portfolio website (HTML only)
      - Restaurant menu page with images and tables
      - Multi-page contact form with validation
    Practice: Build 5 different webpage layouts from scratch
  CSS Fundamentals
    Topics:
      - CSS syntax: selectors, properties, values
      - Three ways to add CSS: inline, internal, external
      - CSS selectors: element, class, ID, descendant, child
      - CSS specificity and cascade rules
      - Color systems: hex, rgb, rgba, hsl, hsla
      - Typography: font-family, size, weight, line-height, letter-spacing
      - Text styling: alignment, decoration, transformation
      - The Box Model: content, padding, border, margin
      - Width, height, and box-sizing
      - Display property: block, inline, inline-block, none
      - Background properties: color, image, position, repeat, size
      - CSS units: px, em, rem, %, vh, vw
    Projects built:
      - Style your portfolio with beautiful CSS
      - Create a styled blog post layout
      - Design a product card component
    Practice: Recreate 10 designs from screenshots using HTML/CSS
  Flexbox, Grid and Responsive Layouts
    Topics:
      - CSS positioning: static, relative, absolute, fixed, sticky
      - Z-index and stacking contexts
      - Float and clear (legacy layout)
      - Flexbox: flex container and flex items
      - Flexbox properties: justify-content, align-items, flex-direction, flex-wrap
      - Flex grow, shrink, and basis
      - CSS Grid: rows, columns, and grid template
      - Grid areas and named grid lines
      - Grid gap, auto-fit, auto-fill, minmax
      - Responsive design principles
      - Media queries: breakpoints and mobile-first approach
      - Viewport meta tag and mobile optimization
    Projects built:
      - Holy grail layout with Flexbox and Grid
      - Responsive navigation menu
      - Photo gallery with Grid
      - Complete responsive landing page
    Practice: Build 5 different layout patterns (sidebar, header-footer, card grid, etc.)
    Assessment: Month 1 check: build a responsive layout live from a wireframe, plus a

```
    take-home assignment mixing all of month 1

Month 2: JavaScript Fundamentals (Weeks 5-8)
  JavaScript Basics and Syntax
    Topics:
      - What is JavaScript? History and ecosystem
      - Adding JavaScript to HTML: script tags, external files
      - Console and debugging basics
      - Variables: var, let, const (differences and scope)
      - Data types: string, number, boolean, null, undefined, symbol
      - Type conversion and coercion
      - Operators: arithmetic, comparison, logical, assignment
      - String methods: length, charAt, slice, indexOf, replace
      - Template literals and string interpolation
      - Comments and code documentation
      - Naming conventions and code style
      - First program: interactive calculator
    Projects built:
      - Temperature converter
      - Simple tip calculator
      - Age calculator with leap year handling
    Practice: Solve 20 basic JavaScript problems on variables and operators
  Control Flow, Loops and Arrays
    Topics:
      - If-else statements and conditions
      - Switch statements
      - Ternary operator
      - Truthy and falsy values
      - Logical operators: &&, ||, !
      - Loops: for, while, do-while
      - Break and continue statements
      - Nested loops and patterns
      - Arrays: creation, indexing, length
      - Array methods: push, pop, shift, unshift
      - Iterating arrays with loops
      - Multi-dimensional arrays
    Projects built:
      - Number guessing game
      - FizzBuzz challenge
      - Pattern printing (stars, pyramids)
      - Shopping cart with array manipulation
    Practice: Solve 30 logic problems on loops and arrays
  Functions, Scope and Closures
    Topics:
      - Function declaration vs expression
      - Parameters and arguments
      - Return statements
      - Default parameters
      - Rest parameters and spread operator
      - Arrow functions (ES6)
      - Function scope and hoisting
      - Lexical scope and closure
      - IIFE (Immediately Invoked Function Expressions)
      - Callback functions introduction
      - Higher-order functions basics
      - Pure functions and side effects
    Projects built:
      - Reusable utility function library
      - Password strength validator
      - Text analyzer (word count, reading time)
      - Simple quiz application
    Practice: Refactor previous projects using functions
  Objects and Data Structures
    Topics:
      - Object literals and properties
      - Accessing properties: dot vs bracket notation
      - Adding and deleting properties
      - Methods and 'this' keyword
      - Object destructuring
      - Object.keys, values, entries
      - JSON: parsing and stringifying
      - Nested objects and arrays
      - Iterating over objects
      - Object spread operator
      - Sets and Maps introduction
      - Comparing objects vs primitives
    Projects built:
      - Student management system
      - Todo list with objects
```

```
      - Contact book application
      - Product inventory manager
    Practice: Build 5 mini-projects using objects and arrays
    Assessment: Month 2 check: solve a data-modeling exercise live, with quiz questions
    reaching back to month 1

Month 3: The Interactive Web (Weeks 9-12)
  The DOM
    Topics:
      - What is the DOM? Tree structure
      - Window and document objects
      - Selecting elements: getElementById, getElementsByClassName, querySelector
      - querySelectorAll and NodeList vs HTMLCollection
      - Traversing the DOM: parent, children, siblings
      - Creating elements: createElement, createTextNode
      - Modifying content: innerHTML, textContent, innerText
      - Modifying attributes: getAttribute, setAttribute
      - Modifying styles: style property, classList
      - Adding and removing classes
      - Inserting elements: appendChild, insertBefore, append, prepend
      - Removing elements: removeChild, remove
    Projects built:
      - Dynamic HTML generator
      - Color scheme switcher
      - Content management system (CMS) simulator
      - Live form preview
    Practice: Manipulate DOM in 15 different ways
  Events and User Interaction
    Topics:
      - Event listeners: addEventListener, removeEventListener
      - Common events: click, dblclick, mouseenter, mouseleave
      - Keyboard events: keydown, keyup, keypress
      - Form events: submit, focus, blur, input, change
      - Event object and properties
      - Event bubbling and capturing
      - Event delegation pattern
      - preventDefault and stopPropagation
      - Creating custom events
      - DOMContentLoaded vs load event
      - Mouse position and coordinates
      - Touch events for mobile
    Projects built:
      - Interactive image gallery with lightbox
      - Drag and drop interface
      - Keyboard-controlled game
      - Real-time form validation
      - Modal window system
    Practice: Create 10 interactive UI components
  Practical JavaScript: Errors, Storage and Regex
    Topics:
      - Array methods: map, filter, reduce, find, findIndex
      - forEach, some, every
      - Sort and reverse
      - Method chaining
      - String methods: split, join, trim, includes
      - Regular expressions basics
      - Date and time in JavaScript
      - Math object and methods
      - Error handling: try-catch-finally
      - Throwing custom errors
      - Strict mode
      - localStorage and sessionStorage
    Projects built:
      - Data filtering and sorting dashboard
      - Expense tracker with local storage
      - Date and time utilities app
      - Form validation with regex
    Practice: Master array methods with 25 exercises
  Async JavaScript, APIs and the First Deploy
    Topics:
      - Synchronous vs asynchronous code
      - setTimeout and setInterval
      - Callbacks and callback hell
      - Promises: creating and consuming
      - Promise chaining
      - Promise.all, Promise.race, Promise.allSettled
      - Async/await syntax
      - Error handling with async/await
      - Fetch API basics
```

