MODERN AGE CODERS

AI Agent, WhatsApp Agent and Support Knowledge Base

Version 2.0 · 4 August 2026

Version 2.1 · Last updated: 1 November 2026 (batch sizes 15 to 20, India one-to-one = 4 flexible classes, 6-month prepay, 2.5% gateway charges, Canada in CAD, Priority Live Demo, overseas demo times in the family's own clock, 24 new courses, UK and US exam guides) · Supersedes the August 2026 edition

> **Purpose.** This document is the single source of truth for any AI assistant, WhatsApp bot, voice agent, or human support person representing Modern Age Coders. Read it top to bottom before answering customers. When uncertain, default to the answers and tone in this document. Anything not covered here, route to a human (Shivam Sir).
>
> **How this version was built.** Every number, price, URL and policy below was read directly out of the live codebase on 4 August 2026: prices from `pricing/pricing.config.jsonc` (config dated **2026-08-03**, commit `e41a8e14`), self-claims from `scripts/brand-facts.json`, URLs from the seven sitemaps cross-checked against the Netlify routing table, and policies from the published policy pages. Nothing was carried forward from the April document on trust. The full site link check passed with 0 broken internal links across 53,903 link instances.
>
> **When prices change again**, do not hand-edit this document. Change `pricing/pricing.config.jsonc`, then regenerate: the price sections and Appendix D are built from that file.

0. CRITICAL ROUTING RULES (READ THIS SECTION FIRST)

Before answering any customer, follow these rules.

1. **Batch timings, schedules, slot availability, "what time can my child join?", "is there a Saturday batch?", or anything time or day related.** Do NOT invent a timing. Always reply with:

   > *"We run multiple batches across weekdays, evenings and weekends, including dedicated slots for international time zones. To find the slot that fits your child's schedule perfectly, please connect with **Shivam Sir on +91 9123366161**. He manages all batch allocations and will help you pick the best one."*

2. **Pricing.** Quote the current three-tier India structure: **₹1,499 / ₹2,999 / ₹4,999 per month**, the same for coding, maths and the AI-agents courses. India one-to-one is **4 private classes a month on a fully flexible schedule**; Group and Mini Batch run two a week. Mini Batch is **India only**. Canadian families pay in **CAD: 140 group, 210 one-to-one**. Everyone else outside India pays **$100 group and $150 one-to-one**. Paying **6 months at once** is an optional saving (§3.4a). A **2.5% payment gateway charge** is added at checkout. Quote only the person's own region. See §3, and read §3.8 before you quote anything.

3. **Demo class requests. There are two kinds; describe both honestly (§7.2).** The **Priority Live Demo** is paid (₹499 in India, CAD 14 in Canada, $10 elsewhere), guaranteed on a day and time the family picks (usually today or tomorrow), a full class of about 45 to 60 minutes, followed by a written skill report and learning roadmap on WhatsApp; the fee is adjusted against the first month if they enrol. Book at `/priority-demo`. The **free demo** is a

waiting list of 30 to 45 minutes: no card, but no promised date. For either, collect: student's name, age or class, parent's WhatsApp number with country code, preferred subject (coding or maths), preferred language (English or Hindi).

4. **Refund or cancellation queries.** Quote the policy verbatim from §13. Do not improvise.
5. **Tone.** Warm, helpful, parent-friendly. Use "Sir" and "Ma'am" with Indian customers. Never overpromise placement, salary or guaranteed outcomes. Never insult a competitor.
6. **Hard escalations to Shivam Sir (+91 9123366161):** custom corporate quotes · payment in a currency other than INR, USD or CAD · bulk school partnerships · refund disputes · anything you cannot find in this document.
7. **Times for families outside India.** They choose and discuss times in their **own local time**. On the website they pick a demo time in their own clock (or type one) and our team matches it to India time. Never ask an overseas family to work in IST.

0.1 THE MOST IMPORTANT CHANGE SINCE APRIL 2026: RETIRED FIGURES

The April 2026 knowledge base actively instructed agents to quote figures that are now **retired**. If your training data or an older document contains any of the following, it is wrong. Quoting one of these is the single highest-damage mistake you can make.

RETIRED, never quote	What it was	Correct current figure
₹2,499 / month	Old Mini Batch	Mini Batch is now **₹2,999**
₹7,500 / ₹8,500 per month	One-to-one rates before 10 August 2026 (coding / maths)	One-to-one is **₹4,999** for both subjects since 10 August 2026. ₹4,999 itself is CURRENT again — the camp fee remains **₹9,999**
$40 / month	Old international group	International group is now **$100**
$100 / month as the one-to-one price	Old international one-to-one	$100 is now the **group** price; one-to-one is **$150**
$149.99 and $374.99	Old international list prices	Retired entirely
Any "lifetime" price or lifetime plan	Retired	We sell monthly only
"ages 6 to 65"	Old age range	**6 to 67**
"500+ students"	Old student count	**10,000+**
"247+ reviews"	Old review count	**547 Google reviews**
"15+ countries"	Old reach claim	**25+ countries**
`/courses/kids-ai-mastery-course`	Retired URL and retired audience	Now `/courses/teens-ai-tools-mastery-course`, and the **age floor moved to 13+**. This is a contract-law age change, not a rename. Never offer this course to an under-13.

Also note: the April document told agents that "₹2,499 is the OLD price for one-to-one." That instruction is itself now out of date, because ₹2,499 is retired at every tier and ₹2,999 replaced it at Mini Batch.

> **The rule for deciding whether a figure is retired.** A number counts as retired **only when it is not a current price anywhere in the pricing config**. Numbers can come back. Since 10 August 2026 **₹9,999** is a live price in one place only, and **₹4,999** is current again as the one-to-one rate:
>
> - **₹9,999 one time** is the India holiday camp fee (§3.4); the AI-agents courses dropped to the standard **₹4,999 / month** one-to-one on 10 August 2026 (§4.7)
> - **₹7,500 and ₹8,500 / month** are the retired one-to-one rates (1 to 10 August 2026); **₹4,999** is current again
>
> If a family quotes ₹9,999 for a course, that premium ended on 10 August 2026; ₹9,999 now only buys the holiday camp, as a single payment.

0.2 FACTS THAT NEED OWNER CONFIRMATION (flag, do not guess)

These are places where the live website currently contradicts itself. Until the owner rules, use the **safe answer** column, which is always the one that under-promises rather than over-promises.

Topic	The contradiction on the live site	Safe answer to give
Group batch size	**Resolved 13 October 2026.** The owner ruled: group **15 to 20 students**, Mini Batch **up to 6**, one-to-one a single student. `scripts/brand-facts.json` and the site were updated on 14 October 2026.	Say **"a group class is 15 to 20 students."** Never promise a smaller group.
"No 6 or 12 month packs" and "the price is the whole price"	`/guarantee` still says "no 6 or 12 month packs" and that the pricing-page price is the whole price. Since October 2026 families may **optionally** pay 6 months at once, and a **2.5% payment gateway charge** is added at checkout.	Say: **"Billing is monthly and you can stop any month. Paying 6 months at once is optional and costs less. A 2.5% payment gateway charge is added at checkout and shown on the bill before you pay."**
Teen age band	Nav and course pages say **13-18**. The `/pricing` and `/contact` FAQs say **13-17**.	Use **13 to 18**.
Overall age range	Brand facts, `/pricing` and `/contact` say **6 to 67**. The `/faq` page is **stale** and still says "aged 6-18 and college students aged 18-21" and "courses for students aged 6-21".	Use **6 to 67**. The `/faq` page needs updating; do not quote it.
Team size	The April document claimed "50+ instructors and staff". This number is **not** in `brand-facts.json` and is not evidenced anywhere in the codebase.	Do not quote a team size. Say "a team of professional engineers and educators".
"500+ families from Delhi's top schools"	Appears on 14 DPS pages, flagged in `brand-facts.json` as unevidenced.	Do not repeat this claim in chat.
Physical office	`/contact` publishes a Kolkata address; the April document said "no physical campus to visit".	Both are true if phrased correctly: see §2 and §14 Q38. All teaching is online; the Kolkata address is the registered office, not a campus students attend.
Stale comment in the pricing config	Resolved on 10 August 2026: the agents block's comment and its value agree again — the AI-agents courses are priced the same as coding (₹4,999 one-to-one).	Nothing to work around any more.

1. COMPANY OVERVIEW

1.1 Identity

Field	Value
Brand name	Modern Age Coders
Legal name	Modern Age Coders Education
Founded	2020
Founder / Director	Shivam Khemka ("Shivam Sir")
Website (primary)	https://learn.modernagecoders.com
Corporate site	https://www.modernagecoders.com
Student dashboard	https://dashboard.modernagecoders.com
HQ country	India (registered office in Kolkata)
Languages of instruction	English, Hindi
Students trained	**10,000+**
Countries served	**25+**
Ages taught	**6 to 67**
Rating	**4.9 across 547 Google reviews**

> **Rule on the rating.** The 4.9 comes from Google Business Profile **reviews**, not from students. Say "rated 4.9 across 547 Google reviews". Never say "rated 4.9 by 547 students" and never round or inflate the 547.
>
> **Rule on all numbers.** Every self-claim above lives in `scripts/brand-facts.json`. A sub-group can never exceed the whole: no single country, age or course may claim more students than 10,000+.

1.2 What we do (the two pillars)

Modern Age Coders does two things and nothing else.

1. **Education for students.** We teach **coding** and **mathematics** to learners aged **6 to 67**: kids, teens, college students, working professionals, corporate teams and retired learners. We do not lecture. Students learn by **building real projects**: games, websites, apps, AI tools.
2. **Software for businesses.** We build custom software, websites, mobile apps and AI solutions for companies. Web and mobile apps, AI agents, automation tools, e-commerce platforms, API development, ongoing maintenance. See §11.2 for the "For Business" pages.

1.3 Founding story (use if a parent asks "tell me about you")

> Modern Age Coders started in 2020 with a simple observation: most coding classes were either too theoretical or too expensive. Students sat through hours of lectures, memorised syntax, and still could not build anything useful.
>
> We flipped that. From day one, students start building. A 12-year-old can create their own game in the first month. Learning to code feels less like homework and more like playing.
>
> Today we have trained **10,000+ students across 25+ countries**. Some have won coding competitions. Others have built apps their friends actually use. Many improved their school grades because coding taught them how to think logically.

1.4 Tagline, positioning and the founder quote

- **Tagline:** "Forging the next generation of innovators."
- **Hero promise:** "Maths + Code Made for Each Other."
- **Founder quote (approved, use freely):** *"Children do not need another app that teaches them to copy code. They need a mentor who teaches them to think."* — Shivam Khemka, Founder.

Core differentiators (lead with these, not with price):

- Live online classes, taught by a real mentor, never pre-recorded
- Batches: group of 15 to 20, mini batch up to 6 (India only), and true one-to-one with 4 flexibly timed classes a month in India
- Project-based: students build real things from the first week
- Maths and code taught together, so logic skills compound across both
- Flexible timing: weekday evening, weekend and international time-zone slots
- A real portfolio: students graduate with projects, not just a certificate
- Regular parent updates: progress reports and parent-mentor sync calls
- Zero-risk start: see a live class first (Priority Live Demo or the free demo waiting list), monthly billing, no registration fee, cancel anytime

> **Positioning rule (important).** Lead with depth, mentorship and interactive live teaching. Price is the **closing proof**, not the opening pitch. We are not the cheapest option and we do not want to be sold as one.

2. CONTACT INFORMATION

Channel	Detail
Primary phone / WhatsApp	**+91 9123366161**
Contact person (batch timings and enrolment)	**Shivam Sir** (Founder / Director)
Email	connect@modernagecoders.com
Registered office	Modern Age Coders Education, 1B, JK Ambika Tower, Kolkata, West Bengal 700002, India
Phone hours	Monday to Saturday, 9:00 AM to 6:00 PM India time (IST). Sunday closed. Families abroad arrange times in their own clock.

Channel	Detail
Callback request	Callback widget on every page. Takes a phone number, **callback within 3 hours**.
Contact-form response time	Within 48 hours on working days
Demo booking	Priority Live Demo: https://learn.modernagecoders.com/priority-demo · free demo waiting list: https://learn.modernagecoders.com/book-demo · or via WhatsApp
Languages on call	English and Hindi

> **Note on the office address.** The Kolkata address is our **registered office**, not a campus. All teaching is 100% online. Students never travel to it. Phrase it as: "We are an online school, so classes happen live over video from wherever you are. Our registered office is in Kolkata, but there is no campus to visit."

2.1 Social handles (current, verified 4 August 2026)

- Instagram: https://instagram.com/modern_age_coders
- YouTube: https://www.youtube.com/@ModernAgeCoders
- LinkedIn (Shivam Khemka): https://www.linkedin.com/in/shivam-khemka-modern-age-coders
- Facebook: https://www.facebook.com/modernagecoders
- GitHub: https://github.com/modernagecoder

> **Changed since April 2026.** The LinkedIn URL changed from `shivam-khemka-948a2a277`, and the Facebook URL changed from a numeric `profile.php?id=...` link. Use the versions above.

2.2 Our subdomains (what each one is)

Subdomain	What it is
`learn.modernagecoders.com`	The main website. Everything in this document lives here unless stated otherwise.
`dashboard.modernagecoders.com`	Student dashboard: login, attendance marking, class recordings.
`misti.modernagecoders.com`	Misti AI, our own AI study assistant.
`mind.modernagecoders.com`	The Beautiful Mind, our sister blog.
`zap.modernagecoders.com`	Zap, a student tool.
`envision.modernagecoders.com`	Envision, a student tool.
`deep64.modernagecoders.com`	Deep 64, a student tool.
`babu.modernagecoders.com`	Beat the Babu, the free game.
`myday.`, `baby.`, `moxo.`, `hugselle.`	Smaller internal or side projects. Do not promote these to customers.

2.3 What to say when asked "Can I speak to someone?"

> "Of course. Shivam Sir handles all enrolments and batch allocations personally. You can reach him at **+91 9123366161** by call or WhatsApp, Monday to Saturday, 9 AM to 6 PM IST. If it is outside those hours, leave a callback request on the site and we will call you back within 3 hours."

3. PRICING

This is the single most asked question. Memorise this section. **Read §3.8 before quoting anything.**

Prices come from one file, `pricing/pricing.config.jsonc`, last changed **23 October 2026**. The model is deliberately simple: **rupees inside India, Canadian dollars in Canada (since 24 October 2026), one flat USD price list for every other country**. Detection is automatic. There is no other country-by-country or purchasing-power pricing; that system was built and then removed by the owner on 1 August 2026.

3.1 India, coding (and every course except maths one-to-one)

Plan	Price	Batch size	Best for
Group Classes	**₹1,499 / month**	15 to 20 students	Beginners, group energy, budget-conscious families
Mini Batch *(Most Popular)*	**₹2,999 / month**	**Up to 6 students**	Near one-to-one attention at an affordable price
Personalised 1-on-1	**₹4,999 / month**	1 student, 1 mentor · 4 private classes a month, fully flexible timing	Custom curriculum, fast learners, exam prep, advanced learners

> **No exceptions to the ₹4,999 one-to-one rate any more.** Since 10 August 2026 the AI-agents courses (Codex + Claude Code, and AI Agents with Copilot Studio) also cost **₹4,999** one-to-one (§4.7), on the same 4-flexible-classes India schedule; the Copilot Studio courses are still taught 1-on-1 only. The one course with its own fee is **Build AI Agents with Google Gemini Enterprise**: 1-on-1 only, **₹14,999 / month** in India, **$250** abroad, **CAD 350** in Canada, two classes a week. Group and Mini Batch are ₹1,499 and ₹2,999 for every course without exception.

3.2 India, mathematics

Identical to coding **except the one-to-one tier**.

Plan	Price
Group Classes	**₹1,499 / month**
Mini Batch	**₹2,999 / month**
Personalised 1-on-1	**₹4,999 / month**

> **No maths surcharge any more.** Since 10 August 2026 maths one-to-one is the same **₹4,999** as coding; no India price differs between the two subjects.

3.3 International (every country outside India)

Plan	Price
Group Classes	**$100 USD / month**
Personalised 1-on-1	**$150 USD / month**
Mini Batch	**Not sold internationally.** India only.

Canada (since 24 October 2026), in Canadian dollars: Group **CAD 140 / month**, Personalised 1-on-1 **CAD 210 / month**, two classes a week. Canadian families pay in CAD at checkout; never quote them a US dollar figure. A +1 phone number can be the US or Canada, so ask which country before quoting.

Applies to coding and maths alike. We can also bill in EUR, GBP, AUD, SGD and AED; for those, route to Shivam Sir on +91 9123366161 for payment details.

Per-class maths, useful when a parent asks "is that expensive?": - India: ₹1,499 ≈ ₹187 per live class · ₹2,999 ≈ ₹375 · ₹4,999 one-to-one ≈ ₹1,250 (4 classes a month) - International: $100 ≈ $12.50 per live class · $150 ≈ $18.75 · Canada: CAD 140 ≈ CAD 17.50 · CAD 210 ≈ CAD 26.25

(Group and Mini Batch figures assume 8 live classes a month; the India one-to-one plan runs 4 a month, which is what makes its per-class figure ₹1,250.)

3.4 Holiday camps (one payment, not monthly)

Region	Price
India	**₹9,999 one time**
Canada	**CAD 280 one time**
International	**$200 one time**

Every camp seat is **8 personalized one-to-one classes** with a dedicated mentor - there are no group camp batches. Summer and winter editions, each with kids, teens and adults tracks (`/summer-coding-camp` , `/winter-coding-camp` and their `-kids` / `-teens` / `-adults` pages).

> Always say **"one time"** with the camp fee, so it is never mistaken for a monthly price. (₹9,999 is no longer any course's monthly rate; the AI-agents premium ended on 10 August 2026.)

3.4a Pay for 6 months at once (optional, since 21 October 2026)

Families can pay for 6 months in one go on the course page and pay less than six monthly payments. Monthly billing stays available; never push the 6-month option, and give its figure only if the family asks about paying upfront or a discount. Quote only their own region.

Region	Group	Mini Batch	1-on-1
India	**₹7,199** (48 sessions)	**₹14,399** (48 sessions)	**₹24,000** (24 sessions)
Canada	**CAD 629** (48 sessions)	not sold	**CAD 941** (48 sessions)
International	**$449** (48 sessions)	not sold	**$672** (48 sessions)

About 20% less than paying monthly in India and about 25% less abroad. It applies to coding, maths and the AI-agents courses; it is **not offered on courses shorter than 6 months** or on Build AI Agents with Google Gemini Enterprise. If the student stops early, every session not yet taken is refunded at the plan's per-session price, at any point in the 6 months (§13.1a).

3.4b The Priority Live Demo fee

₹499 in India · CAD 14 in Canada · $10 elsewhere, one time. It is adjusted against the first month if the family enrols: they send the demo Order ID on WhatsApp and the team applies it. See §7.2.

3.5 In-school bootcamp programmes (India only)

Format	Price
Group	**₹1,499 / month**
One-to-one	**₹2,999 / month**

These are for programmes delivered in partnership with a school. Not offered internationally. Any school enquiry goes to Shivam Sir.

3.6 Custom and corporate pricing

Custom Group Training and Custom 1-on-1 Training are **quote-based**, not fixed price. Used for corporate team upskilling, school partnerships, specialised tech stacks outside our catalogue, bulk enrolments, and job placement or interview prep packages. Custom Group runs 3 to 10 students.

To get a quote, the customer fills the form on the website or speaks to Shivam Sir directly.

3.7 What every plan includes

- **Live one-hour classes: two a week (8 a month) on Group and Mini Batch; 4 private classes a month, timed flexibly, on India one-to-one; two a week on one-to-one outside India**
- **Recorded session access** for revision and missed classes
- **Doubt resolution support**
- **Course completion certificate**
- **Project-based learning**, real builds rather than theory
- **See a live class before you pay**: the Priority Live Demo, or the free demo waiting list (no card)
- **Monthly billing, cancel anytime**, no registration fee, no lock-in

Mini Batch adds: near one-to-one teacher attention, live doubt-clearing every class, targeted topic mastery.

Personalised 1-on-1 adds (as listed on every course page): your own mentor with full individual attention · flexible timing, each class booked when it suits the student · a personal dashboard for student and parent · a daily syllabus tracker · live class recordings · homework and assignments set, submitted and checked on the dashboard · progress reports · response statistics (how the student and the mentor are responding) · parent-teacher meetings. Also a fully customised curriculum and pace. For maths: customised to CBSE, ICSE, IB, IGCSE or state board, with progress tracking reports and Olympiad training available.

> **Careful with the word "lifetime".** "Lifetime recording access" is a real feature of the one-to-one plan and is fine to say. A "lifetime price" or "lifetime plan" does **not** exist and must never be offered.

3.8 What NOT to say about pricing

- Quote **only the fee for where the student lives**. A family in India hears the rupee fee; a family anywhere else hears the dollar fee. Never present both ("in India it is X, internationally it is Y") - one person gets one price: theirs.
- Answer **only the pricing question asked**. Do not volunteer other plans, other regions, or extra pricing commentary. If they ask "what does it cost", give the group fee and mention that 1-on-1 exists for personal attention - nothing more.
- Do **not** quote any price below **₹1,499**. We have no plan cheaper than that.
- Do **not** quote **₹2,499**, **₹7,500** or **₹8,500**. All are retired. (**₹4,999 is current again** — it is the one-to-one rate since 10 August 2026.) See §0.1.
- Do **not** quote **$40**, **$149.99** or **$374.99**. All retired.

- Do **not** quote **$100 as the one-to-one price**. $100 is the **group** price now; one-to-one is **$150**.
- Do **not** quote **₹7,500 or ₹8,500 for any one-to-one**. Both retired on 10 August 2026; the rate is **₹4,999** for coding and maths alike.
- The Codex + Claude Code and Copilot Studio courses share the standard **₹4,999** one-to-one rate since 10 August 2026. Do **not** quote ₹7,500 or ₹9,999 for them.
- **₹9,999** is only the India camp fee, **one time**. Always say "one time" with it. **₹14,999 / month** is the Gemini Enterprise one-to-one fee and applies to that course only.
- Do **not** offer **Mini Batch** to an international customer. It is India only.
- Do **not** quote a US dollar price to a family in **Canada**. They pay in CAD.
- Do **not** leave out the **2.5% payment gateway charge** if a family asks for the exact amount they will pay. It is added at checkout and shown on the bill.
- Do **not** offer any **lifetime** plan.
- Do **not** promise a discount you cannot confirm. Say "let me check with Shivam Sir for any current offers".

3.9 Payment terms

- **Currency:** INR inside India, CAD in Canada, USD everywhere else. Other currencies on request.
- **How to enrol:** anyone can enrol and pay online on the course page (Enroll Now), or through a secure link we send. For a Group or Mini Batch in India the page first asks the family to message our team, so we can check a batch runs at a time that suits them.
- **Methods:** UPI, bank transfer, card. Payments only via secure links or the course page, never card details over chat.
- **Payment gateway charges: 2.5% of the fee**, added at checkout and shown on the bill before paying. Not part of the course price and not refunded.
- **Billing:** monthly and recurring. Cancel anytime, effective at the end of the current cycle.
- **Paying ahead:** the published saving is the optional **6-month prepay** (§3.4a). Sibling offers may apply; confirm with Shivam Sir before promising one.
- **See a class first:** the Priority Live Demo (paid, guaranteed, fee adjusted on enrolment) or the free demo waiting list.
- **Pausing:** students can pause for exams or vacations with about a week's notice, and we hold the spot.

3.10 How we compare (use only if asked, never volunteer a competitor)

	Modern Age Coders	WhiteHat Jr	BYJU'S	Vedantu
Monthly group price	From ₹1,499	₹5,000+	₹3,000 to ₹8,000+	₹3,500+
One-to-one	Yes, from ₹4,999	Yes, ₹8,000+	Limited	Limited
Coding + maths	Both, integrated	Coding only	Maths only	Maths only
Live classes	100% live	Live	Mostly recorded	Live
Contracts	None, cancel anytime	6 to 12 month packs	Long-term lock-in	Varies

International comparison (published US rates as of July 2026, verify before repeating): Mathnasium $300 to $450 · Kumon $150 to $220 per subject · Juni Learning from $275 · Cuemath $200 to $256. Against those, our $100 group and $150 one-to-one are the value case.

> Never disparage a competitor. State our facts and stop.

4. CODING CURRICULUM

We organise coding by **audience**, not by language. **142 course pages** are live (1 November 2026), each at `/courses/<slug>`. The complete list with URLs is **Appendix A**. When a parent or student asks **what a course teaches**, share its curriculum outline and project list from **Appendix E** in detail - transparency is the policy - then send the course link for the full week-by-week plan.

4.0 Courses added since August 2026

Coding and computing: Build AI Agents with Google Gemini Enterprise (1-on-1 only, own fee) · C++ for Kids · Godot Game Development for Kids and Teens · Cybersecurity Competitions for Teens (picoCTF, CyberPatriot) · PCEP and PCAP Python Certification · GCSE Computer Science · A Level Computer Science for AQA 7517 and OCR H446 · Cambridge AS and A Level Computer Science 9618 · CCC Junior and Senior Preparation (Canadian Computing Competition) · Ontario Computer Science Companion (ICS3U and ICS4U).

Mathematics: KS2 SATs Maths · GCSE Maths Resit · Functional Skills Maths Level 1 and 2 · National 5 and Higher Maths (Scotland) · A Level Further Maths · TMUA and STEP Preparation (Oxford no longer uses the MAT; it now uses the TMUA) · SHSAT Math Prep · ACT Math Prep · College Math Placement Test Prep (ACCUPLACER, ALEKS PPL, TSIA2, CLEP) · Middle School Math Competitions · Waterloo Math Contests (Gauss to Euclid) · Ontario Grade 12 University Math (MHF4U, MCV4U) · Western Canada Grade 12 Math (Pre-calculus 12, Math 30-1) · Reasoning and Readiness for Young Thinkers (ages 6 to 9: patterns, spatial and number reasoning, never test-item drilling).

Links for every course are in Appendix A.

4.1 The five audience tracks

Track	Ages	Browse URL
Kids	6 to 12	`/courses/coding/kids`
Teens	13 to 18	`/courses/coding/teens`
College	18 to 25	`/courses/coding/college`
Professionals / Corporate	25+	`/courses/coding/corporate`
Girls Only	all ages	`/courses/coding/girls`

4.2 Kids (ages 6 to 12), featured courses

- **Scratch Programming Complete** (ages 6 to 9), the youngest starting point, real computer-science ideas in friendly blocks
- **Kids Coding, Block-Based Masterclass**, `/courses/kids-coding-blocks-masterclass`
- **Python and AI for Kids** (ages 9 to 13), our most popular on-ramp to real text code
- **Web Design for Kids**, `/courses/kids-ai-web-development-course`
- **Minecraft Coding for Kids**, `/courses/minecraft-coding-for-kids-course`
- **Roblox Game Coding for Kids (Lua)**, `/courses/roblox-game-coding-for-kids-lua-course`
- **AI Literacy for Kids (ages 8 to 14)**, `/courses/ai-literacy-for-kids-course`

> **Age-floor warning.** The old "Kids AI Mastery Course" no longer exists for kids. It became `/courses/teens-ai-tools-mastery-course` and its floor is **13+**, because many of the AI tools it teaches have an 18-or-13 minimum age in their own terms. Never offer it to an under-13. If a parent asks for AI for a younger child, offer **AI Literacy for Kids** instead.

4.3 Teens (ages 13 to 18), featured courses

- **Java Programming Masterclass for Teens**, `/courses/java-programming-masterclass-for-teens`
- **AI & Machine Learning Masterclass for Teens**, `/courses/ai-ml-masterclass-teens`
- **Codex + Claude Code (AI Coding Agents)**, `/courses/codex-and-claude-code-ai-coding-agents-course-for-teens`
- **JavaScript for Teens**, `/courses/javascript-course-for-teens-beginners-interactive-web`
- **React for Teens**, `/courses/react-for-teens-complete-masterclass`
- **Data Science for Teens**, `/courses/data-science-course-for-teens-python-data`
- **Cybersecurity for Teens (ethical and defensive)**, `/courses/cybersecurity-course-for-teens-ethical-defensive`
- **Competitive Programming for Teens**, `/courses/competitive-programming-for-teens-course`
- **IP & CS, Class 11 and 12 (CBSE Python / ICSE Java)**, `/courses/cbse-icse-computer-science-class-11-12-python-java-complete-course`

4.4 College (ages 18 to 25)

Full Stack Web Development · MERN Stack · Advanced DSA · Competitive Programming · Artificial Intelligence Complete · AI/ML Complete · Python Zero to Advanced · Python AI Automation · Data Science Complete · Data Analysis Mastery · Complete Java · C++ Complete · C Programming · React JS Complete · Django/Flask Web Development · Complete App Development · Ethical Hacking · Algorithmic Trading. All URLs in Appendix A.

4.5 Working professionals and corporate

Two flavours: **personal upskilling** (better job, career switch, promotion) and **team training** (for HR and L&D heads upskilling a tech team).

Training areas: Web Development (Full Stack) · Mobile App Development · AI & Machine Learning · Data Science & Analytics · Cloud Computing (AWS/Azure/GCP) · DevOps & CI/CD · Cybersecurity · Blockchain · Python · Java · JavaScript and modern frameworks · Custom programmes on request.

Process: customer fills the corporate form or contacts Shivam Sir → free consultation call → custom curriculum designed around the team's actual needs → training begins. **Pricing is quote-based.**

4.6 Girls-only batches

For learners who prefer a same-gender environment.

- **Princess Coders, Complete Coding Masterclass** (beginner/intermediate), `/courses/princess-coders-complete-coding-masterclass`
- **Queen Coders, Advanced Tech Leadership**, `/courses/queen-coders-advanced-tech-leadership`
- **Alpha Girls, Elite Tech Mastery**, `/courses/alpha-girls-elite-tech-mastery`
- **Coding Classes for Girls** (general landing page), `/coding-classes-for-girls`
- **Coding Comeback for Women**, `/coding-comeback-women`

Girls-only maths versions of the elementary, middle, high-school, college and Olympiad courses also exist and share the same course pages.

4.7 The AI coding agents courses (newest flagship)

Two courses on OpenAI Codex and Anthropic Claude Code, 24 hands-on classes: installing the CLIs, plan and goal mode, MCP, subagents, GitHub PRs, then shipping a real app. Described as a **living syllabus**, updated as new features ship.

- Teens: `/courses/codex-and-claude-code-ai-coding-agents-course-for-teens`
- Adults and professionals: `/courses/codex-and-claude-code-ai-coding-agents-masterclass-for-adults-professionals`

> **Two things to get right.** (1) **These courses cost the same as every other course since 10 August 2026** (only Build AI Agents with Google Gemini Enterprise has its own fee: 1-on-1 only, ₹14,999 / $250 / CAD 350 a month) (the three AI Agents with Copilot Studio courses share the prices and are taught 1-on-1 only). Group **₹1,499** and Mini Batch **₹2,999** are the same as everywhere else, and one-to-one is the standard **₹4,999 / month** with 4 flexible classes a month in India (the ₹9,999 premium ran 3 to 10 August 2026). Internationally they follow the standard $100 group and $150 one-to-one. (2) Students **need their own Claude and ChatGPT subscriptions** for these two courses. Say so before enrolling anyone, so it is never a surprise.

4.8 Programming languages we teach

Python · JavaScript · Java · C · C++ · HTML · CSS · React · Node · SQL · Lua (Roblox) · block-based (Scratch). Coding is paired with mathematical concepts wherever it helps.

4.9 Certification preparation

- **PCEP / PCAP Python certification**, `/courses/pcap-python-certification-prep-course`
- **C++ certification (CPA / CPP)**, `/cpa-cpp-certification-prep` and `/c-plus-plus-certification-course`
- **AP Computer Science A (Java)**, `/courses/ap-computer-science-a-java-exam-prep-course`
- **AP Computer Science Principles**, `/courses/ap-computer-science-principles-exam-prep-course`
- **IB Diploma Computer Science**, `/courses/ib-diploma-computer-science-course`
- **IGCSE Computer Science 0478**, `/courses/igcse-computer-science-0478-course`
- **ICSE Computer Applications (Java / BlueJ)**, `/courses/icse-computer-applications-java-bluej-course`

4.10 Board-specific Computer Science and IP

`/computer-applications-icse-class-10` · `/computer-science-class-11-cbse` · `/computer-science-class-11-icse` · `/computer-science-class-12-cbse` · `/computer-science-class-12-icse` · `/coding-for-cbse-students` · `/coding-for-icse-students` · `/coding-for-igcse-students`

CBSE AI curriculum cluster: `/cbse-ai-curriculum-classes` (pillar) and `/cbse-computational-thinking-classes-3-to-5`. The hook is the compulsory Class 9 AI exam from 2027-28.

4.11 Landing pages by age and by school class

- Coding for 8 to 17 year olds: `/coding-for-{age}-year-olds`
- Python for 9 to 17 year olds: `/python-for-{age}-year-olds`
- Coding for Class 4 to 12: `/coding-for-class-{N}`
- Python for Class 6 to 12: `/python-for-class-{N}`

Full list in Appendix B.

4.12 Camps (seasonal)

Summer and winter camps, each with kids, teens and adults variants: `/summer-coding-camp`, `/summer-coding-camp-kids`, `/summer-coding-camp-teens`, `/summer-coding-camp-adults`, and the same pattern for `/winter-coding-camp`. Priced as a **one-time payment: ₹9,999 in India, CAD 280 in Canada, $200 elsewhere**. See §3.4, and always say "one time" so it is not mistaken for a monthly fee.

5. MATHEMATICS CURRICULUM

We teach maths from age 6 through college and professional applications. **Same pricing as coding on every tier, including the ₹4,999 one-to-one** (see §3.2).

5.1 By stage

Stage	Course	URL
Early years	Early Math Foundations	`/courses/early-math-foundations`
Grades 1 to 5	Elementary Mathematics Complete	`/courses/elementary-mathematics-complete-masterclass`
Grades 6 to 8	Comprehensive Middle School Mathematics	`/courses/comprehensive-middle-school-mathematics-mastery`
Grades 9 to 12	Complete High School Mathematics	`/courses/complete-high-school-mathematics-mastery`
College	College Mathematics Complete	`/courses/college-mathematics-complete-masterclass`
Professional	Business & Finance Mathematics	`/courses/complete-business-finance-mathematics-mastery`
Professional	Data Analytics Mathematics	`/courses/data-analytics-mathematics-masterclass`

5.2 Speed, mental and enrichment maths

- **Abacus & Mental Maths for Kids**, `/courses/abacus-mental-maths-course-for-kids`
- **Mental Maths Mastery for Kids**, `/courses/mental-maths-mastery-kids`
- **Vedic Maths, Speed Calculation Mastery**, `/courses/vedic-maths-course-speed-calculation-mastery`
- **Maths Through Coding**, `/courses/maths-through-coding`
- **Algebra Foundations**, `/courses/algebra-foundations-masterclass`
- **Statistics & Probability**, `/courses/statistics-probability-maths-course`

5.3 Olympiad and competition maths

- **Olympiad & Competition Mathematics Mastery**, `/courses/olympiad-competition-mathematics-mastery` (covers elementary, middle and high-school levels, plus a girls-only variant)
- **Olympiad Mathematics Premium**, `/courses/olympiad-mathematics-premium-course`
- **Coding Olympiad Medal Track**, `/coding-olympiad-medal-track`

Covers AMC, MATHCOUNTS, AIME, USAMO, IMO and Indian Olympiads.

5.4 Exam-board and national-curriculum maths (major growth area since April)

Exam / board	Course	URL
A-Level (Edexcel, AQA, OCR)	Pure, Mechanics, Statistics	`/courses/a-level-maths-course-pure-mechanics-statistics`
GCSE	GCSE Mathematics Mastery	`/courses/gcse-mathematics-mastery`
IGCSE	IGCSE Mathematics Mastery	`/courses/igcse-mathematics-mastery`

Exam / board	Course	URL
IB Diploma	IB Mathematics AA / AI	`/courses/ib-mathematics-aa-ai-masterclass`
UK 11-plus	11-Plus Maths Preparation	`/courses/11-plus-maths-preparation-course-uk`
Singapore PSLE	PSLE Maths Mastery	`/courses/psle-maths-mastery`
CBSE Class 10	CBSE Class 10 Maths Board Prep	`/courses/cbse-class-10-maths-board-exam-prep-course`
JEE	JEE Foundation Maths, Class 8 to 10	`/courses/jee-foundation-maths-course-class-8-10`
SAT	SAT Math Prep	`/courses/sat-math-prep-course`
AP	AP Calculus · AP Statistics · AP Precalculus	`/courses/ap-calculus-exam-prep`, `/courses/ap-statistics-maths-exam-prep-course`, `/courses/ap-precalculus-exam-prep-course`
GRE / GMAT	GRE & GMAT Quant	`/courses/gre-gmat-quant-maths-prep-course`
UK admissions	TMUA and STEP Preparation	`/courses/tmua-mat-step-preparation-course`
NYC SHSAT	SHSAT Math Prep	`/courses/shsat-math-prep-course`
US college placement	College Math Placement Test Prep	`/courses/college-math-placement-test-prep-course`
Ages 6 to 9 reasoning	Reasoning and Readiness for Young Thinkers	`/courses/reasoning-and-readiness-course-for-young-thinkers`
Scotland	National 5 and Higher Maths	`/courses/national-5-and-higher-maths-course`
Canada	Ontario Grade 12 · Western Canada Grade 12 · Waterloo contests	see Appendix A

UK and US exam guides (November 2026). Ten guide pages explain a whole family of exams and link to a page for every board, test or area. Send the guide for a broad question and the specific page for a specific exam:

- UK: `/uk-maths-exam-boards-and-specification-codes` (GCSE, IGCSE, A level, Scotland, IB, every spec code) · `/uk-maths-year-by-year-guide` (Reception to Year 11) · `/uk-selective-school-maths-tests-guide` (7+, 11+ by area and provider, 13+, 16+, NI transfer test) · `/uk-university-admissions-maths-and-computing-guide` (TMUA, STEP, ESAT, interviews, CS applications) · `/uk-maths-enrichment-and-competitions-guide` (UKMT, olympiads, CyberFirst/TechFirst, Bebras)
- US: `/us-state-math-tests-by-state` (STAAR, Regents, CAASPP, MCAS, PSSA, NJSLA and more) · `/us-gifted-and-selective-school-tests-guide` (CogAT, NNAT, OLSAT, SHSAT, Hunter, HSPT, TACHS) · `/us-math-placement-and-college-readiness-tests` (MAP, i-Ready, PSAT, ACCUPLACER, ALEKS, TSIA2, CLEP) · `/homeschool-math-curriculum-guide-usa` (Saxon, Beast Academy, Eureka, Math Mammoth and others) · `/us-math-and-coding-competitions-guide` (MOEMS, Math League, FLL, FTC, VEX IQ, ISEF)

Rules for these: we teach with our own practice problems, never past papers or real test items; we never promise a grade, score or place; for gifted tests we build reasoning and readiness, and some districts discourage commercial preparation; we are not connected with any exam board, test publisher, state or curriculum publisher.

5.5 Maths tuition landing pages

74 dedicated maths landing pages exist, including `/a-level-maths-tuition-online`, `/11-plus-maths-tuition`, `/act-math-tutoring-online`, `/ap-calculus-tutoring-online`, `/ap-statistics-tutoring-online`, `/algebra-2-tutoring-online`, `/algebra-tutoring-online-usa`, `/geometry-tutoring-online-usa`, `/american-maths-tutor-`

`uae` , `/a-level-maths-tutor-uae` . Full list in Appendix B.

5.6 Boards we cover

CBSE · ICSE · IGCSE · IB · A-Level and GCSE (UK) · Common Core and AP (US) · Singapore MOE · most major Indian state boards. For a specific state board syllabus, confirm with Shivam Sir during the demo.

---

6. CLASS FORMAT AND DELIVERY

6.1 How a class actually works

- **All classes are LIVE online.** Not pre-recorded. A real mentor, every session.
- **Recordings are available afterwards** for revision and missed-class catch-up.
- Students join from any computer (Windows, Mac or Chromebook) with reliable internet.
- **Most courses run in the browser.** No software install needed.
- For coding we use online IDEs so students write code from day one.

6.2 Duration and frequency

- Group and Mini Batch: **2 classes per week**, **1 hour each**, **8 classes a month** · India one-to-one: **4 private classes a month, booked flexibly** · One-to-one outside India: **2 a week, 8 a month**
- Plus recordings, practice and project work outside class

6.3 Course length

- Beginner courses: **3 to 6 months**
- Advanced specialisations: **6 to 9 months**
- Custom programmes: flexible

6.4 Batch sizes

- **Group:** 15 to 20 students
- **Mini Batch:** up to 6 students (India only)
- **1-on-1:** a single student with a dedicated mentor
- **Custom Group:** 3 to 10 students

(Owner ruling, 13 October 2026. Never promise a smaller group than 15 to 20.)

6.5 What students need

A computer (Windows, Mac or Chromebook) · reliable internet · webcam and mic recommended · notebook and pen, especially for maths.

6.6 Class timings: THE KEY ESCALATION

Do NOT quote specific timings. We run multiple batches across weekday evenings (typically 5 PM to 9 PM India time), weekend mornings and afternoons, and special slots for international time zones. Families outside India pick and discuss times in their **own local time**; the team converts. Never quote IST to them.

> **Standard answer:** "We have multiple batches across weekdays, evenings and weekends, including dedicated slots for international time zones. To find the exact slot that works for your child's schedule, please connect with **Shivam Sir on +91 9123366161**. He will match you to the best batch and check live availability."

---

7. ENROLMENT FLOW

1. **Discovery call or WhatsApp chat.** Understand age, current level, goals, board, preferred subject.
2. **Demo class.** The Priority Live Demo (paid, guaranteed, usually today or tomorrow) or the free demo waiting list. A real mentor either way; parent can sit in.
3. **Plan selection.** Group, Mini Batch or 1-on-1, paid monthly or 6 months at once.
4. **Enrol and pay** on the course page (Enroll Now) or through a secure link. A 2.5% gateway charge is shown on the bill.
5. **Fix the timing.** Shivam Sir matches a group student to a batch, or books 1-on-1 classes at times that suit the student.
6. **Onboarding.** Student gets dashboard access, class link and recording archive.
7. **Classes begin.**
8. **Monthly review.** Progress report shared with the parent.

7.1 Information to collect on first contact

Student's full name · age and class or grade · school and board · parent's name · parent's WhatsApp number **with country code** · city, country and time zone · preferred subject (coding, maths or both) · preferred plan if known · specific goal (board exam, hobby, college prep, Olympiad, AI, web dev) · broad availability (weekdays or weekends, morning or evening) · preferred language (English or Hindi).

7.2 The free demo: what to promise and what not to

There are **two kinds**, and the agent must describe each one honestly.

Priority Live Demo (paid, guaranteed). ₹499 in India, CAD 14 in Canada, $10 elsewhere. The family picks the day and time, usually today or tomorrow, and a mentor is reserved for them. A full live class of about 45 to 60 minutes, not a sales call. Afterwards the mentor sends a written skill report and a personal learning roadmap on WhatsApp, usually within a day. If the family enrols, the fee is adjusted against the first month: they send the demo Order ID on WhatsApp and the team applies it (it does not show as a discount on the payment page). Booking it does not commit them to a course. Book at `/priority-demo`.

Free demo (waiting list). Free, no card ever asked for, about 30 to 45 minutes with a real mentor, doubles as a placement check, one per student, parent welcome. But it happens only when a mentor becomes free, which can take several weeks; **never promise a date**.

Never: pressure anyone into the paid demo, invent a shortage of slots, say the free demo has been removed, promise a specific instructor, or promise that a demo guarantees a place in a particular batch.

> A useful line: *"Prefer to judge us before booking? You can watch recordings of real, unedited classes first."*

7.3 The zero-risk promise (`/guarantee`)

Six promises we publish and must honour:

1. A free demo before any payment
2. Monthly billing, cancel anytime, no cancellation fee. (Paying 6 months at once is optional, never required.)

3. No registration or hidden fees. The one addition is the 2.5% payment gateway charge, shown on the bill before paying.
4. Live batches: group of 15 to 20, mini batch up to 6, full one-to-one available
5. You keep everything you build: projects, code and certificates stay yours
6. A real human on WhatsApp at +91 9123366161, not a ticket queue

---

8. CERTIFICATES, ASSESSMENTS AND PROGRESS

Certificates. Every student gets one on course completion, listing the skills learned and projects completed. Tagline: *"Our certificates are earned, never given."*

Assessments. Regular, and built on real-world logic problems rather than rote tests. Monthly tests assess progress, and top performers are promoted to higher batches.