- Making HTTP requests
- Working with APIs and JSON
- CORS and API authentication basics
- Deploying the phase capstone to a public URL

Projects built:
- Weather app using a live API
- GitHub profile viewer
- PHASE CAPSTONE: an interactive, API-powered application, deployed

Practice: Integrate 3 public APIs, then ship the capstone

Assessment: Phase 1 exam: build a small app with live data in class, plus a written mixed paper over months 1-3

PHASE 2: TYPESCRIPT AND REACT (MONTHS 4-6, WEEKS 13-24)

Modern JavaScript mastery, TypeScript from the start, and React the way production teams write it, ending in a frontend capstone.

Month 4: Modern JavaScript Mastery (Weeks 13-16)

ES6+ in Depth

Topics:
- Destructuring: arrays and objects (deep)
- Spread and rest operators (advanced usage)
- Enhanced object literals
- Computed property names
- For...of and for...in loops
- Iterators and generators
- Optional chaining (?.)
- Nullish coalescing operator (??)
- Private class fields

Projects built:
- Build utility library with modern JS
- Data transformation pipeline
- Custom iterator implementation

Practice: Refactor old code using modern ES6+ features

Object-Oriented JavaScript

Topics:
- Constructor functions
- Prototypes and prototype chain
- ES6 Classes syntax
- Class inheritance and extends
- Super keyword
- Static methods and properties
- Getters and setters
- Public, private, and protected fields
- Encapsulation principles
- Polymorphism in JavaScript
- Composition over inheritance
- Design patterns: Factory, Singleton, Module

Projects built:
- Bank account system with OOP
- Game character class hierarchy
- Library management system
- Vehicle rental system

Practice: Build 5 different systems using OOP principles

Functional Programming Patterns

Topics:
- First-class functions
- Higher-order functions
- Pure functions and immutability
- Function composition
- Currying and partial application
- Closures (advanced)
- Recursion and recursive patterns
- Memoization and optimization
- Functional array methods (advanced)
- Immutable data structures
- Functional vs OOP: when to use what

Projects built:
- Functional utility library
- Data pipeline with function composition
- Recursive algorithms (tree traversal, etc.)