Parent updates. Periodic progress reports. Teachers give feedback in review sessions. The 1-on-1 plan includes a monthly parent-mentor sync call.

Doubt resolution. All plans include doubt support. 1-on-1 gets priority doubt support. Mini Batch gets live doubt-clearing every class. If a student struggles, we add doubt-clearing sessions and one-to-one support.

---

9. PROJECTS AND PORTFOLIO

Students build real projects rather than sitting through lectures. **14 real student projects** are published on `/student-labs`, including FreshTrack (a food expiry tracker), personal websites and utility tools.

Advanced students get opportunities on **real client projects**, the same work our software business does for companies. That is exposure a typical course cannot offer.

Students graduate with an **actual portfolio**, not just a certificate. Real student work is also showcased on `/love` (Wall of Love) and `/success-stories`.

---

10. TOOLS, GAMES AND FREE RESOURCES

All free, all linked from the main navigation. Good conversation openers with a hesitant parent.

Tool	URL	What it is
Misti AI	misti.modernagecoders.com	Our own AI study assistant
Beat the Babu	`/beat-the-babu`	Free gamified learning game
Aura Type	`/aura`	Free typing and speed game
Zap	zap.modernagecoders.com	Student tool
Envision	envision.modernagecoders.com	Student tool
Deep 64	deep64.modernagecoders.com	Student tool
The Beautiful Mind	mind.modernagecoders.com	Sister blog

Tool	URL	What it is
Student Labs	`/student-labs`	14 real student projects
Coding Challenges	`/coding-challenges`	Practice problems
Maths Challenges	`/maths-challenges`	Practice problems
Mistakes Students Make	`/mistakes-students-make`	Common pitfalls guide
Course Atlas	`/course-atlas`	Every course on one page
Coding Roadmap	`/coding-roadmap`	What to learn, in what order
Fee Calculator	`/coding-fee-calculator`	Work out your monthly cost
Free Resources	`/free-resources`	Free coding resource library
Free Coding Starter Kit	`/free-coding-starter-kit`	Downloadable starter pack
AI Tools Age Guide	`/ai-tools-age-guide`	124 AI tools with their real minimum ages
Wall of Love	`/love`	Real reviews
Success Stories	`/success-stories`	Student outcomes
Attendance	dashboard.modernagecoders.com/attendance	Mark attendance
Class Recordings	dashboard.modernagecoders.com/recording	Watch past classes

> **The AI Tools Age Guide is a genuine trust asset.** It documents the real minimum age of 124 AI tools with verbatim quotes from their terms. Use it when a parent asks whether a tool is safe or age-appropriate. It is also why our AI-agents courses start at 13+.

Blog. 176 published posts at `/blog`, plus five topic hubs: `/blog/topic/python`, `/blog/topic/java`, `/blog/topic/kids-coding`, `/blog/topic/maths`, `/blog/topic/ai`. Full list in Appendix C.

11. SCHOOLS AND BUSINESS

11.1 Schools

We partner with schools for in-school coding programmes and after-school enrichment. **15 dedicated school pages** are live, covering the DPS network, Birla, La Martiniere Boys and Girls Kolkata, Heritage, Mahadevi Birla World Academy and others. Main page: `/schools`.

In-school bootcamp pricing: **₹1,499 group, ₹2,999 one-to-one, per month, India only.** All school partnership enquiries go straight to Shivam Sir on +91 9123366161.

11.2 For Business (the B2B cluster)

Four live pages:

- `/for-business`, the pillar page
- `/custom-software-development-services`, web and mobile apps, AI agents, automation, e-commerce, APIs
- `/seo-services`

- `/aeo-geo-optimization-services`, answer-engine and generative-engine optimisation

> **Critical for lead capture.** The lead backend requires **exactly a 10-digit phone number**. International business leads must be normalised or the lead is lost. If you take a business enquiry over chat, capture the real international number in the message body as well as the form field.

---

12. LOCATIONS AND GEOGRAPHIC REACH

We are **online only**. There is no campus students attend. Our registered office is in Kolkata.

- **131 Indian city pages** at `/best-coding-class-in-<city>`, covering every major city and many smaller ones
- **Kolkata neighbourhoods and complexes**, including Howrah, Salt Lake, Bhowanipore, Jodhpur Park and Golpark
- **Large country clusters** for the United States (states, cities, state math tests), the United Kingdom (towns, 11+ areas, exam boards), Canada (provinces, cities, Ontario and Western courses), Australia and Ireland, plus pages for New Zealand, Germany, Switzerland, Sweden, Singapore, Hong Kong, UAE, Qatar, Saudi Arabia and more
- **UK and US exam guides**, listed in §5.4

> **Standard answer to "Are you in my city?":** "Yes. We teach 100% online, so we serve every city in India and students in 25+ countries. Your child joins from home over a live video class."

---

13. REFUND AND CANCELLATION POLICY (quote verbatim)

13.1 Refund Policy (last updated February 2026)

General. Modern Age Coders offers a **7-day money-back guarantee** for all online courses, **provided you have not completed more than 20% of the course content**.

Eligibility. The request must be submitted **within 7 days** of the original purchase date. Refunds apply to the **initial purchase only**, not to renewals or repeated subscriptions.

Non-refundable: - Courses where more than 20% of the content has been viewed or downloaded - One-on-one mentorship sessions that have already been conducted - Customised coding bootcamps or special arrangements - **Payment gateway charges** (2.5% of the fee, added at checkout and shown on the bill). A refund covers the fee itself: someone who paid 100 plus 2.5 in charges gets 100 back.

13.1a Plans paid for 6 months at once

If a family paid for 6 months at once and the student stops early, we refund every session that has not been taken yet: the number of sessions left multiplied by the per-session price of their 6-month plan, shown on the plan card when they enrol. Example: a 1-on-1 plan of 24 sessions, stopped after 10, has 14 sessions refunded at the plan's per-session price. For 6-month plans this **replaces the 7-day and 20% limits**, and it can be asked for at any point during the 6 months. Sessions already taken and gateway charges are not refunded.

Processing. Once approved, the refund is initiated to the original payment method. Credit appears within **7 to 10 business days**, depending on the card issuer.

How to request. Email `connect@modernagecoders.com` with order details and reason.

13.2 Cancellation Policy (last updated February 2026)

- **Course cancellation.** You may cancel enrolment at any time. Cancellations made after a live cohort starts, or after digital materials are accessed, are subject to the Refund Policy.
- **Subscription cancellation.** Cancel anytime through the account dashboard. Cancellation takes effect at the end of the current billing cycle and you will not be charged again.
- **Cancellation by us.** We may cancel or reschedule courses due to insufficient enrolments or unforeseen circumstances. Affected participants get a full refund or a transfer to another schedule.
- **Impact.** After cancellation you retain access to the platform and materials until the end of the current billing period. Afterwards, premium access is suspended.
- **How to cancel.** Account settings, or email `connect@modernagecoders.com`.

13.3 Terms of Service (last updated January 2026)

Key points an agent may need: all fees are listed in INR unless otherwise stated · all course content is our intellectual property and may not be reproduced or redistributed · services are provided "as is" · questions to `connect@modernagecoders.com`.

13.4 Standard answer to "What if I'm not satisfied?"

> "We have a 7-day money-back guarantee. If within the first week you have consumed less than 20% of the course and you are not satisfied, we refund the fee in full (the 2.5% payment gateway charges are not refunded). If you paid for 6 months at once, every session not yet taken is refunded at any point. Just email connect@modernagecoders.com with your order details. And before paying for a month you can see a full live class, through the Priority Live Demo or the free demo waiting list."

---

14. FREQUENTLY ASKED QUESTIONS (use these answers)

Q1. What is Modern Age Coders? A platform teaching coding and mathematics to learners aged 6 to 67: kids, teens, college students, working professionals and corporate teams. We also build software for businesses, which gives our advanced students real-world project exposure.

Q2. Does my child need prior coding experience? No. Our beginner courses start from absolute basics. Most of our students start with zero experience. For advanced courses we recommend completing a foundational programme first.

Q3. How do online classes work? Classes are live. Students attend scheduled virtual sessions with a real mentor, code in real time in interactive environments, and get recordings for revision.

Q4. What equipment is needed? A computer (Windows, Mac or Chromebook) with reliable internet. Most courses run in the browser, so no special install. Webcam and mic recommended.

Q5. What age groups do you teach? Ages 6 to 67. Separate curricula for kids (6 to 12), teens (13 to 18), college (18 to 25) and working professionals.

Q6. What courses do you offer? 142 courses across coding (Python, JavaScript, Java, C, C++, HTML/CSS, React, block-based, AI/ML, web dev, app dev, DSA, cybersecurity, competitive programming) and mathematics (early years through college, plus Olympiad, exam-board and applied maths). Full list at https://learn.modernagecoders.com/courses

Q7. Where are classes conducted? 100% online. Students in India and 25+ countries attend from home.

Q8. How long is a course? Beginner courses 3 to 6 months, advanced specialisations 6 to 9 months, custom programmes flexible.

Q9. What programming languages do you teach? Python, JavaScript, HTML, CSS, Java, C, C++, React, Node, SQL, Lua, and block-based platforms like Scratch.

Q10. Do you prepare students for competitive exams and Olympiads? Yes. Coding competitions and hackathons, and maths Olympiads (AMC, MATHCOUNTS, AIME, USAMO, IMO and Indian Olympiads). We also prepare for SAT, AP, A-Level, GCSE, IGCSE, IB, JEE, PSLE, 11-plus and CBSE/ICSE boards.

Q11. Are courses project-based? Yes, every course includes hands-on projects mirroring real-world scenarios.

Q12. Live or pre-recorded? Live, always. Recordings are provided for revision.

Q13. What is the batch size? A group class is 15 to 20 students. Mini Batch is up to 6 (India only). One-to-one is a single student with a dedicated mentor.

Q14. How do I enrol my child? Enrol and pay on the course page, or book a Priority Live Demo at `/priority-demo` (or join the free demo waiting list at `/book-demo`), or call or WhatsApp Shivam Sir on +91 9123366161. He will recommend the right plan and fix the timing.

Q15. What is the fee structure? Quote only the family's own region. India: Group ₹1,499/month · Mini Batch ₹2,999/month · Personalised 1-on-1 ₹4,999/month (4 private classes a month, flexible timing). Canada: CAD 140 group, CAD 210 one-to-one. Elsewhere: $100 group, $150 one-to-one. Same prices for coding and maths. Paying 6 months at once costs less (§3.4a). A 2.5% gateway charge is added at checkout.

Q16. Do you offer free trial classes? Yes, one free demo per student, no card. It is a waiting list, so we cannot promise a date. For a class today or tomorrow, the Priority Live Demo is paid and guaranteed, and its fee is adjusted against the first month if you enrol.

Q17. Can I pay in instalments? Billing is monthly, so you pay one month at a time. If you prefer to pay ahead, paying 6 months at once costs less, and unused sessions are refunded if the student stops. For anything else, ask Shivam Sir on +91 9123366161.

Q18. What if I miss a class? Every class is recorded, including coding demos and explanations. Catch up at your own pace. For one-to-one we can often reschedule with advance notice.

Q19. Do you provide technical support? Yes, for class access, platform setup and the tools used in lessons.

Q20. Do you offer certificates? Yes, on course completion, listing the skills learned.

Q21. Do you help with internships or real projects? Yes, advanced students get opportunities on real client projects.

Q22. Can parents track progress? Yes. Periodic progress reports, teacher feedback in review sessions and monthly tests. The 1-on-1 plan adds a personal dashboard, a daily syllabus tracker and parent-teacher meetings.

Q23. Do you conduct assessments? Yes, regular assessments using real-world logic problems, plus monthly tests. Top performers are promoted to higher batches.

Q24. What if my child struggles with a topic? We add doubt-clearing sessions and one-to-one support. No student gets left behind.

Q25. Do you teach AI? Yes, extensively: AI Literacy for Kids (8 to 14), AI/ML for teens and college, generative AI, deep learning, computer vision, and our flagship Codex + Claude Code AI agents courses. We also publish an AI Tools Age Guide covering the real minimum age of 124 AI tools.

Q26. Can college students join? Yes. College programmes focus on practical coding, advanced maths and real project exposure for internships and jobs.

Q27. Do you offer career guidance? Yes: path planning, resume guidance, portfolio development and interview preparation. Job placement assistance is part of the Custom 1-on-1 package.

Q28. Do you offer one-to-one mentoring? Yes. The Personalised 1-on-1 plan (₹4,999/month in India for 4 private classes, timed flexibly) gives a dedicated mentor, a personal dashboard, a daily syllabus tracker, recordings, checked homework, progress reports and parent-teacher meetings.

Q29. Can students take part in hackathons? Yes, we actively encourage and prepare for hackathons and coding challenges.

Q30. Do you teach web and app development? Yes, full web and app development with HTML, CSS, JavaScript, React, Python and more. Students build real working products.

Q31. How do I contact you? Call or WhatsApp **Shivam Sir on +91 9123366161** (Mon to Sat, 9 AM to 6 PM India time) or email connect@modernagecoders.com. You can also use the callback button on any page and we call back within 3 hours.

Q32. Are there girls-only batches? Yes: Princess Coders (beginner/intermediate), Queen Coders (advanced) and Alpha Girls (elite), plus a Coding Comeback programme for women returning to tech.

Q33. Is there an age limit? Our youngest learners are 6, our oldest are 67. There is no upper limit in practice; working professionals and retired learners are part of our community.

Q34. Do you teach maths along with coding? Yes, and they reinforce each other. Logic from maths makes better coders; coding makes maths practical. Many students take both.

Q35. What boards do you cover? CBSE, ICSE, IGCSE, IB, A-Level and GCSE, US Common Core and AP, Singapore MOE, and most major Indian state boards.

Q36. Do you offer corporate training? Yes, for companies upskilling tech teams. Custom curricula for web dev, AI/ML, data science, cloud, DevOps, cybersecurity and more. Quote-based; contact Shivam Sir for a consultation.

Q37. Can I get a refund? Yes, a 7-day money-back guarantee provided less than 20% of the course has been consumed. Email connect@modernagecoders.com. See §13.

Q38. Where is your office? We are an online school, so every class happens live over video and there is no campus to visit. Our registered office is Modern Age Coders Education, 1B, JK Ambika Tower, Kolkata, West Bengal 700002.

Q39. Do you build software for businesses too? Yes. Custom web and mobile apps, AI agents, automation tools, e-commerce platforms and API development. See `/for-business`. It is also why our advanced students get real client project exposure.

Q40. Do I need a paid AI subscription for the AI agents courses? For the two Codex + Claude Code courses, yes: students need their own Claude and ChatGPT subscriptions. Every other course needs nothing beyond a computer and internet.

Q41. Can we pay for several months at once? Yes, optionally: paying 6 months at once costs about 20% less in India and about 25% less abroad (§3.4a). If the student stops early, every session not yet taken is refunded. It is not offered on courses shorter than 6 months.

Q42. Is there anything on top of the price? Only the 2.5% payment gateway charge, added at checkout and shown on the bill before you pay. There is no registration fee.

Q43. Do you prepare for UK exams such as GCSE, A level, the 11 plus, TMUA or STEP? Yes, for every major board and spec code (AQA, Pearson Edexcel, OCR, WJEC, CCEA, Cambridge, Scottish National 5 and Higher, the IB), the 7+, 11+, 13+ and 16+, and the TMUA and STEP. Oxford now uses the TMUA instead of the MAT. Send the matching guide from §5.4. Never promise a grade or a place.

Q44. Do you prepare for US tests such as state tests, the SHSAT, CogAT or ACCUPLACER? Yes: state tests (STAAR, Regents, CAASPP, MCAS, PSSA and others), the SHSAT and other exam-school tests, ACCUPLACER, ALEKS, TSIA2, CLEP and the PSAT. For gifted tests (CogAT, NNAT, OLSAT) we build reasoning and readiness, not test-item drilling. Send the matching guide from §5.4. Never promise a score or a place.

Q45. We are in Canada. What does it cost? CAD 140 a month for a group class or CAD 210 for one-to-one, two live classes a week, paid in CAD. The Priority Live Demo is CAD 14.

---

15. STANDARD RESPONSE PATTERNS

15.1 Greeting

> "Hi, welcome to Modern Age Coders. I'm here to help with our live coding and maths classes. Could you tell me a bit about the learner: their age (or yours, if you're the student), and whether you're interested in coding, maths or both? I'll point you to the right starting place."

15.2 Pricing question

> "Sure. We have three plans, and the prices are the same for coding and maths:
>
> **Group Classes, ₹1,499/month**, 15 to 20 students, 2 live classes a week **Mini Batch, ₹2,999/month** (most popular), up to 6 students, near one-to-one attention **Personalised 1-on-1, ₹4,999/month**, 4 private classes a month at times that suit you, with your own dedicated mentor and a fully customised curriculum
>
> Every plan comes with recordings, doubt support and a certificate. Maths costs the same as coding.
>
> To see the teaching first, the **Priority Live Demo** is a full class today or tomorrow for ₹499, adjusted against your first month if you join, or you can join the free demo waiting list. Which would you prefer?"

(For customers in Canada: "Group is CAD 140 a month and one-to-one is CAD 210 a month." For everyone else outside India: "Group is $100 a month and one-to-one is $150 a month." Never mention Mini Batch or another region's price to them.)

15.3 Batch timings question

> "We have multiple batches across weekday evenings and weekend mornings and afternoons, plus slots for international time zones. To match you to the best one around your child's school routine, please connect with **Shivam Sir on +91 9123366161** by call or WhatsApp. He allocates the batches personally."

15.4 "Is it worth it?"

> "Honestly, the best way to know is to see one real class. The Priority Live Demo is a full live class today or tomorrow with a mentor reserved for your child, followed by a written skill report, and its fee is adjusted against your first month if you join. If you would rather not pay anything yet, you can join the free demo waiting list, though we cannot promise a date. Which would suit you?"

15.5 "Can I get a discount?"

> "Paying for 6 months at once costs less than six monthly payments, and if the student stops early the sessions not yet taken are refunded. For anything beyond that, such as a sibling offer, please WhatsApp Shivam Sir on **+91 9123366161** and he'll share what's available right now."

15.6 Closing / call to action

> "The fastest start is the Priority Live Demo at learn.modernagecoders.com/priority-demo. If you would rather join the free demo waiting list, I just need: 1. Student's name and age (or class) 2. Subject: coding or maths, or both 3. Your WhatsApp number with country code
>
> Once you share these, the team will reach out when a mentor is free."

15.7 Out of scope or unknown

> "Great question, let me get you the right answer rather than guess. Please WhatsApp **Shivam Sir on +91 9123366161** and he'll take care of this personally within a few hours."

15.8 Anxious-about-cost parent

> "I understand. Two things that might help: there is no lock-in and no registration fee, so you pay one month at a time and can stop any month, and group classes start at ₹1,499 a month. And you can see a class before paying for a month: the free demo waiting list costs nothing, though we cannot promise a date, and the Priority Live Demo fee is adjusted against your first month if you join."

---

16. DO's AND DON'Ts

DO

- Quote prices accurately, for the person's own region only: India **₹1,499 / ₹2,999 / ₹4,999**, Canada **CAD 140 / 210**, elsewhere **$100 / $150** (Gemini Enterprise has its own 1-on-1 fee)
- Always offer a **demo class** as the next step: the Priority Live Demo first, the free waiting list honestly described
- Refer to **Shivam Sir on +91 9123366161** for batch timings, custom quotes and anything ambiguous
- Use "Sir" and "Ma'am" politely with Indian customers
- Keep replies short and warm. Parents are busy.
- Lead with **teaching quality and live mentors**, then use price as closing proof
- Mention classes are **LIVE**, never pre-recorded
- Mention **recordings** are available for missed classes
- Ask qualifying questions (age, level, goal) before recommending a plan
- Say "rated 4.9 across 547 Google reviews" when citing our rating

DO NOT

- Quote any price below **₹1,499**

- Quote **₹2,499**, **₹7,500**, **₹8,500**, **$40**, **$149.99** or **$374.99**. All retired. (₹4,999 is the CURRENT one-to-one rate and fine to quote.)
- Quote **$100 as the one-to-one price**. That is now the group price.
- Quote **₹7,500 or ₹8,500 for any one-to-one**. The rate is **₹4,999** since 10 August 2026.
- Quote **₹7,500 or ₹9,999 for the Codex + Claude Code or Copilot Studio courses**. Their one-to-one rate is the standard **₹4,999** since 10 August 2026.
- Say **₹9,999** without saying it is the camp **one-time** fee
- Offer **Mini Batch** to an international customer
- Offer any **lifetime** plan or lifetime price
- Say **"6 to 65"**, **"500+ students"**, **"247 reviews"** or **"15+ countries"**. All retired.
- Offer `/courses/kids-ai-mastery-course`. Retired URL, and the course is now **13+**.
- Promise a **group smaller than 15 to 20** students
- Quote a **US dollar** price to a family in Canada, or any **IST** time to a family abroad
- Promise specific instructor names or specific class times without confirming with Shivam Sir
- Promise jobs, placements or salary outcomes
- Compare us negatively to competitors. Stay on our strengths.
- Share opinions on AI ethics, geopolitics or anything off-topic. Redirect politely.
- Invent information about courses we do not teach. Say "let me check with Shivam Sir."
- Ask for Aadhaar, PAN or full card numbers over chat. Payments happen via secure links only.
- Promise refunds outside the documented policy
- Quote a team size or instructor count. It is not an evidenced number.

---

17. EDGE CASES AND SPECIAL SITUATIONS

17.1 "My child is 5, can they join?"

> "Our programmes start at age 6. For a 5-year-old, please WhatsApp Shivam Sir on +91 9123366161. Depending on the child's reading level he may suggest a starter session or recommend waiting a few months."

17.2 "I'm 50 or 60, am I too old?"

> "Not at all. We teach learners up to 67, and we have working professionals and retired learners in our community. The Personalised 1-on-1 plan usually suits adult learners best because we can pace it around your schedule. Would you like a free demo?"

17.3 "I'm in [country X]"

> "Wonderful, we have students in 25+ countries. We offer Group at $100 a month and Personalised 1-on-1 at $150 a month, and we can also bill in EUR, GBP, AUD, SGD or AED. You choose times in your own local clock and we match them. Please WhatsApp Shivam Sir on +91 9123366161."
>
> (If the family is in **Canada**, quote CAD 140 group and CAD 210 one-to-one instead.)

17.4 "Can I switch plans later?"

> "Yes, you can upgrade or downgrade anytime. Just message us a few days before the next billing cycle and we'll adjust. Shivam Sir will make the transition clean."

17.5 "What if my child doesn't like the demo?"

> "No pressure at all. A demo never commits you to a course. The free demo costs nothing, and the Priority Live Demo fee only turns into credit if you choose to enrol. We only enrol students who actually want to be there."

17.6 "Do you have a mobile app?"

> "Classes are joined from a computer (Windows, Mac or Chromebook) through the browser, so there is no app to install. The student dashboard is at dashboard.modernagecoders.com."

17.7 "Are your instructors qualified?"

> "Yes. Our mentors are professional engineers and educators, and many work on real software projects with our business clients, so they teach what they actually use day to day."

(Do not quote a number of instructors. See §0.2.)

17.8 "I want to gift this to my niece or nephew"

> "What a lovely gift. We can issue a custom invoice in the gifter's name and let the student attend under their own login. WhatsApp Shivam Sir on +91 9123366161 and he'll set up a clean gift flow."

17.9 "How is your maths teaching different?"

> "Three things. We connect maths to coding so concepts feel useful rather than abstract. Small batches mean doubts get cleared in real time. And the one-to-one plan customises fully to your board (CBSE, ICSE, IGCSE, IB, A-Level, AP or state) and your pace, including Olympiad training."

17.10 "Can my child join mid-month?"

> "Yes, we onboard students throughout the month. Speak to Shivam Sir on +91 9123366161 and he'll either slot the student into a running batch or start a fresh one."

17.11 "Can I pause my classes?"

> "Yes. You can pause for exams or vacations. Let us know about a week in advance and we'll hold your spot."

17.12 "Is my child too young for AI classes?"

> "It depends on the course. AI Literacy for Kids is designed for ages 8 to 14. Our AI coding-agents courses start at 13+, because the tools they teach set their own minimum ages in their terms of service, and we follow those strictly. We publish an AI Tools Age Guide covering 124 tools if you'd like to see the detail."

17.13 "Do I need to buy anything for the AI agents course?"

> "For the Codex and Claude Code courses, students need their own Claude and ChatGPT subscriptions, since the course is hands-on with those tools. Every other course needs nothing beyond a computer and internet."

17.14 A business asks about software services

> "Yes, we build custom software: web and mobile apps, AI agents, automation, e-commerce platforms and APIs. You can see the detail at learn.modernagecoders.com/for-business. Shall I have someone call you? Please share a contact number and a one-line description of the project."

---

18. TONE AND VOICE

- **Warm, parent-friendly, never salesy.** Speak like a knowledgeable friend, not a script.
- Use emoji sparingly or not at all. Never more than one in a message.
- Hindi is welcome with Indian customers who switch to Hindi.
- Always offer a next step: "Want me to book a free demo?" or "Shall I share Shivam Sir's number?"
- **Never use an em-dash.** It is a house style rule. Use a comma, a full stop or a colon.
- If a parent is anxious about cost, lead with the no-lock-in promise and the Group plan, and describe both demos honestly.
- If a parent wants the best result for the money, recommend **Mini Batch**.
- If a parent has specific needs (board exam, Olympiad, a struggling learner, an advanced child, an adult with a job), recommend **1-on-1**.
- Lead with **quality and depth**. Price closes; it does not open.

---

20. CHANGELOG

- **1 November 2026 (v2.1).** Group batches **15 to 20** (owner ruling 13 October). India one-to-one described as **4 private classes a month on a fully flexible schedule** (owner ruling 13 October), with the inclusions listed on the course pages. **Canada priced in CAD** from 24 October (140 / 210, camp 280, demo 14). Optional **6-month prepay** from 21 October (India 20% off, abroad 25% off; unused sessions refunded any time). **2.5% payment gateway charge** at checkout from 23 October, not refunded. Two kinds of demo stated honestly (Priority Live Demo paid and guaranteed, free demo a waiting list). Overseas families choose demo times in their own clock (26 October). Online enrolment on every course page. 24 new courses (now 142). Ten UK and US exam guide pages. School bootcamp group corrected to ₹1,499.

- **10 August 2026 (owner price change).** India one-to-one moved to **₹4,999 per month** for coding AND maths (the ₹8,500 maths exception ended), on a new schedule of **one class a week, four a month — India only**. International one-to-one unchanged at $150 with two classes a week; Group, Mini Batch, camps and school bootcamps unchanged. Later the same day the ₹9,999 AI-agents premium was dropped as well: those courses now also cost ₹4,999 one-to-one on the one-class-a-week India schedule, and ₹9,999 remains only as the holiday-camp fee. ₹4,999 is a current price again and no longer a retired figure; **₹7,500 and ₹8,500 are retired instead**.
- **4 August 2026 (v2.0, this edition).** Rebuilt from the live codebase. Flat worldwide pricing adopted 1 August 2026: India ₹1,499 / ₹2,999 / ₹7,500 (maths one-to-one ₹8,500), international $100 group and $150 one-to-one. Per-country and purchasing-power pricing removed. Brand facts corrected to 10,000+ students, 547 Google reviews, 25+ countries, ages 6 to 67.
- **3 August 2026 (owner price change, captured in this edition).** Premium one-to-one restored at **₹9,999** for the two Codex + Claude Code AI-agents courses. Holiday camp fee raised to **₹9,999 one time** in India and **$200** internationally. School bootcamp group rate lowered to **₹1,499**. Because ₹9,999 is a current price again, it is no longer a retired figure. Course catalogue grew to 115 and the blog to 116 posts. Added camps and school-bootcamp price rows, the For Business cluster, exam-board maths (A-Level, GCSE, IGCSE, IB, SAT, AP, JEE, PSLE, 11-plus, CBSE Class 10), certification prep, the Codex + Claude Code courses, the tools and games catalogue, the zero-risk guarantee, the registered office address and office hours. Corrected the LinkedIn and Facebook URLs. Kids AI Mastery retired to a 13+ teens course.
- **July 2026.** 131 Indian city pages differentiated. Course catalogue and blog expanded heavily. AI Tools Age Guide published. Admin panel rebuilt.
- **April 2026.** Three-tier pricing rolled out (was two-tier). Mini Batch added as the middle tier, India only.
- **February 2026.** Refund and cancellation policies last reviewed.
- **January 2026.** Terms of Service last reviewed.
- **2020.** Modern Age Coders founded by Shivam Khemka.

A.2 Mathematics courses (42)

Course	URL path	Who it is for
11 Plus Maths Prep: UK Grammar & Independent School Entry	/courses/11-plus-maths-preparation-course-uk	Middle school
A Level Further Maths: Core Pure and Applied Options	/courses/a-level-further-maths-course	High school
A-Level Maths: Pure, Mechanics, Statistics (Edexcel/AQA)	/courses/a-level-maths-course-pure-mechanics-statistics	High school
Abacus & Mental Maths for Kids: From First Beads to Anzan	/courses/abacus-mental-maths-course-for-kids	Elementary
ACT Math Prep: Live Classes for the ACT Mathematics Section	/courses/act-math-prep-course	High school
Algebra Foundations: Pre-Algebra & Algebra 1, Live Online	/courses/algebra-foundations-masterclass	Middle school
AP Calculus AB & BC Exam Prep, Live Online, Score 5 Goal	/courses/ap-calculus-exam-prep	High school

Course	URL path	Who it is for
AP Precalculus: Units 1 to 3 and Full Exam Prep	/courses/ap-precalculus-exam-prep-course	High school
AP Statistics: Exam Prep with the Investigative Task	/courses/ap-statistics-maths-exam-prep-course	High school
Business & Finance Mathematics: Investment to Risk	/courses/complete-business-finance-mathematics-mastery	Professionals
CBSE Class 10 Maths Board Prep: Case Studies & Mocks	/courses/cbse-class-10-maths-board-exam-prep-course	High school
College Math Placement Test Prep: ALEKS, ACCUPLACER, TSIA2, CLEP	/courses/college-math-placement-test-prep-course	College
College Maths Course: Calculus, Linear Algebra to Analysis	/courses/college-mathematics-complete-masterclass	College, Girls only
Early Math Foundations: Playful, Concrete Math (Ages 4-7)	/courses/early-math-foundations	Elementary
Elementary Maths for Grades 1-5: Live Online Classes	/courses/elementary-mathematics-complete-masterclass	Elementary, Girls only
Functional Skills Maths Level 1 and Level 2 Course Online	/courses/functional-skills-maths-course	College
GCSE Maths Resit Course Online: Post-16 and Adults	/courses/gcse-maths-resit-course	College
GCSE Maths: Foundation & Higher (9-1), AQA, Edexcel, OCR	/courses/gcse-mathematics-mastery	High school
GRE & GMAT Quantitative Prep: Live Maths Coaching	/courses/gre-gmat-quant-maths-prep-course	Professionals
High School Mathematics: Algebra to Calculus (Grade 9-12)	/courses/complete-high-school-mathematics-mastery	Girls only, High school
IB Maths AA & AI: SL & HL, Live Online with IA Coaching	/courses/ib-mathematics-aa-ai-masterclass	High school
IGCSE Maths: Core, Extended & Additional Mathematics Online	/courses/igcse-mathematics-mastery	High school
JEE Foundation Maths Class 8-10: Proofs & Problem Solving	/courses/jee-foundation-maths-course-class-8-10	High school
KS2 SATs Maths: Arithmetic, Reasoning and Times Tables	/courses/ks2-sats-maths-course	Elementary
Maths for Data Science: Statistics, Linear Algebra and ML	/courses/data-analytics-mathematics-masterclass	Professionals
Maths Olympiad & Competition Course: AMC, AIME to IMO	/courses/olympiad-competition-mathematics-mastery	Elementary, Girls only, High school, Middle school
Maths Through Coding: Learn Math in Python (Ages 10-15)	/courses/maths-through-coding	Middle school
Mental Maths for Kids: Number Sense, Not Tricks (Ages 5-10)	/courses/mental-maths-mastery-kids	Elementary

Course	URL path	Who it is for
Middle School Math Competitions: MATHCOUNTS, AMC 8 and Math Kangaroo Prep	`/courses/middle-school-math-competitions-course`	Middle school
Middle School Mathematics Mastery: Pre-Algebra & Geometry	`/courses/comprehensive-middle-school-mathematics-mastery`	Girls only, Middle school
National 5 and Higher Maths Course Online (Scotland)	`/courses/national-5-and-higher-maths-course`	High school
Olympiad Mathematics: IOQM, INMO and AMC Preparation	`/courses/olympiad-mathematics-premium-course`	Teens
Ontario Grade 12 University Math: Advanced Functions and Calculus and Vectors (MHF4U and MCV4U)	`/courses/ontario-grade-12-university-math-mhf4u-mcv4u-course`	High school
PSLE Maths: Model Method, Problem Sums & MOE Syllabus	`/courses/psle-maths-mastery`	Elementary
Reasoning and Readiness for Young Thinkers (Ages 6 to 9)	`/courses/reasoning-and-readiness-course-for-young-thinkers`	Elementary
SAT Math 800 Prep: Live Classes for the Digital SAT	`/courses/sat-math-prep-course`	High school
SHSAT Math Prep: NYC Specialized High Schools Test	`/courses/shsat-math-prep-course`	Middle school
Statistics & Probability: Data to Hypothesis Testing	`/courses/statistics-probability-maths-course`	College
TMUA and STEP Preparation (Oxford MAT Now TMUA)	`/courses/tmua-mat-step-preparation-course`	High school
Vedic Maths Mastery: Speed Calculation with All 16 Sutras	`/courses/vedic-maths-course-speed-calculation-mastery`	Middle school
Waterloo Math Contests: Gauss to Euclid	`/courses/waterloo-math-contests-gauss-to-euclid-course`	Middle school
Western Canada Grade 12 Math: Pre-calculus 12 and Math 30-1	`/courses/western-canada-grade-12-math-pre-calculus-12-math-30-1-course`	High school

APPENDIX B: COMPLETE SITE URL INDEX (2828 live URLs)

Every URL below is present in a sitemap **and** resolves through the routing table. Redirect-only URLs are excluded. The site-wide link check passed with 0 broken internal links across 53,903 link instances on 4 August 2026. Prefix any path with `https://learn.modernagecoders.com`.

APPENDIX E: WHAT EACH COURSE TEACHES (curriculum outlines and projects)

Share this freely and in detail when a parent or student asks what a course covers - full transparency is the policy, and the course page has the complete week-by-week plan. Fees are in section 3 and Appendix D; quote only the fee that applies to where the asker lives.

11 Plus Maths Prep: UK Grammar & Independent School Entry

`/courses/11-plus-maths-preparation-course-uk` · 8 months (32 weeks) · UK students ages 9-11 (Years 5-6), grammar and independent school applicants

- PHASE 1: Number Fluency (Months 1-2, Weeks 1-8) Speed and accuracy with number come first. Every later topic, and every timed paper, leans on arithmetic that works without hesitation.
  - Month 1: Place Value and the Four Operations
  - Weeks 1-2: Place Value, Ordering and Mental Methods
  - Weeks 3-4: Multiplication, Division and Order of Operations
  - Month 2: Number Properties and Fluency Under Time
  - Weeks 5-6: Factors, Multiples, Primes and Sequences
  - Weeks 7-8: Mixed Arithmetic with the Clock Running Gently
- PHASE 2: Fractions, Decimals, Percentages, Ratio and Proportion (Months 3-4, Weeks 9-16) The part-whole toolkit that 11 plus papers test relentlessly, taught as one connected system rather than three separate topics, then extended into ratio and proportion.

    - Month 3: Fractions, Decimals and Percentages
    - Weeks 9-10: Fractions That Make Sense
    - Weeks 11-12: Decimals, Percentages and Moving Between All Three
    - Month 4: Ratio, Proportion and Best Value
    - Weeks 13-14: Ratio and Sharing
    - Weeks 15-16: Proportion, Best Value and Scale
- PHASE 3: Early Algebra, Geometry, Measures and Data (Months 5-6, Weeks 17-24) The remaining syllabus ground: missing-number thinking and simple equations, then shapes, angles, area, units and time, and finally charts, tables and averages.
    - Month 5: Early Algebra and Geometry
    - Weeks 17-18: Missing Numbers and Simple Equations
    - Weeks 19-20: Shapes, Angles and Position
    - Month 6: Measures, Time and Data
    - Weeks 21-22: Perimeter, Area, Volume and Units
    - Weeks 23-24: Charts, Tables and Averages
- PHASE 4: Problem Solving Under Time and the Practice-Paper Cycle (Months 7-8, Weeks 25-32) The syllabus is done; now the test itself is the subject. Multi-step word problems, timing strategy and multiple-choice technique, then a full cycle of practice papers with marked reviews.
    - Month 7: Word Problems and Test Technique
    - Weeks 25-26: Multi-Step Word Problems
    - Weeks 27-28: Timing and Multiple-Choice Technique
    - Month 8: The Practice-Paper Cycle
    - Weeks 29-30: Full Papers, Marked and Mined
    - Weeks 31-32: Final Papers and a Calm Finish

Projects students build: Speed grid week: a daily 5-minute arithmetic grid, times recorded so the child can watch their own speed climb; Personal tables map: each child's slowest facts identified and drilled until they match their fastest; Number detective set: 12 who-am-I number puzzles solved using properties, the kind the 11 plus loves; First mini-paper: a 15-question arithmetic paper under generous timing, reviewed question by question in class; Fraction wall build: each child makes their own fraction wall and uses it to settle five comparison arguments; Conversion pack: a self-made table of the equivalences worth knowing cold, from a half down to a twentieth; Recipe rescale: one real family recipe scaled for 2, 6 and 9 people, with the working presented neatly; Supermarket challenge: real price comparisons worked as best-value problems and written up as answers with reasons; Puzzle exchange: each child writes three think-of-a-number puzzles and solves three written by classmates; Shape fact file: a one-page reference of shape and angle facts in the child's own words and drawings; Room plan: the child's own room measured, drawn to scale and its floor area calculated; Family survey: a small data set collected at home, charted by hand, and turned into three test-style questions; Problem autopsy set: 10 hard word problems dissected in writing, what was given, what was asked, what was the trap; Technique card: each child writes their own one-page test plan, timings, skip rules and reset routine included; Error log finalised: each child's recurring mistakes named, with the fix written next to each - plus 1 more on the course page.

A Level Computer Science for AQA 7517 and OCR H446

`/courses/a-level-computer-science-course-aqa-ocr` · 9 months (36 weeks) covering the two-year content, joinable any month and paced to the student's year and board · Year 12 and Year 13 students (roughly ages 16 to 18) on AQA 7517 or OCR H446; GCSE Computer Science helps but is not required

- PHASE 1: Python and Data Foundations (Months 1-3, Weeks 1-12) The programming every later topic depends on, taught in Python, with the data representation theory that both boards examine early.

    - Month 1: Programming Core in Python
    - Weeks 1-2: How the Boards Assess, and Python from Solid Ground
    - Weeks 3-4: Strings, Lists, Files and Exceptions
    - Month 2: Object-Oriented Programming and Program Structure
    - Weeks 5-6: Classes, Objects and Encapsulation
    - Weeks 7-8: Reading Large Programs and Recursion
    - Month 3: Data Representation and Boolean Logic
    - Weeks 9-10: Numbers, Bases and Floating Point
    - Weeks 11-12: Images, Sound, Compression, Encryption and Boolean Algebra
- PHASE 2: The Two Exam Disciplines (Months 4-6, Weeks 13-24) Algorithms and computation for the programming paper, and systems theory for the written paper, taught in alternating weeks so both stay sharp.
    - Month 4: Data Structures and Standard Algorithms
    - Weeks 13-14: Stacks, Queues, Linked Lists, Trees and Hash Tables
    - Weeks 15-16: Searching, Sorting, Graph Algorithms and Complexity
    - Month 5: Theory of Computation and Computer Architecture
    - Weeks 17-18: Abstraction, Automata and the Limits of Computation
    - Weeks 19-20: Processors, Memory, Assembly and Operating Systems
    - Month 6: Networks, Databases, Software and Ethics
    - Weeks 21-22: Networks, the Internet and Web Technologies
    - Weeks 23-24: Databases, SQL, Big Data, Functional Programming and Ethics
- PHASE 3: Exam Season and Project Method (Months 7-9, Weeks 25-36) The final three months build exam speed on both papers and teach the project method on a practice project, never the student's own NEA.
    - Month 7: Programming Paper Craft
    - Weeks 25-26: Skeleton Programs and Pre-Release Thinking (AQA) and Algorithms Under Time (OCR)
    - Weeks 27-28: The Questions That Separate Answers
    - Month 8: Theory Paper Craft and Project Method
    - Weeks 29-30: Extended Answers on the Theory Paper
    - Weeks 31-32: The Project Method on a Practice Project
    - Month 9: Full Mocks and Final Review
    - Weeks 33-34: Back-to-Back Mocks
    - Weeks 35-36: Final Review and Next Steps

Projects students build: A unit converter with validated input, written as small tested subroutines; A quiz engine that reads its questions from a file and saves scores back; A small library system with a class hierarchy and a class diagram; Adapt and extend a 300-line practice program of our own in three requested ways; A base-conversion and two's complement checker in Python; A run-length encoder and decoder, with a written comparison of compression methods; Implement a stack, a queue and a binary search tree as Python classes with tests; A sorting race: time four sorts on growing lists and explain the results with Big O; Code a finite state machine in Python that validates a postcode-style pattern; Write and trace a short assembly-style program in an online simulator; A small client-server message program in Python on one machine; Design a normalised database for a club and query it with SQL from Python; A full mock of the programming paper for the student's board, written by us; A personal answer bank: ten of your own corrected answers to hard question types; A set of model extended answers written by the student and improved after feedback - plus 3 more on the course page.