Practice: Solve 30 problems using functional approach

Modules, npm and Build Tools

Topics:
- ES6 modules: import/export
- Named vs default exports
- CommonJS vs ES modules
- NPM and package management

```
      - Package.json explained
      - Semantic versioning
      - Installing and managing dependencies
      - Webpack basics: entry, output, loaders
      - Webpack dev server
      - Babel for transpiling
      - Bundling and code splitting
      - Environment variables
    Projects built:
      - Set up a custom build pipeline
      - Multi-page application with a modern bundler
    Practice: Configure build tools for 3 different project types
    Assessment: Month 4 check: refactor a legacy snippet live using modern patterns, plus a
    mixed assignment reaching back to phase 1

Month 5: TypeScript and React Core (Weeks 17-20)
  TypeScript Fundamentals
    Topics:
      - Why TypeScript? Benefits and ecosystem
      - TypeScript setup and tsconfig.json
      - Basic types: string, number, boolean, any, unknown
      - Arrays and tuples
      - Enums and literal types
      - Functions and optional parameters
      - Type inference vs explicit typing
      - Union and intersection types
      - Type aliases and interfaces
      - Compiling TypeScript
      - TypeScript with vanilla JS projects
    Projects built:
      - Convert JavaScript project to TypeScript
      - Todo app with TypeScript
      - Type-safe utility functions
    Practice: Write TypeScript for all future projects
  React Fundamentals
    Topics:
      - What is React? Virtual DOM explained
      - Vite setup
      - JSX syntax and rules
      - Components: functional vs class
      - Props and prop drilling
      - Props validation with PropTypes
      - Rendering lists with map
      - Conditional rendering techniques
      - React fragments
      - Component composition
      - Children prop pattern
      - Event handling in React
    Projects built:
      - Component library showcase
      - Profile card components
      - Product listing page
      - Interactive counter app
    Practice: Build 20 reusable React components
  Hooks and State
    Topics:
      - useState hook: primitive and object state
      - State updates and batching
      - useEffect hook: lifecycle equivalent
      - useEffect dependencies array
      - Cleanup functions in useEffect
      - useContext for prop drilling solution
      - useReducer for complex state
      - Custom hooks creation
      - useRef for DOM access and mutable values
      - useMemo for expensive calculations
      - useCallback for function memoization
      - Rules of hooks
    Projects built:
      - Todo app with hooks
      - Theme switcher with Context
      - Form builder with useReducer
      - Custom hooks library
    Practice: Create 10 custom hooks for common use cases
  Advanced React Patterns
    Topics:
      - Controlled vs uncontrolled components
      - Form handling and validation
      - React Router: routes, navigation, params
```

```
      - Nested routes and layouts
      - Protected routes and authentication
      - Lazy loading and code splitting
      - React.memo for performance
      - Error boundaries
      - Portals for modals and tooltips
      - Higher-Order Components (HOC)
      - Render props pattern
      - Compound components pattern
    Projects built:
      - Multi-page app with React Router
      - Complex form with validation
      - Dashboard with authentication
      - Modal and notification system
    Practice: Build 5 advanced UI patterns
    Assessment: Month 5 check: build a routed, validated mini-app live, plus a mixed quiz
    over months 1-5

Month 6: State, Styling and the Frontend Capstone (Weeks 21-24)
  State Management with Redux Toolkit
    Topics:
      - Why external state management?
      - Redux fundamentals: store, actions, reducers
      - Redux Toolkit (modern Redux)
      - createSlice and configureStore
      - Redux DevTools
      - Async logic with Redux Thunk
      - Zustand (lightweight alternative)
      - When to use Context vs Redux
      - State management best practices
    Projects built:
      - E-commerce app with Redux
      - Social media feed with state management
      - Multi-user chat application
      - Complex dashboard with multiple data sources
    Practice: Refactor Context apps to use Redux
  React with TypeScript
    Topics:
      - Setting up React with TypeScript
      - Typing props and state
      - Event handlers type
      - Children and generic components
      - Hooks with TypeScript
      - Context API with TypeScript
      - Redux with TypeScript
      - Type-safe API calls
      - Utility types for React
    Projects built:
      - Rewrite React projects in TypeScript
      - Type-safe form builder
      - Strongly-typed Redux application
    Practice: All future React projects in TypeScript
  Styling: Tailwind and Component Libraries
    Topics:
      - CSS Modules in React
      - Styled Components library
      - Tailwind CSS with React
      - Tailwind configuration and customization
      - Component libraries: Material-UI (MUI)
      - Theme management
      - Responsive design in React
      - CSS animations in React
      - Framer Motion for animations
    Projects built:
      - Design system with Styled Components
      - Dashboard with Tailwind CSS
      - Animated landing page with Framer Motion
      - Custom theme system
    Practice: Restyle your best project with Tailwind and one component library
  Frontend Capstone
    Topics:
      - Scoping a production-feel frontend in one week
      - Component architecture planned before coding
      - TypeScript throughout, loading and error states everywhere
      - State management where it earns its keep
      - Responsive, accessible and fast
      - Deployment and the case-study README
    Projects built:
      - PHASE CAPSTONE: a polished, deployed React + TypeScript application: dashboard, social feed
```

or store frontend
Practice: Daily commits; one feature finished per session
Assessment: Phase 2 exam: capstone walkthrough plus a written mixed paper spanning phases 1 and 2

PHASE 3: BACKEND ENGINEERING (MONTHS 7-9, WEEKS 25-36)

Node and Express done properly, both database families, safe authentication, OWASP security and real-time, ending with a deployed backend capstone.

Month 7: Node and Express (Weeks 25-28)
Node.js Fundamentals
Topics:
- What is Node.js? V8 engine explained
- Node.js architecture and event loop
- Blocking vs non-blocking code
- Global objects: process, __dirname, __filename
- Modules system: require and module.exports
- Core modules: fs, path, os, http
- File system operations: read, write, append, delete
- Asynchronous file operations
- Buffer and streams
- Event emitters
- Creating HTTP server with Node.js
- Handling requests and responses

Projects built:
- File-based note-taking CLI
- Simple HTTP server
- File upload utility
- Log management system

Practice: Build 10 CLI tools with Node.js

Express.js Framework
Topics:
- Express.js introduction and setup
- Routing: GET, POST, PUT, DELETE
- Route parameters and query strings
- Middleware concept and usage
- Built-in middleware: express.json, express.static
- Custom middleware creation
- Error handling middleware
- Request and response objects
- Sending responses: JSON, HTML, files
- Template engines: EJS, Pug
- Serving static files
- Express Router for modular routes

Projects built:
- RESTful API for blog
- User management system
- File upload service
- Server-side rendered website

Practice: Build 5 different APIs with Express

RESTful API Design
Topics:
- REST principles and constraints
- HTTP methods semantics
- Status codes: 2xx, 3xx, 4xx, 5xx
- API versioning strategies
- Resource naming conventions
- Query parameters for filtering, sorting, pagination
- Request/response body structure
- Error response format
- API documentation with Swagger/OpenAPI
- Postman for API testing
- HATEOAS principle
- API best practices

Projects built:
- Complete REST API for task management
- E-commerce product API
- Social media API endpoints
- API documentation with Swagger

Practice: Design and document 5 different API systems

Production Express: Middleware and Hardening
Topics:
- Application-level vs router-level middleware
- Third-party middleware: helmet, cors, morgan
- Rate limiting and throttling
- Request validation with Joi/Yup
- File upload with Multer

- Cookie and session management
- CSRF protection
- Compression middleware
- Graceful shutdown
- Environment-based configuration
- Logging with Winston
- Security best practices

Projects built:
- Secure API with all middleware
- File upload service with validation
- Session-based authentication system
- Production-ready Express template

Practice: Secure and optimize Express applications

Assessment: Month 7 check: design and defend an API surface live, plus a mixed quiz reaching back to earlier phases

Month 8: Both Database Families (Weeks 29-32)

MongoDB

Topics:
- SQL vs NoSQL databases
- MongoDB introduction and architecture
- MongoDB installation and setup
- MongoDB shell commands
- Collections and documents
- CRUD operations in MongoDB
- Query operators: comparison, logical, element
- Update operators: $set, $inc, $push, $pull
- Aggregation pipeline basics
- Indexing for performance
- Data modeling in MongoDB
- Embedded documents vs references

Projects built:
- User database with MongoDB
- Product catalog system
- Blog posts with comments
- Analytics data aggregation

Practice: Design 10 different database schemas

Mongoose ODM

Topics:
- Mongoose introduction and setup
- Schema definition and types
- Schema validation rules
- Custom validators
- Default values and required fields
- Virtuals and getters/setters
- Instance methods and static methods
- Query helpers
- Middleware (pre/post hooks)
- Population for references
- Discriminators for inheritance
- Schema design patterns

Projects built:
- User management with Mongoose
- E-commerce data models
- Social network schema
- Complex relationships modeling

Practice: Build 5 complex data models with Mongoose

SQL and PostgreSQL

Topics:
- Relational database concepts
- PostgreSQL installation and setup
- SQL basics: SELECT, INSERT, UPDATE, DELETE
- WHERE clause and filtering
- ORDER BY, LIMIT, OFFSET
- Aggregate functions: COUNT, SUM, AVG, MIN, MAX
- GROUP BY and HAVING
- JOINs: INNER, LEFT, RIGHT, FULL
- Subqueries and nested queries
- Data types in PostgreSQL
- Constraints: PRIMARY KEY, FOREIGN KEY, UNIQUE, CHECK
- Normalization (1NF, 2NF, 3NF)

Projects built:
- Library management system
- Inventory tracking database
- School database with relationships
- Complex reporting queries

Practice: Write 50 SQL queries of increasing complexity

Prisma and Choosing Your Database

Topics:

```
      - Model definition and associations
      - Prisma ORM introduction
      - Prisma schema and migrations
      - Type-safe database queries
      - Connection pooling
      - Database transactions in Node.js
      - Choosing the right database
      - Polyglot persistence
      - Prisma as the modern default for typed Node backends
    Projects built:
      - Type-safe API with Prisma
      - The same feature built twice: Mongo vs Postgres, with a written comparison
    Practice: Model one real domain in both database families
    Assessment: Month 8 check: schema design exercise live, plus a mixed assignment over
    phases 1-3 so far

Month 9: Auth, Security and Real-Time (Weeks 33-36)
  Authentication and Authorization
    Topics:
      - Authentication vs authorization
      - Password hashing with bcrypt
      - Salt and rainbow table attacks
      - Session-based authentication
      - Token-based authentication
      - JWT (JSON Web Tokens) structure
      - Creating and verifying JWTs
      - Access tokens and refresh tokens
      - OAuth 2.0 protocol
      - Social login: Google, Facebook, GitHub
      - Passport.js middleware
      - Role-based access control (RBAC)
    Projects built:
      - Complete auth system with JWT
      - Social login integration
      - Multi-role authorization system
      - Password reset functionality
    Practice: Implement authentication in 5 different ways
  API Security: The OWASP Essentials
    Topics:
      - OWASP Top 10 vulnerabilities
      - SQL injection prevention
      - NoSQL injection attacks
      - Cross-Site Scripting (XSS)
      - Cross-Site Request Forgery (CSRF)
      - Security headers: helmet.js
      - CORS configuration and security
      - Rate limiting strategies
      - API keys and secrets management
      - Environment variables and .env
      - Input validation and sanitization
      - HTTPS and SSL/TLS
    Projects built:
      - Secure API with all protections
      - Security audit tool
      - Rate limiting service
      - Input validation library
    Practice: Security audit 5 existing APIs
  Real-Time with Socket.io
    Topics:
      - WebSockets protocol
      - Socket.io library
      - Real-time events: emit, on, broadcast
      - Rooms and namespaces
      - Private messaging
      - Real-time notifications
      - Server-Sent Events (SSE)
      - Real-time database sync
      - Building chat applications
    Projects built:
      - Real-time chat application
      - Live notification system
      - Collaborative editor
      - Real-time dashboard
      - Multiplayer game backend
    Practice: Add real-time features to previous projects
  Backend Capstone
    Topics:
      - Scoping a complete API product
      - Resource design, auth and validation before code
```