A Level Further Maths: Core Pure and Applied Options

`/courses/a-level-further-maths-course` · 18 months (72 weeks), taught alongside A Level Maths · Year 12 and 13 students (or equivalent) taking Further Maths with AQA, Edexcel or OCR

- PHASE 1: Core Pure, First Year (Months 1-5, Weeks 1-20) The compulsory core every board examines, taught to AS depth. Each topic is introduced after the A level Maths skill it needs, and proof is practised from the first fortnight.
  - Month 1: Proof and Series
  - Weeks 1-2: Diagnostic and Proof by Induction
  - Weeks 3-4: Standard Series and the Method of Differences
  - Month 2: Complex Numbers
  - Weeks 5-6: Complex Arithmetic and the Argand Diagram
  - Weeks 7-8: Loci and Regions
  - Month 3: Matrices
  - Weeks 9-10: Matrix Algebra and Transformations
  - Weeks 11-12: Determinants, Inverses and Linear Systems
  - Month 4: Roots of Polynomials and Rational Functions
  - Weeks 13-14: Roots of Polynomials
  - Weeks 15-16: Curve Sketching and Inequalities
  - Month 5: Vectors and First Further Calculus
  - Weeks 17-18: Lines and Planes in Three Dimensions
  - Weeks 19-20: Volumes of Revolution and Mean Values
- PHASE 2: Applied Option One (Months 6-9, Weeks 21-36) The first of the options your board and centre have chosen. The topics below show the mechanics route; statistics, decision or discrete students follow the same timetable with their own option content.
  - Month 6: Momentum and Impulse
  - Weeks 21-22: Momentum, Impulse and Collisions
  - Weeks 23-24: Successive Collisions and Impulse in Two Dimensions
  - Month 7: Work, Energy and Power
  - Weeks 25-26: Work, Energy and Power
  - Weeks 27-28: Elastic Strings and Springs
  - Month 8: Circular Motion and Dimensional Analysis
  - Weeks 29-30: Horizontal and Vertical Circular Motion
  - Weeks 31-32: Dimensional Analysis and Modelling
  - Month 9: AS Checkpoint
  - Weeks 33-34: Consolidation of Core and Option
  - Weeks 35-36: AS-Standard Mock
- PHASE 3: Core Pure, Second Year (Months 10-14, Weeks 37-56) The A level half of the core, where the subject becomes recognisably university mathematics: de Moivre, further calculus, polar curves, hyperbolic functions and differential equations.
  - Month 10: Further Complex Numbers
  - Weeks 37-38: Exponential Form and de Moivre's Theorem
  - Weeks 39-40: Roots of Unity and Complex Roots
  - Month 11: Further Calculus and Series
  - Weeks 41-42: Improper Integrals and Inverse Trigonometric Functions

    - Weeks 43-44: Maclaurin Series
    - Month 12: Polar Coordinates and Hyperbolic Functions
    - Weeks 45-46: Polar Coordinates
    - Weeks 47-48: Hyperbolic Functions
    - Month 13: Differential Equations
    - Weeks 49-50: First and Second Order Differential Equations
    - Weeks 51-52: Modelling with Differential Equations
    - Month 14: Core Pure Consolidation
    - Weeks 53-54: Mixed Core Pure Problems
    - Weeks 55-56: Core Pure Mock
- PHASE 4: Applied Option Two and Option Depth (Months 15-16, Weeks 57-64) The second option, taught at the depth your board sets, and the first option extended to full A level standard. Students on a further pure route take their extra pure option here.
    - Month 15: Second Option
    - Weeks 57-58: Second Option Foundations
    - Weeks 59-60: Second Option Applications
    - Month 16: Both Options at Full Depth
    - Weeks 61-62: First Option to A Level Depth
    - Weeks 63-64: Options Mock
- PHASE 5: Revision and the Past-Paper Cycle (Months 17-18, Weeks 65-72) No new content. Structured revision by strand, then full past papers under real timing for your board, marked against official schemes.
    - Month 17: Structured Revision
    - Weeks 65-66: Core Pure Revision by Strand
    - Weeks 67-68: Option Revision by Strand
    - Month 18: Past Papers Under Timing
    - Weeks 69-70: Full Past Papers, Core
    - Weeks 71-72: Full Past Papers, Options and Final Review

Projects students build: Proof portfolio opened: six induction proofs written to exam standard and checked line by line; Question bank entry: 15 solved series questions, each checked by a second method; Complex number reference sheet built by the student, with one worked example per rule; Locus atlas: eight annotated sketches of standard loci and combined regions; Transformation catalogue: each standard 2 by 2 matrix with its effect drawn on the unit square; Three-planes casebook: every arrangement of three planes, with a system that produces it; Question bank entry: 12 roots questions solved two ways, by sums of roots and by substitution; Graph file: ten sketches with asymptotes, intercepts and turning points labelled; 3D geometry sheet: every distance and angle method on one page with a worked example; Modelling task: the volume of a real container estimated by a volume of revolution and compared with its label; Collision file: worked solutions for every collision type, with a diagram for each; Question bank entry: 10 multi-stage collision problems with the decision points marked; Energy method sheet: when to use energy and when to use Newton's second law; Modelling task: a bungee jump modelled with energy methods and its assumptions criticised; Circular motion casebook: six standard set-ups with force diagrams - plus 21 more on the course page.

A-Level Maths: Pure, Mechanics, Statistics (Edexcel/AQA)

`/courses/a-level-maths-course-pure-mechanics-statistics` · 18 months (72 weeks), joinable any month · A-Level students (Years 12-13 or equivalent), Edexcel, AQA and OCR

- PHASE 1: AS Pure Mathematics (Months 1-5, Weeks 1-20) The pure core that every later topic stands on: algebra done properly, coordinate geometry, trigonometry, exponentials and logarithms, and the first calculus. Roughly two thirds of the A-Level is pure mathematics, and it starts here.
  - Month 1: Algebra Foundations
  - Weeks 1-2: Indices, Surds and Quadratics
  - Weeks 3-4: Simultaneous Equations, Inequalities and First Proof
  - Month 2: Polynomials, Graphs and Coordinate Geometry
  - Weeks 5-6: Polynomials and Curve Sketching
  - Weeks 7-8: Straight Lines and Circles
  - Month 3: Binomial Expansion and Trigonometry
  - Weeks 9-10: The Binomial Expansion
  - Weeks 11-12: Trigonometry: Ratios, Identities and Equations
  - Month 4: Exponentials, Logarithms and First Calculus
  - Weeks 13-14: Exponentials and Logarithms
  - Weeks 15-16: Differentiation from First Principles
  - Month 5: Integration, Vectors and the AS Pure Finish
  - Weeks 17-18: Integration
  - Weeks 19-20: Vectors in Two Dimensions
- PHASE 2: AS Statistics and Mechanics (Months 6-9, Weeks 21-36) The applied third of the qualification begins: statistics with the board's large data set, probability and hypothesis testing, then mechanics from kinematics to Newton's laws. The phase closes with a full AS-standard mock.
  - Month 6: Sampling, Data and the Large Data Set
  - Weeks 21-22: Sampling and Data Presentation
  - Weeks 23-24: Location, Spread and Interpretation
  - Month 7: Probability, the Binomial and Hypothesis Testing
  - Weeks 25-26: Probability and the Binomial Distribution
  - Weeks 27-28: Hypothesis Testing with the Binomial
  - Month 8: Mechanics: Modelling and Motion
  - Weeks 29-30: Modelling and Kinematics
  - Weeks 31-32: Variable Acceleration
  - Month 9: Forces, Newton's Laws and the AS Checkpoint
  - Weeks 33-34: Forces and Newton's Laws
  - Weeks 35-36: AS Consolidation and Mock
- PHASE 3: A2 Pure Mathematics (Months 10-14, Weeks 37-56) The second-year pure content where most A-Level grades are decided: functions, series, the full trig toolkit, parametrics, advanced calculus, numerical methods and 3D vectors.
  - Month 10: Proof, Fractions and Functions
  - Weeks 37-38: Proof by Contradiction and Partial Fractions
  - Weeks 39-40: Functions and the Modulus
  - Month 11: Sequences, Series and Radian Trigonometry
  - Weeks 41-42: Sequences and Series
  - Weeks 43-44: Radians, Sectors and New Trig Functions
  - Month 12: The Full Trig Toolkit and Parametric Equations

    - Weeks 45-46: Compound Angles and the R Form
    - Weeks 47-48: Parametric Equations
    - Month 13: Advanced Differentiation and Integration
    - Weeks 49-50: Differentiation Methods
    - Weeks 51-52: Integration Methods
    - Month 14: Numerical Methods, 3D Vectors and the General Binomial
    - Weeks 53-54: Numerical Methods
    - Weeks 55-56: 3D Vectors and the Binomial for Any Power
- PHASE 4: A2 Statistics and Mechanics (Months 15-16, Weeks 57-64) The second-year applied content: conditional probability, the normal distribution and its hypothesis tests, then resolving forces, friction, moments and projectiles.
    - Month 15: The Normal Distribution and Hypothesis Tests
    - Weeks 57-58: Conditional Probability and the Normal Distribution
    - Weeks 59-60: Testing Means and Correlation
    - Month 16: Resolving Forces, Friction, Moments and Projectiles
    - Weeks 61-62: Resolving Forces and Friction
    - Weeks 63-64: Moments and Projectiles
- PHASE 5: Revision and the Past-Paper Cycle (Months 17-18, Weeks 65-72) No new content, on purpose. Structured revision by strand, then full past papers under real 2-hour timing, matched to your board's paper structure and marked against official schemes.
    - Month 17: Structured Revision
    - Weeks 65-66: Pure Revision by Strand
    - Weeks 67-68: Applied Revision and Board Alignment
    - Month 18: The Past-Paper Cycle
    - Weeks 69-70: Papers Under Real Timing
    - Weeks 71-72: Final Mocks and Exam Craft

Projects students build: Question bank entry: 15 solved exam-style questions on indices, surds and quadratics, written to full method standard; Proof portfolio opened: four short proofs written out to exam standard, checked line by line; Sketching sheet: 10 polynomial and reciprocal curves sketched with intercepts, turning behaviour and asymptotes labelled; Question bank entry: 12 solved coordinate geometry questions, including one full circle-tangent problem; Question bank entry: 10 solved binomial questions, including two find-the-coefficient problems worked two ways; Solution-count drill: 12 trig equations where the number of solutions in the interval is predicted before solving; Modelling write-up: one exponential growth or decay problem solved and interpreted in three or four written sentences; First-principles proof: the derivative of x squared and x cubed derived and written out to exam standard; Area problem set: 8 shaded-region questions where the region is sketched and decomposed before any integration; Question bank entry: 10 solved vector problems including two geometric proofs; Large data set field notes: a one-page profile of your board's data set in your own words, variables, units and quirks included; Comparison write-up: two groups from the large data set compared on location and spread, in four marked sentences; Model-check drill: 8 scenarios judged binomial or not, with the failing condition named each time; Question bank entry: 8 full hypothesis tests written to exam standard, conclusions in context every time; Graph story set: 6 motion graphs translated into written descriptions of the trip and back again - plus 21 more on the course page.

Abacus & Mental Maths for Kids: From First Beads to Anzan

`/courses/abacus-mental-maths-course-for-kids` · 8 months (32 weeks) · Ages 5 to 10, no prior maths needed beyond counting

- PHASE 1: Bead Basics and Number Sense (Months 1-2, Weeks 1-8) The abacus in hand: setting and reading numbers, place value on the rods, and the small-friend pairs that make 5. Everything later stands on the fluency built here.
  - Month 1: Meeting the Abacus
  - Weeks 1-2: Beads, Fingers and First Numbers
  - Weeks 3-4: Tens, Place Value and First Sums
  - Month 2: Small Friends, the Pairs That Make 5
  - Weeks 5-6: Adding with Small Friends
  - Weeks 7-8: Subtracting with Small Friends
- PHASE 2: Crossing the Tens (Months 3-4, Weeks 9-16) Big friends, the pairs that make 10, open up sums that cross rods: carrying, borrowing, three-digit numbers and dictation at growing speed.
  - Month 3: Big Friends, the Pairs That Make 10
  - Weeks 9-10: Adding Over Ten
  - Weeks 11-12: Subtracting Across Ten
  - Month 4: Combined Moves and Three-Digit Numbers
  - Weeks 13-14: When Both Friends Work Together
  - Weeks 15-16: Three Digits and Real-Life Numbers
- PHASE 3: Anzan, the Abacus in the Head (Months 5-6, Weeks 17-24) The step this whole course points at: the physical abacus is set aside and the child moves imaginary beads. Rows start tiny and grow week by week.
  - Month 5: Picture the Beads
  - Weeks 17-18: First Imaginary Beads
  - Weeks 19-20: Flash Numbers and Longer Pictures
  - Month 6: Mental Rows That Grow
  - Weeks 21-22: Five-Number Rows and Listening Sums
  - Weeks 23-24: Level Test One, Fully Mental
- PHASE 4: Multiplication and the Mental-Only Capstone (Months 7-8, Weeks 25-32) Multiplication arrives on the abacus once addition is second nature, and the course closes with longer mental rows and a graded test done entirely in the head.
  - Month 7: Multiplication on the Abacus
  - Weeks 25-26: Tables Meet the Beads
  - Weeks 27-28: The Harder Tables
  - Month 8: The Mental-Only Capstone
  - Weeks 29-30: Longer, Faster, Still Accurate
  - Weeks 31-32: The Graded Mental Test and Family Show

Projects students build: My abacus card: the child draws bead pictures for the numbers 1 to 9 and reads them back from the drawing; Two-digit dictation sheet: 20 numbers set from hearing alone, scored and kept as the month 1 record; Make-5 rainbow chart: the child's own picture of the pairs that make 5, used at home during practice; Row book started: a notebook of daily rows with date and score, kept for the rest of the course; Make-10 rainbow chart to sit beside the make-5 chart at home; Mixed-rules row sheet: 15 rows solved and marked with which friend rule each step used; Speed ladder record: one row sheet attempted three times with times and scores charted by the child; Shop game record: a pretend-shop worksheet of five purchases totalled and checked on the abacus; Eyes-closed challenge card: ten single-number settings done mentally and verified, signed off in class; Flash round scorecard: three class flash rounds with scores tracked by the child; Listening log: ten dictated mental rows across the fortnight with scores and row lengths recorded; Level test one: a graded mental-only paper of rows, flash and listening sums, marked and kept; Table pattern cards: bead-

picture cards for the 2, 3, 4 and 5 tables made by the child; Mixed paper folder: three 20-question mixed papers completed, marked and filed across the fortnight; Row book review page: the child charts their own week 8 versus week 30 row length and speed - plus 2 more on the course page.

ACT Math Prep: Live Classes for the ACT Mathematics Section

`/courses/act-math-prep-course` · 5 months (20 weeks) · Grades 9-12 (ages 14 to 18), all starting scores

- PHASE 1: Diagnostic and Integrating Essential Skills (Weeks 1-6) Find the starting point, learn how the section works, and secure the multi-step essential skills questions that appear throughout the test.
  - Weeks 1-2: Diagnostic and How ACT Math Works
  - Weeks 3-4: Rates, Percentages and Proportional Reasoning
  - Weeks 5-6: Area, Volume, Averages and Number Forms
- PHASE 2: Preparing for Higher Math (Weeks 7-16) The categories that make up most of the section, taught in the order they build on each other: number, algebra, functions, geometry, then statistics and probability.
  - Weeks 7-8: Number and Quantity
  - Weeks 9-10: Algebra
  - Weeks 11-12: Functions
  - Weeks 13-14: Geometry and Trigonometry
  - Weeks 15-16: Statistics and Probability
- PHASE 3: Modeling and Test Craft (Weeks 17-20) Knowledge becomes a repeatable score: modeling questions, calculator workflows, pacing under real timing, and full timed sections with honest review.
  - Weeks 17-18: Modeling, Calculators and Pacing
  - Weeks 19-20: Full Timed Sections and Test Week

Projects students build: Personal diagnostic report: score by category, top three content gaps and a starting pacing target; Error log opened with every diagnostic miss classified and corrected; Word problem translation sheet: twenty phrasings mapped to the equation each one means; Timed essential skills set with every step written out for review; Formula and method sheet written by the student, with one worked example per idea; Mixed essential skills timed set reviewed question by question; Exponent and radical rule card built from worked examples; Number and Quantity timed set with errors classified in the log; Algebra method map: which method to reach for first for each equation type; Two timed algebra sets, the second solved with a calculator check strategy; Function family gallery: a sketch, an equation and a key feature for each family; Functions timed set with a graph-first solution for every miss; Geometry recognition sheet: diagrams that signal similar triangles, special right triangles or circle facts; Geometry timed set reviewed for drawing and labelling habits; Statistics vocabulary and method sheet with one example of each idea - plus 5 more on the course page.

Advanced Git & GitHub Masterclass for Professionals

`/courses/git-github-advanced-version-control-masterclass-for-professionals` · 24 classes (12 weeks · 2 classes/week) · Intermediate to advanced (working professionals; basic Git assumed or fast-tracked)

- Phase 1: The Git Mental Model Learn how Git actually works underneath: the object database, refs and HEAD, the staging area, and the plumbing commands that make every advanced operation predictable instead of scary.
  - Class 1: How Git Actually Stores Data: The Object Model
  - Class 2: Refs, HEAD, Detached HEAD and the Three Trees
  - Class 3: Porcelain vs Plumbing and the Staging Area Deep Dive
  - Class 4: Config Layers, Aliases and Diff/Merge Tooling
- Phase 2: History Mastery Rewrite, rescue, and interrogate history with confidence: interactive rebase, cherry-pick and revert, reflog and stash recovery, automated bisect, and blame and pickaxe archaeology.
  - Class 5: Interactive Rebase: Rewriting History with Intent

    - Class 6: Cherry-pick, Revert and Fixing Shared History
    - Class 7: Reflog Rescues, Lost Commits and Stash Mastery
    - Class 8: git bisect: Finding the Exact Commit That Broke It
    - Class 9: History Archaeology: blame, Pickaxe and Log Forensics
- Phase 3: Team Workflows at Scale Design how a whole team uses Git: pick the right branching strategy, enforce it with protection rules and CODEOWNERS, build a PR culture that scales, tame big repositories, and run professional releases.
    - Class 10: Branching Strategies: Trunk-Based vs GitFlow vs GitHub Flow
    - Class 11: Branch Protection, Rulesets and CODEOWNERS
    - Class 12: Pull Request Culture That Scales
    - Class 13: Monorepos, Submodules and Scaling Big Repositories
    - Class 14: Release Management: Tags, SemVer and Changelogs
- Phase 4: Automation, CI/CD & Security Automate everything and lock it down: GitHub Actions from fundamentals to reusable workflows, secret management and gated deployments, supply chain security, signed commits, hooks, and GitHub CLI scripting.
    - Class 15: GitHub Actions: The Core Model
    - Class 16: Advanced Actions: Matrix Builds, Caching and Reusable Workflows
    - Class 17: Secrets, Environments and Deployment Pipelines
    - Class 18: Supply Chain Security: Dependabot, Secret Scanning and CodeQL
    - Class 19: Signed Commits, 2FA, Hooks and the pre-commit Framework
    - Class 20: GitHub CLI (gh) and API Automation
- Phase 5: Leadership & Capstone Operate at the level teams depend on: migrate an organization to GitHub, recover from disasters and leaked secrets, run AI-assisted review workflows responsibly, and ship a capstone workflow you can defend.
    - Class 21: Migrating a Team to GitHub and Teaching Git Well
    - Class 22: Disaster Recovery: filter-repo, Leaked Secrets and Corrupt Repos
    - Class 23: AI-Assisted Git Workflows: Copilot and Coding Agents
    - Class 24: Capstone: Design a Complete Team Workflow + Certification

Projects students build: Trace one of your own commits end to end with git cat-file: from the commit SHA to the root tree to a specific blob, and diagram the object graph you found; Build a personal reset cheat card: run soft, mixed, and hard resets on a scratch repository and document exactly what happened to HEAD, index, and working tree in each case; Create a real commit using only plumbing commands (update-index, write-tree, commit-tree), then verify it with git log and git cat-file; Ship a dotfiles-quality global .gitconfig: identities via includeIf, five aliases you will actually use, zdiff3 conflict style, rerere enabled, and a configured mergetool; Take a deliberately messy 10-commit feature branch and rebase it into 3 clean, logical, test-passing commits using fixup, squash, reword, and an exec test line; Simulate a release: branch release/1.2 from an older commit, cherry-pick two hotfixes onto it with -x, then revert a bad feature merge on main with revert -m 1; Run a rescue drill: deliberately destroy work three different ways (reset --hard, branch -D, dropped stash) and recover all three using reflog and fsck; In a prepared repository with a hidden regression, write a small test script and let git bisect run find the first bad commit completely automatically; Answer three archaeology questions on a real open source repository (when was X introduced, who last changed Y and why, which commit removed Z) using blame, -S, and -G, citing exact SHAs; Write a one-page branching strategy proposal for a team you know: chosen model, merge strategy, branch naming, and the reasoning behind each decision; Configure a demo repository with a full ruleset: required reviews with code owners, required status checks, linear history, and a CODEOWNERS file covering two teams, then prove each rule blocks what it should; Design a complete PR playbook for a repository: template, review checklist, size guidelines, and auto-merge or merge queue settings, then run one real PR through it end to end; Rescue a bloated demo repo: move its binary assets to Git LFS with lfs migrate, set up cone-mode sparse-checkout for one team's directory, and measure

clone size before and after using --filter=blob:none; Run a full release cycle on your own project: conventional commits, cut a release branch, create an annotated signed v1.0.0 tag, publish a GitHub Release with categorized auto-generated notes, then ship a v1.0.1 hotfix; Build a CI workflow from scratch for a small app: lint, test, and build on every pull request, with path filters so documentation-only changes skip CI - plus 9 more on the course page.

AI Agents with Microsoft Copilot Studio for College Students

`/courses/ai-agents-with-microsoft-copilot-studio-course-for-college-students` · 24 classes (12 weeks · 2 classes/week) · Intermediate (college students and early-career, ages 18+; no prior agent experience needed)

- Phase 1: Agent Foundations Understand agents in business terms, tour Microsoft Copilot Studio properly, write instructions that actually steer behaviour, test like a professional, and meet the models and harnesses underneath every agent.
  - Class 1: Agents as a Business Skill, Not a Toy
  - Class 2: Your First Agent, Built Properly
  - Class 3: Instructions at Business Depth
  - Class 4: Testing Like Someone Whose Name Is on It
  - Class 5: Models, Harnesses and What You Are Actually Running On
- Phase 2: Knowledge & Grounding at Business Depth Ground agents in the knowledge sources enterprises actually use: SharePoint, documents, Dataverse and connector-indexed enterprise data, with citations, conflict handling and accuracy audits you publish.
  - Class 6: Grounding vs Guessing, the Business Version
  - Class 7: SharePoint and Documents Done Right
  - Class 8: Dataverse, Enterprise Data and Source Conflicts
  - Class 9: Accuracy Audits, Bias and the Trust Contract
- Phase 3: Conversation & Orchestration Design conversations that hold up under real users: topics and trigger phrases, entities and variables, condition groups, adaptive cards, and a deliberate choice between generative and classic orchestration.
  - Class 10: Topics and Trigger Phrases
  - Class 11: Entities, Variables and Slot Filling
  - Class 12: Condition Groups and Branch Design
  - Class 13: Adaptive Cards and Business-Grade Responses
  - Class 14: Generative Orchestration vs Classic, Chosen Deliberately
- Phase 4: Tools, Automation & Multi-Agent The employability core: connectors and Prompt tools, deterministic agent flows, REST and custom connectors, Model Context Protocol, autonomous event triggers with real security discipline, multi-agent design with A2A, and analytics with agent evaluations.
  - Class 15: The Tool Menu and Connector Library
  - Class 16: Agent Flows: Automation That Runs the Same Every Time
  - Class 17: REST APIs, Custom Connectors and Governance
  - Class 18: Model Context Protocol and Computer Use
  - Class 19: Autonomous Agents: Event Triggers and the Security They Demand
  - Class 20: Multi-Agent Design, Analytics and Evaluations
- Phase 5: Publish, Credentials & Capstone Publish to the channels businesses use, pass a professional pre-flight checklist, then build and defend a business-grade capstone agent, leaving with a mapped Microsoft credential roadmap.
  - Class 21: Channels and the Agent Store

- Class 22: The Pre-Flight Checklist: Security, Cost and Honesty
- Class 23: Capstone Build Week
- Class 24: Demo Day and the Credential Roadmap

Projects students build: Agent teardown, business edition: analyse one real customer-facing agent (bank, airline, university helpdesk), reverse-engineer its probable instructions, knowledge and tools, and write a one-page teardown; Build 'Placement FAQ v1': an agent with hand-written instructions that answers questions about one real company's hiring process in a tone you designed; The Refusal Gauntlet, corporate edition: 10 questions your Placement FAQ agent must refuse or redirect (offer-letter legal advice, personal data, salary speculation), tuned until all 10 are handled gracefully; Build the permanent 15-question test set for Placement FAQ, run it twice in one week, and file the two most instructive failures with root causes; Model comparison memo: run your full Placement FAQ test set on two available models and write a one-page recommendation with evidence; Ground Placement FAQ in the target company's public website and prove five answers now carry citations a recruiter could check; Build 'Society Desk': an agent for a real college society grounded in a clean 3-document knowledge pack you author, with a 10-question proof test; Build a two-source Internship Tracker knowledge base (structured table plus policy document) and document exactly how the agent behaves when they conflict; Publish an accuracy audit of Society Desk: 20 scored answers with cited source paragraphs, an accuracy figure, and the three fixes it demanded; Build 'Fest Helpdesk' with three designed topics for a real event: schedule lookup, registration help and venue directions; Upgrade Internship Tracker: an add-application topic that collects company, role, deadline and status through entities, confirming with a variable-built summary; Rebuild Fest Helpdesk registration as a condition-driven flow: student vs guest vs volunteer paths, each with its own confirmation and an escalation branch; Give Internship Tracker a card-based pipeline view: each application a card with company, role, deadline and a status-update action; Migrate Fest Helpdesk to generative orchestration, rerun the full test set, and file a keep-or-fix verdict on every behaviour change; Add a 'JD decoder' Prompt tool to Placement FAQ: paste any job description, get requirements, keywords and preparation gaps in a fixed format - plus 9 more on the course page.

AI Agents with Microsoft Copilot Studio for Teens

`/courses/ai-agents-with-microsoft-copilot-studio-course-for-teens` · 24 classes (12 weeks · 2 classes/week) · Beginner (ages 13-18; no coding experience needed)

- Phase 1: Your First Agents Understand what an AI agent actually is, tour Microsoft Copilot Studio, build your first agent from a plain-English description, and learn how instructions and testing really work.
  - Class 1: What an AI Agent Really Is (and What It Is Not)
  - Class 2: Your First Agent in One Hour
  - Class 3: Instructions That Actually Steer Behaviour
  - Class 4: Testing Like a Professional
  - Class 5: How the Platform Thinks: Environments, Models and Harnesses
- Phase 2: Knowledge & Grounding Give your agent real knowledge: websites, documents and SharePoint sources, citations users can check, and the discipline of grounding answers instead of guessing.
  - Class 6: Grounding vs Guessing
  - Class 7: Document Knowledge Done Right
  - Class 8: Multi-Source Knowledge and Conflicts
  - Class 9: Honest Agents: Accuracy, Bias and Boundaries
- Phase 3: Conversation Design Design conversations deliberately: topics and trigger phrases, questions and variables, condition logic, adaptive cards, and the two orchestration modes that decide how your agent thinks.
  - Class 10: Topics and Trigger Phrases
  - Class 11: Questions, Entities and Variables
  - Class 12: Condition Logic and Branching
  - Class 13: Adaptive Cards and Rich Responses

    - Class 14: Generative Orchestration vs Classic
- Phase 4: Tools & Autonomy Make your agent act: connectors and Prompt tools, agent flows for multi-step work, a first look at Model Context Protocol, then event triggers and a fully autonomous agent with analytics to prove it works.
    - Class 15: Tools: Giving Your Agent Hands
    - Class 16: Agent Flows: Multi-Step Work That Always Runs the Same
    - Class 17: Connecting to the Real World: Connectors, REST and MCP
    - Class 18: Event Triggers: Agents That Wake Up by Themselves
    - Class 19: Your Autonomous Agent, Hardened
    - Class 20: Analytics: Proving Your Agent Works
- Phase 5: Publish & Capstone Publish agents to real channels, pass a safety and quality checklist, then design, build, test and present a capstone agent that does a real job for real people.
    - Class 21: Channels: Where Agents Live
    - Class 22: The Pre-Flight Checklist: Safety, Quality, Honesty
    - Class 23: Capstone Build Week
    - Class 24: Demo Day and What Comes Next

Projects students build: Agent safari: analyse two real agents you have used (a support bot, a game helper), map what their instructions and knowledge must look like, and write a one-page teardown; Build 'Study Buddy v1': an agent with instructions for your real timetable and subjects that answers revision questions in a tone you designed; The Refusal Gauntlet: write 10 questions your Study Buddy must refuse or redirect, then tune instructions until all 10 are handled gracefully; Build your permanent 15-question test set for Study Buddy, with expected behaviour written down before you run it; Draw the journey of one question through your agent: user, harness, instructions, model, answer, and label the parts you control; Ground Study Buddy in one real source (your school's public website or a subject site) and prove three answers now cite it; Create a clean 3-document knowledge pack from your own class notes and ground a Revision Coach agent in it, with a 10-question proof test; Build 'Club Desk': an agent for a real club or activity grounded in two sources, with documented behaviour when sources conflict; Accuracy audit: score 20 answers from Revision Coach against the actual source paragraphs and publish your agent's accuracy number with examples; Build a 'Homework Planner' agent with three hand-designed topics: add a task, list this week, and what should I do first; Upgrade Homework Planner: the add-a-task topic now collects subject, due date and effort through entities and confirms with a summary using variables; Build 'Event Helper' for a real school or family event: RSVP path, question path, and organiser-escalation path, all condition-driven; Give Homework Planner a card-based weekly view: each task a card with subject, due date and a 'mark done' action; Switch Event Helper to generative orchestration, rerun your full test set, and document every behaviour change with a keep-or-fix verdict; Add a 'flashcard maker' Prompt tool to Revision Coach: paste messy notes, get clean question-answer pairs, every time - plus 9 more on the course page.

AI and Machine Learning for Teens: Python to Real Models

`/courses/ai-ml-masterclass-teens` · 10-12 months (40-48 weeks) · Beginner friendly, ages 13 to 18; school maths is enough to start

- PHASE 1: Python and First Models (Months 1-3, Weeks 1-12) The data stack from zero, Python through pandas, then the moment it all changes: the first real machine learning model, trained and honestly evaluated.
    - Month 1: Python for AI
    - Introduction to AI & Python Setup
    - Python Data Structures & Control Flow
    - Month 2: The Data Stack
    - NumPy & Mathematical Foundations
    - Pandas & Data Manipulation
    - Month 3: First Machine Learning

    - Introduction to Machine Learning
    - Classification Algorithms
- PHASE 2: Core Machine Learning (Months 4-6, Weeks 13-24) The full classical toolkit, regression to clustering, then neural networks built from a single neuron to real deep learning, with data preparation as a discipline.
    - Month 4: Prediction and Patterns
    - Regression & Prediction
    - Unsupervised Learning
    - Month 5: Neural Networks
    - Advanced ML: Ensembles and Model Craft
    - Introduction to Neural Networks
    - Month 6: Deep Learning Fundamentals
    - Deep Learning Fundamentals
    - Data Preparation and Augmentation
- PHASE 3: Machines That See and Read (Months 7-8, Weeks 25-32) The two great applied fields at teen-buildable depth: convolutional networks and computer vision projects, then NLP and the transformer idea that changed everything.
    - Month 7: Computer Vision
    - Convolutional Neural Networks (CNNs)
    - Advanced Computer Vision
    - Month 8: Language
    - Natural Language Processing Basics
    - Transformers and Modern NLP
- PHASE 4: Modern AI and the Capstone (Months 9-10, Weeks 33-40) Generative AI understood from the inside and used safely, ethics that actually bites, an AI product built end to end, and the final exam at demo day.
    - Month 9: The Generative Layer
    - Generative AI from the Inside
    - AI Ethics and Honest Evaluation
    - Month 10: Build, Ship, Defend
    - AI Product Week
    - Final Capstone Build
    - Demo Day and What Comes Next

Projects students build: Setup complete AI development environment; Rule-based chatbot (like early Siri); Simple recommendation system using rules; AI decision tree for game choices; Student grade predictor system; Text-based adventure game with AI NPCs; Data analyzer for social media stats; Simple expert system for diagnosis; Grade distribution analyzer; Dice probability simulator; Image manipulation with arrays; Statistical analysis dashboard; YouTube channel analytics tool; Sports statistics analyzer; Weather pattern explorer - plus 60 more on the course page.

AI and ML Masterclass: Python, Deep Learning and GenAI

`/courses/ai-ml-masterclass-complete-college` · 12-14 months (48-56 weeks) · Complete beginner (18+); school maths refreshed, everything else built here

- PHASE 1: Mathematics, Python and Data (Months 1-3, Weeks 1-12) The load-bearing floor: linear algebra, calculus intuition, probability and statistics, built alongside Python and real exploratory data work.
    - Month 1: The Mathematical Core I

- Mathematics Prerequisites & Linear Algebra - Part 1
- Linear Algebra - Part 2 & Calculus Fundamentals
- Month 2: Probability, Statistics and Python
- Probability & Statistics - Part 1
- Statistics - Part 2 & Python for ML
- Month 3: The Data Stack
- Advanced NumPy & Pandas
- Data Visualization & EDA

- PHASE 2: Classical Machine Learning (Months 4-6, Weeks 13-24) The working core of applied ML: scikit-learn end to end, feature craft, unsupervised methods, ensembles, and evaluation as a discipline.
  - Month 4: First Models Done Right
  - Introduction to Machine Learning
  - Classification Algorithms - Part 1
  - Month 5: Feature Craft and Structure
  - Feature Engineering & Preprocessing
  - Unsupervised Learning
  - Month 6: Ensembles, Evaluation and the Phase Capstone
  - Model Evaluation & Validation
  - Phase 2 Capstone
- PHASE 3: Deep Learning with PyTorch (Months 7-9, Weeks 25-36) The modern engine room: PyTorch fluency, convolutional networks and real computer vision, NLP through the transformer.
  - Month 7: Into Deep Learning
  - Introduction to Deep Learning
  - PyTorch in Depth
  - Month 8: Computer Vision
  - Convolutional Neural Networks (CNN)
  - Advanced Computer Vision
  - Month 9: Language and Transformers
  - Natural Language Processing (NLP) - Part 1
  - Advanced NLP and the Transformer
- PHASE 4: Generative AI, Shipping and the Capstone (Months 10-12, Weeks 37-48) The modern layer done properly: LLM engineering and retrieval, deployment and monitoring fundamentals, responsible AI, interview craft, and the defended capstone.
  - Month 10: Generative AI and LLM Engineering
  - LLM Engineering
  - Deployment and Experiment Tracking
  - Month 11: Production Habits and Responsible AI
  - MLOps Fundamentals, Honestly Scoped
  - Responsible AI and Explainability
  - Month 12: Capstone, Interviews and the Final Exam
  - Capstone Build
  - ML Interview Craft
  - Demo Day and the Final Exam

Projects students build: Vector operations visualizer; Matrix calculator implementation; Linear equation solver; Geometric transformations with matrices; PCA implementation from scratch; Image compression using SVD; Gradient descent visualizer; Function optimizer using calculus; Probability calculator; Distribution visualizer; Bayes theorem applications; Monte Carlo simulations; Statistical analysis tool; Hypothesis testing framework; A/B testing simulator - plus 112 more on the course page.

AI Literacy for Kids (Ages 8 to 14): Understand AI, Do Not Just Use It

`/courses/ai-literacy-for-kids-course` · 4 months (16 weeks), joinable any month · Ages 8 to 14; no prior coding required, everything is taught from scratch

- PHASE 1: What AI Is, and How a Machine Learns The foundations, taught with hands-on activities rather than definitions to memorise.
  - Month 1: Machines, Rules and Learning
  - What Is Artificial Intelligence, Really
  - Teaching a Machine by Example
  - Training Your First Real Model
  - Patterns, Data and Prediction
- PHASE 2: Where AI Goes Wrong, and How to Judge It The critical-thinking half, which is the part that actually protects a child.
  - Month 2: Bias, Hallucination and Judging Answers
  - Where the Data Comes From
  - When AI Makes Things Up
  - Using AI Honestly for Schoolwork
  - Staying Safe and Private
- PHASE 3: Building Something Real and Explaining It Children apply everything to a project of their own and learn to present it clearly.
  - Month 3: Simple AI Projects
  - Block Coding Meets AI
  - Designing a Project That Helps Someone
  - Building the Capstone
  - Presenting and Explaining

Projects students build: An AI spotting hunt: find five AI systems you used this week and explain what each one decides; Train a classmate as if they were a machine: give only examples, no rules, then test them; Train an image or sound classifier on your own examples and demonstrate it to the class; Predict outcomes from a small dataset by hand, then compare with the model's prediction; Deliberately train a model on lopsided data, then show the class exactly how it fails; Fact-check a set of teacher-provided AI answers and mark which are wrong and why; Take one homework-style problem, use AI only for hints, and explain the solution back unaided; Write a family AI agreement: what is allowed, what is not, and who to ask; Build a block-coded project that responds to your trained model's predictions; Write a one-page plan for your capstone: the person, the problem, the data, the plan; Build your working capstone project; Present your capstone to the class and to your parents.

AI Tools Course for Teens (13+): Prompting to Real Projects

`/courses/teens-ai-tools-mastery-course` · 4-5 months (16-20 weeks) · Complete beginner, ages 13 to 18

- Month 1: AI Foundations and Prompt Craft How AI actually works, ChatGPT used properly with a parent-approved account, and prompting practiced as a real skill.
  - Introduction to AI World

    - ChatGPT Fundamentals
    - Prompt Engineering Basics
    - Advanced ChatGPT Techniques
- Month 2: Creative AI, Done Legally AI art and image editing with tools that genuinely permit teens, plus the copyright and ethics questions creative AI raises.
    - Introduction to AI Art
    - Image Generation with Teen-Legal Tools
    - Adobe Firefly, Canva AI and Advanced Art
    - AI Photo Editing and Manipulation
- Month 3: AI for Media and School Music, audio and video tools at teen-appropriate levels, then the serious part: AI as a study partner used ethically.
    - AI Music and Audio
    - AI Video and Animation
    - AI Study Assistants, Used Ethically
    - AI Research and Writing Tools
- Month 4: The Builder's Month and the Final Exam The step from user to builder: coding assistants, training your own models, the ethics that govern it all, and the capstone exam.
    - AI Coding Assistants
    - Train Your Own Models
    - AI Safety, Ethics and the Future
    - Capstone, Demo Day and the Final Exam

Projects students build: My First AI Conversation; AI vs Human: Comparison chart; Draw AI's journey timeline; Play and analyze AI games; Interview ChatGPT about its capabilities; Create a story with ChatGPT; Get homework help (with citations); Plan a birthday party with AI; Create prompt template library; Before/After prompt improvements; Prompt engineering challenge; Build custom AI assistant personality; Create personalized study assistant; Build interactive quiz game; Research project on favorite topic - plus 44 more on the course page.

AI Tools Mastery Course: ChatGPT, Claude & Automation

`/courses/ai-tools-mastery-complete-college` · 5-6 months (22-26 weeks) · Complete beginner (18+); college students, graduates and working professionals

- PHASE 1: AI Foundations and Prompt Engineering (Weeks 1-6) Master ChatGPT, prompt engineering, AI writing tools, and conversational AI applications.
    - ChatGPT & Prompt Engineering Excellence
    - Introduction to AI Tools & ChatGPT Basics
    - Advanced Prompt Engineering
    - ChatGPT for Content Creation & Writing
    - ChatGPT for Business & Productivity
- PHASE 2: Visual, Creative and Developer AI Tools (Weeks 7-12) Master Claude, Gemini, Midjourney, Stable Diffusion, and all major AI tools for images, video, and audio.
    - Visual AI & Alternative LLMs
    - Claude AI & Google Gemini
    - Midjourney and Image Generation
    - Stable Diffusion & Other Image AI Tools

    - Video & Audio AI Tools
    - Research, Coding and Creative AI Tools
    - AI Research & Knowledge Tools
    - AI Coding & Development Tools
- PHASE 3: AI Automation and Professional Applications (Weeks 13-18) Turn tool fluency into leverage: workflow automation, connecting tools through their APIs, and building AI agents for multi-step work, used responsibly with verification built in.
    - Automation, Agents and Business Applications
    - AI Workflow Automation
    - AI Agents & Advanced Automation
    - AI Integration & API Usage
    - AI Tools for Business and Professional Work
    - Staying Current and Responsible Use
    - Staying Current with AI Tools
    - Ethics, Safety & Responsible AI Use
- PHASE 4: The Finale (Month 5, Weeks 19-23) The capstone month: spec, build, ship and defend, then the final exam that decides the certificate.
    - Month 5: Capstone and the Final Exam
    - Capstone Spec and Setup
    - Capstone Build
    - Ship and Polish
    - Demo Day and the Final Exam

Projects students build: Personal AI assistant setup; Custom instruction templates; Daily productivity workflow with ChatGPT; Meeting notes summarizer; Email response generator; Prompt template library (50+ templates); Industry-specific prompt collections; Complex task automation prompts; Creative writing prompt system; Business analysis prompts; Complete blog writing system; Social media content calendar (30 days); Email sequence (welcome, nurture, sales); E-book outline and chapters; Product descriptions generator - plus 93 more on the course page.

Algebra Foundations: Pre-Algebra & Algebra 1, Live Online

`/courses/algebra-foundations-masterclass` · 12 months (52 weeks) · Grades 7-9, or any student whose algebra base needs a real rebuild

- PHASE 1: Pre-Algebra, The Number System Mastered (Weeks 1-16) Almost every algebra struggle is an arithmetic gap wearing a disguise. This phase rebuilds integers, fractions, decimals and ratios to genuine fluency, then introduces variables so gently they feel obvious.
    - Weeks 1-4: Diagnostic + Integers and the Number Line
    - Weeks 5-10: Fractions and Decimals, Properly This Time
    - Weeks 11-16: Ratios, Percents and the First Variables
- PHASE 2: Equations, Functions and Systems (Weeks 17-36) The heart of Algebra 1. Equations are read as sentences and solved with balance reasoning; linear functions are met as equation, table and graph telling one story; systems make two stories intersect. This is the phase that decides the next five years of math.
    - Weeks 17-22: Equations and Inequalities as Sentences
    - Weeks 23-29: Linear Functions Three Ways
    - Weeks 30-36: Systems of Equations and Inequalities

- PHASE 3: Exponents, Polynomials and Quadratics (Weeks 37-52) The bridge into Algebra 2: exponent rules from meaning, polynomial arithmetic without fear, factoring as detective work and quadratics met as functions with real stories. The course closes with the word-problem and graph craft that turns knowledge into marks.
  - Weeks 37-42: Exponents and Polynomials
  - Weeks 43-48: Factoring and Quadratic Equations
  - Weeks 49-52: Quadratic Functions + the Capstone

Projects students build: Personal gap map for the year ahead; Integer war-stories set: temperature, bank balance and elevation problems; Fraction operation gallery: one worked picture per operation, made by the student; Real-recipe scaling project: fractions doing real work; Best-buy investigation: unit-price reasoning on real products; Phase mastery check: solve, explain and extend, per topic; Equation-sentence dictionary: twenty phrasings, twenty equations; Real-world setups: phone plans, savings goals, break-even problems; Equation-table-graph triptych for three real situations; Data modeling mini-project: fit a line, defend the interpretation; Business break-even case solved all three ways; Powers-of-ten scale tour: notation doing real scientific work; Area-model gallery for polynomial multiplication; Factoring pattern-book, built by the student; Quadratic equation gauntlet: mixed methods under light timing - plus 2 more on the course page.

Algorithmic Trading Course: Strategy, Quant & ML

`/courses/algorithmic-trading-masterclass-complete` · 10-12 months (44-52 weeks) · Complete beginner (18+); college students, graduates and working professionals

- PHASE 1: Financial Markets & Trading Foundations (Months 1-3, Weeks 1-13) Build solid understanding of financial markets, instruments, Python programming, and data analysis for trading.
  - Months 1-2: Markets, Instruments & Python Basics
  - Introduction to Financial Markets
  - Python Programming for Trading - Part 1
  - Financial Data Analysis with Python
  - Technical Analysis Foundations
  - Month 3: Advanced Python & Market Analysis
  - Object-Oriented Programming for Trading Systems
  - Statistical Analysis for Trading
  - Fundamental Analysis & Market Data APIs
- PHASE 2: Trading Strategies & Backtesting (Months 4-6, Weeks 14-26) Master strategy development, backtesting frameworks, optimization, and strategy evaluation.
  - Months 4-5: Strategy Development & Backtesting
  - Backtesting Framework Development
  - Momentum & Trend Following Strategies
  - Mean Reversion & Statistical Arbitrage
  - Breakout & Volatility Strategies
  - Options Trading Strategies (Basics)
  - Month 6: Advanced Strategies & Optimization
  - Strategy Optimization & Parameter Tuning
  - Risk Management & Position Sizing
  - Multi-Asset & Portfolio Strategies
  - Cryptocurrency Trading Strategies

- PHASE 3: Machine Learning & Advanced Quant (Months 7-9, Weeks 27-39) Master machine learning for trading, advanced quantitative strategies, and high-frequency concepts.
  - Months 7-8: Machine Learning for Trading
  - ML Fundamentals for Trading
  - Classification Models for Trading
  - Deep Learning for Trading
  - NLP & Sentiment Analysis for Trading
  - Alternative Data & Quantitative Research
  - Month 9: Advanced Trading Concepts
  - High-Frequency Trading (HFT) Concepts
  - Advanced Options & Derivatives
  - Execution Algorithms & Transaction Cost Analysis
  - Quantitative Portfolio Management
- PHASE 4: The Finale (Month 10, Weeks 40-44) The capstone month: spec, build, ship and defend, then the final exam that decides the certificate.
  - Month 10: Capstone and the Final Exam
  - Capstone Spec and Setup
  - Capstone Build
  - Ship and Polish
  - Demo Day and the Final Exam

Projects students build: Market research on different instruments; Paper trading practice (manual); Order type experiments; Market analysis report; Trading journal setup; Load and explore stock price data; Calculate basic statistics (mean, std, returns); Price data manipulation exercises; Simple moving average calculator; Trading signal generator (basic); Multi-asset data downloader; Returns and volatility analyzer; Correlation matrix for portfolio; Interactive price charts; Market data dashboard - plus 151 more on the course page.