- Environment configuration and secrets done right
- Deploying the API with its database
- Documentation a stranger could build against
- A cumulative review of the backend phase

Projects built:

- PHASE CAPSTONE: a documented, authenticated, deployed API with real-time features: social backend, store backend or project tool

Practice: Have a classmate integrate against your API using only the docs

Assessment: Phase 3 exam: API walkthrough from schema to deployed URL, plus a written mixed paper over phases 1-3

PHASE 4: PRODUCTION ENGINEERING AND THE CAPSTONE (MONTHS 10-12, WEEKS 37-48)

What separates course graduates from employable developers: testing, Next.js, performance, Docker, CI/CD, cloud fundamentals, system design, AI features, and a shipped capstone.

Month 10: Quality and the Modern Stack (Weeks 37-40)

Testing Across the Stack

Topics:

- Introduction to testing: why test?
- Jest testing framework
- React Testing Library
- Writing unit tests
- Testing components and hooks
- Mocking API calls and modules
- Integration testing
- Test-driven development (TDD)
- Testing best practices
- Code coverage reports
- API testing with supertest
- What to test first when time is short

Projects built:

- Add tests to existing projects
- TDD todo application
- E2E tests for complete user flow
- Testing utilities library

Practice: Write tests for all previous projects

Next.js and Server-Side Rendering

Topics:

- Next.js introduction and setup
- File-based routing
- Pages and layouts
- Server-side rendering (SSR)
- Static site generation (SSG)
- Incremental static regeneration (ISR)
- API routes in Next.js
- Data fetching strategies
- Image optimization with next/image
- Next.js deployment
- SEO optimization

Projects built:

- Blog with Next.js SSG
- E-commerce with SSR
- Portfolio with Next.js
- Full-stack Next.js application

Practice: Migrate React app to Next.js

Performance: Measuring and Fixing

Topics:

- React DevTools Profiler
- Identifying performance bottlenecks
- Virtual scrolling for large lists
- Image optimization techniques
- Lazy loading images
- Code splitting strategies
- Bundle size optimization
- Lighthouse audits
- Core Web Vitals
- Performance monitoring tools
- Memoization best practices
- Backend performance: the N+1 query problem and friends

Projects built:

- Optimize slow React application
- Large list with virtualization
- Image gallery with lazy loading
- Performance dashboard