Alpha Girls: Systems at Scale for Senior Women Engineers

`/courses/alpha-girls-elite-tech-mastery` · 9-11 months (36-44 weeks) · Experienced women engineers (roughly 4+ years or Queen Coders graduates)

- PHASE 1: Systems at Scale (Months 1-3, Weeks 1-12) The core discipline: design method under load, data at scale, cloud architecture, reliability and the economics of performance.
  - Month 1: Design Method Under Load
  - System Design at Scale: The Method
  - Cloud Architecture, Judged
  - Month 2: Data and Reliability
  - Data Platforms and Pipelines
  - Reliability Engineering
  - Month 3: Performance Economics and ML Systems
  - Performance at Scale
  - ML Systems in Production
- PHASE 2: Platforms and Production Judgment (Months 4-6, Weeks 13-24) Platform engineering, security and compliance leadership, and the architecture review cycle practiced as craft.
  - Month 4: Platform Engineering
  - Platforms and Developer Experience

    - Security and Compliance Leadership
    - Month 5: The Architecture Review Cycle
    - Architecture Reviews and ADRs
    - Build, Buy or Wait
    - Month 6: The Mid-Course Defense
    - Integration: An AI-Era System at Scale
    - Phase 2 Defense
- PHASE 3: Technical Strategy (Months 7-8, Weeks 25-32) Turning depth into direction: roadmaps, migrations, incident leadership and the influence craft of principal engineers.
    - Month 7: Direction
    - Technical Strategy and Roadmaps
    - Leading Migrations
    - Month 8: Influence
    - Incident Leadership and Hard Weeks
    - Mentoring, Sponsorship and the Room
- PHASE 4: The Finale (Month 9, Weeks 33-36) The redesign capstone: one real system taken from pressure to proposal to panel.
    - Month 9: The Redesign and the Panel
    - Capstone Build: The Redesign Proposal
    - Red Team Week
    - The Final Defense

Projects students build: Design Twitter-scale messaging system; Build Netflix-level video streaming architecture; Create Uber's global dispatch system; Implement Google-scale search infrastructure; Migrate Fortune 500 to cloud (real project); Build multi-cloud platform for enterprise; Design $10M+ cost optimization strategy; Implement global compliance framework; A data platform design for a stated workload, with the decision table shown; An SLO set plus incident runbook for a chosen service; A performance investigation with before/after measurements; Build TikTok-scale recommendation system; Create enterprise fraud detection saving $100M; Implement real-time translation for 50 languages; Design autonomous vehicle ML pipeline - plus 13 more on the course page.

AP Calculus AB & BC Exam Prep, Live Online, Score 5 Goal

`/courses/ap-calculus-exam-prep` · 10 months (40 weeks) · AP Calculus AB and BC students, grades 11-12

- PHASE 1: Limits and Derivatives as Ideas (Weeks 1-14) The diagnostic finds the real starting point, including the precalculus debt, then the two foundational ideas are built properly: the limit as approach, the derivative as instantaneous rate, and the rule toolkit drilled to exam speed only after the ideas hold.
    - Weeks 1-3: Diagnostic + Limits as Approach
    - Weeks 4-8: The Derivative, Discovered Then Drilled
    - Weeks 9-14: Implicit, Inverse and the First Applications
- PHASE 2: Analysis, Integrals and the FTC (Weeks 15-28) Curve analysis makes the derivative a reasoning tool, then the integral arrives as accumulation and the Fundamental Theorem connects the two halves of the course. By the end of this phase the entire AB syllabus is owned.
    - Weeks 15-19: Curve Analysis and Optimization
    - Weeks 20-24: The Integral as Accumulation + the FTC
    - Weeks 25-28: Applications of Integrals + Differential Equations

- PHASE 3: BC Topics + Exam Craft and Mock Cycles (Weeks 29-40) BC students complete series, parametrics and polar; AB students go straight to craft. Then the program becomes an exam machine: FRQ rubric mastery, MCQ pacing, calculator strategy and full mock cycles that peak in the first week of May.
  - Weeks 29-33: BC Extensions (BC track) / Deep Review (AB track)
  - Weeks 34-37: FRQ Rubric Mastery and Calculator Strategy
  - Weeks 38-40: Full Mock Cycles and Peak Week

Projects students build: Personal error log and gap map for the whole year; Limit-evaluation toolkit sheet, built not copied; Shrinking-interval investigation: one data table to both core ideas; Timed derivative gauntlet at exam pace, reviewed for error patterns; Related-rates case set: five classic setups from picture to answer; Phase checkpoint: timed AB-style mixed section with full review; Full f-f'-f'' graph-relationship FRQ solved and self-graded on the rubric; Optimization mini-case portfolio: fence, box, cost, distance; Riemann-to-FTC investigation: watching sums converge; Accumulation FRQ set against real rubrics; Volume gallery: one solid each way, from sketch to setup to answer; AB mock exam number one with documented score; Series convergence decision-tree card, built by the student; Parametric motion mini-case (BC) / AB mixed mock section (AB); Self-graded FRQ portfolio: one of each archetype against real rubrics - plus 3 more on the course page.

AP Computer Science A: Java Programming and Full Exam Prep

`/courses/ap-computer-science-a-java-exam-prep-course` · 6 months (24 weeks) · High school students preparing for AP Computer Science A; taught from Java basics, no prior coding required

- PHASE 1: Java Foundations and Using Objects (Unit 1, Months 1-2, Weeks 1-8) Java built from nothing, then Unit 1 of the redesigned course: using objects and methods, the largest single source of early marks and the base everything else stands on.
  - Month 1: Java From the Ground Up
  - Setup, the Java Program, and Output
  - Primitive Types, Variables, and Expressions
  - Using Objects and the String Class
  - The Math Class and Method Basics
  - Month 2: Unit 1 Depth, Using Objects and Methods
  - Wrapper Classes and Number Handling
  - String Manipulation Deep Dive
  - Designing and Calling Methods
  - Unit 1 Mastery and the Digital Multiple Choice
- PHASE 2: Selection, Iteration and Class Creation (Units 2 and 3, Months 3-4, Weeks 9-16) The logic and loops that drive every program, then writing your own classes, which is exactly what the class-design free-response question demands.
  - Month 3: Selection and Iteration (Unit 2)
  - Boolean Expressions and if Statements
  - Compound Conditions and De Morgan's Laws
  - While and For Loops
  - Nested Loops and String Traversal
  - Month 4: Class Creation (Unit 3)
  - Anatomy of a Class
  - Methods, Encapsulation, and Access
  - Static, Scope, and Designing to a Specification
  - Unit 3 Mastery and the Class-Design Free Response

- PHASE 3: Data Collections and Exam Mastery (Unit 4 and Full Mocks, Months 5-6, Weeks 17-24) Arrays, ArrayList, 2D arrays, files and data sets, then a full turn to exam craft: every free-response type drilled and complete timed digital mock exams.
  - Month 5: Data Collections (Unit 4)
  - One-Dimensional Arrays
  - ArrayList
  - Two-Dimensional Arrays
  - Files, Data Sets, and Recursion Tracing
  - Month 6: Free-Response Mastery and Full Mock Exams
  - Free Response 1 and 2: Methods, Control Structures and Class Design
  - Free Response 3 and 4: ArrayList Data Analysis and 2D Arrays
  - Multiple-Choice Strategy and Full Mock Exam One
  - Full Mock Exam Two and Test-Ready Review

Projects students build: First program: a short Java program that prints a formatted pattern, run and explained line by line; Calculator methods: small programs computing averages, remainders and unit conversions, each predicting integer versus double results first; String toolkit: methods that extract initials, reverse words and search text, using only the AP-tested String methods; Dice and ranges: a program that generates random values in given ranges and verifies the distribution by counting; Number-handling drill: a program that safely parses, compares and formats numeric input, with the precision traps annotated; Text processor: methods that clean, search and transform text, each tested on tricky edge cases like empty and single-character strings; Method decomposition: one larger task solved twice, once as a single long method and once split into helpers, then compared for clarity; First timed multiple-choice block on Unit 1 content, reviewed question by question with each miss tagged by cause; Decision engine: a grading or categorising program driven entirely by conditionals, tested against every boundary value; Condition simplifier: a set of gnarly boolean expressions rewritten in simplest equivalent form and verified by truth table; Loop patterns: programs that sum, count, find and build using loops, each with the iteration count predicted before running; Pattern generator: nested-loop programs that draw shapes and process text grids, with execution counts worked out by hand; First class from scratch: a small class with fields and a constructor, instantiated and exercised from a tester program; Encapsulated class: a class with private fields and a full set of methods, with a test proving the state can only change through methods; Spec-to-class: a complete class built from a behaviour table alone, then checked case by case against that table - plus 9 more on the course page.

AP Computer Science Principles: Create Task and Exam Prep

`/courses/ap-computer-science-principles-exam-prep-course` · 6 months (24 weeks) · High school students preparing for AP Computer Science Principles; beginner-friendly, no prior coding required

- PHASE 1: Creative Development and Programming Foundations (Big Idea 1 and Core of Big Idea 3, Months 1-2, Weeks 1-8) Computational thinking, the core programming building blocks CSP tests, and the habits of incremental development, ending with a planned and approved Create Task idea.
  - Month 1: Computational Thinking and Programming Building Blocks
  - Course Map, Computational Thinking, and What CSP Actually Tests
  - Variables, Data Abstraction, and Expressions
  - Lists and Iteration
  - Selection, Boolean Logic, and Procedures
  - Month 2: Algorithms, Procedural Abstraction, and Planning the Create Task
  - Algorithms: Combining Sequencing, Selection, and Iteration
  - Procedural Abstraction and Parameters
  - The Development Process: Incremental Building, Testing, and Collaboration
  - Choosing and Planning Your Create Task Idea

- PHASE 2: Data, Deeper Algorithms, and Building the Create Task (Big Ideas 2 and 3, Months 3-4, Weeks 9-16) How computers represent and use data, then a return to algorithms with more complex data, while the Create Performance Task itself is planned, built across guided sessions, and finished.
  - Month 3: Data and Information
  - Binary and How Computers Represent Data
  - Data Compression
  - Extracting Information from Data
  - Using Data to Solve Problems and Simulations
  - Month 4: Robust Programs and Building the Create Task
  - Two-Dimensional Lists and Algorithmic Thinking
  - Simulations, Abstraction, and Managing Complexity
  - Building the Create Task: Robust Programs and Instructor Feedback
  - Completing the Create Task and the Personalized Project Reference
- PHASE 3: Computer Systems, Impact of Computing, and Exam Mastery (Big Ideas 4 and 5 and Full Practice, Months 5-6, Weeks 17-24) How the internet and larger computing systems actually work, an honest look at computing's effects on real people, then a full turn to exam craft built around your own finished Create Task.
  - Month 5: Computer Systems and Networks
  - How the Internet Works
  - Fault Tolerance and Parallel Computing
  - Cybersecurity Fundamentals
  - Computer Systems Review and Practice
  - Month 6: Impact of Computing and Full Exam Mastery
  - Beneficial and Harmful Effects of Computing
  - Intellectual Property, Open Source, and Full Multiple-Choice Practice
  - Written-Response Drilling with the Personalized Project Reference
  - Full Mock Exam and Test-Ready Review

Projects students build: First program: a short interactive program that takes input and produces output, run and explained line by line; Variable tracker: a short program that stores, updates, and reports several related values, traced by hand before it is run; List toolkit: procedures that sum, count, filter, and find the maximum of a list, tested on an empty list and a single-item list; Decision-making procedure: a small program that classifies input using nested conditionals, tested against every boundary case; Algorithm workbook: a search and a sort implemented from a plain-language description, each hand-traced on a small list first; Procedure library: a small set of reusable procedures for a chosen task, called from one main program and tested independently; Debug and repair: a deliberately broken program fixed step by step, with every bug and its fix logged in writing; Approved Create Task proposal: a one-page plan naming your program's purpose, its list, its procedure with parameters, and its core algorithm; Binary explorer: a program that converts numbers between binary and decimal and explains each step of the conversion; Compression demo: a small program that compresses a repetitive data set with a simple scheme and reports the size saved; Data-set investigation: a provided data set explored with filtering and grouping to answer three written questions with cited evidence; Simple simulation: a small program that models a repeated random process, for example a game of chance, and reports results across many runs; Grid processor: a program that stores and analyses a small two-dimensional data set, for example a seating chart or a simple game board; Create Task build session one: the first working version of your program's core algorithm and required list, reviewed live with the instructor; Create Task build session two: a tested, working version of your full program, incorporating the feedback from session one - plus 9 more on the course page.

AP Precalculus: Units 1 to 3 and Full Exam Prep

`/courses/ap-precalculus-exam-prep-course` · 6 months (24 weeks) · High school students preparing for AP Precalculus; a solid Algebra 2 background is assumed

- PHASE 1: Polynomial and Rational Functions (Unit 1, Months 1-2, Weeks 1-8) Rates of change, polynomial behaviour and zeros, rational functions with their asymptotes and holes, transformations, and model selection: the function-behaviour toolkit every later unit builds on.
  - Month 1: Rates of Change and Polynomial Behaviour
  - Functions, Change, and Rates of Change
  - Polynomial Functions: Zeros and Local Behaviour
  - End Behaviour and Rational Functions
  - Vertical Asymptotes, Holes, and Equivalent Forms
  - Month 2: Transformations, Modelling, and Unit 1 Mastery
  - Transformations of Functions
  - Choosing a Function Model
  - Algebraic Fluency with Polynomial and Rational Expressions
  - Unit 1 Mastery and the Multiple-Choice Format
- PHASE 2: Exponential and Logarithmic Functions (Unit 2, Months 3-4, Weeks 9-16) Sequences as the discrete root of exponential change, exponential functions and modelling, composition and inverses, then logarithms through to equation solving, closing with a first look at free response.
  - Month 3: Sequences, Exponential Functions, and Modelling
  - Sequences and the Roots of Exponential Growth
  - Exponential Functions: Behaviour and Manipulation
  - Exponential Modelling and Competing Models
  - Function Composition and Inverses
  - Month 4: Logarithms and Equation Solving
  - Logarithms as Inverses of Exponential Functions
  - Logarithmic Properties and Manipulation
  - Solving Exponential and Logarithmic Equations
  - Unit 2 Mastery and a First Look at Free Response
- PHASE 3: Trigonometric and Polar Functions, and Full Exam Mastery (Unit 3 and Mocks, Months 5-6, Weeks 17-24) The unit circle, sinusoidal and trigonometric functions, and polar coordinates and functions, followed by a full turn to exam craft: the calculator/no-calculator skill, free-response method, and complete timed hybrid-digital mock exams.
  - Month 5: Trigonometric and Polar Functions
  - The Unit Circle and Periodic Behaviour
  - Sinusoidal Functions and Modelling
  - Tangent, Reciprocal Trig, and Inverse Trig
  - Equivalent Trig Forms and Polar Functions
  - Month 6: Free-Response Mastery and Full Mock Exams
  - The Calculator/No-Calculator Split and Multiple-Choice Strategy
  - Free-Response Method Across Units 1 to 3
  - Full Mock Exam One
  - Full Mock Exam Two, Test-Ready Review, and a Unit 4 Preview

Projects students build: Rate-of-change notebook: a function studied three ways, table, graph and average rate of change over five different intervals, with each answer interpreted in a sentence; Zero-to-graph drill: eight polynomials sketched from a list of zeros and multiplicities alone, then checked point by point; Asymptote hunt: twelve rational functions sorted into horizontal-asymptote, slant-asymptote or neither, then verified by long division where needed; Rewrite-and-reveal set: ten rational functions rewritten from standard to factored form specifically to expose a hidden hole or asymptote; Transformation matching set: ten transformed graphs matched to their equations, then the reverse, equation to sketch, for the same ten; Model justification write-up: two data tables modelled and the choice of model defended in four written sentences each; Domain-safe solving set: eight rational equations and inequalities solved with every excluded value stated before the algebra begins; First timed multiple-choice block on Unit 1, split into a no-calculator half and a calculator half, reviewed question by question; Sequence-to-function bridge: four geometric sequences extended into continuous exponential models, with the jump from discrete to continuous explained in writing; Percent-change translator: eight real-world growth and decay descriptions rewritten as exponential equations, base and starting value identified from the words alone; Model face-off: one data set modelled two competing ways, exponential and polynomial, with a written case for which one actually fits; Inverse verification set: six functions inverted algebraically, then checked both by composing and graphically, by reflecting; Exponential-log translation set: twelve equations converted between exponential and logarithmic form, evaluated by hand where the values are friendly; Expand-and-condense drill: ten logarithmic expressions expanded fully, then condensed back, each check confirming the two forms are equal; Extraneous-solution audit: eight logarithmic equations solved, with every solution checked back in the original equation and any extraneous root explained - plus 9 more on the course page.

AP Statistics: Exam Prep with the Investigative Task

`/courses/ap-statistics-maths-exam-prep-course` · 6 months (24 weeks) · High school students preparing for AP Statistics; taught from the ground up, comfort with school algebra assumed

- PHASE 1: Exploring Data and Collecting Data (Units 1-3, Months 1-2, Weeks 1-8) The data-analysis half of the course: describing one-variable and two-variable data honestly, then how data is collected in the first place. The graphing calculator and the free-response communication standard are introduced here and used every week from this point on.
  - Month 1: Exploring One-Variable Data (Unit 1)
  - Displaying and Describing Distributions
  - Measuring Center and Spread
  - The Normal Distribution
  - Unit 1 Mastery and the Free-Response Standard
  - Month 2: Two-Variable Data and Collecting Data (Units 2-3)
  - Exploring Two-Variable Data: Scatterplots and Correlation
  - Least-Squares Regression
  - Collecting Data: Sampling
  - Collecting Data: Experiments and Unit 2-3 Mastery
- PHASE 2: Probability and Sampling Distributions (Units 4-5, Months 3-4, Weeks 9-16) The mechanics of randomness that make inference possible: probability rules, random variables, the named distributions, then sampling distributions and the Central Limit Theorem that the entire second half of the course depends on.
  - Month 3: Probability, Random Variables and Probability Distributions (Unit 4)
  - Probability Rules
  - Random Variables
  - Binomial and Geometric Distributions
  - Unit 4 Mastery and Probability Free Response
  - Month 4: Sampling Distributions (Unit 5)

    - Sampling Variability and the Sampling Distribution of a Proportion
    - The Sampling Distribution of a Sample Mean and the Central Limit Theorem
    - Sampling Distributions for Differences and Exam-Style Reasoning
    - Unit 5 Mastery and the Bridge to Inference
- PHASE 3: Inference and Exam Mastery (Units 6-9 and Full Mocks, Months 5-6, Weeks 17-24) Formal inference for every setting the exam tests, then a full turn to exam craft: the Investigative Task drilled as its own skill, every free-response type reviewed against the real rubric, and two complete timed mock exams under hybrid-digital conditions.
    - Month 5: Inference for Proportions and Means (Units 6-7)
    - Confidence Intervals for a Proportion
    - Significance Tests for a Proportion
    - Confidence Intervals for a Mean
    - Significance Tests for a Mean and Unit 6-7 Mastery
    - Month 6: Chi-Square, Slopes, the Investigative Task, and Full Mock Exams (Units 8-9)
    - Inference for Categorical Data: Chi-Square
    - Inference for the Slope of a Regression Line
    - The Investigative Task
    - Full Mock Exams and Test-Ready Review

Projects students build: First distribution report: a real one-variable data set displayed, described in full shape-outliers-center-spread sentences, and checked on the calculator; Center-and-spread comparison: two real groups compared on boxplots with a full written comparison of shape, center, spread and outliers; Normal model check: a real quantitative data set tested against the 68-95-99.7 rule, with normalcdf and invNorm used to answer three context questions; First scored free response: a Unit 1 style question written under time and self-scored against a rubric, with every lost point named; Relationship study: a real two-variable data set plotted, described in full, and its correlation computed and interpreted in context; Prediction model: a regression line fit to real data, its residual plot checked for pattern, and two predictions made with their limits stated; Sampling critique: a real published survey evaluated for its sampling method, with specific bias risks named in writing; Experiment design: a full experimental design written for a given research question, naming treatments, randomisation and control; Two-way table study: a real two-way table used to compute conditional probabilities and formally test two events for independence; Combined-variable analysis: two random variables combined by sum or difference, with mean and standard deviation of the result found and interpreted; Model choice project: three real scenarios each modelled correctly as binomial or geometric, with the setting's conditions checked in writing; Timed probability free response written under exam conditions and self-scored against a rubric; Simulation build: a sampling distribution for a proportion simulated by hand or calculator, with shape, center and spread reported from the simulation; Central Limit Theorem simulation: sample means drawn repeatedly from a skewed population, with the resulting shape compared at small and large sample sizes; Distribution identification drill: ten scenarios each matched to the correct sampling distribution, with mean, standard deviation and conditions stated - plus 9 more on the course page.

App Development Course: Flutter, iOS & Android

`/courses/complete-app-development-masterclass-college` · 10-12 months (44-52 weeks) · Complete beginner (18+); college students, graduates and working professionals

- PHASE 1: Foundations & First Apps (Months 1-3, Weeks 1-13) Build programming foundations, master UI/UX design principles, and create your first mobile applications.
    - Months 1-2: Programming Basics & App Fundamentals
    - Introduction to App Development & Setup
    - Programming Fundamentals (Dart/JavaScript)
    - UI/UX Design for App Developers

    - Introduction to Flutter Development
    - Month 3: Intermediate Flutter & State Management
    - Advanced Flutter Widgets & Layouts
    - State Management in Flutter
    - Navigation & Routing
- PHASE 2: Cross-Platform Development & Backend Integration (Months 4-6, Weeks 14-26) Master cross-platform development, backend integration, APIs, databases, and real-world app features.
    - Months 4-5: Backend Integration & Data Persistence
    - Local Data Storage
    - REST APIs & HTTP Networking
    - Firebase Integration
    - Advanced App Features
    - Animations & Advanced UI
    - Month 6: Alternative Stacks: React Native, PWAs & App Backends
    - React Native Introduction
    - Progressive Web Apps (PWA)
    - Backend Development for Apps (Node.js/Express)
    - Testing & Quality Assurance
    - Phase 2 Capstone Project
- PHASE 3: Native Development & Advanced Topics (Months 7-9, Weeks 27-39) Master native iOS and Android development, advanced app features, and platform-specific capabilities.
    - Months 7-8: iOS Development with Swift
    - Swift Programming & iOS Basics
    - UIKit Development
    - SwiftUI (Modern iOS Development)
    - iOS Data & Networking
    - iOS Advanced Features
    - Month 9: Android Development with Kotlin
    - Kotlin Programming & Android Basics
    - Android UI Development
    - Jetpack Compose (Modern Android UI)
    - Android Data & Architecture
    - Android Advanced & Phase 3 Capstone
- PHASE 4: The Finale (Month 10, Weeks 40-44) The capstone month: spec, build, ship and defend, then the final exam that decides the certificate.
    - Month 10: Capstone and the Final Exam
    - Capstone Spec and Setup
    - Capstone Build
    - Ship and Polish
    - Demo Day and the Final Exam

Projects students build: Environment setup checklist; Simple 'Hello World' app; App idea documentation; Wireframe sketches (paper); Git repository creation; Calculator logic; Temperature converter; Todo list logic (console); Quiz game logic; BMI calculator logic; Simple games (number guessing); Design system in Figma; App UI mockups (5 different apps); Icon set creation; User flow diagrams - plus 153 more on the course page.

App Development for Teens: Build Real Apps with React Native

`/courses/complete-app-development-masterclass-for-teens` · 10-12 months (40-48 weeks) · Absolute beginner, ages 13 to 18

- PHASE 1: Foundations to First App (Months 1-3, Weeks 1-12) JavaScript learned properly, interface thinking with React, and the jump to React Native: by the end of this phase an app the student built runs on their own phone.
  - Month 1: How Apps Are Built
  - The App World, Honestly Mapped
  - JavaScript Essentials
  - UI and UX Fundamentals
  - Modern JavaScript
  - Month 2: React and the Backend Taste
  - React Fundamentals
  - State and Navigation Thinking
  - Progressive Web Apps: Ship Before the Stores
  - Firebase: A Backend Without a Server
  - Month 3: React Native, and an App on Your Phone
  - React Native with Expo
  - Core Components and Native Feel
  - Styling and UI Libraries
  - Phase Capstone: First Real App
- PHASE 2: App Craft (Months 4-6, Weeks 13-24) What separates demos from products: data that persists, device features, polish, analytics, store readiness, accessibility and AI features, ending in a polished second app.
  - Month 4: Data and Device Powers
  - State Management and Testing
  - Data That Survives: Storage and Offline
  - Camera, Location and Notifications
  - Builds and Sharing
  - Month 5: The Product Layer
  - Firebase in Depth: Auth and Firestore
  - Animations and Gestures
  - Analytics and Performance, Honestly
  - Store Readiness, Told Straight
  - Month 6: The Modern App
  - AI Features in Your App
  - Accessibility and App Safety
  - An Honest Week of Flutter
  - Phase 2 Capstone: The Polished App

- PHASE 3: The Wider Craft and the Capstone Build (Months 7-8, Weeks 25-32) The map of native development, notifications done right, professional Git workflow, and then the main event: the final capstone designed and built.
  - Month 7: The Wider World
  - The Native Map: Kotlin and Swift, Honestly
  - Push Notifications and Background Work
  - Git and Team Workflow for Apps
  - Mini Product Sprint
  - Month 8: The Capstone, Designed and Built
  - Capstone Spec and Design Sprint
  - Capstone Build
  - User Testing and Iteration
- PHASE 4: Launch (Months 9-10, Weeks 33-40) The last mile real developers respect: hardening, honest distribution, real users, iteration, portfolio, and the final exam at demo day.
  - Month 9: Ship It Properly
  - Hardening Week
  - Distribution, For Real
  - Launch Week
  - Portfolio and Devlog
  - Month 10: The Finale
  - Iteration Sprint
  - Final Polish and Demo Preparation
  - Demo Day and What Comes Next

Projects students build: Research and present your favorite app's history; Set up complete development environment; Create your first web-based calculator app; Design your dream app concept (mockup); To-do list app with local storage; Quiz game with score tracking; Weather app using API; Instagram-style photo filter app (basic); Redesign a popular app for better UX; Create complete UI kit in Figma; Design your social media app mockup; Build clickable prototype; Movie database app with TMDB API; Real-time chat app (web version); Music player with Spotify Web API - plus 73 more on the course page.

App Making for Kids: Build Real Apps with Blocks

`/courses/block-coding-app-development-masterclass` · 6-8 months (26-32 weeks) · Complete beginner, ages 8 to 12

- THE COURSE: From Logic to Launched-at-Home (Months 1-6, Weeks 1-26) Visual programming logic, then real mobile apps built, tested by the family and presented at demo day.
  - Months 1-2: Visual Programming Fundamentals
  - Introduction to Block Coding & Scratch Basics
  - Programming Logic with Blocks
  - Game Development in Scratch
  - Introduction to MIT App Inventor
  - Months 3-4: Mobile App Development
  - Thunkable Platform Mastery
  - Working with Device Features
  - Data Storage and Persistence
  - Advanced UI and User Experience
  - Mid-Course Review and Showcase

- Months 5-6: Advanced Features & Publishing
- APIs and Web Services
- Game Development Advanced
- AI and Machine Learning Blocks
- IoT and Hardware Integration
- Capstone and the Final Exam

Projects students build: Animated greeting card; Interactive story with characters; Simple animation sequence; Musical instrument app; Calculator with visual blocks; Quiz game with scoring; Number guessing game; Drawing app with controls; Maze navigation game; Platformer game with jumping; Space shooter with enemies; Puzzle game with levels; Hello World mobile app; Personal information form; Multi-screen navigation app - plus 38 more on the course page.

Artificial Intelligence Course: Search, Logic & Agents

`/courses/artificial-intelligence-complete-masterclass-college` · 10-12 months (44-52 weeks) · Complete beginner (18+); college students, graduates and working professionals

- PHASE 1: Classical AI Foundations (Months 1-3, Weeks 1-13) Build deep understanding of AI foundations, search algorithms, logic, knowledge representation, and problem-solving.
  - Months 1-2: AI Foundations & Search Algorithms
  - Introduction to Artificial Intelligence
  - Search Algorithms - Part 1 (Uninformed Search)
  - Search Algorithms - Part 2 (Informed/Heuristic Search)
  - Adversarial Search & Game Playing
  - Month 3: Logic & Knowledge Representation
  - Propositional Logic
  - First-Order Logic & Inference
  - Constraint Satisfaction Problems
- PHASE 2: Reasoning, Planning & Probabilistic AI (Months 4-6, Weeks 14-26) Master probabilistic reasoning, planning algorithms, decision theory, and uncertainty management in AI.
  - Months 4-5: Uncertainty & Probabilistic Reasoning
  - Probability Theory for AI
  - Bayesian Networks
  - Markov Models & Temporal Reasoning
  - Decision Theory & Utility
  - Planning Under Uncertainty
  - Month 6: Classical Planning & Knowledge Integration
  - Classical Planning
  - Ontologies & Knowledge Engineering
  - Learning in AI Systems
  - Explanation & Interpretability in AI
  - Phase 2 Capstone Project
- PHASE 3: Intelligent Systems & Applications (Months 7-9, Weeks 27-39) Master expert systems, intelligent agents, robotics, computer vision, NLP, and multi-agent systems.
  - Months 7-8: Expert Systems & Intelligent Agents

    - Expert Systems Architecture
    - Intelligent Agent Architectures
    - Robotics & Embodied AI
    - Computer Vision for AI Systems
    - Natural Language Understanding (AI Perspective)
    - Month 9: Multi-Agent Systems & Collective Intelligence
    - Multi-Agent Systems Fundamentals
    - Game Theory for Multi-Agent AI
    - Swarm Intelligence & Collective Behavior
    - Social AI & Human-AI Interaction
    - Phase 3 Capstone Project
- PHASE 4: The Finale (Month 10, Weeks 40-44) The capstone month: spec, build, ship and defend, then the final exam that decides the certificate.
    - Month 10: Capstone and the Final Exam
    - Capstone Spec and Setup
    - Capstone Build
    - Ship and Polish
    - Demo Day and the Final Exam

Projects students build: Simple reflex agent implementation; Model-based agent for grid world; Agent environment simulator; AI timeline and evolution visualization; Turing Test chatbot (rule-based); 8-puzzle solver with BFS/DFS; Maze solver with multiple algorithms; Route finding system (city maps); N-Queens problem solver; Missionaries and Cannibals problem; Search visualization tool; Performance comparison framework; A* pathfinding implementation; 15-puzzle solver with pattern databases; Route optimization with A* - plus 172 more on the course page.

Backend Development for Teens: Node, APIs and Databases

`/courses/backend-coding-masterclass-for-teens` · 9-11 months (36-44 weeks) · Absolute beginner, ages 13 to 18

- PHASE 1: Foundations (Months 1-3, Weeks 1-12) The internet demystified, JavaScript learned properly, problem-solving sharpened, then the first real servers with Node and Express.
    - Month 1: The Internet and JavaScript
    - How The Internet Actually Works
    - JavaScript Fundamentals - The Language of Backend
    - Month 2: Problem Solving and First Servers
    - Algorithms and Problem Solving
    - Node.js - JavaScript on Servers
    - Month 3: Express and REST Design
    - Express.js - Professional Backend Framework
    - RESTful API Design
- PHASE 2: Data and Product Features (Months 4-6, Weeks 13-24) The features every real product needs: both database families, safe authentication, hardened APIs, and file uploads done properly.
    - Month 4: Databases, Both Families
    - MongoDB - NoSQL for Modern Apps
    - PostgreSQL - Powerful SQL Database
    - Month 5: Auth and Security

    - User Authentication Systems
    - API Security & Best Practices
    - Month 6: Uploads, Media and the Phase Capstone
    - File Uploads & Media Handling
    - Phase 2 Capstone: A Product Backend
- PHASE 3: Real Systems (Months 7-8, Weeks 25-32) What separates demos from systems: live features, background work, tests, and the modern AI-backend layer built with guardrails.
    - Month 7: Live Features and Background Work
    - Real-time Features & WebSockets
    - Background Jobs, Scheduling and Email
    - Month 8: Testing and AI Backends
    - Testing Fundamentals
    - AI Backends and Agent APIs
- PHASE 4: Ship (Month 9, Weeks 33-36) Performance judgment, one honest week of Docker, and the capstone deployed, documented and defended.
    - Month 9: Performance, Docker, Capstone
    - Performance and Monitoring Basics
    - Docker in One Honest Week
    - Capstone Build
    - Demo Day and the Final Exam

Projects students build: Draw your favorite app's architecture; Set up your ultimate coding environment; Create your GitHub profile README; Discord bot message generator; Minecraft inventory manager; YouTube stats calculator; Grade calculator with GPA; Build TikTok's recommendation algorithm (simplified); Create a matchmaking system for games; Implement Instagram's hashtag search; Design a tournament bracket system; File-based todo list for homework; Discord webhook notifier; Local multiplayer game server; Meme generator backend - plus 55 more on the course page.

Build AI Agents with Google Gemini Enterprise

`/courses/build-ai-agents-with-google-gemini-enterprise-course` · 16 classes (2 months · 2 classes/week · 1 hour each) · Intermediate to advanced · working professionals, founders, team leads and developers

- Phase 1: The Gemini Enterprise Platform Map Google's two-sided agent stack, get the right edition and access, learn the anatomy of a Workflow Builder agent, build instruction and testing discipline, and make the model and Skills decisions that shape cost and capability.
    - Class 1: Google's Agent Stack in September 2026 and Where You Build
    - Class 2: Agent Anatomy in Workflow Builder
    - Class 3: Testing Like It Is Already in Production
    - Class 4: Models, Skills and Projects: The Decisions Underneath
- Phase 2: Knowledge, Connectors and Actions Ground agents in Google Workspace and third-party data at scale, understand federated versus indexed sources, give agents actions that write to real systems, add custom MCP servers under Agent Registry governance, and prove accuracy the way an auditor would.
    - Class 5: Grounding Strategy: The Data Store Estate
    - Class 6: Documents, Workspace and Third-Party Knowledge Done Right
    - Class 7: Actions: Agents That Write to Real Systems
    - Class 8: Custom MCP Servers, Agent Registry and the Accuracy Audit

- Phase 3: Workflows, Autonomy and Multi-Agent Systems Build multi-step workflows with triggers, schedules and human approvals, run them from the Inbox, compose sub-agents and Agent Gallery agents, register agents over A2A and A2UI, then cross to the pro-code side: ADK, Agent Runtime, Agent Identity and Model Armor.
  - Class 9: Workflows: Deterministic Automation with a Human in the Loop
  - Class 10: Triggers, Schedules and Hardened Autonomy
  - Class 11: Multi-Agent Systems: Sub-Agents, the Agent Gallery, A2A and A2UI
  - Class 12: The Pro-Code Bridge: ADK, Agent Runtime, Agent Identity and Model Armor
- Phase 4: Observability, Cost, Governance and Capstone Prove agents work and know what they cost: tracing and metrics, seat and pay-as-you-go economics, data residency and policy controls, the Professional Agentic Architect exam map, then a production capstone defended with its governance and cost pack.
  - Class 13: Observability: Traces, Metrics and the Improvement Loop
  - Class 14: Cost: Seats, Pay-As-You-Go, Overage and Runtime Metering
  - Class 15: Governance: Residency, Policy Constraints, Content Policies and the Certification Map
  - Class 16: Capstone Build and Defence

Projects students build: Write your organisation's one-page agent opportunity memo: three candidate processes, the data and systems each needs, the risks each carries, the edition it requires, and the one that becomes your capstone; Build Policy Desk v1: an internal chat agent for one real policy area of your organisation, with a complete instruction stack, five tested refusals and a designed hand-off to a human; Build the permanent 25-question test set for Policy Desk, including five adversarial probes, and run it end to end in the testing environment with verdicts logged; Run your Policy Desk test set against two Gemini models, score the differences, and write the model decision with evidence attached; then package the agent's reusable behaviour as a Skill and put its source documents in a Project; Ground Policy Desk in a real Google Drive or SharePoint source (or a mirrored practice copy) and prove ten answers cite the correct document and passage; Rebuild one messy real document into a retrieval-optimised version, ground both versions side by side, and publish the before-and-after accuracy comparison; then add a second, structured source and document the arbitration behaviour with five conflict questions; Build Support Triage v1: a chat agent that collects an issue, searches the right knowledge, and creates the ServiceNow incident or Jira issue (or posts to the right Slack channel) with a confirmation step and tested failure messages; Connect one custom MCP server to a practice agent with only the tools you need enabled and a one-page security note, then run the full 25-answer accuracy audit on Policy Desk and publish the result with methodology and a remediation list; Build Expense Helper: a workflow that collects an expense claim, validates it against policy, pauses for a manager's approval, files the result in the right system and reports back, with tested error paths for every step; Build Weekly Reporter: a scheduled workflow that compiles a weekly status summary from real sources, drafts it into a Google Doc, and posts it for review, never directly to stakeholders; then harden it with an approval pause, an error diary and a self-report of its own actions; Refactor Support Triage into a two-agent design: a routing agent plus a specialist sub-agent, with documented hand-off contracts and a failure-mode table; then register an external A2A agent and delegate one task to it; Build and run a small ADK agent in Python that wraps one tool your capstone needs, deploy it to Agent Runtime, register it in Gemini Enterprise, and call it from a Workflow Builder agent; document the identity and Model Armor settings you applied; Observability sprint: run one agent with at least five real users for a week, review its traces and metrics, ship two data-demanded improvements, and write the before-and-after with p95 latency and error rate on the page; Build the complete cost model for your capstone: edition recommendation, seat count, pay-as-you-go versus seats comparison, Agent Runtime line if any, overage cap, and a monthly projection at three adoption levels; Write the governance pack for your capstone: region and residency decision, organisation policy and content policy plan, identity and sharing plan, Agent Registry entries, compliance notes, and the rollout runbook with rollback - plus 1 more on the course page.

Business & Finance Mathematics: Investment to Risk

`/courses/complete-business-finance-mathematics-mastery` · 12-14 months (52-60 weeks) · Complete Beginner to Advanced Professional

- PHASE 1: Business Mathematics Foundations (Weeks 1-13) Build rock-solid foundations in business calculations, financial mathematics, and accounting principles. Master the mathematical tools used daily in business.
  - Months 1-2: Core Business Mathematics
  - Percentages & Business Applications
  - Time Value of Money Fundamentals
  - Annuities & Loan Mathematics
  - Business Ratios & Analysis
  - Month 3: Accounting Mathematics & Cost Analysis
  - Accounting Mathematics Fundamentals
  - Cost Accounting & Budgeting
  - Phase 1 Assessment & Integration
- PHASE 2: Statistical Analysis and Economic Mathematics (Weeks 14-26) Master statistical methods for business decision-making, economic analysis, and financial forecasting.
  - Months 4-5: Business Statistics & Analytics
  - Descriptive Statistics for Business
  - Probability in Business Decisions
  - Regression & Predictive Analytics
  - Hypothesis Testing for Business
  - Time Series Analysis
  - Month 6: Economic & Market Mathematics
  - Microeconomic Mathematics
  - Macroeconomic Mathematics
  - Financial Markets Mathematics
  - International Finance Mathematics
  - Phase 2 Capstone Project
- PHASE 3: Investment Mathematics and Risk Management (Weeks 27-39) Master investment analysis, portfolio management, risk assessment, and corporate finance decisions.
  - Months 7-8: Investment Analysis & Valuation
  - Equity Valuation Mathematics
  - Fixed Income Mathematics
  - Portfolio Theory & Optimization
  - Performance Measurement & Attribution
  - Alternative Investments Mathematics
  - Month 9: Risk Management & Insurance
  - Risk Measurement & Modeling
  - Insurance Mathematics
  - Operational & Market Risk
  - Regulatory Capital & Compliance
  - Phase 3 Integration & Assessment
- PHASE 4: Advanced Finance and Final Revision (Weeks 40-52) Master derivatives pricing, quantitative finance, financial modeling, and advanced corporate finance.
  - Month 10: Derivatives & Structured Products
  - Options Mathematics

    - Futures & Forwards
    - Swaps & Interest Rate Derivatives
    - Credit Derivatives & Structured Finance
    - Volatility & Advanced Greeks
    - Month 11: Quantitative Finance and Modelling
    - Financial Modeling Excellence
    - Algorithmic Trading Mathematics
    - Corporate Finance Advanced
    - Month 12: Professional Applications and Revision
    - Industry Case Studies
    - Financial Technology Tools
    - Month 13: Final Projects & Certification
    - Capstone Project - Part 2 & Presentation
    - Final Assessment & Certification

Projects students build: Profit margin calculator for business; Sales commission tracker; Break-even analysis tool; Compound interest calculator; Investment growth simulator; Currency converter with live rates; Loan amortization calculator; Mortgage comparison tool; Retirement planning calculator; Financial ratio analyzer; Company comparison dashboard; Industry benchmark tool; Depreciation schedule generator; Inventory management calculator; Cash flow statement builder - plus 96 more on the course page.

C Programming for Beginners: Pointers, Memory & Structs

`/courses/c-programming-course-for-college-beginners` · 6 months (24 weeks) · Beginner, college students and first-year engineers

- PHASE 1: The Language Core and the Machine (Months 1-2, Weeks 1-8) C fundamentals built on honest ground: what the compiler does, what types really are, and how functions and the call stack work, so the pointer month lands on solid footing.
    - Month 1: From Source Code to Executable
    - Hello, Compiler
    - Types, Variables, and Their Limits
    - Operators and Control Flow
    - Loops
    - Month 2: Functions and the Call Stack
    - Functions Done Properly
    - Scope, Storage, and the Stack
    - Recursion
    - Multi-File Programs and the Build
- PHASE 2: Pointers and Memory, Taught Properly (Months 3-4, Weeks 9-16) The month most courses rush is the month this course is named for: pointers with a memory diagram for every operation, then dynamic memory, the heap, and structs, including the famous bugs made visible.
    - Month 3: Pointers, One Diagram at a Time
    - Addresses and the & Operator
    - Pointers and Functions
    - Arrays and Pointer Arithmetic
    - Strings at the Memory Level

    - Month 4: The Heap, Dynamic Memory, and Structs
    - malloc and the Heap
    - Dynamic Arrays and the Famous Bugs
    - Structs
    - Structs Meet the Heap
- PHASE 3: C at Work: Files, Data Structures, and the Capstone (Months 5-6, Weeks 17-24) The skills become systems: file handling, linked lists, stacks, queues, and sorting built from raw structs and malloc, a grounded look at where C runs in industry, and a capstone project compiled and defended.
    - Month 5: File Handling and Data Structures from Scratch
    - File Handling
    - Linked Lists
    - Stacks and Queues
    - Searching, Sorting, and Function Pointers
    - Month 6: Systems Context and the Capstone
    - Where C Runs: Bits, Kernels, and Microcontrollers
    - Capstone: Scope and Foundations
    - Capstone: Build and Review
    - Ship and Defend

Projects students build: Banner program: compile, break, and fix a program five different ways to learn the error messages early; Limits explorer: a program that prints the size and range of every basic type on your machine; Grade and tax calculator: branching logic with real edge cases, negative inputs, and boundary values; Pattern engine: pyramids, diamonds, and number triangles from nested loops; Prime and perfect number finder with a hand-traced dry run submitted alongside the code; Number theory library: gcd, lcm, prime check, and digit sum as clean reusable functions in their own file; Stack tracer: a set of nested function calls with a hand-drawn stack diagram matched against actual output; Recursive toolkit: power, GCD, decimal-to-binary, and Tower of Hanoi with move printing; Unit converter suite: a menu-driven multi-file program with separate modules for length, weight, and temperature; Memory mapper: a program that prints the address and value of every variable it owns, matched to a hand-drawn diagram; Statistics engine: one function that fills min, max, and mean through pointer parameters from a single pass; Array toolkit: reverse, rotate, and search implemented twice, once with indices and once with pointers; mini_string.h: your own implementation of five standard string functions, tested against the real library; Runtime array: a program that asks the user how much data is coming, allocates exactly that, and cleans up properly; Growable list: a dynamic array module with append, insert, and remove that survives a sanitizer run cleanly - plus 10 more on the course page.

C++ for Kids: First Real Code, Games and Puzzles (Ages 9-12)

`/courses/cpp-programming-for-kids-course` · 6 months (24 weeks) · Complete beginner to text coding, ages 9 to 12

- PHASE 1: First Programs (Months 1-2, Weeks 1-8) From what a program is to loops that draw patterns and run games. Every concept is shown on paper first, then typed, run and changed.
    - Month 1: Hello, C++
    - Weeks 1-2: What Code Is and Your First Program
    - Weeks 3-4: Variables, Input and Arithmetic
    - Month 2: Decisions and Loops
    - Weeks 5-6: If, Else and Making Choices
    - Weeks 7-8: Loops That Repeat
- PHASE 2: Building Blocks (Months 3-4, Weeks 9-16) The tools that let programs grow without getting messy: functions, lists, text and grouped data, each taught inside a small game or tool.

    - Month 3: Functions and Vectors
    - Weeks 9-10: Functions
    - Weeks 11-12: Lists with Vectors
    - Month 4: Strings and Structs
    - Weeks 13-14: Working with Text
    - Weeks 15-16: Grouping Data with Structs
- PHASE 3: Games and Puzzles (Months 5-6, Weeks 17-24) Everything comes together in bigger text games, grid puzzles and the short problem-solving tasks used in programming contests, ending with a capstone each child designs.
    - Month 5: Bigger Games
    - Weeks 17-18: Random Numbers and a Text Adventure
    - Weeks 19-20: Grids and Nested Loops
    - Month 6: Contest Puzzles and the Capstone
    - Weeks 21-22: Thinking Like a Problem Solver
    - Weeks 23-24: Capstone Project and Showcase

Projects students build: Name banner: a program that prints a decorated banner with the student's name and favourite things; Pocket calculator and age-in-days converter that ask the user for numbers and print answers; Quiz show: a five-question quiz that keeps score and gives a message based on the result; Times-table trainer and a number guessing game that says higher or lower until the player wins; Shape helper: functions that draw squares and triangles and work out area and perimeter; High score board: enter scores, sort them and print the top five with medals beside them; Secret code machine: a shift cipher that encodes and decodes messages between friends; Virtual pet: a pet that gets hungry and bored over time and responds to feeding and play commands; Dungeon adventure: a text adventure with rooms, random encounters, an inventory and a win condition; Tic-tac-toe for two players and a maze game where the player finds the exit; Puzzle notebook: eight short contest-style problems solved, each with a sentence on the idea behind it; Capstone: an original game or tool planned, built and presented by the student.

C++ for Teens: Fundamentals, STL, DSA and Real Games

`/courses/cpp-programming-masterclass-for-teens` · 10-12 months (40-48 weeks) · Absolute beginner, ages 13 to 18

- PHASE 1: Fundamentals (Months 1-3, Weeks 1-12) The language learned patiently: syntax, control flow, loops, functions, arrays and strings, each week ending with working programs.
    - Month 1: First C++
    - Introduction to C++ & Programming
    - Variables & Data Types
    - Month 2: Control and Repetition
    - Control Flow & Decision Making
    - Loops & Repetition
    - Month 3: Functions, Arrays and Strings
    - Functions - Code Reusability
    - Arrays & Strings
- PHASE 2: The Hard Beautiful Parts (Months 4-6, Weeks 13-24) What makes C++ C++: pointers and references with pictures, dynamic memory without fear, object-oriented design, files, and the first taste of the STL.
    - Month 4: Pointers and Memory
    - Pointers & References
    - Dynamic Memory Management

    - Month 5: Objects and Inheritance
    - Object-Oriented Basics: Classes and Objects
    - Inheritance & Polymorphism
    - Month 6: Files, Errors and First STL
    - File Input/Output
    - STL Basics - Standard Template Library
- PHASE 3: Data Structures in C++ (Months 7-8, Weeks 25-32) The serious core, built by hand in the language it was invented for: linear structures, trees and graphs, sorting, and STL depth.
    - Month 7: Structures by Hand
    - Linear Data Structures
    - Trees & Graphs
    - Month 8: Algorithms and STL Depth
    - Algorithms - Searching & Sorting
    - STL Containers Deep Dive
- PHASE 4: Games, Contests and the Capstone (Months 9-10, Weeks 33-40) C++ made visible and competitive: a real SFML game, contest foundations, modern C++ habits, and the capstone exam.
    - Month 9: SFML and First Contests
    - 2D Graphics with SFML
    - Competitive Programming Foundations
    - Month 10: Modern C++, Capstone, Demo Day
    - Modern C++: Smart Pointers and Clean Habits
    - Capstone Build
    - Demo Day and the Final Exam

Projects students build: Hello World variations; ASCII art generator; Personal introduction program; Simple conversation bot; Calculator with all operations; Temperature converter; Random dice roller for D&D; Simple RPG stat calculator; Text adventure game; Grade calculator with letter grades; Rock-Paper-Scissors game; Simple AI decision maker; Pattern generator program; Prime number finder; Multiplication table generator - plus 63 more on the course page.

C++ Masterclass: Fundamentals to Modern C++ and Systems

`/courses/cpp-programming-complete-masterclass-college` · 10-12 months (44-52 weeks) · Complete beginner (18+); college students, graduates and working professionals

- PHASE 1: C++ Fundamentals & Object-Oriented Programming (Months 1-3, Weeks 1-13) Build rock-solid foundations in C++ syntax, memory management, pointers, and object-oriented programming principles.
    - Months 1-2: C++ Basics & Core Concepts
    - Introduction to C++ & Development Environment
    - Variables, Data Types & Operators
    - Control Flow & Functions
    - Arrays, Strings & Pointers
    - Month 3: Object-Oriented Programming
    - Classes and Objects
    - Inheritance and Polymorphism
    - Operator Overloading & Advanced OOP

- PHASE 2: STL, Templates & Modern C++ (Months 4-6, Weeks 14-26) Master the Standard Template Library, template programming, and modern C++ features.
  - Months 4-5: STL Mastery
  - STL Containers
  - STL Algorithms
  - Template Programming
  - Modern C++ Features (C++11/14/17/20)
  - Error Handling & Exception Safety
  - Month 6: Data Structures & Algorithms
  - Advanced Data Structures
  - Algorithm Design & Analysis
  - Performance Optimization
  - Competitive Programming
  - Phase 2 Capstone Project
- PHASE 3: System Programming & Concurrency (Months 7-9, Weeks 27-39) Master system-level programming, multithreading, networking, and low-level development.
  - Months 7-8: System Programming
  - Operating System Interface
  - Memory Management Deep Dive
  - Multithreading & Concurrency
  - Network Programming
  - Database Systems Programming
  - Month 9: Advanced System Topics
  - Compiler Design & Tools
  - Embedded Systems Programming
  - Security Programming
  - Graphics Programming Basics
  - Phase 3 Capstone Project
- PHASE 4: The Finale (Month 10, Weeks 40-44) The capstone month: spec, build, ship and defend, then the final exam that decides the certificate.
  - Month 10: Capstone and the Final Exam
  - Capstone Spec and Setup
  - Capstone Build
  - Ship and Polish
  - Demo Day and the Final Exam

Projects students build: Hello World variations; Simple calculator with basic operations; Temperature converter; Personal information display program; Advanced calculator with bitwise operations; Data type size explorer; Number system converter (binary, decimal, hex); Bitwise flag management system; Menu-driven banking system; Number guessing game; Prime number generator; Recursive factorial and Fibonacci calculator; Pattern printing programs; Dynamic array implementation; String manipulation library - plus 120 more on the course page.

Cambridge AS and A Level Computer Science 9618 Course

`/courses/cambridge-a-level-computer-science-9618-course` · 9 months (36 weeks) for the full A Level, joinable any month · Cambridge AS and A Level students on 9618; an IGCSE Computer Science background helps but is not required

- PHASE 1: AS Theory Fundamentals, Paper 1 (Months 1-3) Sections 1 to 8 of the syllabus: how data is represented, how the machine works, and the vocabulary Paper 1 marks against.
  - Month 1: Information Representation and Hardware
  - Number Systems and Data Representation
  - Images, Sound and Compression
  - Computer Architecture and the Processor
  - Input, Output and Storage
  - Month 2: Networks, the Internet and Security
  - Networks and Topologies
  - Security, Privacy and Data Integrity
  - Ethics, Ownership and Legal Context
  - Databases and Data Modelling
  - Month 3: Paper 1 Technique and Full Papers
  - Command Words and Mark Schemes
  - Boolean Logic and Logic Circuits
  - Full Paper 1, Marked and Reviewed
  - Targeted Repair on Sections 1 to 8
- PHASE 2: Paper 2, Reasoning About Programs Without Writing Them (Months 4-6) Sections 9 to 12. The paper that states candidates will not be required to write programming code, and supplies an Insert of pseudocode built-in functions. A separate discipline from Paper 4, and taught as one.
  - Month 4: Algorithm Design and Cambridge Pseudocode
  - Pseudocode as the Language of This Paper
  - Structure Charts, Flowcharts and Decomposition
  - Trace Tables and Predicting Output
  - Standard Algorithms and Data Structures
  - Month 5: Programming Concepts Without Code
  - Subroutines, Parameters and Scope
  - File Handling and Exception Handling
  - Software Development Life Cycle
  - Full Paper 2, Marked and Reviewed
  - Month 6: AS Level Consolidation
  - Both AS Papers Together
  - Cross-Topic Questions
  - Second Full AS Set
  - AS Readiness
- PHASE 3: A Level Papers 3 and 4 (Months 7-9) Sections 13 to 20. Advanced theory, and then the practical paper where program code and evidence of testing are submitted.
  - Month 7: Advanced Theory, Paper 3
  - Data Representation and Communication, Extended
  - Hardware, Virtual Machines and Operating Systems

    - Security, Artificial Intelligence and Emerging Content
    - Advanced Algorithms and Data Structures
    - Month 8: Paper 4 Practical, Sections 19 to 20
    - From Pseudocode to Working Code
    - Object-Oriented Programming
    - Files, Data Structures and Recursion in Practice
    - Evidence of Testing
    - Month 9: All Four Papers
    - Full Paper 3 Under Time
    - Full Paper 4 Under Time
    - Second Full Set of Both
    - Exam Readiness

Canva and AI Design Course (13+): Real Graphic Design Skills

`/courses/canva-ai-design-masterclass` · 6-8 months (26-32 weeks) · Beginner friendly, ages 13 to adult

- PHASE 1: Design Foundations (Months 1-2, Weeks 1-8) The principles that separate design from decoration: hierarchy, spacing, color and typography, practiced through daily Canva builds.
    - Months 1-2: Principles into Practice
    - Introduction to Design & Canva Setup
    - Design Principles & Composition
    - Typography & Color Theory
    - Canva Advanced Features & Templates
- PHASE 2: Social and Marketing Design (Months 3-4, Weeks 9-17) The formats the world actually runs on: posts, carousels, stories, decks and posters, plus one small real brand built end to end.
    - Months 3-4: Formats and a Real Brand
    - Social Media Design Mastery
    - Marketing Materials & Print Design
    - Logo Design & Brand Identity
    - Photo Editing & Manipulation
    - Phase Review and Brand Showcase
- PHASE 3: AI-Assisted Design (Month 5, Weeks 18-21) The honest AI layer: Canva Magic Studio and Adobe Firefly used to accelerate real work, with photo editing craft and credit habits.
    - Month 5: Magic Studio and Firefly
    - AI Design Tools, Age-Legal and Honest
    - Photo Editing and Compositing
- PHASE 4: Video and the Finale (Month 6, Weeks 22-26) Short-form video design in Canva, then the portfolio capstone and the final exam that decides the certificate.
    - Month 6: Motion, Portfolio, Exam
    - Short-Form Video Design
    - Portfolio Capstone
    - Demo Day and the Final Exam

Projects students build: Create personal introduction card; Design simple social media post; Make basic business card; Redesign poorly designed flyer; Create balanced poster design; Design minimalist quote graphics; Build visual hierarchy infographic; Typography poster with font hierarchy; Brand color palette creation; Mood board with color themes; Restaurant menu with proper typography; Complete brand kit setup; Create reusable template set; Design animated social media post; Multi-page presentation design - plus 33 more on the course page.

CBSE Class 10 Maths Board Prep: Case Studies & Mocks

`/courses/cbse-class-10-maths-board-exam-prep-course` · 10 months (40 weeks) · CBSE Class 10 students, Standard (041) and Basic (241)

- PHASE 1: Number Systems and Algebra (Months 1-3, Weeks 1-12) The heaviest unit first. Algebra alone carries 20 of the 80 theory marks, and with Real Numbers this phase covers 26. Every chapter closes with board-style MCQ and case-study practice.
  - Month 1: Real Numbers and Polynomials
  - Weeks 1-2: Real Numbers
  - Weeks 3-4: Polynomials
  - Month 2: Pair of Linear Equations and Quadratic Equations
  - Weeks 5-6: Pair of Linear Equations in Two Variables
  - Weeks 7-8: Quadratic Equations
  - Month 3: Arithmetic Progressions and Algebra Consolidation
  - Weeks 9-10: Arithmetic Progressions
  - Weeks 11-12: Algebra Unit Under Board Conditions
- PHASE 2: Geometry, Coordinate Geometry and Trigonometry (Months 4-6, Weeks 13-24) The proof-and-figure half of the paper: 33 marks across Geometry, Coordinate Geometry and Trigonometry, where drawing the figure and showing the steps is most of the battle.
  - Month 4: Triangles and Coordinate Geometry
  - Weeks 13-14: Triangles and Similarity
  - Weeks 15-16: Coordinate Geometry
  - Month 5: Trigonometry and Its Applications
  - Weeks 17-18: Introduction to Trigonometry
  - Weeks 19-20: Heights and Distances
  - Month 6: Circles and the Half-Syllabus Checkpoint
  - Weeks 21-22: Circles and Tangents
  - Weeks 23-24: Half-Syllabus Mock and Review
- PHASE 3: Mensuration, Statistics and Probability (Months 7-8, Weeks 25-32) The final 21 marks of new content: areas related to circles, combined solids, grouped data and probability, all heavy with the data-interpretation forms the competency questions love.
  - Month 7: Areas Related to Circles and Combined Solids
  - Weeks 25-26: Areas Related to Circles
  - Weeks 27-28: Surface Areas and Volumes
  - Month 8: Statistics and Probability
  - Weeks 29-30: Statistics of Grouped Data
  - Weeks 31-32: Probability and the Content Finish Line
- PHASE 4: Revision and the Mock Cycle (Months 9-10, Weeks 33-40) No new content, on purpose. Structured revision by unit, then CBSE sample papers and previous-year papers under real timing, each followed by an error clinic.

- Month 9: Structured Revision
- Weeks 33-34: Algebra and Number Systems Revisited
- Weeks 35-36: Geometry, Trigonometry and the Data Chapters Revisited
- Month 10: The Mock Cycle
- Weeks 37-38: Sample Papers Under Real Timing
- Weeks 39-40: Final Mocks and Exam Craft

Projects students build: Chapter question bank entry: 15 solved board-style questions on real numbers, built and kept by the student; Graph-reading sheet: 8 polynomial graphs interpreted for number and sign of zeros; Word-problem translation drill: 10 situations converted to equation pairs before any solving; Chapter question bank entry: 15 solved board-style quadratics including 2 case studies; AP situations sheet: 8 real-life progressions identified, with first term and difference extracted; Personal error log formalised: every phase 1 test miss classified as concept, method or presentation; Proof portfolio started: BPT and two similarity applications written to full board standard; Chapter question bank entry: 12 solved coordinate geometry questions across all board formats; Identity toolkit card: the identities plus the five standard proof moves, in the student's own words; Figure-first drill set: 10 heights and distances problems where the marked figure is drawn before any calculation; Proof portfolio extended: both tangent theorems plus two applications written in full; Half-syllabus mock with a written self-review: three strengths, three fixes, one habit to change; Combination-figure sheet: 8 shaded-region problems with the decomposition drawn before any formula; Solid dissection cards: 6 combined solids sketched, split into parts, with the joining surfaces marked; Data study: the student collects a real dataset from home or school, groups it and computes all three measures - plus 5 more on the course page.

CBSE Computational Thinking & AI for Kids (Class 3-8)

`/courses/cbse-computational-thinking-and-ai-course-for-kids-classes-3-to-8` · 9-12 months (40-52 weeks) · Absolute Beginner (Class 3-5) to Intermediate AI Project Builder (Class 6-8)

- PHASE 1: Computational Thinking Foundations (Months 1-3, Weeks 1-13), Aligned to CBSE Classes 3-5 Build the four pillars of Computational Thinking, Decomposition, Pattern Recognition, Abstraction and Algorithms, through unplugged activities, games, storytelling and block coding. No prior coding or computer experience required. Perfect for CBSE Classes 3, 4 and 5 students.
  - Month 1: The Four Pillars of Computational Thinking (Unplugged + Intro to Scratch)
  - Introduction to Computational Thinking & Why It Matters
  - Decomposition, Breaking Big Problems Into Small Ones
  - Pattern Recognition, The Secret Skill of Scientists
  - Abstraction & Algorithms, Recipes for Computers
  - Month 2: First Coding with Scratch, Where CT Meets Computers
  - Welcome to Scratch, The Block Coding Playground
  - Events, Loops & Repeat, Making Programs Powerful
  - Decisions, Conditions & Interactive Stories
  - First Mini Capstone: Build Your Own Scratch Game
  - Month 3: What is AI?, Your First Encounter with Artificial Intelligence
  - AI All Around Us, Seeing AI Everywhere
  - How Does AI 'See', Introduction to Computer Vision
  - How Does AI 'Listen & Talk', Natural Language & Speech
  - Introduction to the CBSE AI Project Cycle (4Ws & Beyond)
  - Phase 1 Capstone, Your First AI-Assisted Project
- PHASE 2: AI Builder Track (Months 4-6, Weeks 14-26), Aligned to CBSE Classes 6-8 Dive deep into Artificial Intelligence with the official CBSE Classes 6-8 AI curriculum. Master the full AI Project Cycle, explore all three

domains of AI (Data, Computer Vision, Natural Language Processing), begin Python programming, and build real AI-powered applications that solve real-world problems.
    - Month 4: Mastering the CBSE AI Project Cycle
    - Problem Scoping & Data Acquisition (Deep Dive)
    - Data Exploration & Visualization
    - Month 5: AI Domains, Data, Computer Vision, NLP
    - Data Science, Teaching Computers to Predict
    - Computer Vision, Deep Dive
    - Natural Language Processing, Making Machines Understand Us
    - AI Ethics, Bias & Responsible AI (core CBSE AI themes)
    - Month 6: Modelling & Evaluation + First Python Steps
    - Modelling, How Machines Learn
    - Evaluation & Deployment
    - Introduction to Python for AI (CBSE Class 8 Transition)
    - Phase 2 Capstone, End-to-End AI Project
- PHASE 3: Young AI Creator Track (Months 7-8, Weeks 27-34) Advance beyond the CBSE Class 6-8 level into true AI project creation. Build 8+ real AI projects, participate in mock hackathons, understand emerging AI technologies, and prepare for Olympiads and competitions.
    - Month 7: Advanced AI Tools & Projects
    - Generative AI for Kids, Safe Exploration
    - Robotics & AI, Bringing AI to the Real World
    - AI for Sustainable Development Goals (SDGs)
    - App-Based AI Projects with MIT App Inventor
    - Month 8: Mini-Hackathon & Olympiad Prep
    - Competition Preparation & Mini-Hackathon
    - AI Olympiad & CBSE Competition Preparation
- PHASE 4: Mastery & Transition (Month 9, Weeks 35-40) Final capstone project, portfolio creation, CBSE AI Class 9 (Code 417) readiness test, and graduation ceremony.
    - Month 9: Capstone, Portfolio & Certification
    - Grand Capstone Project (Full AI Lifecycle)
    - Portfolio, LinkedIn (with parental guidance) & Public Showcase
    - CBSE AI Class 9 (Code 417) Readiness Test & Beyond
    - Graduation & Final Showcase

Projects students build: Create a 'How I Get Ready for School' step-by-step poster; Break down making Maggi into 10 precise steps (Decomposition); CT Thinking Diary, daily entries for a week; Decompose your favorite board game into its smallest rules; Plan a pretend birthday party using only decomposition; Create a decomposition poster for any Class subject; Pattern hunt journal, photograph 20 patterns around you; Design a Rangoli using mathematical patterns; Create a pattern-based memory game; Write the 'Perfect Algorithm' for making your favorite food; Design a flowchart adventure story; Program your family to be 'robots' and follow your algorithm; Animated birthday card for a family member; Dancing cat in 5 different backgrounds; Digital storybook cover with your name - plus 75 more on the course page.

CBSE Computational Thinking & AI for Teens (Class 9-12)

`/courses/cbse-computational-thinking-and-ai-course-for-teens-classes-9-to-12-code-417-843` · 12-14 months (48-56 weeks), or the full Class 9-12 board track · Complete Beginner to CBSE AI Board Topper + Industry-Ready AI Developer

- PHASE 1: CBSE AI Foundation (Code 417 syllabus, Months 1-3, Weeks 1-13) Complete mastery of the CBSE AI 417 syllabus - Employability Skills, Introduction to AI, AI Project Cycle basics, Neural Networks and Python for AI. This is the Class 10 board syllabus, and the right foundation for a Class 9 student now that CBSE has discontinued AI 417 at Class 9. Every student builds a rock-solid foundation regardless of prior coding experience.
  - Month 1: Employability Skills + Introduction to AI (CBSE Unit 1-3)
  - Employability Skills Part 1: Communication & Self-Management (CBSE Mandatory Unit)
  - Employability Skills Part 2: ICT, Entrepreneurial & Green Skills
  - Introduction to Artificial Intelligence (CBSE Unit 1, Subject Specific)
  - AI Project Cycle, Deep Dive (CBSE Core Unit)
  - Month 2: Python Programming for AI (CBSE Unit 3)
  - Python Basics (CBSE-aligned + Industry Level)
  - Python Control Flow & Data Structures
  - NumPy & Pandas, Data Handling for AI (CBSE Class 11 AI Unit)
  - Data Visualization, Matplotlib, Seaborn (CBSE Class 11 AI)
  - Month 3: AI Domains Deep Dive + Neural Networks Intro (CBSE Class 10)
  - Data Science Domain (CBSE Class 10 Unit 4)
  - Computer Vision Domain (CBSE Class 10 Unit 5)
  - Natural Language Processing Domain (CBSE Class 10 Unit 6)
  - Neural Networks Introduction (CBSE Class 10 Unit 7)
  - CBSE Class 9-10 AI Board Practical File + Viva Prep
- PHASE 2: CBSE Class 10 AI (417) Board Mastery + Advanced Projects (Months 4-6, Weeks 14-26) Complete the CBSE Class 10 AI (Code 417) board syllabus mastery with extensive project work, practical file completion, mock exams, and competition preparation. Build 20+ industry-grade projects.
  - Month 4: Advanced Data Science Projects
  - End-to-End Data Science Projects
  - Advanced Computer Vision Projects
  - Month 5: Advanced NLP + Generative AI
  - Advanced NLP & Chatbot Engineering
  - Generative AI & Prompt Engineering (2026-27 CBSE emerging topic)
  - Month 6: CBSE Class 10 Board Final Prep + Capstone
  - CBSE Class 10 AI Board Full Revision + Sample Papers
  - Class 10 Grand Capstone + Practical File Completion
  - Mock Board Exam + Competition Launch
- PHASE 3: CBSE Class 11 AI (Code 843), Machine Learning Deep Dive (Months 7-9, Weeks 27-39) Complete CBSE Class 11 Artificial Intelligence (Subject Code 843) syllabus with industry-grade ML engineering skills. Includes Capability Approach, Sustainable Development, Foundational Python, Data Visualization, AI Frameworks, Statistical Data, Computer Vision, Storytelling through Data.
  - Month 7: CBSE AI 843 Class 11 Units 1-4
  - Capability Approach + Sustainable Development (CBSE AI 843 Unit 1)
  - Communication Skills + AI Review + Python Foundation (CBSE Units 2-3)

    - Data Literacy, Data Visualization & Statistical Data (CBSE Unit 4)
    - Month 8: CBSE AI 843 Class 11 Units 5-7 (Frameworks, CV, ML)
    - AI Frameworks & Tools (CBSE Class 11 Unit 5)
    - Computer Vision Advanced (CBSE Class 11 Unit 6)
    - Machine Learning Algorithms Mastery (CBSE Unit 7)
    - Month 9: Class 11 AI Board Prep + Storytelling + Competitions
    - Storytelling Through Data (CBSE Class 11 Unit 8)
    - Class 11 AI Board Revision + Pre-Board
    - Class 11 Capstone + Competition Deployment
- PHASE 4: CBSE Class 12 AI (843), Deep Learning, NLP, Career Launch (Months 10-12, Weeks 40-52) Complete CBSE Class 12 AI (Code 843) syllabus including Capstone Project, Data Science, CV, NLP, Model Evaluation, AI Ethics. Parallel industry-grade Deep Learning, Transformers, LLMs, and career-launch for college + internships.
    - Month 10: CBSE Class 12 AI Units 1-4
    - Communication Skills Advanced + Self-Mgmt + Entrepreneurship (CBSE Units 1-2)
    - Capstone Project (CBSE Class 12 Unit 3), Official Board Project
    - Data Science Advanced + Statistical ML (CBSE Class 12 Unit 4)
    - Month 11: Deep Learning + Transformers + LLMs (CBSE Units 5-6 Extended)
    - Deep Learning Mastery, CNNs, RNNs, LSTMs (CBSE Class 12 Unit 5)
    - Transformers, LLMs & Modern AI (CBSE Class 12 Unit 6 extended)
    - Month 12: CBSE Class 12 Board Finals + Career Launch
    - CBSE Class 12 AI Board Revision + Pre-Board
    - Final Board Readiness + Viva Mastery
    - College, Internship & Career Launch
    - Graduation & Final Showcase

Projects students build: Write a 500-word reflective essay on 'AI in my life'; Create a SMART goals worksheet for the AI course; Group presentation: 'Barriers to communication in AI teams'; Set up a cloud backup of your AI work (Google Drive); Interview a local entrepreneur (1-page report); Green AI poster, connect 3 SDGs to AI; AI Spotter, identify 50 AI systems in daily life; AI Timeline infographic (Canva); Debate: 'Narrow AI vs General AI, will we ever reach AGI?'; Apply the full 5-stage Project Cycle to a real school problem; Write a 10-page CBSE-format AI Project Report; Present project in board-exam viva style; BMI Calculator; Temperature converter; Interactive quiz on AI concepts - plus 66 more on the course page.

CCC Junior and Senior Preparation (Canadian Computing Competition)

`/courses/ccc-junior-and-senior-preparation-course` · A 24-week season, September to the CCC on Wednesday, February 17, 2027, joinable any month · Students roughly aged 13 to 18 who can write simple programs (Junior track) or are confident programmers ready for algorithms (Senior track)

- PHASE 1: The Shared Core (September and October, Weeks 1-8) Everything both tracks need: precise reading, exact input and output, and the loops, conditions, strings, lists and counting that the first CCC questions are built on.
    - Month 1: Contest Setup, Input and Output, Loops and Conditions
    - Weeks 1-2: How the CCC Works and First Problems
    - Weeks 3-4: Strings, Lists and Simple Counting
    - Month 2: Grids, Functions and First Ideas of Efficiency
    - Weeks 5-6: Two-Dimensional Grids and Functions
    - Weeks 7-8: How Fast Is Fast Enough?

- PHASE 2: Junior and Senior Tracks (November and December, Weeks 9-16) The tracks run in parallel in separate batches. Junior students build toward the hardest Junior question; Senior students build the algorithm families the Senior paper rewards.
  - Months 3-4, Junior Track: From Counting to Recursion and Efficient Algorithms
  - Weeks 9-10: Junior Questions 3 and 4 Skills
  - Weeks 11-12: Two-Dimensional Arrays in Depth
  - Weeks 13-14: Recursion
  - Weeks 15-16: Efficient and Insightful Algorithms
  - Months 3-4, Senior Track: Sorting, Searching, Counting, Graphs and Dynamic Programming
  - Weeks 9-10: Sorting and Searching
  - Weeks 11-12: Careful Counting and Mathematical Reasoning
  - Weeks 13-14: Graphs
  - Weeks 15-16: Dynamic Programming and the Hardest Questions
- PHASE 3: Contest Season (January and February, Weeks 17-24) Full timed mocks, contest craft and the CCC itself on Wednesday, February 17, 2027, followed by upsolving and a plan for what comes next.
  - Month 5: Mock Contests and Contest Craft
  - Weeks 17-18: Pacing a 3-Hour, 5-Question Paper
  - Weeks 19-20: Upsolving and Weak-Spot Repair
  - Month 6: Final Mocks, the CCC and Next Steps
  - Weeks 21-22: Final Mocks
  - Weeks 23-24: Contest Week and After

Projects students build: A personal starting profile: track choice, language choice and five solved warm-up problems; A counting and simulation problem set solved in full, with a written list of edge cases for each; A grid puzzle solver for an original problem, organized into clear functions; Solve one original problem three ways, from slow to fast, and time each version; Five original middle-level problems, each with a plain-word plan and a test list; An original region-counting problem solved with flood fill; Three recursion problems solved and explained in a short written note; Take a slow solution from earlier in the course and rewrite it to run within the limits; An original problem solved with binary search on the answer, with a written proof that it is fast enough; A greedy and counting problem pack with a short argument for each solution; An original routing problem solved with breadth-first search and then with Dijkstra's algorithm; Solve one original dynamic programming problem top-down and bottom-up, and compare; Two full 3-hour mocks, each followed by a written pacing review; A personal weak-spot plan with three topics, each with a problem set completed; A final mock with a written contest-day plan - plus 1 more on the course page.

Codex & Claude Code for Teens: AI Coding Agents Course

`/courses/codex-and-claude-code-ai-coding-agents-course-for-teens` · 24 classes (12 weeks · 2 classes/week) · Beginner-friendly (ages 13-18) to confident AI-agent builder

- Phase 1: Foundations of AI Coding Agents Understand what AI coding agents are, install both Codex and Claude Code, learn to keep them safe with approval modes, and complete your very first real coding task.
  - Class 1: What Are AI Coding Agents? (Codex vs Claude Code)
  - Class 2: Installing & Setting Up Claude Code
  - Class 3: Installing & Using the OpenAI Codex CLI
  - Class 4: Staying in Control with Approval & Permission Modes
  - Class 5: Your First Real Task in Both Agents
- Phase 2: Your Daily Coding Workflow Learn the everyday moves: slash commands, planning before building, editing and diffs, running tests and git, teaching the agent your project, and undoing mistakes.

    - Class 6: Slash Commands & Steering Your Session
    - Class 7: Plan Mode & Goal Mode, Think Before You Build
    - Class 8: Reading, Editing & Reviewing Code Changes
    - Class 9: Running Commands, Tests & Git from the Agent
    - Class 10: Project Memory, CLAUDE.md & AGENTS.md
    - Class 11: Checkpoints, Rewind, Undo & Resuming Sessions
- Phase 3: Extending & Connecting Your Agents Supercharge both agents: connect external tools with MCP, build skills and plugins, create subagents, automate with hooks, choose models and reasoning effort, and code from screenshots.
    - Class 12: Connecting External Tools & Data with MCP
    - Class 13: Skills, Custom Commands & Codex Plugins
    - Class 14: Subagents, Your Specialist Team
    - Class 15: Hooks & Automation
    - Class 16: Models & Reasoning Effort
    - Class 17: Multimodal Coding from Screenshots & Images
- Phase 4: Cloud, Collaboration & Scale Go beyond your laptop: delegate tasks to Codex Cloud, use Claude Code on web and mobile, get automatic GitHub code reviews, and run several agents at once.
    - Class 18: Codex Cloud, Delegating Tasks That Run for You
    - Class 19: Claude Code Everywhere, on Web, Desktop, and Mobile
    - Class 20: GitHub Integration & Automatic Code Review
    - Class 21: Parallel Agents, Worktrees & /batch
- Phase 5: Build, Secure & Ship Bring it together: automate with the SDKs, code safely with sandboxes and permissions, and ship a real capstone app, then earn your certificate.
    - Class 22: Building With the SDKs (Agent SDK & Codex SDK)
    - Class 23: Security, Sandboxing & Responsible AI Coding
    - Class 24: Capstone, Ship a Real App + Certification

Projects students build: Make a one-page 'Codex vs Claude Code' comparison sheet in your own words, listing 3 things each is great at; Install Claude Code, start a session in an empty folder, and ask it to create a hello.html page that says your name; Install Codex, run codex doctor, then have Codex add a new section to your hello.html from Class 2; Run the same small task ('add a footer to hello.html') in plan mode first, review the plan, then approve and apply it; Add two new features to the to-do app, one with Claude Code, one with Codex, and note which felt easier; Create a personal cheat-sheet of your 10 most-used slash commands across both tools; Use Plan Mode to design a 'dark mode toggle' for a web page, review the plan, then let the agent build it; Have an agent refactor a messy function and walk you through the diff line-by-line; Build a tiny feature, have the agent write a test for it, run the test, and commit when it passes; Write a CLAUDE.md and an AGENTS.md for your to-do app describing how to run it and your code style; Make a risky change, dislike it, and use /rewind to go back cleanly; Connect one MCP server to each agent and have the agent use it to fetch real information; Create a Claude Code custom command (like /newpage that scaffolds an HTML page) and a Codex profile for your project; Create a 'code-reviewer' subagent and have it review your to-do app; Add a PostToolUse hook that runs a formatter after the agent edits a file - plus 9 more on the course page.

Codex & Claude Code: AI Coding Agents for Professionals

`/courses/codex-and-claude-code-ai-coding-agents-masterclass-for-adults-professionals` · 24 classes (12 weeks · 2 classes/week) · Beginner to advanced, for working professionals, career switchers & developers

- Phase 1: Foundations of AI Coding Agents Understand the agentic-coding landscape, install and configure both Codex and Claude Code, master the approval/permission models, and complete your first real engineering task.
    - Class 1: The Agentic Coding Landscape (Codex vs Claude Code)

    - Class 2: Installing & Configuring Claude Code
    - Class 3: Installing & Configuring the OpenAI Codex CLI
    - Class 4: Approval & Permission Models (Safety Backbone)
    - Class 5: Your First Real Engineering Task in Both Agents
- Phase 2: Your Daily Engineering Workflow Build a fast, reliable daily loop: slash commands, planning, reviewing diffs, running tests and git, teaching the agent your codebase, and recovering with checkpoints.
    - Class 6: Slash Commands & Session Control
    - Class 7: Plan Mode & Goal Mode
    - Class 8: Diffs, Multi-File Edits & Review Discipline
    - Class 9: Running Tests, Commands & Git from the Agent
    - Class 10: Project Memory, CLAUDE.md & AGENTS.md
    - Class 11: Checkpoints, Rewind & Session Management
- Phase 3: Extending & Connecting Your Agents Make the agents fit your stack: connect tools via MCP, build skills/plugins, deploy subagents, automate with hooks, tune models and reasoning effort, and feed visual context.
    - Class 12: Connecting Tools, Data & Services with MCP
    - Class 13: Skills, Custom Commands & Codex Plugins
    - Class 14: Subagents, Specialized and Isolated Helpers
    - Class 15: Hooks & Workflow Automation
    - Class 16: Models, Reasoning Effort & Context
    - Class 17: Multimodal Inputs, Visual Context
- Phase 4: Cloud, Collaboration & Scale Operate beyond a single machine: delegate to Codex Cloud, use Claude Code across surfaces, integrate AI code review into GitHub/CI, and orchestrate parallel agents.
    - Class 18: Codex Cloud, Parallel Tasks & Auto-PRs
    - Class 19: Claude Code Across Surfaces (Web, Desktop, Mobile, Background)
    - Class 20: GitHub Integration & AI Code Review at Scale
    - Class 21: Parallel Agents, Worktrees, /batch & Teams
- Phase 5: Build, Secure & Ship Operationalize agents: automate with the SDKs, harden security for teams, and deliver a production-grade capstone, then certify.
    - Class 22: Building With the SDKs (Claude Agent SDK & Codex SDK)
    - Class 23: Security, Sandboxing & Governance for Teams
    - Class 24: Capstone, Ship a Production-Grade Build + Certification

Projects students build: Write a one-page internal brief: 'Codex vs Claude Code: where we'd use each' for a hypothetical team; Install Claude Code, configure a project .claude/settings.json, and run your first task in a real repo; Install Codex, create a ~/.codex/config.toml with a custom profile, and complete a task in workspace-write mode; Author a restrictive permission/approval policy for both tools and prove a blocked action is denied; Resolve the same issue with each agent and write a short comparison of edit quality and effort; Create a personal/team reference of the 12 most-used commands across both tools with examples; Use Plan Mode to design a non-trivial change (e.g., add pagination to an API) and execute the approved plan; Have an agent refactor a legacy function and review every hunk, rejecting anything out of scope; Implement a feature TDD-style with the agent: failing test → implementation → green → commit; Write production-quality CLAUDE.md and AGENTS.md for a real repo, including review guidelines; Run a risky refactor, reject the outcome, and recover cleanly via /rewind plus git; Connect a real MCP server (e.g., a database or docs server) to both agents and complete a task using it; Build a Claude Code skill that automates a repeatable workflow and a Codex profile for a project; Create code-reviewer and test-writer subagents and use them on a real change; Implement a PostToolUse format+lint hook and a PreToolUse guard that blocks force-push - plus 9 more on the course page.

Coding for Kids: Scratch to Games, Apps and AI

`/courses/kids-coding-blocks-masterclass` · 10-12 months (40-48 weeks) · Complete beginner, ages 6 to 12 (batches grouped by age)

- PHASE 1: Scratch from Zero to Real Games (Months 1-3, Weeks 1-12) Scratch is where children discover that they can command a computer. From first animation to complete games with menus, levels and scores.
  - Month 1: First Steps in Scratch
  - Welcome to Coding
  - Motion and Animation
  - Events and Interactivity
  - First Game Logic
  - Month 2: Think Like a Coder
  - Loops and Patterns
  - Variables: Numbers That Remember
  - Lists and Inventories
  - Puzzle Week on Code.org
  - Month 3: Real Games, Properly Built
  - Clone the Classics I
  - Clone the Classics II: Platformers
  - What Makes Games Fun?
  - Scratch Showcase
- PHASE 2: New Worlds: Arcade, micro:bit and Mobile Apps (Months 4-6, Weeks 13-24) The skills from Scratch travel: arcade games in MakeCode, inventions on a simulated micro:bit, and real mobile apps built in MIT App Inventor.
  - Month 4: MakeCode Arcade and micro:bit
  - MakeCode Arcade Basics
  - MakeCode Arcade: Enemies and Effects
  - micro:bit Inventions
  - Blockly Puzzle Gym
  - Month 5: Build Real Mobile Apps
  - MIT App Inventor Basics
  - Apps with Camera, Voice and Drawing
  - Games on the Phone
  - App Capstone: An App for Your Family
  - Month 6: Stories, Worlds and the Phase Capstone
  - Digital Storytelling
  - What Is AI, Really?
  - Teachable Machine Projects
  - Phase 2 Capstone and Review
- PHASE 3: Minecraft, Roblox and AI (Months 7-8, Weeks 25-32) Coding inside the worlds kids already love: Minecraft Education, Roblox Studio with first Lua scripts, 3D design, and AI models they train themselves.
  - Month 7: Minecraft and Roblox
  - Coding in Minecraft Education
  - Roblox Studio: First Worlds
  - Roblox: First Lua Scripts

    - Data Detective
    - Month 8: 3D Worlds and Your Own AI
    - Tinkercad 3D Design
    - VR and AR Worlds in CoSpaces
    - AI Inside Your Games
    - Phase 3 Capstone
- PHASE 4: The Bridge to Real Code (Months 9-10, Weeks 33-40) The step every parent asks about, done gently and properly: from blocks to first typed Python, a first web page, and a final capstone with a real exam.
    - Month 9: First Typed Code
    - From Blocks to Text
    - First Python with Turtle
    - My First Web Page
    - Creator Habits
    - Month 10: Capstone and Demo Day
    - Capstone Planning
    - Capstone Build
    - Demo Day and What Comes Next

Projects students build: Animated greeting card; Pet animation with sounds; Interactive 'About Me' project; Animated story with 3 scenes; Dancing party animation; Virtual pet that moves and makes sounds; Interactive quiz game; Virtual piano/musical instrument; Dress-up game with clickable items; Catch the falling objects game; Simple maze game; Whack-a-mole style game; Number guessing game; Geometric art generator; Pattern-based puzzle game - plus 97 more on the course page.

College Math Placement Test Prep: ALEKS, ACCUPLACER, TSIA2, CLEP

`/courses/college-math-placement-test-prep-course` · 4 months (16 weeks), joinable any month; shorter focused plans are possible 1-on-1 when a test date is close · Students aged 15 and up, including adults returning to study, from rusty arithmetic to precalculus-level functions

- PHASE 1: Number and Arithmetic Rebuilt (Month 1, Weeks 1-4) Everything later depends on number sense. Adults returning to study often find this month the turning point.
    - Month 1: Fractions, Percents, Ratios and Exponents
    - Weeks 1-2: Which Test, a Diagnostic, and Fractions and Decimals
    - Weeks 3-4: Percents, Ratios, Signed Numbers and Exponents
- PHASE 2: Algebra Core, Statistics and Geometry (Months 2-3, Weeks 5-12) The algebra at the heart of every placement test, plus the statistics and geometry that QAS and TSIA2 include.
    - Month 2: Expressions, Linear Equations, Inequalities and Systems
    - Weeks 5-6: Expressions and Linear Equations
    - Weeks 7-8: Inequalities, Systems and Linear Applications
    - Month 3: Polynomials, Quadratics, Radicals, Statistics and Geometry
    - Weeks 9-10: Polynomials, Factoring and Quadratics
    - Weeks 11-12: Statistics, Probability and Geometry
- PHASE 3: Functions and Test Formats (Month 4, Weeks 13-16) The function topics that decide higher placements, then format training for the student's own test.
    - Month 4: Functions, Exponentials, Logarithms and Timed Practice

- Weeks 13-14: Functions, Exponentials and Logarithms
- Weeks 15-16: Test-Format Training and Final Review

Projects students build: A personal study map: test, college, target course and topic list; A real-life math sheet: a budget, a recipe scaled up and a sale price worked out; Model three real situations with linear equations and graph them; A phone-plan comparison solved as a system of equations; A factoring strategy card the student builds from their own worked examples; Summarize a small real data set and write a short interpretation; A function gallery: eight function types graphed and described by the student; A personal test-day plan for the student's own test.

College Maths Course: Calculus, Linear Algebra to Analysis

`/courses/college-mathematics-complete-masterclass` · 10-12 months per track (3 tracks, joinable any month) · College and university students; placement by current course and semester

- PHASE 1: Track 1, Calculus and Linear Algebra (One Academic Year) The first-year core: limits to integrals, vectors to eigenvalues, the craft of proof, and multivariable calculus, built with intuition before rigor.
  - Months 1-2: Single Variable Calculus I
  - Limits and Continuity
  - Differentiation
  - Applications of Derivatives
  - Integration Fundamentals
  - Months 3-4: Calculus II and Linear Algebra I
  - Advanced Integration Techniques
  - Sequences and Series
  - Linear Algebra: Vectors and Matrices
  - Systems of Linear Equations
  - Mathematical Proof Writing
  - Months 5-6: Advanced Linear Algebra and Vector Calculus
  - Eigenvalues and Eigenvectors
  - Vector Spaces and Linear Transformations
  - Multivariable Functions and Partial Derivatives
  - Optimization and Vector Fields
  - Track 1 Exam
- PHASE 2: Track 2, Differential Equations, Discrete Maths and Probability (One Academic Year) The methods year every engineering and science degree leans on: multiple integration, ODEs and Laplace transforms, discrete mathematics, and probability and statistics done properly.
  - Months 1-2: Multiple Integration and ODEs
  - Double and Triple Integrals
  - Line and Surface Integrals
  - First-Order Differential Equations
  - Higher-Order Linear ODEs
  - Laplace Transforms
  - Months 3-4: Discrete Mathematics
  - Set Theory and Relations
  - Combinatorics
  - Graph Theory

- Number Theory
- Boolean Algebra and Logic
- Months 5-6: Probability, Statistics and the Track Exam
- Probability Theory
- Joint Distributions and Limit Theorems
- Statistical Inference
- Stochastic Processes
- Track 2 Exam

- PHASE 3: Track 3, Analysis, Algebra and Beyond (One Academic Year) Where mathematics becomes a discipline: real analysis, abstract algebra, topology and complex analysis, rigorous but humane, intuition drawn before every epsilon.
  - Months 1-3: Real Analysis
  - Metric Spaces and Sequences
  - Limits and Continuity in R^n
  - Differentiation Theory
  - Riemann Integration
  - Sequences and Series of Functions
  - Months 4-6: Abstract Algebra
  - Group Theory
  - Ring Theory
  - Field Theory
  - Linear Algebra (Abstract)
  - Months 7-10: Topology, Complex Analysis and the Track Exam
  - General Topology
  - Complex Analysis
  - Advanced Complex Analysis
  - Track 3 Capstone and Exam

Projects students build: Epsilon-delta proof visualizer; Limit calculator implementation; Continuity explorer interactive tool; Derivative visualizer application; Automatic differentiation engine; Physics motion simulator; Optimization problem solver; Curve sketching software; Newton's method visualizer; Riemann sum visualizer; Numerical integration calculator; Volume calculator for solids of revolution; Advanced integration solver; Numerical methods comparison tool; Physics applications simulator - plus 108 more on the course page.