Practice: Audit and optimize 5 projects

Backend Patterns: Caching, Jobs and Integrations

Topics:

```
      - MVC architecture pattern
      - Repository pattern
      - Service layer pattern
      - Dependency injection
      - SOLID principles
      - Caching strategies: Redis
      - Cache invalidation patterns
      - Background jobs: Bull queue
      - Task scheduling with cron
      - Email sending: Nodemailer
      - Payment flow anatomy, studied in test mode
    Projects built:
      - Layered architecture API
      - Background job processor
      - Email notification service
      - Payment processing system
    Practice: Refactor projects using design patterns
    Assessment: Month 10 check: a mixed assignment spanning testing, performance and
    earlier phases

Month 11: Docker, CI/CD, Cloud and AI (Weeks 41-44)
  Docker and Containers
    Topics:
      - What is Docker? Containers vs VMs
      - Docker installation and setup
      - Docker images and containers
      - Dockerfile creation
      - Docker commands: run, build, push, pull
      - Docker volumes for persistence
      - Docker networks
      - Multi-container apps with Docker Compose
      - Docker Compose YAML
      - Environment variables in Docker
      - Docker best practices
      - Container security
    Projects built:
      - Dockerize Node.js application
      - Multi-container app with database
      - Docker Compose for full stack
      - Custom Docker images
    Practice: Containerize all previous projects
  CI/CD with GitHub Actions
    Topics:
      - Continuous Integration explained
      - Continuous Deployment explained
      - Git workflow strategies
      - GitHub Actions basics
      - Writing workflow YAML files
      - Automated testing in pipelines
      - Build and deployment automation
      - Environment management
      - Blue-green deployments
      - Canary releases
    Projects built:
      - GitHub Actions pipeline
      - Automated testing workflow
      - Multi-environment deployment
      - Complete CI/CD for full stack app
    Practice: Set up CI/CD for all projects
  System Design Fundamentals
    Topics:
      - What is system design?
      - Scalability: vertical vs horizontal
      - Load balancing concepts
      - Load balancer types: Layer 4 vs Layer 7
      - Caching strategies and levels
      - Content Delivery Networks (CDN)
      - Database sharding and partitioning
      - Database replication: master-slave
      - CAP theorem explained
      - Consistency models
      - Latency vs throughput
      - Back-of-envelope calculations
    Projects built:
      - Design URL shortener
      - Design pastebin service
      - Design simple caching system
      - Load balancer simulation
    Practice: Solve 10 system design problems
```

```
      AI Features, End to End
        Topics:
          - Where AI belongs in a full-stack app
          - Server-side model calls: never from the browser
          - Streaming responses without freezing the UI
          - Structured output and validation
          - Retrieval over your own database
          - Function calling to trigger app actions
          - Cost, caching and rate limits
          - Guardrails and untrusted input
          - Telling users honestly what the AI did
          - TensorFlow.js and ML APIs: the pre-trained shortcut
        Projects built:
          - AI-powered search
          - Retrieval Q&A feature
          - Agentic action endpoint
          - Guardrail + eval harness
        Practice: Add an AI feature end to end
        Assessment: Month 11 check: design an AI feature on paper with guardrails and costs,
        plus a cumulative quiz

    Month 12: The Capstone (Weeks 45-48)
      Capstone Planning and Cloud Setup
        Topics:
          - Choosing the capstone: your strongest idea, scoped to four weeks
          - A one-page spec: users, features, stack, milestones
          - Schema and API design before UI
          - Cloud fundamentals: where each piece of your app will live
          - Repository, CI check and deployment target ready on day one
        Projects built:
          - Approved capstone spec, repository, schema and first deployed endpoint
        Practice: Pitch the spec to the batch and absorb one hard question
      Capstone Build
        Topics:
          - Vertical slices: database to API to UI, one feature at a time
          - Instructor checkpoints and course corrections
          - Tests on the logic that must not break, running in CI
          - Docker for a reproducible development environment
          - An AI feature where it genuinely helps
          - Daily commits and an always-working build
        Projects built:
          - The final capstone, built over two focused weeks with version control, tests and CI
        Practice: A working build at the end of every session, no exceptions
      Launch, Demo Day and What Comes Next
        Topics:
          - Production deployment with a custom domain and HTTPS
          - Error tracking and logs: knowing when it breaks
          - The launch checklist run end to end
          - Presenting the capstone: live demo plus the hardest bug story
          - Portfolio final pass: GitHub profile, case studies, README quality
          - Where each path leads: DSA for interviews, deeper backend, or system design at scale
        Projects built:
          - The capstone live on its own URL, presented at demo day
        Assessment: FINAL EXAM: a practical build plus a written paper with questions mixed
        from every phase. Passing earns the certificate; a learner who falls short gets a
        focused revision plan and a free retest

PROJECTS THE STUDENT BUILDS AND KEEPS

  - Phase 1: hand-built responsive sites, interactive JavaScript apps, and an API-powered
    capstone deployed to a public URL
  - Phase 2: TypeScript utilities, React applications with real state management, and a polished
    frontend capstone
  - Phase 3: Express APIs against MongoDB and PostgreSQL, safe auth, OWASP hardening, real-time
    features, and a deployed backend capstone
  - Phase 4: tested, containerized, CI-checked work, AI features with guardrails, and the final
    production capstone

  Total projects: 30+ real projects, crowned by a deployed, tested full-stack application with an AI feature

SKILLS THE STUDENT WILL HAVE AT THE END

  - Frontend: HTML5, CSS3, JavaScript to depth, TypeScript, React, Redux Toolkit, Next.js,
    Tailwind
  - Backend: Node.js, Express, REST design, authentication, OWASP security, Socket.io real-time
  - Databases: MongoDB with Mongoose, PostgreSQL with SQL fluency, Prisma, schema design in both
    families
  - Production: Jest and React Testing Library, supertest, Docker, GitHub Actions CI/CD,
    deployment
```

- Architecture: system design fundamentals, caching, background jobs, performance measurement
- AI features: server-side model calls, streaming, retrieval over app data, guardrails and cost control
- Professional habits: Git workflow, code review, documentation and honest estimation

HOW A TYPICAL WEEK IS SPLIT

Live classes: 2 live one-hour classes per week, coding along with the instructor
Homework: Homework after every class, and a mixed-review assignment at the end of every month so earlier skills stay sharp
Practice: 4-6 hours of projects and challenges between classes
Review: Every submitted project reviewed with written feedback; recurring issues reopened in class

SUPPORT INCLUDED

Doubt support: WhatsApp doubt support between classes, so nobody stays stuck on a broken build for days
Progress updates: Direct written feedback on every submission, plus honest monthly progress reviews

CERTIFICATION DETAIL

Completion: Certificate from Modern Age Coders, awarded on passing the final exam. Fall short and there is focused revision and a free retest: the certificate certifies knowledge, not attendance

WHERE THIS CAN LEAD

- Full stack developer roles: the portfolio and vocabulary this course builds are exactly what those interviews probe
- Data Structures and Algorithms: our dedicated course for the interview problem-solving bar
- Specialization: deeper backend engineering, React ecosystems, or DevOps from the Docker and CI base laid here
- Freelance and product work: the end-to-end skill to build for clients or for yourself
- Further AI engineering: the AI-features foundation extends into our AI and agents courses

EARNING POTENTIAL (share only if asked, and never promise it)

Market context: The ranges below are general market salary bands for these roles in India and abroad, drawn from public industry data. They are shown for career context only and are not a promise or guarantee of income. Actual pay depends on your skills, experience, location, and the job market.
Growing roles: Rs 3-5 LPA (Junior Developer)
Experienced roles: Rs 6-10 LPA (Full Stack Developer); Rs 10-18 LPA (Senior Developer); Rs 15-30+ LPA (Senior/Lead roles)
Freelance: Rs 500-2,000/hour
International: $50k-120k USD based on location and experience

COMMON QUESTIONS ABOUT THIS COURSE

For anything about cost, use PART 4 and RULE 1. Do not quote two regions.

Q: What is full stack web development and why learn it?
A: Full stack development means building complete web applications: the frontend users see and the backend that powers it, databases included. It remains the most employable generalist skill in software because one full stack developer can take an idea from empty folder to running product. This course teaches the specific stack hiring asks for in 2026: JavaScript, TypeScript, React, Node, SQL and MongoDB, plus the Docker, CI and deployment habits that separate juniors who get hired from juniors who wait.