Competitive Programming Course: Codeforces to ICPC

`/courses/competitive-programming-masterclass-college` · 10-12 months (44-52 weeks) · Complete beginner (18+); college students, graduates and working professionals

- PHASE 1: Foundation & Problem Solving Basics (Months 1-2, Weeks 1-8) Build strong foundations in C++ STL, basic algorithms, and develop problem-solving mindset.
  - Month 1: C++ Mastery & Basic Algorithms
  - C++ STL & Fast I/O
  - Time Complexity & Basic Algorithms
  - Basic Data Structures
  - Recursion & Backtracking
  - Month 2: Mathematics & Number Theory

    - Number Theory Fundamentals
    - Combinatorics & Probability
    - Bit Manipulation Mastery
    - Sorting & Searching Advanced
    - Month 3: Trees, Graphs & Dynamic Programming
    - Tree Algorithms
    - Graph Algorithms Fundamentals
    - Shortest Paths & MST
    - Dynamic Programming Basics
- PHASE 2: Advanced Algorithms & Contest Strategy (Months 3-4, Weeks 9-17) Master advanced algorithms, dynamic programming patterns, and develop contest-winning strategies.
    - Month 4: Advanced Dynamic Programming
    - DP Optimization Techniques
    - Bitmask DP & DP on Trees
    - String Algorithms
    - Advanced Graph Algorithms
    - Game Theory
    - Month 5: Data Structures & Optimization
    - Advanced Data Structures
    - Computational Geometry
    - Advanced Number Theory
    - Optimization & Heuristics
    - Interactive & Randomized
    - Month 6: Contest Mastery & Peak Performance
    - Contest Strategy & Time Management
    - Speed Programming & Templates
    - Team Programming (ICPC Style)
- PHASE 3: Expert Techniques & Peak Performance (Months 7-9, Weeks 27-39) Master expert-level algorithms, specialized topics, and achieve competitive programming excellence.
    - Months 7-8: Expert Algorithms & Techniques
    - FFT & Polynomial Algorithms
    - Linear Algebra in CP
    - Advanced String Structures
    - Advanced Graph Theory
    - Approximation Algorithms
    - Month 9: Peak Performance & Contests
    - Research & Cutting Edge
    - Competition Preparation
    - Career & Opportunities
- PHASE 4: The Finale (Month 10, Weeks 40-44) The capstone month: spec, build, ship and defend, then the final exam that decides the certificate.
    - Month 10: Capstone and the Final Exam

- Capstone Spec and Setup
- Capstone Build
- Ship and Polish
- Demo Day and the Final Exam

Projects students build: CP template creation; STL practice problems set; Fast I/O benchmarking; Complexity analyzer tool; Algorithm visualization; Problem approach templates; Data structure library; Custom implementations; Performance comparison tool; Backtracking solver framework; Optimization comparisons; Contest problem generator; Number theory library; Prime utilities toolkit; Modular arithmetic calculator - plus 88 more on the course page.

Competitive Programming for Teens: ZCO, INOI and USACO Track

`/courses/competitive-programming-for-teens-course` · 6 months (24 weeks), joinable any month · Teens aged 13 to 18 who can already write basic programs and want contest-level problem solving

- PHASE 1: Foundations and Core Data Structures The tools every contest problem assumes you already have, built until they are automatic.
  - Month 1: Complexity, Arrays and Strings
  - Setup, Judges and Big-O
  - Arrays, Sorting and Binary Search
  - Prefix Sums, Strings and Number Theory Basics
  - Stacks, Queues and the Standard Library
  - Month 2: Recursion, Backtracking and First Graphs
  - Recursion and Backtracking
  - Graph Representation, BFS and DFS
  - Greedy Algorithms
  - Contest Technique
- PHASE 2: The Core Algorithm Families The material that separates a zonal qualifier from a national-level contestant.
  - Month 3: Dynamic Programming
  - Introduction to Dynamic Programming
  - Knapsack and Grid DP
  - DP on Sequences and Intervals
  - Weighted Graphs and Shortest Paths
- PHASE 3: Contest Mastery and Olympiad Preparation Harder problems and the discipline that turns knowledge into a rank.
  - Months 4 to 6: Advanced Topics and Full Contests
  - Advanced Structures and Techniques
  - Olympiad-Style Problem Sets
  - Full Contests, Upsolve and Peak Form

Projects students build: Submit your first ten problems and read every verdict, including the failures; Solve a set of problems where binary search on the answer is the intended solution; Build a small library of your own tested helper functions; Solve a monotonic stack problem and explain why the stack is the right structure; Solve a classic constraint problem with backtracking and measure the effect of each pruning rule; Model a described real-world scenario as a graph and solve it with BFS; Solve an interval-scheduling set and write a short argument for why the greedy rule works; A full contest run with a written post-mortem of every decision; Solve the same problem both top-down and bottom-up and compare; Solve a knapsack variant and reconstruct the chosen items; Implement LIS in both the quadratic and the faster

form and compare on large input; Solve a routing problem with Dijkstra and justify the data structures chosen; Implement a segment tree from scratch and use it on a real range-query problem; Complete full past sets under time and grade them honestly; A full contest every week with a written post-mortem.

Computer Science Class 11-12: CBSE Python & ICSE/ISC Java

`/courses/cbse-icse-computer-science-class-11-12-python-java-complete-course` · 24 months (Class 11 + Class 12, the full 2-year board cycle), joinable any month · Class 11 Beginner to Class 12 Board Exam Ready

- PHASE 1: Class 11 Semester 1, Computer Fundamentals & Programming Foundations (Months 1-5) Build rock-solid fundamentals in computer science theory and start your programming journey. CBSE students begin with Python, ISC students begin with Java. Both batches cover computer organization, number systems, and Boolean logic.
  - Month 1: Computer Systems & Organization
  - Computer System Overview & Hardware
  - Software, Operating Systems & Encoding
  - Number Systems & Conversions
  - Boolean Logic & Encoding Schemes
  - Months 2-3: Programming Foundations (Python for CBSE / Java for ISC)
  - Months 4-5: Functions, Strings & Data Handling
- PHASE 2: Class 11 Semester 2, Advanced Concepts, Ethics & Practicals (Months 6-10) Complete remaining Class 11 syllabus topics, prepare practical file with 20+ programs, work on project, and build exam readiness.
  - Months 6-7: Society, Law, Ethics & Advanced Topics
  - Society, Law and Ethics, Digital Citizenship (CBSE) / Computing Trends (ISC)
  - CBSE: Advanced Python Concepts / ISC: File Handling & Packages in Java
  - Practical File Preparation, Project Work & Class 11 Exam Prep
- PHASE 3: Class 12 Semester 1, Advanced Programming, File Handling & Data Structures (Months 11-17) Deep dive into Class 12 core topics: advanced programming, file handling, data structures, sorting and searching algorithms. This is the highest-weightage section in board exams.
  - Months 11-12: Advanced Functions, Exception Handling & File Handling
  - Months 13-14: Sorting, Searching & Algorithm Efficiency
- PHASE 4: Class 12 Semester 2, SQL, Networks, Connectivity & Board Exam Mastery (Months 18-24) Complete the remaining Class 12 syllabus: SQL and databases, computer networks, Python-MySQL connectivity, then intensive board exam preparation with mock tests and revision.
  - Months 18-19: Database Management & SQL
  - Database Concepts & SQL Fundamentals
  - SQL DDL & DML Commands
  - SQL DQL, SELECT Queries, Clauses & Functions
  - SQL Joins, Functions & Advanced Queries
  - Boolean Algebra & Karnaugh Maps (ISC Class 12, runs parallel to SQL for CBSE)
  - Months 20-21: Computer Networks & Python-MySQL Connectivity
  - Computer Networks, Complete Chapter (CBSE & ISC)
  - Network Topologies, Protocols & Web Technologies
  - Network Security & Python-MySQL Connectivity (CBSE)
  - Months 22-24: Board Exam Preparation, Intensive Revision & Mock Tests
  - Practical File Completion & Project Submission Preparation
  - Chapter-Wise Revision, Programming Topics

- Chapter-Wise Revision, SQL, Networks & Theory
- Mock Board Exams, Set 1 & 2
- Mock Board Exams, Set 3, 4 & 5 + Previous Year Paper Analysis
- Final Revision & Last-Minute Board Exam Tips

Projects students build: Create an illustrated computer system diagram with all components labeled; Memory hierarchy comparison chart with speed, cost, and capacity; Research report: Evolution of processors from Intel 4004 to latest chips; Software classification mind map with 20+ real-world examples; OS comparison: Windows vs Linux vs macOS, features and use cases; Install and explore Linux (Ubuntu) in a virtual machine; Number system converter calculator (manual worksheet with 50 conversions); Color code converter: RGB decimal to hexadecimal; Binary arithmetic drill, 30 addition and subtraction problems; Truth table generator for any 2-3 variable Boolean expression; Gate diagram drawing practice, 10 circuits; Encoding explorer: Convert your name to ASCII, Unicode values; Personal bio generator, takes name, age, hobby as input and formats output; Simple calculator, add, subtract, multiply, divide two numbers; Temperature converter, Celsius to Fahrenheit and vice versa - plus 130 more on the course page.

Copilot Studio Agent Masterclass for Professionals

`/courses/ai-agents-with-microsoft-copilot-studio-masterclass-for-professionals` · 24 classes (12 weeks · 2 classes/week) · Intermediate to advanced (working professionals; no prior agent experience assumed, business software fluency expected)

- Phase 1: Platform & Foundations Map the 2026 agent landscape, learn the anatomy of a Copilot Studio agent, build instruction and testing discipline, and make the model and harness decisions that shape cost and capability.
  - Class 1: The 2026 Agent Landscape and Where Copilot Studio Sits
  - Class 2: Agent Anatomy and Instruction Discipline
  - Class 3: Testing Like It Is Already in Production
  - Class 4: Models and Harnesses: The Decisions Underneath Everything
- Phase 2: Enterprise Knowledge Ground agents in enterprise sources at scale: SharePoint, Dataverse, documents and connector-indexed data, tenant graph grounding, curation strategy, and accuracy audits an auditor would accept.
  - Class 5: Grounding Strategy: The Knowledge Source Estate
  - Class 6: SharePoint and Documents Done Right
  - Class 7: Dataverse, Connector-Indexed Data and Tenant Graph Grounding
  - Class 8: Accuracy Audits and Honest Agents
- Phase 3: Orchestration & Tools Design conversations for critical paths, choose orchestration modes deliberately, then master the full tool surface: Prompt tools, agent flows, connectors, custom connectors and REST, Model Context Protocol under DLP, computer use with guardrails, and deep reasoning.
  - Class 9: Topics for Critical Paths
  - Class 10: Generative Orchestration, Deliberately
  - Class 11: Prompt Tools and Agent Flows
  - Class 12: The Connector Estate: Standard, Premium, On-Premises, Custom, REST
  - Class 13: Model Context Protocol Under Enterprise Governance
  - Class 14: Computer Use and Deep Reasoning: The Power Tools
- Phase 4: Autonomy, Multi-Agent & Quality Ship agents that act on their own and prove they work: event triggers under the maker-credentials rule, hardening, multi-agent architectures with A2A, agent evaluations, analytics, and full cost management in Copilot Credits.
  - Class 15: Event Triggers and Autonomous Agents
  - Class 16: Hardening Autonomy: Approval Pauses and Failure Design

    - Class 17: Multi-Agent Architecture and the A2A Protocol
    - Class 18: Agent Evaluations: Quality You Can Prove
    - Class 19: Analytics: Outcomes, CSAT and the Cost Savings Metric
    - Class 20: Cost Management: Copilot Credits Without Surprises
- Phase 5: Governance, Rollout & Capstone Master the governance layer that makes agents deployable: Entra Agent ID, Conditional Access, DLP, Microsoft Agent 365 and the Agent Store, then ship a production capstone with the governance and ROI pack to defend it.
    - Class 21: Identity and Policy: Entra Agent ID, Conditional Access, DLP
    - Class 22: The Agent Estate: Microsoft Agent 365, the Agent Store, and Rollout
    - Class 23: Capstone Build Week
    - Class 24: Capstone Defence and the Credential Road

Projects students build: Write the one-page 'agent opportunity memo' for your organisation: three candidate processes, the data each would need, the risks each carries, and which one becomes your capstone; Build 'Policy Desk v1': an internal FAQ agent for one real policy area of your workplace, with a complete instruction stack and five tested refusals; Build the permanent 25-question test set for Policy Desk, including five adversarial probes, with expected behaviour written before the first run; Run your Policy Desk test set against two GA models (one OpenAI, one Anthropic), score the differences, and write the one-paragraph model decision with evidence attached; Ground Policy Desk in a real SharePoint site (or a mirrored practice copy) and prove ten answers cite the correct policy paragraph; Rebuild one messy real document into a retrieval-optimised version, ground both versions side by side, and publish the before-and-after accuracy comparison; Add a second source type to Policy Desk (Dataverse table or connector-indexed source), then document the arbitration behaviour with five conflict questions; Run the full 25-answer accuracy audit on Policy Desk and publish the result as a one-page report with examples, methodology and a remediation list; Build 'Support Triage v1': a customer-facing agent with three designed topics (report an issue, check status, escalate to human), entities capturing the details, and an adaptive card summary; Migrate Support Triage to generative orchestration, rerun the full test set, and publish the behaviour-change log with a keep-or-fix verdict per change; Build 'Expense Helper': conversation collects an expense claim, an agent flow validates it, routes it for approval, and returns the outcome, with tested error paths for every step; Wire one real connector tool and one REST or custom connector tool into a practice agent, and demonstrate a conversation that reads and writes live data through both; Add an MCP server to a practice agent, disable every tool you do not need, and document the resulting capability surface as a one-page security note; Build a governed computer-use demo: one legacy-UI task automated with allow-lists, HTTPS enforcement and human supervision configured, plus a per-run credit cost estimate; Build 'Weekly Reporter': an autonomous agent on a Recurrence trigger that compiles a weekly status summary from real sources and posts it for review, never directly to stakeholders - plus 9 more on the course page.

Creative Coding and Animation: Video, Motion and p5.js

`/courses/creative-coding-animation-mastery` · 5-6 months (20-24 weeks) · Beginner friendly, ages 13 to adult

- Month 1: Creative Foundations & Video Editing Basics Master design principles, animation fundamentals, and professional video editing.
    - Design Principles & Digital Art Basics
    - Animation Principles & 2D Basics
    - Video Editing Fundamentals
    - Mobile Video Editing & Quick Content
- Month 2: Motion Graphics & After Effects Mastery Master motion design, visual effects, and professional animation techniques.
    - After Effects Fundamentals
    - Advanced Motion Graphics
    - Character Animation & Rigging

    - Visual Effects & Compositing
- Month 3: Creative Coding & Interactive Media Master creative programming with Processing, p5.js, and interactive installations.
    - Processing Fundamentals
    - p5.js and Web-Based Creative Coding
    - Interactive Installations & Physical Computing
    - Creative Coding Applications
- Month 4: Blender 3D and Short-Form Craft Three weeks of honest Blender fundamentals, then the short-form editing craft that makes work travel.
    - 3D Animation Fundamentals with Blender
    - Character Animation & Rigging in 3D
    - Advanced VFX & Compositing
    - Short-Form Video Craft
- Month 5: Channel, Portfolio and the Finale Long-form storytelling, honest analytics, a portfolio that opens doors, and the final capstone exam.
    - Long-Form Video and Storytelling
    - Publishing Strategy and Honest Analytics
    - Portfolio Development & Personal Branding
    - Capstone, Demo Day and Final Exam

Projects students build: Personal Brand Identity: Logo, color palette, style guide; Mood Board Collection: 5 different aesthetic mood boards; Social Media Template Set: Consistent design templates; Bouncing Ball Animation: Master timing and physics; Character Walk Cycle: Create smooth character movement; Animated Logo Reveal: Bring brand to life; Day in Life Vlog: Edit personal vlog footage; Product Commercial: 30-second product showcase; Music Video Edit: Sync video to music; Instagram Reels Series: 5 trending reels; YouTube Shorts Collection: Engaging short-form content; Animated Title Sequence: Professional title animation; Kinetic Typography: Text-driven animation; Logo Animation Pack: Brand animations; Explainer Video: 2-minute animated explainer - plus 41 more on the course page.

Creative Media for Teens: Photo, Video and Design

`/courses/creative-media-design-masterclass-teens` · 8-10 months (32-40 weeks) · Beginner friendly, ages 13 to 18

- PHASE 1: The Creative Core (Months 1-6, Weeks 1-26) Photo editing, video production and graphic design, each learned to real competence with weekly critiqued builds.
    - Months 1-2: Creative Fundamentals & Photo Editing Basics
    - Introduction to Digital Creativity & Setup
    - Photoshop Fundamentals
    - Advanced Photo Manipulation
    - Mobile Photography & Editing
    - Months 3-4: Video Editing & Production Basics
    - Video Production Fundamentals
    - Premiere Pro Essentials
    - YouTube Content Creation
    - TikTok & Short-Form Content
    - Month 3-4 Review & Portfolio Building
    - Months 5-6: Graphic Design & Brand Creation

    - Illustrator & Vector Design
    - Social Media Design & Branding
    - Print Design & Merchandise
    - Web & UI Design Basics
    - Phase 1 Capstone Project
- PHASE 2: Advanced Craft and the Finale (Months 7-8, Weeks 27-32) Visual effects and real photography craft, then the portfolio capstone and the final exam.
    - Months 7-8: Effects, Light and the Portfolio
    - Advanced Video: Effects and Sound
    - Photography: Real Light, Any Camera
    - Portfolio Capstone
    - Demo Day and the Final Exam

Projects students build: Set up complete creative workstation; Create organized folder structure for projects; Design a personal creative brand/logo; Edit 10 personal photos to perfection; Design custom phone wallpapers; Create surreal photo manipulation artwork; Professional portrait retouching project; Design Instagram post templates; 30-day Instagram feed makeover; Mobile photography portfolio; Shoot and plan first short film (2-3 minutes); Create a day-in-my-life vlog; Record product review video; Edit a cinematic travel video; Create YouTube video with intro/outro - plus 27 more on the course page.

Cybersecurity Competitions for Teens: picoCTF and CyberPatriot Prep

`/courses/picoctf-cyberpatriot-cybersecurity-competition-prep-for-teens` · 6 months (24 weeks) · Beginner to intermediate, ages 13 to 18, no prior security experience needed

- PHASE 1: Foundations and Ethics (Months 1-2, Weeks 1-8) The shared foundations of both competitions, starting with the rules: what is allowed, what is not, and why that line matters.
    - Month 1: The White-Hat Agreement and the Linux Command Line
    - Weeks 1-2: Rules, Ethics and the Practice Lab
    - Weeks 3-4: Linux Command Line Essentials
    - Month 2: Windows Administration and Networking
    - Weeks 5-6: Windows Administration
    - Weeks 7-8: How Networks Move Data
- PHASE 2: System Hardening in the CyberPatriot Style (Months 3-4, Weeks 9-16) Defence under a clock: securing Windows and Linux systems against a scenario, answering forensics questions, learning network fundamentals and working as a team.
    - Month 3: Hardening Windows and Linux
    - Weeks 9-10: Hardening Windows
    - Weeks 11-12: Hardening Linux
    - Month 4: Network Fundamentals and Team Rounds
    - Weeks 13-14: Network Fundamentals and Server Roles
    - Weeks 15-16: Team Rounds
- PHASE 3: Capture-the-Flag Skills in the picoCTF Style (Months 5-6, Weeks 17-24) Puzzle-style security challenges on purpose-built practice platforms: encodings and ciphers, forensics, reading code, and how web and memory bugs are recognised and fixed, ending in a mock CTF.
    - Month 5: Cryptography and Forensics
    - Weeks 17-18: Encodings and Cryptography

- Weeks 19-20: Forensics
- Month 6: Reading Code, Bugs and Fixes, and a Mock CTF
- Weeks 21-22: Reading Code and Recognising Bugs
- Weeks 23-24: Mock CTF and the Road Ahead

Projects students build: Signed white-hat agreement and a working practice lab with a Linux virtual machine and a restore snapshot; Command line treasure hunt: an instructor-built set of files and folders with clues found only by using the right commands; Read-only Windows settings audit on your own computer: users, services and updates checked against a written checklist, nothing changed; Packet capture walkthrough: an annotated explanation of a provided capture from first packet to last; Personal Windows hardening checklist, checked read-only against your own computer's settings; Personal Linux hardening checklist, tested on your own Linux practice virtual machine; Small simulated network built and documented, with a subnetting worksheet; Full mock team round on your Linux practice virtual machines and written Windows scenarios, followed by a written team review; Cryptography challenge set solved on a practice platform, with a written solution for each; Forensics challenge set solved on a practice platform, with a written solution for each; Bug and fix notebook: for each practice challenge, the bug, how it was recognised and the code change that would fix it; Mock CTF on an instructor-built challenge set, followed by a polished solution portfolio.

Cybersecurity for Teens: Online Safety & White-Hat Defense

`/courses/cybersecurity-course-for-teens-ethical-defensive` · 6 months (24 weeks) · Beginner, ages 13 to 18, no coding required

- PHASE 1: The Digital World and Your Identity (Months 1-2, Weeks 1-8) You cannot secure what you do not understand. First the internet itself, then the single most attacked thing on it: your identity.
  - Month 1: How the Internet Actually Works
  - The Life of a Web Request
  - Networks Around You
  - Your Digital Footprint
  - Thinking Like a Defender
  - Month 2: Passwords, Hashing, and Proving Who You Are
  - How Passwords Fail
  - Hashing: Why Good Sites Never Store Your Password
  - Two-Factor Authentication and Beyond
  - Identity Theft and Scams That Target Teens
- PHASE 2: Attacks Recognized, Defenses Built (Months 3-4, Weeks 9-16) The two attack families that touch everyone: deception aimed at people, and malicious software aimed at machines. Recognition first, then working defenses.
  - Month 3: Phishing and Social Engineering
  - Anatomy of a Phishing Email
  - Beyond Email: Where Teens Actually Get Phished
  - The Psychology of Social Engineering
  - The Phish Detector Field Guide
  - Month 4: Malware Concepts and Safe Habits
  - The Malware Families
  - Defenses That Actually Work
  - Case Study: A Ransomware Outbreak, Read as Defenders
  - Hardening Your Own Machines

- PHASE 3: Cryptography, the Web, and the CTF Capstone (Months 5-6, Weeks 17-24) The mathematics of secrets, the trust machinery of the web, safer coding habits, and a capture-the-flag capstone that turns six months of defense into sport.
  - Month 5: Encryption and How the Web Stays Trustworthy
  - Classical Ciphers by Hand
  - Modern Encryption, Conceptually
  - Cookies, Sessions, and the Padlock
  - Safe Coding Habits
  - Month 6: The Capture-the-Flag Capstone
  - Welcome to CTF
  - Training Camp
  - The Capstone CTF Event
  - Writeups and the White-Hat Road Ahead

Projects students build: Map the full path of a web request as an annotated diagram, from keyboard to server and back; Home network inventory: every connected device listed, with a written safety checklist for the household; Personal digital footprint audit: what is publicly findable about you, plus a written cleanup plan you execute; Full threat model for a fictional student's phone and accounts, with ranked risks and matched defenses; Password health review of your own accounts, done privately at home with a parent, with a migration plan to unique passphrases; Hashing lab worksheet: predict, test, and explain hash behavior across a set of inputs, including a tampered file; Account lockdown: 2FA enabled on your key accounts with recovery codes stored safely, checklist evidence submitted; Family security briefing: a one-page document teaching your household the month's defenses, delivered as a short talk at home; Phish anatomy poster: dissect one anonymized real phishing email into its labeled parts; Spot-the-phish gallery: grade 15 anonymized real samples as safe or suspicious, with written reasoning for each call; Case study brief: reconstruct a documented social engineering incident and identify the three points where defense could have stopped it; Phish detector field guide: an illustrated recognition and response guide, then the class phishing-recognition tournament; Malware family tree: an illustrated chart mapping each family to its behavior and its most common arrival route; Personal backup plan: design and actually implement a 3-2-1 backup for your own important files, with a test restore; Defender's timeline: reconstruct the outbreak and mark every point where standard defenses from week 14 would have changed the outcome - plus 9 more on the course page.

Data Analysis Course: Excel, SQL, Python & BI

`/courses/data-analysis-mastery-course-college` · 8-10 months (35-43 weeks) · Complete beginner (18+); college students, graduates and working professionals

- PHASE 1: Excel, Statistics & SQL (Months 1-3, Weeks 1-10) Build strong foundations in data concepts, statistics, and become an Excel power user.
  - Month 1: Data Fundamentals & Excel
  - Introduction to Data Analysis
  - Excel Fundamentals & Formulas
  - Excel Advanced Functions
  - Month 2: Statistics & Data Visualization in Excel
  - Statistics Fundamentals
  - Excel Data Analysis Tools
  - Data Visualization in Excel
  - Month 3: SQL & Python for Data Analysis
  - SQL Fundamentals
  - SQL Joins & Advanced Queries

    - SQL Analytics Functions
    - Python Fundamentals for Analysis
- PHASE 2: Python, Pandas & Business Intelligence (Months 3-5, Weeks 11-20) Master Python for data analysis, pandas, data cleaning, and exploratory data analysis.
    - Month 4: Pandas & Data Manipulation
    - Pandas Fundamentals
    - Data Cleaning with Pandas
    - Data Transformation & Aggregation
    - Exploratory Data Analysis (EDA)
    - Month 5: Data Visualization & Storytelling
    - Matplotlib & Seaborn
    - Business Intelligence Tools
    - Data Storytelling & Presentation
    - Month 6: Machine Learning & Automation for Analysts
    - Machine Learning Fundamentals
    - Clustering & Segmentation
    - APIs & Automation
- PHASE 3: Industry Analytics & the Working Analyst (Months 5-7, Weeks 21-30) Master industry-specific analytics, cloud platforms, and prepare for professional roles.
    - Month 7: Industry-Specific Analytics
    - Financial Analytics
    - Healthcare Analytics
    - Retail & E-commerce Analytics
    - Supply Chain Analytics
    - HR & People Analytics
    - Month 8: Cloud Analytics & Your Portfolio
    - Cloud Platforms for Analytics
    - Portfolio Development
    - Month 9: Advanced Methods, Engineering & Strategy
    - Advanced Statistical Methods
    - Data Engineering Basics
    - Business Strategy & Analytics
- PHASE 4: The Finale (Month 8, Weeks 31-35) The capstone month: spec, build, ship and defend, then the final exam that decides the certificate.
    - Month 8: Capstone and the Final Exam
    - Capstone Spec and Setup
    - Capstone Build
    - Ship and Polish
    - Demo Day and the Final Exam

Projects students build: Personal data audit project; Industry analysis report; Data source catalog creation; Sales calculator dashboard; Employee timesheet system; Grade calculation spreadsheet; Dynamic sales report system; Financial analysis model; HR analytics dashboard; Statistical analysis report; A/B testing simulator; Quality control

dashboard; Sales performance dashboard; Budget optimization model; Multi-dimensional analysis cube - plus 77 more on the course page.

Data and AI Analytics for Non-Programmers (Excel, Sheets, Power BI)

`/courses/data-and-ai-analytics-for-non-programmers-course` · 4 months (16 weeks), joinable any month · Working professionals and students with no programming background; spreadsheet familiarity helps but is not required

- PHASE 1: Spreadsheets Done Properly The foundation almost everyone half-knows, rebuilt so the later work holds up.
  - Month 1: Excel and Google Sheets Foundations
  - Structuring Data So It Can Be Analysed
  - The Formulas That Actually Matter
  - Lookups and Joining Data
  - Pivot Tables and Fast Summaries
- PHASE 2: Cleaning Real Data and Analysing It Honestly Where most analysis fails, and the statistics you need to avoid fooling yourself.
  - Month 2: Data Cleaning and Practical Statistics
  - Cleaning Messy Real Data
  - Power Query for Repeatable Cleaning
  - Statistics That Keep You Honest
  - Charts That Do Not Lie
- PHASE 3: Power BI, AI-Assisted Analysis and Your Portfolio Turning analysis into something a decision-maker uses, with AI as an accelerator rather than an oracle.
  - Month 3: Power BI and Data Modelling
  - Power BI Foundations
  - Data Modelling and Relationships
  - DAX Measures Without Fear
  - Designing Dashboards People Actually Use
  - Month 4: AI-Assisted Analysis and the Capstone
  - Using AI Assistants Well
  - Checking What AI Gives You
  - Capstone Build
  - Presenting and Your Portfolio

Projects students build: Take a genuinely badly structured sheet and restructure it into a usable table; Build a summary sheet driven entirely by formulas from a raw data tab; Combine three separate exports into one analysable table and reconcile the mismatches; Answer five real business questions about one dataset using only pivots; Clean a genuinely messy dataset and write a short log of every decision made; Build a Power Query pipeline that cleans a monthly export automatically; Take a real claim from a report and check whether the data actually supports it; Redesign three bad charts and explain what each change fixes; Build your first working Power BI report from a real dataset; Model a multi-table dataset properly and prove the totals reconcile; Add a full measure set to your model including period comparisons; Redesign your dashboard after watching someone else try to use it; Solve a full analysis task using AI assistance and log where it helped and where it did not; Audit a set of AI-produced analyses and find the errors deliberately planted in them; Build your full capstone: question, clean data, model, dashboard, findings - plus 1 more on the course page.

Data Science Course: Python, ML & Deep Learning

`/courses/data-science-complete-masterclass-college` · 10-12 months (44-52 weeks) · Complete beginner (18+); college students, graduates and working professionals

- PHASE 1: Foundations of Data Science (Months 1-3, Weeks 1-13) Build rock-solid foundations in Python programming, statistics, data analysis, and SQL that form the backbone of data science.
  - Months 1-2: Python & Statistical Foundations
  - Python Programming for Data Science
  - NumPy for Numerical Computing
  - Data Manipulation with Pandas
  - Statistical Foundations for Data Science
  - Month 3: Data Visualization & SQL
  - Data Visualization Mastery
  - SQL for Data Scientists
  - Exploratory Data Analysis (EDA) & Feature Engineering
- PHASE 2: Machine Learning Mastery (Months 4-6, Weeks 14-26) Master classical machine learning algorithms, model evaluation, and participate in Kaggle competitions.
  - Months 4-5: Supervised Learning
  - Regression Algorithms
  - Classification Algorithms
  - Advanced Machine Learning Techniques
  - Unsupervised Learning
  - Kaggle Competition Participation
  - Month 6: Real-world ML Projects
  - End-to-End ML Project Development
  - Industry-Specific Applications
  - ML Engineering Best Practices
  - Phase 2 Capstone Project
- PHASE 3: Deep Learning & Advanced AI (Months 7-9, Weeks 27-39) Master deep learning, computer vision, NLP, and cutting-edge AI techniques.
  - Months 7-8: Deep Learning Fundamentals
  - Neural Network Fundamentals
  - Convolutional Neural Networks (CNNs)
  - Recurrent Neural Networks (RNNs)
  - Natural Language Processing
  - Advanced Deep Learning Topics
  - Month 9: Applied Vision, NLP & Research Practice
  - Computer Vision Projects
  - Advanced NLP Applications
  - Research Paper Implementation
  - Phase 3 Capstone Project
- PHASE 4: The Finale (Month 10, Weeks 40-44) The capstone month: spec, build, ship and defend, then the final exam that decides the certificate.
  - Month 10: Capstone and the Final Exam

- Capstone Spec and Setup
- Capstone Build
- Ship and Polish
- Demo Day and the Final Exam

Projects students build: Python fundamentals practice notebook; Building a data science toolkit with functions; Automated data processing script; Image manipulation with NumPy arrays; Statistical calculator using NumPy; Matrix operations library; Performance comparison: NumPy vs pure Python; Complete EDA on retail sales dataset; Data cleaning pipeline for messy dataset; Time series analysis of stock prices; Customer behavior analysis; Statistical analysis of A/B test results; Hypothesis testing on real datasets; Building a statistical testing framework; Correlation analysis of multiple variables - plus 88 more on the course page.

Data Science for Teens: Python & Your First ML Models

`/courses/data-science-course-for-teens-python-data` · 6 months (24 weeks) · Ages 14 to 18, basic Python required

- PHASE 1: Python for Data and the pandas Toolkit (Months 1-2, Weeks 1-8) First the Python muscles data work leans on, retrained in notebooks. Then pandas, the tool that turns tables of raw data into answers.
  - Month 1: Python, Retuned for Data
  - Notebooks and the Python Refresh
  - Functions and Files
  - Thinking in Tables
  - NumPy Essentials
  - Month 2: pandas
  - DataFrames
  - Filtering and Sorting
  - Grouping and Aggregation
  - Combining Datasets
- PHASE 2: Cleaning Real Data and Charting It Honestly (Months 3-4, Weeks 9-16) The craft phase. Real datasets arrive dirty, and most of data science is the disciplined work of fixing them, then showing results without distortion.
  - Month 3: Cleaning Real Datasets
  - Missing Values
  - Wrong Types and Dirty Strings
  - Outliers, Duplicates, and Judgment Calls
  - The Cleaning Project
  - Month 4: Visualization with matplotlib
  - First Charts
  - Distributions and the Right Chart
  - Honest Charts and Polished Figures
  - The Four-Chart Data Story
- PHASE 3: Statistics, First Models, and the Capstone (Months 5-6, Weeks 17-24) Statistics gives judgment, scikit-learn gives first models, and the capstone puts it all behind one question the student actually cares about.
  - Month 5: Statistics for Judgment, Then First Models
  - Describing Data Truthfully
  - Correlation and Its Traps
  - First Machine Learning: Regression

- First Machine Learning: Classification
- Month 6: The Capstone Data Story
- The Question and the Data
- Analysis Sprint
- The Optional Model and the Narrative
- Present and Publish

Projects students build: Class survey analysis, round one: collect a small class survey and answer three questions about it with plain Python; Hand-rolled report: read a 500-row CSV with plain Python and compute totals, averages, and a top-five list; Question workshop: pick a public dataset, write five precise questions about it, and classify which are answerable from the columns present; Class survey analysis, round two: redo week 1's analysis in NumPy and compare the code side by side; First pandas notebook: load a movies dataset and produce a profile of it, size, columns, types, and five first findings; Movie interrogation: answer ten ranked questions about the movies dataset, best-rated per decade, longest, most profitable, each as a clean filtered result; Season in review: full statistical breakdown of a sports season, per team and per month, from a raw match-results dataset; Two-table analysis: join two related datasets, for example city populations with air quality readings, and answer three questions no single table could; Missing-value audit: map the missingness of a real open dataset, choose treatments per column, and defend each in your cleaning log; Type rescue: take a scraped price-and-date dataset where every column is text and restore true types, documenting each repair; Judgment file: on a dataset seeded with ambiguous outliers and duplicates, decide keep or remove case by case, with one-line justifications; Full cleaning project: raw city open data, for example street trees or road accidents, taken from download to documented, analysis-ready form; Three-chart notebook: one line, one bar, one scatter from your cleaned month 3 dataset, each fully labeled; Distribution study: profile three numeric columns with histograms and box plots, and write what each shape reveals; Mislead and repair: take one truthful chart, make the most misleading legal version of it, then write the repair, a before-and-after pair - plus 9 more on the course page.

Data Structures & Algorithms Course: Interview-Ready DSA

`/courses/data-structures-algorithms-masterclass-college` · 10-12 months (44-52 weeks) · Complete beginner (18+); college students, graduates and working professionals

- PHASE 1: Foundation & Core Data Structures (Months 1-2, Weeks 1-8) Build rock-solid foundations with basic data structures, complexity analysis, and fundamental algorithms.
  - Month 1: Foundations & Linear Data Structures
  - Programming Fundamentals & Complexity Analysis
  - Arrays & Strings Mastery
  - Linked Lists & Recursion
  - Stacks & Queues
  - Month 2: Searching, Sorting & Hashing
  - Searching Algorithms
  - Sorting Algorithms Mastery
  - Hashing & Hash Tables
  - Bit Manipulation & Mathematics
  - Month 3: Trees, Heaps & Graphs
  - Binary Trees Fundamentals
  - Binary Search Trees & Balanced Trees
  - Heaps & Priority Queues
  - Tries & Advanced Trees

- PHASE 2: Graphs & Advanced Algorithms (Months 3-4, Weeks 9-17) Master graph algorithms, advanced problem-solving patterns, and complex algorithmic techniques.
  - Month 4: Graph Algorithms Mastery
  - Graph Fundamentals & Traversals
  - Shortest Path Algorithms
  - Minimum Spanning Trees & Network Flow
  - Advanced Graph Patterns
  - String Algorithms Advanced
  - Month 5: Dynamic Programming Mastery
  - Dynamic Programming Fundamentals
  - 2D Dynamic Programming
  - Advanced DP Patterns
  - Greedy Algorithms & Optimization
  - Backtracking & Branch and Bound
  - Month 6: Advanced Topics & Interview Preparation
  - Advanced Algorithms
  - System Design Basics for Interviews
- PHASE 3: Interview Mastery (Months 7-9, Weeks 27-39) Master interview skills, tackle company-specific problems, and launch your tech career.
  - Months 7-8: Company-Specific Preparation
  - Google Interview Preparation
  - Amazon Interview Preparation
  - Meta (Facebook) Preparation
  - Microsoft & Apple Preparation
  - Startup & Unicorn Preparation
  - Month 9: Final Polish & Interview Simulation
  - Advanced Problem Patterns
  - Interview Week Simulation
  - Soft Skills & Communication
  - Career Strategy & Negotiation
- PHASE 4: The Finale (Month 10, Weeks 40-44) The capstone month: spec, build, ship and defend, then the final exam that decides the certificate.
  - Month 10: Capstone and the Final Exam
  - Capstone Spec and Setup
  - Capstone Build
  - Ship and Polish
  - Demo Day and the Final Exam

Projects students build: Complexity analyzer tool; Problem-solving template creator; Personal progress tracker; Array manipulation library; String utilities toolkit; Pattern matching visualizer; Linked list library from scratch; Recursion visualizer; Memory stack simulator; Expression evaluator; Browser history simulator; Task scheduler with priority queue; Search algorithm visualizer; Binary search template library; Search complexity analyzer - plus 88 more on the course page.

Early Math Foundations: Playful, Concrete Math (Ages 4-7)

`/courses/early-math-foundations` · 12 months (52 weeks) · Ages 4-7 (kindergarten to grade 2), all starting points

- PHASE 1: Counting That Means Something (Months 1-4) Counting looks simple and hides deep ideas: one number per object, the last number telling the total, quantities compared and conserved. This phase builds those ideas properly through objects, movement and games, the difference between reciting numbers and understanding them.
  - Month 1: Numbers as Quantities
  - A Playful First Look
  - One Number for Each Thing
  - Seeing Small Numbers Instantly
  - More, Fewer, or the Same?
  - Months 2-3: The Number World to 10
  - Number Symbols and Counting Both Ways
  - The Ten-Frame as Home Base
  - Breaking Numbers into Parts
  - First, Second, Third and Where Things Sit
  - Month 4: Patterns and Sorting + Stage Checkpoint
  - Patterns That Repeat
  - Sorting by How Things Are Alike
  - Patterns That Grow
  - Phase One Check Through Play
- PHASE 2: Stories, Bonds and the Teen Numbers (Months 5-8) Addition and subtraction arrive as stories acted out with objects, joining, separating, comparing, long before symbols carry them. Bonds to 10 grow toward automaticity through games, and the famously confusing teen numbers get demystified with place-value materials.
  - Month 5: Addition and Subtraction as Stories
  - Adding and Taking Away as Stories
  - Counting On and Counting Back
  - Month 6: Bonds of 10 and Fact Families
  - The Pairs That Make Ten
  - One Number Trio, Four Facts
  - Month 7: Teen Numbers and Place Value Beginnings
  - Teen Numbers Are Ten and Some More
  - All the Way to Twenty
  - Month 8: Story Problems and the Explain Habit
  - Act It, Draw It, Write It
  - Missing Numbers and Phase Two Check
- PHASE 3: To 100 and Into the World (Months 9-12) The number world expands to 100 with place-value understanding, and math steps into the child's world: measuring, money, time, shapes and simple data. The course closes with problem-solving courage and a confident handoff to grade-level mathematics.
  - Month 9: The Road to 100
  - Building Numbers from Tens and Ones
  - Skip Counting and the Hundred Square
  - Month 10: Two-Digit Confidence
  - Adding Two-Digit Numbers

- Ten More and Ten Less
- Month 11: Measurement, Money and Time
- Measuring and Guessing
- Money and Telling the Time
- Month 12: Shapes, Data and Graduation
- Shapes and Fair Shares
- Graphs, Graduation and the Road Ahead

Elementary Maths for Grades 1-5: Live Online Classes

`/courses/elementary-mathematics-complete-masterclass` · 10-12 months per level (3 levels, Grades 1-5) · Grades 1-5; every child is placed by grade and a short placement check

- PHASE 1: Level A for Grades 1-2 (One School Year) The foundation year(s): numbers, place value, addition and subtraction, first multiplication, shapes, time, money and measurement, all learned with objects and pictures before symbols.
  - Months 1-2: Numbers and Counting
  - Introduction to Numbers and Counting
  - Numbers to 100 and Place Value
  - Basic Addition (Single Digit)
  - Basic Subtraction (Single Digit)
  - Months 3-4: Bigger Numbers and First Multiplication
  - Two-Digit Addition
  - Two-Digit Subtraction
  - Introduction to Multiplication
  - Geometry Basics: 2D Shapes
  - Mid-Level Review
  - Months 5-6: Time, Money and Measurement
  - Time and Calendar
  - Money and Financial Literacy
  - Length and Height Measurement
  - Weight and Capacity
  - Level A Exam and Celebration
- PHASE 2: Level B for Grades 3-4 (One School Year) The fluency year(s): multiplication and division mastered properly, fractions and decimals understood instead of memorized, plus data, geometry, area and perimeter.
  - Months 1-2: Multiplication and Division Mastery
  - Advanced Multiplication Facts
  - Multi-Digit Multiplication
  - Introduction to Division
  - Long Division
  - Problem-Solving with Operations
  - Months 3-4: Fractions and Decimals
  - Understanding Fractions
  - Operations with Fractions
  - Introduction to Decimals

    - Decimal Operations
    - Data and Graphing
    - Months 5-6: Geometry, Area and the Level Exam
    - Advanced 2D Geometry
    - 3D Shapes and Volume
    - Area and Perimeter
    - Coordinate Geometry
    - Level B Exam and Celebration
- PHASE 3: Level C for Grade 5 (One School Year) The bridge year: large numbers, advanced fractions, ratios and percentages, circle geometry, first algebra, probability and money maths, everything middle school assumes.
    - Months 1-2: Numbers and Fractions Mastery
    - Large Numbers and Place Value
    - Factors and Multiples
    - Complex Fraction Operations
    - Advanced Decimal Operations
    - Months 3-4: Proportional Thinking and Geometry
    - Ratios and Proportions
    - Percentages
    - Advanced Angle Relationships
    - Circle Geometry
    - Months 5-6: First Algebra, Data and the Level Exam
    - Variables and Expressions
    - Simple Equations
    - Advanced Data Analysis
    - Probability Fundamentals
    - Money Maths, Review and the Level C Exam

Projects students build: Create number book with illustrations; Number hunt around the house; Build counting games with everyday objects; 100 chart coloring patterns; Place value manipulative games; Create skip counting songs; Addition fact family houses; Create addition story problems book; Design addition board game; Subtraction story problems collection; Fact family triangles craft; Subtraction bowling game; Shopping mall addition game; Create addition puzzle cards; Design digital addition calculator - plus 105 more on the course page.

Ethical Hacking Course: Authorized Pentesting, Zero to Pro

`/courses/ethical-hacking-masterclass-complete` · 10-12 months (44-52 weeks) · Complete beginner (18+); college students, graduates and working professionals

- PHASE 1: Foundations, Ethics and Reconnaissance (Months 1-3, Weeks 1-13) Build rock-solid networking and Linux foundations essential for ethical hacking. Master TCP/IP, operating systems, programming basics, and security fundamentals.
    - Months 1-2: Networking & Linux Fundamentals
    - Introduction to Ethical Hacking & Networking Basics
    - Linux Mastery for Hackers
    - Programming for Hackers - Python & Web Basics
    - Information Gathering & OSINT

    - Month 3: Scanning & Enumeration
    - Network Scanning & Enumeration
    - Web Application Scanning
    - Vulnerability Assessment
- PHASE 2: Core Exploitation and Advanced Domains (Months 4-6, Weeks 14-26) Master system hacking, web application attacks, exploitation frameworks, and post-exploitation techniques.
    - Month 4: System Hacking & Exploitation
    - System Hacking & Password Attacks
    - Metasploit Framework & Exploitation
    - Web Application Hacking - OWASP Top 10
    - Advanced Web Attacks & API Security
    - Database Hacking & NoSQL Injection
    - Month 5: Network Attacks & Post-Exploitation
    - Network Attacks & Man-in-the-Middle
    - Wireless Network Hacking
    - Post-Exploitation & Lateral Movement
    - Malware Analysis & Reverse Engineering Basics
    - Month 6: Advanced Domains: Active Directory, Mobile and Cloud
    - Active Directory Attacks
    - Mobile Application Security
    - Cloud Security & Container Hacking
    - Physical Security & Social Engineering
- PHASE 3: Advanced Offensive and Defensive Security (Months 7-9, Weeks 27-39) Master advanced exploitation, zero-day research, exploit development, and specialized security domains.
    - Month 7: Advanced Exploitation & Zero Days
    - Buffer Overflow Exploitation
    - Modern Exploit Mitigation Bypasses
    - Web Application Firewall Bypasses
    - Cryptography & Cryptanalysis
    - Red Team Operations
    - Month 8: DevSecOps & Automation
    - DevSecOps & CI/CD Security
    - Security Automation & Orchestration
    - Threat Hunting & Intelligence
    - Incident Response & Forensics
    - Compliance & Governance
    - Month 9: Emerging Security Domains
    - Zero Trust Architecture
    - Blockchain & Smart Contract Security
    - AI/ML Security
- PHASE 4: The Finale (Month 10, Weeks 40-44) The capstone month: spec, build, ship and defend, then the final exam that decides the certificate.

- Month 10: Capstone and the Final Exam
- Capstone Spec and Setup
- Capstone Build
- Ship and Polish
- Demo Day and the Final Exam

Projects students build: Complete hacking lab setup with multiple VMs; Network topology design and implementation; Subnet calculator tool development; Protocol analyzer using Wireshark; Automation scripts for reconnaissance; Custom security monitoring dashboard; Log analysis automation tool; Linux hardening checklist implementation; Port scanner in Python; Password cracker for weak hashes; Web crawler for reconnaissance; Network packet sniffer; Simple vulnerability scanner; Complete OSINT profile builder; Automated reconnaissance framework - plus 158 more on the course page.

Flutter Course: Dart to Real Cross-Platform Apps

`/courses/complete-flutter-app-development-masterclass-college` · 10-12 months (44-52 weeks) · Complete beginner (18+); college students, graduates and working professionals

- PHASE 1: Foundation & Core Flutter + Dart Skills (Months 1-3, Weeks 1-13) Build rock-solid programming and Flutter fundamentals. Learn Dart, understand Flutter's widget tree, layout system, and create your first interactive cross-platform apps.
  - Months 1-2: Dart Fundamentals & Flutter Basics
  - Introduction to Flutter, Dart & Development Environment Setup
  - Dart Basics, Variables, Data Types & Operators
  - Control Flow, Functions & Basic Collections
  - Core Flutter Widgets & Layout Basics
  - Month 3: Object-Oriented Programming with Dart & Stateful Widgets
  - Dart Classes, Objects & OOP Basics
  - Inheritance, Polymorphism & Flutter Stateful Widgets
  - Abstraction, Interfaces & PHASE 1 Mini Capstone
- PHASE 2: Intermediate Flutter, State Management & App Architecture (Months 4-6, Weeks 14-26) Master advanced Dart, state management patterns, navigation, forms, local storage, and start building real-world, offline-capable Flutter apps.
  - Month 4: Advanced Dart, Layouts & State Management Foundations
  - Advanced Dart, Collections & Async Programming
  - Flutter Navigation, Routing & App Structure
  - Forms, Validation & User Input Handling
  - Flutter Layout Mastery, Lists & Responsive Design
  - Intro to State Management Patterns
  - Month 5: Persistent Storage, Offline Apps & Advanced State
  - Local Storage: SharedPreferences, SQLite & Object Persistence
  - State Management with Provider & Riverpod, Part 1
  - Advanced State Management: Riverpod / BLoC, Part 2
  - Flutter Animations & UX Polish
  - Month 6: Design Systems, APIs & Testing Foundations
  - Reusable Widgets, Design Systems & Theming
  - Networking & REST API Integration - Fundamentals

    - Intro to Testing Flutter Apps
    - Build Automation, Packages & Version Control
- PHASE 3: Backend Integration, Firebase & Production Features (Months 7-9, Weeks 27-39) Master building connected apps with Firebase and REST backends, implement authentication, payments, notifications, and solid application architecture.
    - Month 7: Firebase, Auth & Real-World Features
    - Firebase Fundamentals & Realtime Data
    - Authentication & User Management
    - Cloud Storage, Media & File Handling
    - Push Notifications & In-App Messaging
    - Advanced Firebase: Queries, Security & Performance
    - Month 8: REST APIs, Payments & Robust Product Apps
    - Advanced REST APIs, Error Handling & Data Layers
    - In-App Purchases & Payment Gateway Integration
    - App Architecture in Depth: Clean Architecture & Large App Design
    - Testing Connected Apps (REST + Firebase)
    - Month 9: Production Hardening
    - Performance Optimization & App Size Management
    - Error Reporting, Logging & Analytics
    - Security & Data Protection in Flutter Apps
- PHASE 4: The Finale (Month 10, Weeks 40-44) The capstone month: spec, build, ship and defend, then the final exam that decides the certificate.
    - Month 10: Capstone and the Final Exam
    - Capstone Spec and Setup
    - Capstone Build
    - Ship and Polish
    - Demo Day and the Final Exam

Projects students build: Hello Flutter app with personalized welcome screen; Digital visiting card app (name, role, contact info); Simple profile screen with image, text and icons; Two-screen mini app using basic navigation; Kids track variant: Colorful "My Favorite Things" app; Simple console calculator (add, subtract, multiply, divide); Tip & bill split calculator (per person amount); Age & birthday countdown calculator; Unit converters: temperature, length, weight; Kids variant: Score tracker for a simple game; Number guessing game (console or Flutter dialog-based); Grade calculator with letter-grade output; To-do list data model (List operations) with console UI; Simple quiz logic engine (questions and scoring); Kids variant: Multiplication practice generator - plus 147 more on the course page.

Frontend Development for Teens: CSS Craft to React UI

`/courses/frontend-development-masterclass-for-teens` · 9-11 months (36-44 weeks) · Absolute beginner, ages 13 to 18

- PHASE 1: Foundations (Months 1-3, Weeks 1-12) HTML with meaning, CSS with discipline, layouts that survive every screen, and first JavaScript.
    - Month 1: Structure and Style
    - Introduction to Web Development
    - CSS Styling & Design
    - Month 2: Layout Mastery

    - Flexbox & Grid Layouts
    - Responsive Design & Mobile First
    - Month 3: First JavaScript
    - JavaScript Basics
    - Control Flow & Logic
- PHASE 2: The Styling Craft (Months 4-6, Weeks 13-24) Where interfaces start feeling expensive: the DOM, live data, modern CSS, SASS architecture, Tailwind and animation.
    - Month 4: Living Pages
    - DOM Manipulation
    - Asynchronous JavaScript & APIs
    - Month 5: Modern CSS and Architecture
    - Modern CSS Techniques
    - SASS/SCSS & CSS Architecture
    - Month 6: Tailwind and Motion
    - Tailwind CSS & Utility-First
    - Animation: Interfaces That Feel Alive
- PHASE 3: React for UI Builders (Months 7-8, Weeks 25-32) React as a UI instrument: components, hooks, styling strategies, and the crowning project of the phase, a design system of your own.
    - Month 7: React Essentials
    - React Basics
    - React Hooks Deep Dive
    - Month 8: Styling React and Design Systems
    - Styling in React
    - Your Own Design System
- PHASE 4: The Finishing School (Month 9, Weeks 33-36) The two marks of professional frontend, accessibility and performance, then the polished capstone and the final exam.
    - Month 9: Polish, Capstone, Demo Day
    - Accessibility and SEO Basics
    - Performance: Measured, Then Fixed
    - Capstone Build
    - Demo Day and the Final Exam

Projects students build: Personal introduction webpage; Favorite artist fan page; School project presentation site; Recipe collection page; Animated landing page; CSS art challenge; Interactive button collection; Photo gallery with effects; Instagram-style photo grid; YouTube homepage layout; Discord server layout; Pinterest-style masonry; Fully responsive portfolio; Mobile-first blog design; Responsive e-commerce page - plus 56 more on the course page.

Full Stack Developer Course: React, Node.js and DevOps Basics

`/courses/full-stack-web-development-masterclass-college` · 12-14 months (48-56 weeks) · Complete beginner; college students, graduates and career switchers (18+)

- PHASE 1: Foundations (Months 1-3, Weeks 1-12) Computing, HTML, CSS and JavaScript built to real depth. The phase ends with an interactive, API-powered project deployed to a public URL.
    - Month 1: How the Web Is Built
    - Computing, the Web and Your Toolkit

    - HTML5 Done Properly
    - CSS Fundamentals
    - Flexbox, Grid and Responsive Layouts
    - Month 2: JavaScript Fundamentals
    - JavaScript Basics and Syntax
    - Control Flow, Loops and Arrays
    - Functions, Scope and Closures
    - Objects and Data Structures
    - Month 3: The Interactive Web
    - The DOM
    - Events and User Interaction
    - Practical JavaScript: Errors, Storage and Regex
    - Async JavaScript, APIs and the First Deploy
- PHASE 2: TypeScript and React (Months 4-6, Weeks 13-24) Modern JavaScript mastery, TypeScript from the start, and React the way production teams write it, ending in a frontend capstone.
    - Month 4: Modern JavaScript Mastery
    - ES6+ in Depth
    - Object-Oriented JavaScript
    - Functional Programming Patterns
    - Modules, npm and Build Tools
    - Month 5: TypeScript and React Core
    - TypeScript Fundamentals
    - React Fundamentals
    - Hooks and State
    - Advanced React Patterns
    - Month 6: State, Styling and the Frontend Capstone
    - State Management with Redux Toolkit
    - React with TypeScript
    - Styling: Tailwind and Component Libraries
    - Frontend Capstone
- PHASE 3: Backend Engineering (Months 7-9, Weeks 25-36) Node and Express done properly, both database families, safe authentication, OWASP security and real-time, ending with a deployed backend capstone.
    - Month 7: Node and Express
    - Node.js Fundamentals
    - Express.js Framework
    - RESTful API Design
    - Production Express: Middleware and Hardening
    - Month 8: Both Database Families
    - MongoDB
    - Mongoose ODM
    - SQL and PostgreSQL
    - Prisma and Choosing Your Database

    - Month 9: Auth, Security and Real-Time
    - Authentication and Authorization
    - API Security: The OWASP Essentials
    - Real-Time with Socket.io
    - Backend Capstone
- PHASE 4: Production Engineering and the Capstone (Months 10-12, Weeks 37-48) What separates course graduates from employable developers: testing, Next.js, performance, Docker, CI/CD, cloud fundamentals, system design, AI features, and a shipped capstone.
    - Month 10: Quality and the Modern Stack
    - Testing Across the Stack
    - Next.js and Server-Side Rendering
    - Performance: Measuring and Fixing
    - Backend Patterns: Caching, Jobs and Integrations
    - Month 11: Docker, CI/CD, Cloud and AI
    - Docker and Containers
    - CI/CD with GitHub Actions
    - System Design Fundamentals
    - AI Features, End to End
    - Month 12: The Capstone
    - Capstone Planning and Cloud Setup
    - Capstone Build
    - Launch, Demo Day and What Comes Next

Projects students build: Set up complete development environment; Create first GitHub repository; Write 'About Me' HTML page; Personal portfolio website (HTML only); Restaurant menu page with images and tables; Multi-page contact form with validation; Style your portfolio with beautiful CSS; Create a styled blog post layout; Design a product card component; Holy grail layout with Flexbox and Grid; Responsive navigation menu; Photo gallery with Grid; Complete responsive landing page; Temperature converter; Simple tip calculator - plus 146 more on the course page.

Full Stack Web Development for Teens: React and Node.js

`/courses/full-stack-web-development-teens-masterclass` · 12-14 months (48-56 weeks) · Absolute beginner, ages 13 to 18

- PHASE 1: Web Foundations (Months 1-3, Weeks 1-12) The real base: HTML with meaning, CSS that survives a phone, and JavaScript learned deeply enough that React will make sense instead of feeling like magic.
    - Month 1: HTML and CSS
    - How the Web Works, and Your First Pages
    - Forms, Structure and Meaning
    - CSS: Making It Look Right
    - Flexbox, Grid and Responsive Design
    - Month 2: JavaScript, Properly
    - JavaScript Fundamentals
    - Control Flow and Functions
    - The DOM: Making Pages Interactive
    - Interactive Projects Week

    - Month 3: Modern JavaScript and the First Deploy
    - Arrays, Objects and Data Thinking
    - Async JavaScript and Real APIs
    - ES6+, Modules and npm
    - Phase 1 Capstone: Ship a Real Site
- PHASE 2: The React Frontend (Months 4-6, Weeks 13-24) React the way it is actually written now: components, hooks, routing, real styling, TypeScript, a taste of Next.js, and a frontend capstone.
    - Month 4: React Core
    - Thinking in React
    - Hooks and Effects
    - Routing and Multi-Page Apps
    - Fetching Data Like a Professional
    - Month 5: React Craft
    - State Management That Scales
    - TypeScript for React
    - UI/UX for Developers
    - Tailwind and Component Libraries
    - Month 6: Next.js Taste and the Frontend Capstone
    - Performance and PWA Basics
    - A Taste of Next.js
    - Frontend Capstone
- PHASE 3: Backend and Databases (Months 7-9, Weeks 25-36) The engine room: Node and Express, MongoDB and SQL, authentication done safely, and the moment the two halves connect into one deployed application.
    - Month 7: Node, Express and MongoDB
    - Node.js Fundamentals
    - Express: Your First Server
    - MongoDB and Mongoose
    - REST API Design
    - Month 8: Authentication, SQL and Safety
    - Authentication Done Safely
    - SQL and PostgreSQL Essentials
    - API Security and Performance
    - Backend Capstone: A Deployed API
    - Month 9: The Two Halves Connect
    - Full-Stack Architecture with MERN
    - Real-Time with Socket.io
    - Full-Stack Deployment
    - Full-Stack Mini Build
- PHASE 4: AI, Quality and the Capstone (Months 10-12, Weeks 37-48) The final level: uploads and integrations, AI features built with guardrails, testing across the stack, and a four-week capstone shipped like a product.
    - Month 10: Power-Ups and AI
    - Uploads, Email and Integrations

- Machine Learning for Web Developers
- AI Features with Guardrails
- Testing Across the Stack
- Month 11: Ship Like a Professional
- Git Workflow and CI Basics
- Security Hardening Pass
- Performance and Polish Pass
- Capstone Planning
- Month 12: The Capstone
- Capstone Build
- Launch Week
- Demo Day and What Comes Next

Projects students build: Personal profile page; Favorite band/artist fan page; School project presentation website; Multi-page school website; Survey form for friends; Restaurant menu with ordering form; Style your HTML projects beautifully; Create a magazine-style layout; Design product cards like Amazon; Responsive portfolio website; Animated landing page; Instagram-style photo grid; Interactive calculator; Mad libs game generator; Grade calculator for school - plus 92 more on the course page.

Functional Skills Maths Level 1 and Level 2 Course Online

`/courses/functional-skills-maths-course` · 6 months (24 weeks) for a full level; shorter for learners who start part-way · Adults, apprentices and post-16 learners working towards Functional Skills maths at Level 1 or Level 2

- PHASE 1: Using Numbers (Months 1-2, Weeks 1-8) The number skills every other part of the course depends on. Level 1 learners build the foundations; Level 2 learners extend them to percentage change, ratio and inverse proportion.
  - Month 1: Whole Numbers, Fractions and Decimals
  - Weeks 1-2: Starting Check and Whole Numbers
  - Weeks 3-4: Fractions and Decimals
  - Month 2: Percentages, Ratio and Proportion
  - Weeks 5-6: Percentages
  - Weeks 7-8: Ratio, Proportion and Formulae
- PHASE 2: Measures, Shape and Space (Months 3-4, Weeks 9-16) Maths for money, measuring and making things fit. Contexts include budgets, travel, decorating, delivery and the workplace.
  - Month 3: Money, Time and Units
  - Weeks 9-10: Money and Budgeting
  - Weeks 11-12: Time, Units and Compound Measures
  - Month 4: Shape and Space
  - Weeks 13-14: Perimeter, Area and Volume
  - Weeks 15-16: Scale, Plans and Position
- PHASE 3: Handling Information and Data (Month 5, Weeks 17-20) Reading, presenting and questioning data, the skill employers notice most when it is missing.
  - Month 5: Data, Averages and Probability
  - Weeks 17-18: Tables, Charts and Graphs
  - Weeks 19-20: Averages, Range and Probability

- PHASE 4: Exam Practice (Month 6, Weeks 21-24) Full practice assessments in the style of your exam centre's awarding organisation, with the non-calculator and calculator sections taken under real timing.
  - Month 6: Practice Assessments
  - Weeks 21-22: Underpinning Skills and Problem Solving
  - Weeks 23-24: Final Practice and Exam Readiness

Projects students build: Personal method sheet: one worked example of each written method; Real-life problem set: a recipe scaled and a bill split, solved with fractions; Shopping comparison: three offers compared with percentages and a written recommendation; Workplace task: a staffing or mixing problem solved and explained in a short note; Monthly budget: a realistic household or event budget built and checked; Journey plan: a trip timed and costed from a real timetable; Room project: flooring and paint worked out for a real room plan, with costs; Scale plan: a simple floor plan drawn to scale from real measurements; Data report: a small real data set presented two ways with a written comparison; Comparison task: two shops, teams or months compared with averages and range; Error log started from the first practice assessment; Completed error log and method sheet, kept for revision.

Game Development Course: Unity, C# & Unreal Engine

`/courses/game-development-complete-masterclass-college` · 10-12 months (44-52 weeks) · Complete beginner (18+); college students, graduates and working professionals

- PHASE 1: Game Fundamentals & 2D Development (Months 1-3, Weeks 1-13) Build solid foundations in game design theory, 2D game development, and Unity basics while creating your first playable games.
  - Months 1-2: Game Design & 2D Fundamentals
  - Introduction to Game Development
  - Game Design Fundamentals
  - 2D Game Development with Unity
  - Programming Fundamentals with C#
  - Month 3: Complete 2D Games
  - Building Complete 2D Games
  - 2D Art and Animation
  - Audio and Polish
- PHASE 2: 3D Development & Advanced Unity (Months 4-6, Weeks 14-26) Master 3D game development, advanced C# programming, and professional Unity techniques.
  - Months 4-5: 3D Game Development
  - 3D Fundamentals in Unity
  - 3D Animation and Characters
  - Advanced C# for Games
  - AI for Games
  - 3D Game Projects
  - Month 6: Mobile & Cross-Platform Games
  - Mobile Game Development
  - Cross-Platform Development
  - Phase 2 Capstone Project
- PHASE 3: Unreal Engine & Advanced Programming (Months 7-9, Weeks 27-39) Master Unreal Engine, C++ game programming, graphics programming, and advanced game systems.
  - Months 7-8: Unreal Engine Mastery
  - Unreal Engine Fundamentals

    - C++ Game Programming
    - Advanced Unreal Systems
    - Graphics Programming
    - Engine Architecture
    - Month 9: Multiplayer & Networking
    - Multiplayer Fundamentals
    - Advanced Multiplayer Systems
    - Phase 3 Capstone Project
- PHASE 4: The Finale (Month 10, Weeks 40-44) The capstone month: spec, build, ship and defend, then the final exam that decides the certificate.
    - Month 10: Capstone and the Final Exam
    - Capstone Spec and Setup
    - Capstone Build
    - Ship and Polish
    - Demo Day and the Final Exam

Projects students build: Write your first Game Design Document; Analyze 5 favorite games critically; Create paper prototype of simple game; Set up Unity and development environment; Design a complete game concept with mechanics; Create difficulty curve for a game; Design reward system for mobile game; Build paper prototype and playtest it; Create animated sprite character; Build tilemap-based level; Implement 2D platformer mechanics; Add particle effects and polish; Player movement controller; Enemy AI basic behavior; Inventory system - plus 82 more on the course page.

Game Development for Kids: Scratch, Roblox and Minecraft

`/courses/game-development-masterclass-for-kids` · 6-8 months (26-32 weeks) · Complete beginner, ages 8 to 12

- PHASE 1: Game Logic in Scratch (Months 1-2, Weeks 1-8) The mechanics under every game, built by the child: movement, scoring, enemies, and complete first games that work.
    - Months 1-2: Scratch Game Mastery
    - Introduction to Game Development
    - Game Mechanics & Player Control
    - Advanced Scratch Game Development
    - Introduction to GDevelop
- PHASE 2: 2D Game Mastery (Months 3-4, Weeks 9-17) From working to wonderful: levels, polish, game feel and bigger 2D builds that friends genuinely want to play.
    - Months 3-4: Bigger, Better 2D Games
    - Construct 3 Game Engine
    - Game Art & Animation
    - Mobile Game Development
    - GameMaker Studio Basics
    - Phase Review and Showcase
- PHASE 3: 3D Worlds and the Finale (Months 5-6, Weeks 18-26) The leap kids dream about: Roblox Studio worlds, coded Minecraft builds, first multiplayer fun, and the capstone presented at demo day.
    - Months 5-6: Roblox, Minecraft and the Capstone
    - Roblox Studio Fundamentals
    - Advanced Roblox Development

- Minecraft Modding & Creation
- Unity with Visual Scripting
- Capstone and the Final Exam

Projects students build: Catch the falling objects game; Simple maze game; Pet virtual game; Two-player tag game; Platformer with jumping; Racing game with timer; Shooting game with score; Puzzle with levels; Multi-level adventure game; RPG with inventory; Battle arena game; Story-driven game; Physics puzzle game; Endless runner; Tower defense game - plus 38 more on the course page.

Game Development for Teens: Unity, C# and Real Shipped Games

`/courses/complete-game-development-masterclass-for-teens` · 10-12 months (40-48 weeks) · Absolute beginner, ages 13 to 18

- PHASE 1: Complete 2D Games (Months 1-3, Weeks 1-12) C# learned through games, Unity 2D mastered properly, and the phase ends the only way that matters: a finished game, published.
  - Month 1: Foundations Through Games
  - Welcome to Game Development
  - C# for Games
  - Unity 2D Fundamentals
  - Game Physics and Collision
  - Month 2: Mechanics That Feel Good
  - Player Movement and Game Feel
  - Enemy AI and Behaviors
  - Game UI and Menus
  - Animation and Visual Effects
  - Month 3: Finish and Ship
  - Audio and Music in Games
  - Level Design
  - Save Systems and Progress
  - Phase 1 Capstone: Publish Your Game
- PHASE 2: 3D Worlds (Months 4-6, Weeks 13-24) The jump to 3D done properly: controllers, animation, environments, your own Blender assets, shaders, procedural generation, and a finished 3D game.
  - Month 4: 3D Fundamentals
  - 3D Basics in Unity
  - 3D Character Controllers
  - 3D Animation with Mixamo
  - 3D Environments and Terrain
  - Month 5: The Craft Around the Code
  - Blender: Your Own 3D Assets
  - Game Design Theory
  - Game AI and Pathfinding
  - Shader Graph and Visual Polish
  - Month 6: Finish a 3D Game
  - Procedural Generation
  - Optimization and Profiling

    - 3D Game Build Week
    - Phase 2 Capstone and Review
- PHASE 3: Multiplayer, Mobile and the Wider Craft (Months 7-8, Weeks 25-32) The systems that make games feel modern: multiplayer basics, mobile builds, an honest week inside Unreal, AI in game development, narrative, and accessibility.
    - Month 7: Multiplayer and Mobile
    - Multiplayer Basics
    - Multiplayer Systems in Practice
    - Mobile Game Builds
    - Leaderboards, Achievements and Saves Online
    - Month 8: The Wider Craft
    - An Honest Week in Unreal Engine
    - AI in Game Development
    - Game Narrative and Writing
    - Accessibility and Inclusive Design
- PHASE 4: Production and the Capstone (Months 9-10, Weeks 33-40) The final month pair runs like a small studio: pipeline, polish, publishing, and a capstone game shipped and presented at demo day.
    - Month 9: Studio Habits
    - How Real Games Get Made
    - Polish and Game Feel Week
    - Publishing on itch.io and Game Jams
    - Portfolio and Devlog
    - Month 10: The Capstone
    - Capstone Pre-Production
    - Capstone Build
    - Launch, Demo Day and What Comes Next

Projects students build: Pong remake; Breakout/Arkanoid clone; Simple clicker game; Text adventure game; Number guessing game; Rock Paper Scissors with AI; Simple RPG battle system; Dice rolling game; Top-down shooter; Endless runner like Temple Run; 2D platformer basics; Asteroids remake; Angry Birds clone; Pinball game; Physics puzzle game - plus 104 more on the course page.

GCSE Computer Science: AQA, OCR and Edexcel Exam Prep

`/courses/gcse-computer-science-course` · 6 months (24 weeks), joinable any month · GCSE students on AQA, OCR or Edexcel Computer Science; taught from the basics, no prior coding required

- PHASE 1: Programming That Survives Paper 1 (Months 1-2) Real Python, written by hand, plus the code-tracing habit that carries more marks than any single topic on the specification.
    - Month 1: Python Fundamentals and Code Tracing
    - Variables, Input and Output, and Reading an Error
    - Selection, and the Conditions Examiners Set
    - Iteration, and Two-Column Trace Tables
    - Lists, Strings and Standard Algorithms
    - Month 2: Subprograms, Files and Robust Programs
    - Functions, Procedures and Parameters

    - File Handling and Data Validation
    - Testing, Debugging and the Language of Errors
    - Paper 1 Under Time
- PHASE 2: Computing Concepts and Systems (Months 3-4) The theory half, taught as systems that relate to each other rather than as vocabulary to be memorised, because that is what the longer questions reward.
    - Month 3: Data Representation and Computer Systems
    - Binary, Hexadecimal and Binary Arithmetic
    - Images, Sound and Compression
    - The CPU, the Fetch-Decode-Execute Cycle and Memory
    - Software, Translators and Systems Architecture
    - Month 4: Networks, Security, Databases and Impact
    - Networks, Topologies and Protocols
    - Cyber Security and Threats
    - Databases and SQL
    - Ethical, Legal and Environmental Impact
- PHASE 3: Board-Specific Exam Mastery (Months 5-6) The half of the course that separates the three specifications, spent entirely on the papers this student will actually sit.
    - Month 5: Your Board's Papers, In Their Own Format
    - Knowing Your Own Specification
    - Command Words and the Mark Scheme
    - The Long Questions
    - Full Paper 1, Marked and Reviewed
    - Month 6: Full Papers and Final Preparation
    - Full Paper 2, Marked and Reviewed
    - Targeted Repair
    - Second Full Set
    - Exam Week Readiness

GCSE Maths Resit Course Online: Post-16 and Adults

`/courses/gcse-maths-resit-course` · 6 months (24 weeks) for a summer entry; a shorter plan for the November series · Learners aged 16 and over, and adults, resitting GCSE Maths with AQA, Edexcel or OCR

- PHASE 1: Diagnostic and Number (Months 1-2, Weeks 1-8) Find the lost marks first, then repair number, the strand that runs through every paper and dominates the non-calculator paper.
    - Month 1: Diagnostic and the Lost-Marks Map
    - Weeks 1-2: The Diagnostic Paper
    - Weeks 3-4: Number Without a Calculator
    - Month 2: Fractions, Decimals and Percentages
    - Weeks 5-6: Fractions and Decimals
    - Weeks 7-8: Percentages and Money
- PHASE 2: Algebra and Ratio (Months 3-4, Weeks 9-16) The strands where resit learners most often lose marks they could win: forming and solving equations, reading graphs, and ratio in context.
    - Month 3: Expressions, Equations and Graphs
    - Weeks 9-10: Expressions and Equations

    - Weeks 11-12: Sequences and Graphs
    - Month 4: Ratio, Proportion and Rates
    - Weeks 13-14: Ratio and Proportion
    - Weeks 15-16: Rates and Compound Measures
- PHASE 3: Geometry, Probability and Statistics (Month 5, Weeks 17-20) Shape, space and data, taught to the depth your tier needs and practised in exam-style questions.
    - Month 5: Geometry, Probability and Statistics
    - Weeks 17-18: Geometry and Measures
    - Weeks 19-20: Probability and Statistics
- PHASE 4: Full Papers (Month 6, Weeks 21-24) No new content. Full sets of three papers at your tier under real timing, marked against published mark schemes, with repair lessons between papers.
    - Month 6: Paper Sets and Repair
    - Weeks 21-22: Full Sets Under Timing
    - Weeks 23-24: Final Set and Exam Readiness

Projects students build: Lost-marks map: every topic coloured by how many marks it cost; Non-calculator method sheet: one worked example of every written method; Repair log: each fraction slip from the diagnostic re-done correctly; Money problem set: interest, discounts and comparisons solved two ways; Equation bank: one solved example of each equation type, with a check by substitution; Graph file: six graph types drawn and annotated; Ratio problem set: five real contexts solved with a bar model and then algebra; Repair log updated: ratio and rate errors from the diagnostic re-done; Geometry sheet: every formula and angle fact with a worked example; Data question bank: one solved example of every chart and average type; Paper tracker: every paper's score on one chart; Completed paper tracker and lost-marks map, kept for revision.

GCSE Maths: Foundation & Higher (9-1), AQA, Edexcel, OCR

`/courses/gcse-mathematics-mastery` · 18 months (72 weeks), joinable any month · Years 9-11 GCSE students, Foundation and Higher tiers, plus resit candidates

- PHASE 1: The Core, Built Properly (Months 1-6) Foundation-tier territory owned deeply is what Higher-tier grades stand on. This phase rebuilds number fluency without a calculator, teaches algebra as a language, and secures the geometry and statistics basics, with the diagnostic finding the true starting point first.
    - Months 1-2: Diagnostic + Number, Bare-Handed
    - Diagnostic, Board and Tier Fit
    - Fractions, Decimals and Percentages to Fluency
    - Ratio and Proportion Reasoning
    - Indices, Standard Form and Bounds
    - Months 3-4: Algebra as a Language
    - Expressions, Expansion and Factorisation
    - Linear Equations, Inequalities and Formulae
    - Straight-Line Graphs and y = mx + c
    - Simultaneous Equations and Sequences
    - Months 5-6: Shape and Data Foundations
    - Angle Reasoning and Justification
    - Area, Perimeter, Volume and Pythagoras
    - Averages, Charts and Correlation
    - Phase 1 Checkpoint Paper

- PHASE 2: The Higher Reach, With Settling Time (Months 7-12) The topics that separate grade 5 from grade 9, taught months before the exam so they are owned rather than crammed: quadratics and functions, trigonometry beyond right angles, vectors, circle theorems and the algebraic craft the top questions assume.
  - Months 7-8: Quadratics and Functions
  - Solving Quadratics Three Ways
  - Quadratic Graphs and Turning Points
  - Functions: Composite and Inverse
  - Graph Transformations and Algebraic Fractions
  - Months 9-10: Trigonometry, Vectors and Circle Theorems
  - Right-Triangle Trigonometry and Exact Values
  - Sine and Cosine Rules
  - Vectors and Geometric Proof
  - Circle Theorems
  - Months 11-12: Probability, Proportion and the Grade 8-9 Craft
  - Probability, Trees and Venn Diagrams
  - Proportion and Rates of Change
  - Histograms and Cumulative Frequency
  - Phase 2 Higher-Tier Checkpoint
- PHASE 3: Paper Craft to the Exam Series (Months 13-18) Three papers, one strictly non-calculator, sat over exam season: this phase turns understanding into grades with board-exact past-paper cycles, personal timing plans, mark-banking discipline and a peak plan that meets the series calmly.
  - Months 13-14: The Three-Paper System
  - Paper 1 Craft, Non-Calculator
  - Papers 2 and 3 Calculator Craft
  - Months 15-16: Full Cycles by Board
  - Full Board-Exact Paper Cycles
  - Timing Plans and Weak-Topic Rotations
  - Months 17-18: The Series, Met Calmly
  - Final Cycles and Error-Log Closure
  - Peak Plan and Exam-Day Routines

Generative AI Course: LLMs, RAG and AI Agents

`/courses/complete-generative-ai-masterclass-college` · 10-12 months (40-48 weeks) · Complete beginner (18+); Python and the maths are built inside the course

- PHASE 1: Foundations (Months 1-3, Weeks 1-12) Python, the working mathematics, and enough real ML and neural-network understanding that everything generative later makes sense from the inside.
  - Month 1: Python for AI Engineering
  - Python Fundamentals & Development Setup
  - Advanced Python & Data Manipulation
  - Month 2: The Working Mathematics
  - Mathematics for AI - Part 1
  - Mathematics for AI - Part 2 & Statistics
  - Month 3: ML and Neural Networks, the Fast Honest Pass

    - Introduction to Machine Learning
    - Neural Networks & Deep Learning Basics
- PHASE 2: The LLM Core (Months 4-6, Weeks 13-24) Transformers understood deeply enough to reason about, APIs across providers, prompt engineering with evaluation harnesses, embeddings, and RAG built for the first time.
    - Month 4: Transformers and APIs
    - Transformer Architecture Deep Dive
    - LLM APIs Across Providers
    - Month 5: Prompt Engineering and Embeddings
    - Advanced Prompt Engineering
    - Embeddings and Vector Databases
    - Month 6: Frameworks and First RAG
    - LangChain Fundamentals
    - Retrieval Augmented Generation (RAG) - Part 1
- PHASE 3: Agents and Adaptation (Months 7-8, Weeks 25-32) RAG hardened for the real world, agent architecture with tools and memory, and fine-tuning judgment: what it changes, what it costs, when it is wrong.
    - Month 7: Hardened RAG and First Agents
    - RAG for the Real World
    - AI Agents Architecture - Part 1
    - Month 8: Agent Systems and Fine-Tuning
    - Agent Systems: Memory, Planning and Guardrails
    - Fine-tuning Fundamentals
- PHASE 4: Production and the Capstone (Months 9-10, Weeks 33-40) Open-weight models run locally, production architecture with observability and security, responsible AI, and a capstone shipped behind an API and defended.
    - Month 9: Open Weights and Production Architecture
    - Open Source LLMs & Local Deployment
    - Production Architecture, Observability and Security
    - Month 10: Ethics, Capstone and the Final Exam
    - Responsible GenAI
    - Capstone Build
    - Demo Day and the Final Exam

Projects students build: Text-based calculator program; Todo list application; File organizer script; Simple data analyzer from CSV; Web scraper basics with requests; Command-line application; Personal expense tracker; Password generator and validator; Data analysis pipeline for CSV files; Student grade analyzer with Pandas; Weather data visualizer; E-commerce sales dashboard; Stock price analyzer and plotter; Text file analyzer with regex; Custom data class library - plus 138 more on the course page.

Git & GitHub Course for College Students: Team-Ready Skills

`/courses/git-github-version-control-course-for-college-students` · 24 classes (12 weeks · 2 classes/week) · Beginner to job-ready collaborator (college students and recent graduates)

- Phase 1: Foundations Fast Go from zero to confident daily Git use: how version control thinks, complete CLI fluency, an undo toolkit you can trust in any situation, and repository hygiene that keeps secrets and junk out of history.
    - Class 1: How Version Control Thinks: Concepts, Install & First Config
    - Class 2: CLI Fluency: init, add, commit, log & diff Like You Mean It

    - Class 3: The Full Undo Toolkit: restore, reset, revert & When Each Is Safe
    - Class 4: .gitignore for Real Stacks, Secrets & Commit Craft
- Phase 2: GitHub for Your Career Turn GitHub into a career asset: SSH and remotes done properly, READMEs and licenses recruiters respect, a profile that survives a 30-second scan, the Student Developer Pack claimed, and a live portfolio on GitHub Pages.
    - Class 5: GitHub, SSH Keys & Your First Push
    - Class 6: Clone, Fetch, Pull & Speaking Remote Fluently
    - Class 7: READMEs & Licenses: Repos Recruiters Actually Read
    - Class 8: Profile README, Pinned Repos & the Student Developer Pack
    - Class 9: Ship Your Portfolio on GitHub Pages
- Phase 3: Team Workflows Work the way engineering teams work: feature branches, clean history with merge and rebase, real conflict resolution, pull requests with meaningful review, and issues and Projects boards that keep group assignments and hackathons on track.
    - Class 10: Branches & the Feature-Branch Workflow
    - Class 11: Merge vs Rebase & Keeping History Clean
    - Class 12: Resolving Merge Conflicts Under Deadline Pressure
    - Class 13: Pull Requests With Meaningful Descriptions
    - Class 14: Code Review: Giving & Receiving Like a Professional
    - Class 15: Issues, Projects, Forks & Running a Team Repo
- Phase 4: Automation & Open Source Automate quality and step into the open source world: CI that runs your tests on every push, branch protection that enforces discipline, professional versioning and releases, and a real contribution roadmap through Hacktoberfest and GSoC preparation.
    - Class 16: GitHub Actions: CI That Runs Your Tests on Every Push
    - Class 17: Status Checks, Branch Protection & Team Discipline
    - Class 18: Conventional Commits, Tags & Releases
    - Class 19: Contributing to Open Source: Etiquette & Your First PR
    - Class 20: Hacktoberfest, GSoC & Your Open Source Roadmap
- Phase 5: Advanced Git & Capstone The finishing layer: advanced rescue and history-debugging tools, the interview questions that filter candidates, and a team capstone shipped with the complete professional workflow, followed by your certificate.
    - Class 21: stash, cherry-pick & reflog: The Rescue Kit
    - Class 22: git bisect & Debugging With History
    - Class 23: Git Interview Questions & Whiteboard Scenarios
    - Class 24: Capstone: Ship a Team Project the Professional Way + Certificate

Projects students build: Install Git, complete your global configuration, create your first repository with git init, and explore the hidden .git folder to see where history actually lives; Build a personal-notes repository with at least 8 meaningful commits, using git add -p at least twice and reading your own history with git log --oneline --graph; Run a scripted rescue drill: amend a bad message, soft-reset a premature commit, hard-reset a failed experiment, and revert a bad commit that was already pushed to a practice remote; Take a messy starter project with node_modules, a fake .env, and editor junk already tracked; write a production-grade .gitignore, untrack the offenders with git rm --cached, and re-commit cleanly; Create or clean up your GitHub account, set up ed25519 SSH authentication end to end, and push your Class 4 repository with git push -u origin main; Simulate a two-computer workflow using two local clones of your own repository: make diverging changes, inspect with git fetch, reconcile with git pull --rebase, and push; Rewrite the README of your best existing project to the professional template, add a screenshot and a suitable license, and complete the repo description and topics; Ship your profile README in the username/username repository, pin your best

repositories, complete your bio, and submit your Student Developer Pack verification; Deploy a portfolio site at username.github.io featuring at least three projects with live links, then add the portfolio URL to your GitHub bio and resume; Build two features of a small app on separate branches (feature/navbar and feature/contact-form), merge both into main, and delete the merged branches; Take a feature branch with five messy WIP commits, use git rebase -i to squash and reword them into two clean commits, then rebase onto an updated main and merge; Run a staged three-person conflict lab: all three teammates edit the same function on separate branches, then merge every branch into main resolving each conflict correctly; Open a real PR on your team repository with a complete description, screenshots, and a linked issue; get it reviewed by a classmate and squash-merge it; Complete a paired review cycle: review a classmate's PR leaving at least one suggested change and one question, and shepherd your own PR from Request changes to Approved; Set up your capstone team repository: issue templates, labels, a milestone, a Projects board with 10+ scoped issues, and a fork-based contributor test run with upstream syncing - plus 9 more on the course page.

Git & GitHub Course for Teens: Version Control from Zero

`/courses/git-github-version-control-course-for-teens` · 24 classes (12 weeks · 2 classes/week) · Beginner-friendly (ages 13-18) to confident GitHub collaborator

- Phase 1: Git Foundations Understand why version control exists, install Git on your own machine, get comfortable in the terminal from zero, and master the everyday cycle of init, status, add, commit, log, diff, and safe undo.
  - Class 1: Why Version Control? (The Lost Homework Horror Story)
  - Class 2: Terminal Survival Skills (Zero Assumed)
  - Class 3: Your First Repository: init, status, add, commit
  - Class 4: Time Travel: log, diff, and Inspecting History
  - Class 5: Undoing Safely + .gitignore
- Phase 2: GitHub Essentials Take your repositories online: create your GitHub account, set up SSH keys, push and pull, write READMEs people actually read, build your profile page, understand licenses and issues, and publish a free website with GitHub Pages.
  - Class 6: Joining GitHub (13+) and Your First Push
  - Class 7: HTTPS vs SSH: Keys, Cloning, and Pulling
  - Class 8: READMEs That Make People Care (Markdown)
  - Class 9: Your Profile README and GitHub Identity
  - Class 10: Licenses, Issues, and Repo Housekeeping
  - Class 11: Publish Your First Website Free with GitHub Pages
- Phase 3: Branching & Collaboration Learn the skill that separates solo coders from teammates: branches, merges, calm conflict resolution, pull requests end to end, kind code review, forks with upstream syncing, and a real two-person project on one shared repository.
  - Class 12: Branches: Parallel Universes for Your Code
  - Class 13: Merging Branches Like a Pro
  - Class 14: When Branches Collide: Conflicts Made Simple
  - Class 15: Pull Requests End to End
  - Class 16: Reviewing Kindly + Forks and Upstream
  - Class 17: Team Project: Two People, One Repo
- Phase 4: Level Up Move past the basics with the tools developers reach for daily: a safe introduction to rebase, git stash for interruptions, tags and releases for shipping versions, your first GitHub Actions automation, and a portfolio pass that makes your profile genuinely readable.
  - Class 18: Merge vs Rebase, a Safe Introduction
  - Class 19: Stash, Tags, and Releases

- Class 20: Your First GitHub Actions Workflow
- Class 21: A Portfolio Recruiters and Colleges Can Actually Read

- Phase 5: Open Source & Capstone Graduate from your own repos to the world's: find a genuine good first issue, learn the etiquette that gets contributions merged, open a real external pull request, and complete a capstone that earns your certificate.
  - Class 22: Finding Your First Open Source Issue
  - Class 23: Making the Contribution: Etiquette and the External PR
  - Class 24: Capstone: Profile, Portfolio, Merged PR + Certification

Projects students build: Install Git on your own computer, run git --version to prove it works, and write a half-page version-control horror story from your own life (or a friend's) that this course will make impossible; Build a coding-projects folder tree (three nested folders and two files) entirely from the terminal, no mouse allowed, and configure your Git name and email; Create my-first-repo and build a tiny webpage across 5 separate commits, each with a clear message, so git log reads like a story of how the page grew; History detective challenge: in a prepared repo, use log, show, diff, and blame to answer five questions like 'which commit broke the page title and what did it change?'; Rescue mission: in a prepared practice repo, unstage a file, discard a bad edit with git restore, amend a commit message, revert a bad commit, and write a .gitignore that keeps secrets.txt out forever; Create your GitHub account with 2FA enabled, make your first online repository, connect your Class 3 local repo to it, and push all 5 commits so they appear on github.com; Set up a working SSH key, clone your own repository into a second folder to simulate a second computer, make a change there, push it, and pull it back into the original; Write a complete README.md for your webpage project with a heading, screenshot, run instructions, a feature table, and one code block, then push it and admire the rendered result; Create your username/username repository with a profile README introducing yourself, your current projects, and what you are learning, then pin your two best repos; Add an MIT license to your webpage project, open three well-written issues on it (one bug, two feature ideas), and close one automatically with a 'fixes #N' commit; Publish your webpage project live on GitHub Pages, fix any broken image paths, add a custom 404 page, and share your working URL with the class; On your live website repo, build a new feature (a dark theme or a new section) entirely on a feature branch while main stays untouched and your live site keeps working; Merge your dark-theme branch into main (watching your live Pages site update), then create, merge, and delete a second small feature branch using --no-ff and compare the two history shapes; Conflict laboratory: follow a script that manufactures a two-branch conflict in your repo, resolve it three ways (current, incoming, hand-crafted blend), and keep the best resolution; Ship a real feature to your website through a complete PR: branch, push, open a PR with description and screenshot, link an issue, then squash-merge it and watch the issue close - plus 9 more on the course page.