Q: How long does it take to become a full stack developer?
A: Honestly: 12 months of consistent work at 2 live classes a week plus 4 to 6 hours of practice, and this course is paced exactly for that. The syllabus keeps 2 months of margin in hand, so learners who need more repetition take up to 14 months with no rushing and no penalty. Courses promising full stack in 8 weeks are compressing a profession into a demo; the first deployed project here ships in month 3, and the depth keeps compounding after it.

Q: How am I assessed? Is the certificate just for attending?
A: No. Classwork runs inside every session, homework follows every class, and each month ends with an assignment that deliberately mixes new questions with earlier topics so knowledge compounds instead of fading. Every phase closes with a cumulative exam, and the course ends with a final exam: a practical build plus written questions drawn from the whole syllabus. Passing earns the certificate; falling short earns a focused revision plan and a free retest. We optimize for real knowledge and real depth, not attendance.

Q: Do I need prior coding experience or a computer science degree?
A: Neither. The course starts from absolute zero, how computers and the web work, and no degree is required for full stack roles; portfolios and demonstrated skill carry the

interviews. What is required is consistency: this is a 12-month professional skill, and the course is structured, assessed and reviewed to keep you consistent.

Q: Which technologies does the course cover?
A: The modern hiring stack, learned in order: HTML5, CSS3 and JavaScript to depth, then TypeScript, React, Redux Toolkit and Next.js on the frontend; Node.js, Express, MongoDB, PostgreSQL and Prisma on the backend; JWT auth and OWASP security; Socket.io real-time; Jest and supertest for testing; Docker, GitHub Actions CI/CD and cloud deployment; a system design introduction; and AI features built server-side with guardrails.

Q: What will I actually build?
A: More than 30 real projects, each phase ending with something deployed: an API-powered site in month 3, a React and TypeScript frontend capstone in month 6, an authenticated real-time backend in month 9, and a final capstone with tests, CI, Docker and an AI feature, live on its own URL. The portfolio is the point: every claim on your CV gets a working link behind it.

Q: How is AI covered in this course?
A: As an engineering skill. Students add AI features to their own applications the way production teams do: model calls made server-side, responses streamed into React, retrieval over the app's own data, structured output validation, guardrails against prompt injection, and cost control. The result is a developer who can ship an AI feature responsibly, which in 2026 is a hiring differentiator, not a novelty.

Q: What job market context should I expect?
A: Full stack developers remain among the most consistently hired software roles. The salary ranges shown on this page are general market bands from public industry data, shown for context only, never a promise: actual outcomes depend on your skill, portfolio, location and the market. What this course controls is the input: real projects, real depth and interview-ready fundamentals.

Q: Is there a free demo class?
A: Yes, book a free, no-commitment demo at learn.modernagecoders.com/contact or message us on WhatsApp at +91 91233 66161. It is a real class, not a sales pitch: you will build something small in it and meet the teaching style directly.

Q: Are classes live or recorded?
A: Every class is live: a 1-hour online session where a real instructor works with a small group, never a pre-recorded video. You code during class, ask questions in the moment, and get unstuck immediately, which matters most in the early months.

To enrol, message Shivam Sir on +91 9123366161 or send the parent this link: https://learn.modernagecoders.com/courses/full-stack-web-development-masterclass-college
For a demo: the Priority Live Demo (guaranteed, today or tomorrow) is booked at https://learn.modernagecoders.com/priority-demo . The free demo is a waiting list with no fixed date.

==========
COURSE 62 OF 137: FULL STACK WEB DEVELOPMENT FOR TEENS: REACT AND NODE.JS
==========

Course link: https://learn.modernagecoders.com/courses/full-stack-web-development-teens-masterclass
Subject area: Web Development
Designed for: Teens
Who can join: Absolute beginner, ages 13 to 18
Course length: 12-14 months (48-56 weeks)
Time needed: 2 live classes/week + 3-4 hours practice
Certificate: Certificate from Modern Age Coders, awarded on passing the final exam

PRICE FOR THIS COURSE (quote only the one that applies to the person asking)
In India, per month: group Rs 1,499, mini batch Rs 2,999, one to one Rs 4,999
Outside India, per month: group $100, one to one $150
Classes: group and mini batch two live classes a week, eight a month; one to one in India one live class a week, four a month; one to one outside India two live classes a week, eight a month. Each class is one hour.

WHAT THIS COURSE IS

Full stack web development course for teens aged 13-18: HTML, CSS, JavaScript, React, Node.js, MongoDB, AI features and a deployed capstone in 12-14 months.

In one line: One honest stack, learned deeply: from a first hand-typed page to a deployed application with accounts, a database, live chat and an AI feature.

ABOUT THE PROGRAMME

Full stack means owning both halves of an application: the frontend people see and the backend that quietly runs it. This live online course takes students aged 13 to 18 from an empty folder to exactly that, a real deployed application with user accounts, a database,

real-time features and an AI-powered capability, built with the stack that dominates modern development: JavaScript, React, Node.js and MongoDB, with SQL and TypeScript where the industry expects them. The arc is deliberate. Three months of true foundations: HTML, CSS, layouts that survive a phone screen, then JavaScript learned properly, including the asynchronous side that separates real developers from tutorial followers. Three months of React, the way it is actually written in 2026: hooks, routing, TypeScript, a taste of Next.js, and a frontend capstone. Three months of backend: Node and Express, MongoDB and SQL, authentication done safely, and an API deployed to a public URL. The final three months put the halves together: file uploads, live chat with Socket.io, AI features built with proper guardrails, testing, and a four-week capstone shipped like a product. The pace is honest: two live classes a week plus three to four hours of practice fits this in twelve months, and students who need longer take up to fourteen, the class adapts instead of rushing. Learning is checked the honest way too: homework after every class, monthly assignments that mix new questions with earlier topics, and a final exam that decides the certificate. Real knowledge, real work, real projects, depth over dopamine.

WHAT MAKES THIS COURSE DIFFERENT

- One stack learned deeply instead of four frameworks skimmed: JavaScript, React, Node and MongoDB, with SQL and TypeScript where industry expects them
- Everything ships: projects go to real public URLs from month 3 onward, not screenshots on a laptop
- AI is built, not bolted on: students add AI features to their own apps with streaming, guardrails and cost control
- An honest 12-month arc with 2 months of margin built in: students who need more practice take up to 14, nobody is rushed
- Live batches capped at 20 students, with mini-batch and 1-on-1 options for closer attention
- Real assessment: weekly homework, mixed-review assignments every month, and a final exam that decides the certificate, with focused revision and a free retest for students who fall short

THE LEARNING PATH, STEP BY STEP

Phase 1: Web foundations (Months 1-3): HTML, CSS, responsive layouts, then JavaScript learned properly through the async side
Phase 2: React frontend (Months 4-6): components, hooks, routing, TypeScript, a taste of Next.js, and a frontend capstone
Phase 3: Backend (Months 7-9): Node, Express, MongoDB and SQL, safe authentication, and a deployed full-stack app
Phase 4: The full picture (Months 10-12): uploads, live chat, AI features with guardrails, testing, and the final capstone

WHAT A STUDENT NEEDS BEFORE STARTING

Coding experience: None. The course starts from the very first HTML tag
Computer skills: Comfortable typing and managing files and folders
Equipment: A computer with a stable internet connection; every tool used in the course is free
Age: 13 to 18. Batches are grouped by age and pace so the room always fits
Time commitment: 2 live classes plus 3-4 hours of practice a week

WHO THIS COURSE IS FOR

Complete beginners: Teens starting from zero who want the full picture of how real applications are built
App dreamers: Students who look at the apps they use daily and think: I want to build one of those
Future engineers: Teens eyeing computer science degrees who want live products behind their applications
Makers: The kind of student who finishes a tutorial and immediately asks what they can build for real
Ai curious: Teens who want to put AI inside real products, not just talk to chatbots

FULL CURRICULUM, WEEK BY WEEK

This is the complete teaching plan. Parents can ask about any week.

PHASE 1: WEB FOUNDATIONS (MONTHS 1-3, WEEKS 1-12)

The real base: HTML with meaning, CSS that survives a phone, and JavaScript learned deeply enough that React will make sense instead of feeling like magic.

Month 1: HTML and CSS (Weeks 1-4)
How the Web Works, and Your First Pages
Topics:
- How the internet works - explained for teens
- What happens when you open Instagram or YouTube
- Frontend vs Backend - what's the difference?
- Setting up your coding environment (VS Code)

- Essential VS Code extensions and themes
- Introduction to HTML - the skeleton of websites
- HTML tags and structure basics
- Creating your first webpage
- Adding text, headings, and paragraphs
- Links and navigation between pages
- Images and media elements
- Git and GitHub - saving your code like a pro

Projects built:
- Personal profile page
- Favorite band/artist fan page
- School project presentation website

Practice: Create 5 HTML pages about things you actually care about

Forms, Structure and Meaning

Topics:
- HTML5 semantic elements for better structure
- Creating forms - how login pages work
- Input types: text, email, password, number, date
- Dropdowns, checkboxes, and radio buttons
- HTML tables for displaying data
- Embedding content: YouTube videos, Spotify, Maps
- Audio and video elements
- Canvas element introduction
- Meta tags for SEO
- Accessibility - making sites for everyone
- HTML best practices
- Validating HTML code

Projects built:
- Multi-page school website
- Survey form for friends
- Restaurant menu with ordering form

Practice: Build 5 different forms, each validated by the browser

CSS: Making It Look Right

Topics:
- CSS basics - adding style to HTML
- Selectors: targeting elements precisely
- Colors, backgrounds, and gradients
- Typography - making text look professional
- Box Model - spacing and layout basics
- Borders, shadows, and visual effects
- CSS units: px, %, em, rem, vh, vw
- Positioning elements on the page
- Display properties and visibility
- Overflow and scrolling
- Z-index and layering
- Pseudo-classes and pseudo-elements

Projects built:
- Style your HTML projects beautifully
- Create a magazine-style layout
- Design product cards like Amazon

Practice: Recreate 5 popular website components from screenshots

Flexbox, Grid and Responsive Design

Topics:
- Flexbox - create flexible layouts easily
- CSS Grid - magazine and blog layouts
- Responsive design - mobile-first approach
- Media queries for different screen sizes
- CSS animations and transitions
- Keyframe animations
- Transform and 3D effects
- CSS variables (custom properties)
- Modern CSS features
- CSS best practices and organization

Projects built:
- Responsive portfolio website
- Animated landing page
- Instagram-style photo grid

Practice: Make every page you have built responsive