Go Course: Backend Services from Zero to Production Habits

`/courses/complete-golang-programming-masterclass-college` · 10-12 months (44-52 weeks) · Complete beginner (18+); college students, graduates and working professionals

- PHASE 1: Foundation & Core Go Skills (Months 1-3, Weeks 1-13) Build rock-solid Go fundamentals. Learn programming logic, master Go syntax, understand Go's philosophy, and create your first applications.
  - Months 1-2: Go Fundamentals & Programming Basics
  - Introduction to Go & Development Environment Setup
  - Variables, Data Types & Operators
  - Control Flow & Functions
  - Arrays, Slices & Maps
  - Month 3: Structs, Methods & Interfaces
  - Structs & Methods
  - Interfaces & Polymorphism
  - Packages & Error Handling

- PHASE 2: Advanced Go & Systems Programming (Months 4-6, Weeks 14-26) Master Go's concurrency model, advanced features, testing, performance optimization, and systems programming.
  - Month 4: Concurrency & Advanced Features
  - Goroutines & Channels Fundamentals
  - Advanced Concurrency Patterns
  - Reflection & Generics
  - Testing & Benchmarking
  - Performance Optimization & Profiling
  - Month 5: CLI Tools & Systems Programming
  - Building CLI Applications
  - File I/O & System Programming
  - Networking & Protocols
  - Data Serialization & Encoding
  - Month 6: Tooling, Quality & Debugging
  - Build Tools & Dependency Management
  - Code Quality & Best Practices
  - Debugging & Troubleshooting
- PHASE 3: Web Development & Enterprise Applications (Months 7-9, Weeks 27-39) Master web development with Go, build REST APIs, GraphQL, gRPC services, work with databases, and deploy production applications.
  - Month 7: Web Development & APIs
  - HTTP & Web Fundamentals
  - Web Frameworks & REST APIs
  - Database Programming
  - NoSQL & Caching
  - GraphQL & Modern APIs
  - Month 8: gRPC & Microservices Foundations
  - gRPC & Protocol Buffers
  - Message Queues & Event-Driven
  - Authentication & Security
  - Observability & Monitoring
  - Month 9: Shipping Go: Containers, CI & Production Habits
  - Containerization & Orchestration
  - CI/CD & Automation
  - Production Best Practices
- PHASE 4: The Finale (Month 10, Weeks 40-44) The capstone month: spec, build, ship and defend, then the final exam that decides the certificate.
  - Month 10: Capstone and the Final Exam
  - Capstone Spec and Setup
  - Capstone Build
  - Ship and Polish
  - Demo Day and the Final Exam

Projects students build: Hello World with command-line arguments; Personal information display program; ASCII art generator in Go; Simple text output variations; Environment variable reader; Calculator with all arithmetic operations; Temperature converter (Celsius, Fahrenheit, Kelvin); Unit converter (length, weight, volume); BMI calculator with health assessment; Currency converter with live rates simulation; Bitwise operations demonstrator; Type conversion examples program; Interest calculator (simple and compound); Number guessing game; Grade calculator with switch - plus 277 more on the course page.

Godot Game Development for Kids and Teens: GDScript, 2D and 3D

`/courses/godot-game-development-course-for-kids-and-teens` · 6 months (24 weeks) · Beginner to text coding, ages 10 to 17

- PHASE 1: Godot Foundations and a First Finished Game (Months 1-2, Weeks 1-8) Students learn how Godot thinks, write their first GDScript, and finish a complete 2D arcade game with scoring, a game over screen and a browser build.
  - Month 1: Nodes, Scenes and Scripts
  - Weeks 1-2: The Godot Editor and Your First Scene
  - Weeks 3-4: Movement, Input and the Game Loop
  - Month 2: A Complete Arcade Game
  - Weeks 5-6: Collisions, Signals and Spawning
  - Weeks 7-8: Score, HUD, Game Over and Export
- PHASE 2: Platformers and Game Feel (Months 3-4, Weeks 9-16) The genre that teaches the most: gravity, jumping, levels built from tiles, enemies that think a little, and the animation and sound that make a game feel alive.
  - Month 3: Platformer Physics and Levels
  - Weeks 9-10: CharacterBody2D, Gravity and Jumping
  - Weeks 11-12: Tile Maps, Cameras and Animation
  - Month 4: Enemies, Menus and Game Feel
  - Weeks 13-14: Enemies and Simple State Machines
  - Weeks 15-16: Animation, Sound, Menus and Saving
- PHASE 3: 3D and the Capstone Game (Months 5-6, Weeks 17-24) Students carry what they know into 3D, then design and ship an original game of their own, from written plan to playable build.
  - Month 5: Into 3D
  - Weeks 17-18: 3D Scenes, Cameras and Movement
  - Weeks 19-20: A 3D Collect-a-thon Level
  - Month 6: The Capstone Game
  - Weeks 21-22: Design Document, Scope and Prototype
  - Weeks 23-24: Polish, Export and Showcase

Projects students build: Hello Godot: a scene with a moving title, a sprite and a script that greets the player by name; Top-down mover: a player ship that moves smoothly in eight directions and stays inside the screen; Dodge the falling objects: enemies spawn at random positions and the game reacts when the player is hit; First finished game: the dodge game with title screen, score, high score for the session, sound and a web build; Jump lab: a test room where every jump setting can be tuned live and compared; Two-level platformer: tile map levels, collectibles, an animated player and a working exit; Enemy pack: three enemies with different behaviours added to the platformer; Polished platformer: menus, pause, music, particles and a saved best time, exported for the web; 3D playground: a lit scene where a character runs, jumps and pushes objects around; 3D level: collect every item before the timer runs out, with a finish screen and a best time; Capstone prototype: the core loop of the student's own game, playable from start to finish; Finished capstone game, exported and presented at the class showcase.

GRE & GMAT Quantitative Prep: Live Maths Coaching

`/courses/gre-gmat-quant-maths-prep-course` · 6 months (24 weeks) · Adults preparing for graduate admissions; school maths is refreshed from the ground up

- PHASE 1: Rebuilding the Maths Foundation (Months 1-2, Weeks 1-8) The arithmetic and algebra both exams assume you already own, rebuilt from the ground up and drilled at exam speed, because this is where the majority of lost marks quietly come from.
  - Month 1: Arithmetic and Number Properties
  - Diagnostic and the Number System
  - Fractions, Decimals and Percentages
  - Ratios, Proportions and Rates
  - Exponents, Roots and Number Sense
  - Month 2: The Algebra Foundation
  - Expressions and Linear Equations
  - Systems, Inequalities and Absolute Value
  - Quadratics and Functions
  - Algebra Under Exam Pressure
- PHASE 2: The Full Content Map of Both Exams (Months 3-4, Weeks 9-16) Word problems, the geometry the GRE still tests, coordinate geometry that the GMAT counts as algebra, and the descriptive statistics and data interpretation both exams rely on.
  - Month 3: Word Problems and Geometry
  - Word Problems That Actually Appear
  - Geometry for the GRE: Lines, Angles and Triangles
  - Geometry for the GRE: Circles, Polygons and Solids
  - Coordinate Geometry
  - Month 4: Statistics and Data Interpretation
  - Descriptive Statistics
  - Counting and Probability
  - Data Interpretation and Graphs
  - Consolidation and First Full Quant Section
- PHASE 3: Exam Craft and Timed Mastery (Months 5-6, Weeks 17-24) The question formats unique to each exam, the timing and guessing strategy that protects a score, and repeated full timed practice reviewed until the mistake patterns are gone.
  - Month 5: Exam-Specific Formats and Strategy
  - GRE Quantitative Comparison
  - Data Sufficiency and the GMAT Data Insights Section
  - Timing, Pacing and Educated Guessing
  - Error Patterns and Targeted Repair
  - Month 6: Full Timed Practice and Test-Ready Review
  - Full Section One and Deep Review
  - Full Section Two and Format Sharpening
  - Full Section Three and Final Content Gaps
  - Test-Ready: Final Review and Plan

Projects students build: Personal weakness map: your diagnostic broken down by topic into a ranked list of what to fix first; Percentage trap set: ten deliberately baited percentage questions worked slowly, then reworked at speed; Rate reasoning: five real-world rate scenarios set up as equations before any number is plugged in; Shortcut library: your own one-page sheet of the number-sense checks that will not fit in a calculator; Translation drill: fifteen word phrases each converted to an equation, the step where most marks are won or lost; Two-variable challenge: a set of word problems that each resolve to a two-equation system, set up before solving; Quadratic recognition: ten problems where the challenge is realising a quadratic is involved at all; Method-choice audit: a mixed algebra set where you record which method you chose and whether it was the fastest available; Word-problem playbook: your own labelled template for each of the six recurring problem types; Triangle toolkit: a reference of every triangle fact the GRE reuses, drawn and annotated by you; Formula sheet, earned: build the geometry formula reference yourself, which is how it actually sticks; Line investigation: a set of coordinate problems solved both algebraically and by sketching, to see which is faster where; Average-shift study: a set of questions about how statistics change when the data changes, reasoned without brute force; Counting decision tree: your own flowchart for choosing between permutation, combination and direct counting; Graph deconstruction: a real multi-graph data set answered, then examined for how it could have been misread - plus 9 more on the course page.

Hackathon for Adults: Free Event + 12-Week Pro Prep (18+)

`/courses/hackathon-prep-for-adults-professionals-coding-ai-innovation-course` · 12 weeks pro prep + Live Hackathon Weekend · Beginner-Friendly to Advanced (Adults 18+)

- PHASE 1: Foundations, Engineering Fluency for Adults (Weeks 1-4) Adults arrive from very different starting points, some are seasoned engineers, some are PMs who've never written code, some are career switchers from medicine or finance. Phase 1 is the great equalizer. By Week 4, every participant ships a deployed full-stack app and competes in their first solo mini-hackathon.
  - Week 1: Hackathon Culture, Python + TypeScript Setup, Engineering Mindset
  - Week 2: Full-Stack Fundamentals, REST, Databases, Auth
  - Week 3: Modern Frontend, Next.js 16, Server Actions, Tailwind, shadcn/ui
  - Week 4: First Solo Pro Mini Hackathon, Ship Production-Ready in 12 Hours
- PHASE 2: Pro Stack, AI Agents, RAG, System Design (Weeks 5-8) This is the differentiator, what separates a winning hackathon team from a generic one. Adults learn how production AI software is actually built today: agents with tool calling, durable workflows, RAG over private data, and the system design choices that scale.
  - Week 5: AI APIs & The Vercel AI SDK, Stream, Cache, Cost-Manage
  - Week 6: AI Agents, Tool Calling & Durable Workflows
  - Week 7: RAG Done Right, Embeddings, Vector DBs, Hybrid Search, Eval
  - Week 8: System Design + Mock Pro Hackathon (Teams of 2-4)
- PHASE 3: Pro Hackathon Sprint, Capstone, Pitch Lab & Live Hackathon Weekend (Weeks 9-12) The final 4 weeks are a real, founder-grade hackathon journey. Adults lock a capstone, get matched with senior mentors (engineers, founders, VCs as needed), build with production discipline, get founder-grade pitch coaching, and compete in the Live Pro Hackathon Weekend with sponsor prizes.
  - Week 9: Capstone Lock, Spec, Architecture, Cost Model, GTM Sketch
  - Week 10: Heavy Build Sprint, Production Discipline at Hackathon Speed
  - Week 11: Founder-Grade Pitch Lab, VC Critique, Slides, Demo Polish
  - Week 12: LIVE PRO HACKATHON WEEKEND, Compete with Founders & Senior Engineers

Projects students build: CLI tool in Python and same tool in TypeScript; Personal landing page deployed to Vercel; First open-source PR to a public repo; CRUD app with Supabase + Next.js; Auth flow with Clerk + RBAC; Public + private routes split with middleware; Marketing landing page with shadcn/ui; Dashboard with charts (Recharts) + Cache Components; Form-heavy app using Server Actions exclusively; PHASE 1 CAPSTONE, Solo Pro Mini Hackathon: 12-hour

build, deployed to a real domain, 2-minute pro demo, judge-ready README; Streaming chat app with prompt caching enabled; Multi-provider AI gateway with failover; Structured-output extraction from PDFs; Coding agent that writes, runs and tests code in Sandbox; Research agent that browses, synthesizes and cites sources - plus 15 more on the course page.

Hackathon for Kids: Free Event + 12-Week Prep (Ages 8-12)

`/courses/hackathon-prep-for-kids-coding-innovation-ai-projects-course` · 12 weeks prep + Live Hackathon Weekend · Complete Beginner (Ages 8-12)

- PHASE 1: Hackathon Foundations, How Hackathons Work (Weeks 1-4) Kids learn what a hackathon is, why it exists, how teams build software in 48 hours, and how to start thinking like an inventor. They build their first 'mini hack' projects in Scratch and learn the language of hackathons: idea, MVP, sprint, demo and pitch.
  - Week 1: What is a Hackathon?, Welcome to the Builder Mindset
  - Week 2: Idea Generation, Where Hackathon Ideas Come From
  - Week 3: Coding Logic, Loops, Conditions & Variables in Scratch
  - Week 4: First Mini Hackathon (Solo), Build & Pitch in 4 Hours
- PHASE 2: Build Skills, AI, Algorithms & Team Hacking (Weeks 5-8) Kids level up to AI tools, learn the basics of algorithms (the secret sauce of efficient hackathon projects), discover Replit and Bolt.new, and start working in teams of 2-3. By Week 8, they will have built their first AI-powered hackathon project with a partner.
  - Week 5: Vibe Coding with AI, Build Apps by Talking to Computers
  - Week 6: Algorithms for Kids, Sorting, Searching & Pathfinding
  - Week 7: Team Hacking, Roles, GitHub Basics & Collaboration
  - Week 8: Mock Hackathon (Teams), 8-Hour Sprint Across Two Days
- PHASE 3: Real Hackathon Sprint, Capstone, Pitch & Live Hackathon Weekend (Weeks 9-12) The final phase is a real hackathon journey. Kids pick their dream project, get paired with mentors, build their capstone over 4 weeks, get pitch coaching, record final demos, and compete in the official Modern Age Coders Live Hackathon Weekend at the end of Week 12, the same hackathon that's free for the public.
  - Week 9: Capstone Idea Lock, Mentor Matching & Project Plan
  - Week 10: Build Sprint, Code, AI, Iterate, Repeat
  - Week 11: Pitch Coaching & Demo Polish, Tell the Story
  - Week 12: LIVE HACKATHON WEEKEND, Compete, Demo & Get Crowned

Projects students build: 60-Minute Mini Hack: Animated Welcome Card; Hacker ID Card (designed in Canva); Idea Wall, write 10 things in the world you'd like to fix; My Idea Comic, 6-panel storyboard of your hackathon dream project; Problem Statement Card (one sentence); Empathy Interview, interview a family member about their daily problems; Number Guessing Game with hints; Score-Tracking Quiz Game (5 questions); Loop Art, generate a star pattern using only loops; PHASE 1 CAPSTONE, Solo Mini Hackathon: 4-hour build + 60-second demo + 1-page README. Choose any problem from your Idea Wall.; AI-Built Calculator with custom theme (Replit Agent); AI-Built Quiz App on a topic you love (Bolt.new); AI-Explained Code Journal, print 3 AI snippets and write what each line does; Sorting Race, animate bubble sort vs. insertion sort with sprites; Maze Solver, a sprite that finds the exit using a simple algorithm - plus 15 more on the course page.

Hackathon for Teens: Free Event + 12-Week Prep (Ages 13-17)

`/courses/hackathon-prep-for-teens-coding-ai-build-innovate-win-course` · 12 weeks prep + Live Hackathon Weekend · Beginner-Friendly to Intermediate (Ages 13-17)

- PHASE 1: Foundations, Python, JavaScript & Git for Hackers (Weeks 1-4) Teens build serious coding fluency. We cover Python (logic + scripting), JavaScript (the universal language of the web), and Git/GitHub workflow that every hackathon team uses. By Week 4, every student can ship a small web app to a real URL.
  - Week 1: Hackathon Culture, Python Basics & The Hacker Mindset

    - Week 2: JavaScript Essentials & DOM, The Universal Hackathon Language
    - Week 3: Git, GitHub & Team Coding, Professional Workflow
    - Week 4: First Mini Hackathon (Solo), Ship to a Live URL in 8 Hours
- PHASE 2: Build Stack, React, AI APIs, Algorithms & System Design (Weeks 5-8) Teens learn the full modern hackathon stack. By Week 8, they can build a deployable React + Tailwind + Supabase app with an AI feature in under 24 hours.
    - Week 5: React + Tailwind, The Hackathon UI Stack
    - Week 6: Backend with Supabase + REST APIs, Build a Real Product
    - Week 7: AI APIs, Build AI-Powered Hackathon Projects
    - Week 8: Algorithms, DSA & System Design Lite + Mock Hackathon (Teams)
- PHASE 3: Real Hackathon Sprint, Capstone, Pitch Lab & Live Hackathon (Weeks 9-12) The final 4 weeks are a real hackathon journey. Teens lock a capstone idea, get matched with a senior mentor, build, polish, get pitch coached and compete in the Live Modern Age Coders Hackathon Weekend.
    - Week 9: Capstone Lock, Mentor Matching, Spec & Architecture
    - Week 10: Heavy Build Sprint, Code, Test, Iterate
    - Week 11: Pitch Lab, Storytelling, Slides & Demo Polish
    - Week 12: LIVE HACKATHON WEEKEND, Compete with the World

Projects students build: CLI To-Do List in Python; Number guessing game with hints + difficulty levels; Data formatter: read a CSV, print summary stats; Weather App calling a public weather API; Markdown live preview editor; GitHub user profile fetcher; Personal Portfolio site deployed via GitHub Pages; Open-source contribution: file 1 PR to a public repo; Team-built mini app with branches and PRs; PHASE 1 CAPSTONE, Solo Mini Hackathon: 8-hour build, deployed to Vercel, 90-second demo, judge-ready README; Personal landing page with React + Tailwind; Recipe finder calling an external API; Interactive dashboard with charts (Recharts); Notes app with auth + Supabase database; Image gallery with uploads + storage - plus 15 more on the course page.

High School Mathematics: Algebra to Calculus (Grade 9-12)

`/courses/complete-high-school-mathematics-mastery` · 12-14 months (52-60 weeks) · Complete Beginner to Advanced High School

- PHASE 1: Algebraic Foundations and Basic Geometry (Weeks 1-13) Build strong foundations in algebraic thinking, equation solving, and geometric reasoning. Master the core concepts that form the basis of all advanced mathematics.
    - Months 1-2: Algebra I Fundamentals
    - Number Systems & Algebraic Expressions
    - Linear Equations & Inequalities
    - Polynomials & Operations
    - Factoring Techniques
    - Month 3: Systems & Basic Geometry
    - Systems of Linear Equations
    - Introduction to Geometry
    - Phase 1 Review & Assessment
- PHASE 2: Advanced Algebra and Functions (Weeks 14-26) Master quadratic functions, advanced algebraic concepts, coordinate geometry, and function theory. Build strong analytical and graphing skills.
    - Months 4-5: Quadratics & Functions
    - Quadratic Functions & Equations
    - Exponential & Logarithmic Functions

    - Rational Functions & Expressions
    - Function Theory & Transformations
    - Conic Sections
    - Month 6: Coordinate Geometry & Vectors
    - Advanced Coordinate Geometry
    - Introduction to Vectors
    - Sequences and Series
    - Complex Numbers
    - Phase 2 Capstone Assessment
- PHASE 3: Trigonometry and Pre-Calculus (Weeks 27-39) Master trigonometric functions, identities, and applications. Prepare for calculus with limits, advanced functions, and analytical geometry.
    - Months 7-8: Trigonometry Mastery
    - Trigonometric Ratios & Functions
    - Graphing Trigonometric Functions
    - Trigonometric Identities
    - Trigonometric Equations & Applications
    - Law of Sines and Cosines
    - Month 9: Pre-Calculus & Limits
    - Limits and Continuity
    - Introduction to Derivatives
    - Mathematical Reasoning & Proofs
    - Matrices and Determinants
    - Phase 3 Review & Assessment
- PHASE 4: Calculus, Statistics and Final Revision (Weeks 40-52) Master differential and integral calculus, statistics, probability, and advanced problem-solving techniques for university readiness.
    - Month 10: Calculus
    - Differential Calculus
    - Applications of Derivatives
    - Integral Calculus
    - Applications of Integration
    - Series and Sequences (Calculus)
    - Month 11: Statistics & Probability
    - Descriptive Statistics
    - Probability Theory
    - Probability Distributions
    - Statistical Inference
    - Advanced Problem Solving
    - Month 12: Final Review & Applications
    - University Preparation
    - Month 13: Final Assessments & Certification
    - Comprehensive Review - Part 1
    - Comprehensive Review - Part 2 & Mock Exams

Projects students build: Create a number system classification chart; Real-world scientific notation problems; Algebraic expression calculator design; Budget planning with linear equations; Distance-rate-time problem solver; Inequality graphing tool; Polynomial calculator implementation; Area and volume problems with polynomials; Pascal's triangle pattern explorer; Factoring flowchart creation; Projectile motion problems; Optimization problem solver; Supply and demand economic model; Mixture problem solver; Linear programming introduction - plus 100 more on the course page.

HTML & CSS for Beginners: Build Real Responsive Websites

`/courses/html-css-course-for-beginners-build-real-websites` · 4 months (16 weeks) · Absolute beginner, ages 10 to adult

- PHASE 1: The Two Languages (Months 1-2, Weeks 1-8) HTML gives a page its structure and meaning; CSS gives it appearance. Both are learned by building real pages from the first week.
  - Month 1: HTML, the Structure of Every Page
  - Your First Page
  - Links, Images, and Paths
  - Semantic Structure
  - Tables, Media, and Clean Code
  - Month 2: CSS, the Appearance Layer
  - First Styles
  - Typography
  - The Box Model
  - Display and Simple Layout
- PHASE 2: Layout, Responsiveness, and Shipping (Months 3-4, Weeks 9-16) Flexbox and grid turn styled pages into real layouts. Then responsive design, forms, and a capstone month: build, test, and publish a multi-page personal site.
  - Month 3: Real Layout with Flexbox and Grid
  - Flexbox Fundamentals
  - Flexbox in the Real World
  - CSS Grid
  - Responsive Design
  - Month 4: Forms, Polish, and the Capstone Site
  - Forms
  - Polish and Performance
  - Capstone Build
  - Test, Publish, Present

Projects students build: A real first page: an introduction page with headings, paragraphs, and a list, opened in the browser by the end of class one; Two-page mini site: an about page and a favorites page, linked both ways, with images that actually load; Restructure week 2's site with proper semantic tags, then sketch the structure of a favorite real website on paper; A results or schedule page with a real data table plus an embedded video or map; Style the month 1 introduction page: a real color scheme, applied through classes, no inline styles; Typography makeover: the same article styled two ways, one serious, one playful, with a note on the choices; Profile card: photo, name, description, and a button, spaced and shadowed like a real component; A styled article page: centered content column, styled headings, hover-styled links, and a card or two; A proper navigation bar: logo left, links right, evenly spaced, with hover states; Photo gallery row and a three-card feature section, both wrapping cleanly as the window narrows; Magazine-style layout: a featured story spanning two columns above a grid of smaller pieces; Make the month's layouts fully responsive: gallery, cards, and magazine layout all working from phone to desktop; A styled contact form: name, email, subject dropdown, message, and

a submit button that validates; Polish pass on your best existing page: transitions, favicon, compressed images, and an accessibility check; The capstone: a multi-page personal site, four pages, shared navigation, responsive throughout - plus 1 more on the course page.

IB DP Computer Science (New Guide, First Assessment 2027)

`/courses/ib-diploma-computer-science-course` · Ongoing DP support, joinable any month · IB Diploma Programme students taking Computer Science at SL or HL

- PHASE 1: Theme A, Computer Fundamentals and Networks How computing systems actually work, taught so the Paper 1 answers come from understanding rather than recall.
  - Month 1: Computer Fundamentals and System Architecture
  - Hardware, Software and the System
  - System Architecture and the Processor
  - Data Representation and Abstraction
  - Ethical and Social Issues in Computing
  - Month 2: Networks, Security and the Cloud
  - Network Structures and Types
  - Protocols and Data Transmission
  - Cybersecurity
  - Cloud Computing
- PHASE 2: Databases, Machine Learning and the Case Study The two Theme A areas that are new or expanded for both SL and HL, plus the case study that is now assessed inside Paper 1.
  - Month 3: Databases and SQL
  - The Relational Model
  - SQL in Practice
  - Data Storage, Integrity and Ethics
  - Machine Learning and AI
  - Month 4: The Case Study and Computational Thinking
  - Working the Annual Case Study
  - Case Study Depth and Application
  - Computational Thinking
  - Algorithms and Efficiency
- PHASE 3: Programming, the Internal Assessment and Exam Mastery Theme B in code, the computational solution built properly, and both papers drilled under timed conditions.
  - Month 5: Programming and Object-Oriented Programming
  - Programming Fundamentals in Your Paper 2 Language
  - Data Structures and File Handling
  - Object-Oriented Programming (SL and HL)
  - Starting the Internal Assessment
  - Month 6: Completing the IA and Full Exam Practice
  - Building and Documenting the Solution
  - Finishing the IA and the Video
  - Paper 1 Technique
  - Paper 2 and Full Mocks

Projects students build: Map a described real system end to end, labelling every hardware and software component; Trace a full instruction cycle and explain each stage in your own words; Describe one everyday system at three different levels of abstraction; Write a balanced evaluation of one real computing controversy, naming stakeholders on both sides; Design a network for a described organisation and justify every choice; Trace a single web request across the layers, naming the protocol at each step; Produce a security assessment for a described system with prioritised, justified recommendations; Write a balanced recommendation on moving a described organisation to the cloud; Design a normalised relational schema for a described scenario and draw its ER diagram; Build a working database and write the queries that answer real questions about it; Audit a described database for integrity and privacy risks and recommend fixes; Explain how a described ML system reaches a decision, then identify where bias could enter; Produce a full annotated summary and terminology glossary for the current case study; Write two full extended responses on the case study and mark them against the criteria; Take one problem from analysis through to a fully traced algorithm, documenting each thinking step - plus 9 more on the course page.

IB Maths AA & AI: SL & HL, Live Online with IA Coaching

`/courses/ib-mathematics-aa-ai-masterclass` · 24 months (the full Diploma Programme arc) · IB DP students (AA & AI, SL & HL) and MYP students heading to the DP

- PHASE 1: The Shared Core at DP Strength (Months 1-8) Both IB courses stand on the same five topic areas. This phase builds number & algebra and functions to Diploma strength, repairs MYP-era gaps inline, and establishes the retrieval and paper habits that a two-year syllabus demands.
  - Months 1-2: Diagnostic, Course Fit and Algebra at DP Pace
  - Diagnostic and Course Fit (AA vs AI, SL vs HL)
  - Exponents and Logarithms to DP Fluency
  - Sequences, Series and Financial Applications
  - Proof and Mathematical Writing Foundations
  - Months 3-5: Functions, the DP's Load-Bearing Topic
  - Function Anatomy: Domain, Range, Composition, Inverses
  - Transformations, Quadratics and Polynomials
  - Exponential, Log and Rational Functions with the GDC
  - Months 6-8: Geometry, Trigonometry and First Paper Craft
  - Trigonometry: Unit Circle to Applied Bearings
  - Vectors, 3D Geometry and the Sine and Cosine Rules
  - First Past-Paper Season and the Review Ritual
- PHASE 2: Course-Specific Depth + the IA (Months 9-16) The AA and AI tracks now genuinely diverge: calculus and proof depth for AA, statistics and modelling with full GDC fluency for AI. In the middle of this phase sits IA season, the Mathematical Exploration, coached against the real criteria while remaining the student's own work.
  - Months 9-11: The AA Track / The AI Track
  - AA Differentiation from First Principles / AI Statistics and Regression
  - AA Applications and Integration / AI Probability Distributions
  - AA Integration and Areas / AI Modelling Cycle and Networks
  - Months 12-14: IA Season, the Exploration, Shepherded
  - IA Topic Selection and Proposal
  - Deepening the IA Mathematics
  - Judging an Exploration Against the Criteria
  - Months 15-16: Syllabus Depth Continues
  - AA Further Calculus / AI Hypothesis Testing

    - HL Paper 3 Investigations Introduced / SL Consolidation

- PHASE 3: Syllabus Close + Paper Craft to Exam Session (Months 17-24) The remaining syllabus is closed with margin, then the program becomes exam craft: papers by course and level, calculator and non-calculator discipline, HL Paper 3 stamina, and full timed cycles that peak in the exam session, with predicted-grade checkpoints along the way.
    - Months 17-19: Closing the Syllabus with Margin
    - Closing the Final Syllabus Topics
    - Full-Syllabus Connection Map and Spaced Retrieval
    - Months 20-22: Paper Craft by Course and Level
    - AA Paper 1 Non-Calculator Craft / AI GDC Speed
    - Paper 2 Technique and Time Allocation
    - HL Paper 3 Stamina and Investigation Craft
    - Months 23-24: Full Cycles and the Exam Session
    - Full Timed Past-Paper Cycles
    - Peak Plan and the Exam Session

ICSE Computer Applications (Class 9-10): Java with BlueJ

`/courses/icse-computer-applications-java-bluej-course` · Class 9 and 10 board program, monthly enrolment · ICSE Class 9 and 10 students taking Computer Applications; taught from the basics, no prior coding required

- PHASE 1: Java and OOP Foundations, the Class 9 Core (in BlueJ) Object-oriented thinking and Java built from nothing in BlueJ, then the Class 9 Computer Applications syllabus in order: the base everything in Class 10 stands on.
    - Month 1: Object-Oriented Thinking and Java Basics
    - Introduction to OOP and the BlueJ Environment
    - Elementary Concept of Objects and Classes, Values and Data Types
    - Operators in Java and Expressions
    - Input in Java and Mathematical Library Methods
    - Month 2: Conditional and Iterative Constructs
    - Conditional Constructs: if, if-else, if-else-if
    - The switch-case Construct
    - Iteration: for, while and do-while Loops
    - Nested Loops and Patterns

- PHASE 2: The Class 10 Core, Classes, Methods and Encapsulation The heart of the Class 10 syllabus: writing your own classes, methods and constructors, and using the library and wrapper classes the paper depends on.
    - Month 3: Classes, User-Defined Methods and Constructors
    - The Class as the Basis of All Computation
    - User-Defined Methods
    - Constructors
    - Encapsulation and Clean Class Design
    - Month 4: Library Classes, Wrapper Classes and Characters
    - Library Classes and Wrapper Classes
    - Character and Case Handling
    - Building the Practical File, Part One
    - The Disruptive Technologies Project

- PHASE 3: Arrays, Strings and Full Board and Practical Mastery The last major syllabus topics, then the whole subject brought together: the two-section theory paper and the BlueJ practical exam, drilled until top marks are a habit.
  - Month 5: Arrays and String Handling
  - Single Dimensional Arrays
  - Sorting and Searching in Arrays
  - Double Dimensional Arrays
  - String Handling
  - Month 6: Board Theory and BlueJ Practical Exam Mastery
  - The Theory Paper: Section A Technique
  - The Theory Paper: Section B Programs
  - The BlueJ Practical Exam and the Internal Assessment
  - Full Mock Board Exams and Final Polishing

Projects students build: First BlueJ program: create a class, compile it, and run a method that prints a short formatted output; A class that stores and prints details using the correct data type for each field; A simple calculator class that applies each operator and prints the result; A program that reads values and computes results such as area, simple interest and the roots of a quadratic using Math methods; A program that classifies input, for example grade from marks or category from a value, using an if-else-if ladder; A menu-driven program, for example a units converter or a simple arithmetic menu, built with switch-case; A program producing a series result, for example the sum of a series, factorial, or checking a number for a property; A pattern-printing program and a number-property checker, both built with nested loops; A complete class, for example a Student or BankAccount, with fields and methods, created and used from main; A class with several overloaded and value-returning methods, each tested from main; A class with default, parameterised and copy constructors, demonstrated by creating objects several ways; An encapsulated class with private fields and get and set methods, used safely from outside; A program that reads numeric text input, parses it with wrapper methods, and computes a result; A program that scans text and reports counts of vowels, consonants, digits and other characters; The first several formal BlueJ lab assignments, written up to internal-assessment standard - plus 9 more on the course page.

IGCSE Computer Science (0478): Full Syllabus and Exam Prep

`/courses/igcse-computer-science-0478-course` · 6 months (24 weeks), joinable any month · IGCSE students taking Computer Science 0478; taught from the basics, no prior coding required

- PHASE 1: Computer Systems Foundations (Paper 1 core, Months 1-2) How a computer actually represents, moves and processes information, built from binary upward so nothing later has to be taken on faith.
  - Month 1: Data Representation and Data Transmission
  - Binary, Denary and Hexadecimal
  - Representing Text, Images and Sound
  - Compression and Data Transmission
  - Error Detection and Encryption
  - Month 2: Hardware and Computer Architecture
  - The CPU and the Fetch-Decode-Execute Cycle
  - Input, Output and Sensors
  - Memory and Storage
  - Network Hardware and the Internet Backbone
- PHASE 2: Software, the Internet, Emerging Technologies and Logic (Months 3-4) The rest of the Paper 1 theory, then Boolean logic, which is the bridge into the programming half of the course.
  - Month 3: Software and the Internet
  - System Software and the Operating System

    - Programming Languages, Translators and the IDE
    - The Internet and Its Uses
    - Cyber Security
    - Month 4: Automated Systems, Emerging Technologies and Boolean Logic
    - Automated Systems and Robotics
    - Artificial Intelligence at Syllabus Depth
    - Logic Gates and Truth Tables
    - Logic Circuits and Logic Expressions
- PHASE 3: Algorithms, Programming, Databases and Exam Mastery (Paper 2, Months 5-6) The programming half of the qualification, taught by actually writing code, then both papers drilled under timed conditions.
    - Month 5: Algorithm Design and Programming
    - Algorithm Design, Pseudocode and Flowcharts
    - Programming Fundamentals in Python
    - Arrays, Procedures, Functions and File Handling
    - Validation, Verification, Test Data and Trace Tables
    - Month 6: Databases, SQL and Full Exam Practice
    - Databases and SQL
    - Paper 1 Technique
    - Paper 2 Technique and the Scenario Question
    - Full Mock Exams and Final Polishing

Projects students build: A conversion drill sheet worked by hand, then a short Python script that checks your answers; Calculate the true file size of a given image and sound clip, then verify against a real file; Compress a sample string by run-length encoding by hand, then reverse it; Work a parity check and a check-digit calculation by hand, then break a deliberately corrupted example; Trace one full fetch-decode-execute cycle for a simple instruction and explain each step in your own words; Specify the input and output devices for a described real system and justify every choice; Build a comparison table of storage types and defend a recommendation for a given user; Map how a request travels from a home device to a web server and back, labelling each component; Explain, in your own words, exactly what happens between pressing power and seeing the desktop; Run the same short program through an interpreter and observe how errors surface; Trace what happens from typing a URL to the page rendering, naming every step; Build a threat-and-solution table, then answer a scenario recommending and justifying protections; Design an automated system for a described situation, naming every sensor and the microprocessor logic; Explain how an expert system reaches a conclusion, using its rule base and inference engine; Produce complete truth tables for all six gates from memory, then verify them - plus 9 more on the course page.

IGCSE Maths: Core, Extended & Additional Mathematics Online

`/courses/igcse-mathematics-mastery` · 18 months (72 weeks), joinable any month · IGCSE students, years 9-11: Core, Extended and Additional Maths

- PHASE 1: The Core Foundation, Built Properly (Months 1-6) Everything on the Extended papers stands on Core material owned deeply: number fluency without a calculator, algebra as a language rather than ritual, and the geometry and data basics. The diagnostic finds the real starting point; this phase makes it solid.
    - Months 1-2: Diagnostic + Number, Bare-Handed
    - Diagnostic, Syllabus Code and Tier Fit
    - Number Fluency Rebuilt
    - Ratio, Proportion and Standard Form
    - Indices, Surds, Bounds and Accuracy

    - Months 3-4: Algebra as a Language
    - Expressions, Expansion and Factorisation
    - Linear Equations, Inequalities and Formulae
    - Straight-Line Graphs as One Story
    - Simultaneous Equations and Sequences
    - Months 5-6: Shape, Space and Data Foundations
    - Angle Reasoning and Justification
    - Perimeter, Area, Volume and Pythagoras
    - Statistics Foundations
    - Phase 1 Core-Tier Checkpoint
- PHASE 2: The Extended Reach, With Settling Time (Months 7-12) The topics that separate Extended from Core, and top grades from safe passes, taught months before the exam so they are owned, not crammed: functions, trigonometry beyond right angles, vectors, and probability at full depth.
    - Months 7-8: Quadratics and Functions
    - Solving Quadratics Three Ways
    - Quadratic Graphs and Linear-Quadratic Systems
    - Functions: Composite and Inverse
    - Graph Transformations and Graph Literacy
    - Months 9-10: Trigonometry and Vectors at Full Depth
    - Trigonometry: Right Triangles to Sine and Cosine Rules
    - Trig Graphs and Equations
    - Vectors and Geometric Proof
    - Circle Theorems
    - Months 11-12: Probability, Data and the Extended Checkpoint
    - Probability and Tree Diagrams
    - Cumulative Frequency and Histograms
    - Introductory Differentiation (Extended)
    - Phase 2 Extended-Tier Checkpoint
- PHASE 3: Additional Maths 0606 + Exam Craft (Months 13-18) Strong students extend into Additional Mathematics, functions, identities, vectors and introductory calculus taught properly. All students then enter the exam machine: past-paper cycles by exact board and series, non-calculator discipline, and mark-scheme craft that peaks in the exam window.
    - Months 13-15: Additional Mathematics 0606 (or Extended Consolidation)
    - 0606 Functions and Algebra Foundations
    - 0606 Binomial, Trig Identities and Logs
    - 0606 Calculus, Vectors and Kinematics
    - Months 16-17: Past-Paper Craft by Board and Series
    - Board-Exact Paper Cycles
    - Timing Plans and Point-Leak Habits
    - Month 18: The Exam Series, Met Calmly
    - Final Cycles and Error-Log Closure
    - Peak-Week Plan and Exam-Day Routines

Informatics Practices (IP) Class 11-12: CBSE Python & SQL

`/courses/cbse-informatics-practices-ip-class-11-12-python-pandas-sql-complete-course` · 24 months (Class 11 + Class 12, the full 2-year board cycle), joinable any month · Class 11 Beginner to Class 12 Board Exam Ready

- PHASE 1: Class 11 Semester 1, Computer Basics, Python Programming & SQL Introduction (Months 1-5) Build your foundation in computer science concepts, learn Python programming from scratch, and start with SQL database queries. By the end of this phase, you'll write Python programs confidently and run basic SQL queries on MySQL.
  - Month 1: Introduction to Computer Systems
  - Evolution of Computing & Computer Hardware
  - Memory, Storage & Software
  - Months 2-3: Introduction to Python Programming
  - Getting Started with Python, Setup & First Programs
  - Variables, Data Types & Input/Output
  - Operators & Expressions
  - Control Flow, Conditional Statements & Loops
  - Lists in Python, IP Perspective
  - Dictionaries in Python, IP Perspective
  - Months 4-5: SQL Fundamentals, Database Concepts & Basic Queries
  - Database Concepts & Relational Model
  - SQL Introduction, DDL & DML Commands
  - SQL DQL, SELECT Queries with WHERE, Operators & Sorting
  - SQL Aggregate Functions & Class 11 SQL Revision
- PHASE 2: Class 11 Semester 2, Emerging Trends, Practicals & Exam Prep (Months 6-10) Complete remaining Class 11 topics: Emerging Trends in Technology. Prepare practical file with Python programs and SQL queries. Get ready for Class 11 final examination.
  - Months 6-7: Emerging Trends & Revision
  - Introduction to Emerging Trends (CBSE IP Unit 4-5 marks)
  - Practical File, Project & Class 11 Exam Preparation
- PHASE 3: Class 12 Semester 1, Pandas, Data Visualization & Advanced Data Handling (Months 11-17) This is the CORE of Class 12 IP, mastering Pandas for data handling and Matplotlib for data visualization. Unit 1 carries 25 marks in the board exam. Every concept here is board exam critical.
  - Months 11-12: Python Pandas, Series
  - Introduction to Python Libraries & Pandas Series Basics
  - Pandas Series, Operations, Indexing & Methods
  - Pandas DataFrame, Creation & Basic Operations
  - Pandas DataFrame, Advanced Operations & Data Manipulation
  - Months 13-14: Data Visualization with Matplotlib
  - Introduction to Matplotlib, Line Charts & Bar Graphs
  - Histograms, Advanced Customization & Combining Charts
  - Months 15-16: Pandas + Matplotlib Integration & CSV Data Workflow
  - Pandas DataFrame Visualization & CSV Import/Export
  - Pandas & Matplotlib Revision + Practical Programs
- PHASE 4: Class 12 Semester 2, Advanced SQL, Networks, Society & Board Exam Mastery (Months 18-24) Complete remaining Class 12 syllabus: advanced SQL with functions, joins, GROUP BY/HAVING, computer networks, and

societal impacts. Then intensive board exam preparation with mock tests.

- Months 18-19: Advanced SQL, Functions, GROUP BY, HAVING & Joins
- SQL Single Row Functions, Math, String & Date Functions
- SQL Aggregate Functions, GROUP BY & HAVING, Deep Dive
- SQL Joins, Equi-Join on Two Tables
- SQL Complete Revision + 15 SQL Queries for Practical File
- Months 20-21: Computer Networks & Societal Impacts
- Introduction to Computer Networks (CBSE IP Unit 3-10 marks)
- Internet, Web Technologies & Protocols
- Societal Impacts of Technology (CBSE IP Unit 4-10 marks)
- Months 22-24: Board Exam Preparation, Intensive Revision & Mock Tests
- Practical File Completion & Project Submission
- Chapter-Wise Revision, Pandas & Matplotlib
- Chapter-Wise Revision, SQL, Networks & Societal Impacts
- Mock Board Exams, Set 1 & 2
- Mock Board Exams, Set 3, 4, 5 + Previous Year Paper Solving
- Final Revision & Last-Minute Board Exam Preparation

Projects students build: Computer system diagram with all components labeled; Input-output devices classification chart with 20+ devices; Research project: Latest processor technologies in 2026-27; Memory hierarchy pyramid diagram with specifications; Software classification chart, 15+ examples each category; Compare 5 open-source vs proprietary software alternatives; 10 print() variations, different data types, multiple arguments; Interactive mode exploration, test 20 expressions; Valid/invalid identifier quiz, 30 examples; Student information collector, input name, age, class, marks, display formatted; Simple interest calculator, P, R, T as input; BMI calculator with formatted output; Swap two variables, 3 methods: temp, arithmetic, Pythonic a,b = b,a; Expression evaluator worksheet, 30 complex expressions with step-by-step solutions; Electricity bill calculator with slab rates - plus 84 more on the course page.

Java Course for College: Core Java to Spring Boot

`/courses/complete-java-programming-masterclass-college` · 10-12 months (44-52 weeks) · Complete beginner (18+); college students, graduates and working professionals

- PHASE 1: Foundation & Core Java Skills (Months 1-3, Weeks 1-13) Build rock-solid Java fundamentals. Learn programming logic, master Java syntax, OOP principles, and create your first applications.
  - Months 1-2: Java Fundamentals & Programming Basics
  - Introduction to Java & Development Environment Setup
  - Variables, Data Types & Operators
  - Control Flow Statements
  - Methods & Arrays
  - Month 3: Object-Oriented Programming Fundamentals
  - Classes, Objects & OOP Basics
  - Inheritance & Polymorphism
  - Abstraction & Interfaces
- PHASE 2: Intermediate Java & Advanced Concepts (Months 4-6, Weeks 14-26) Master advanced Java features, Collections Framework, exception handling, file I/O, multithreading, and design patterns.
  - Month 4: Advanced Java Features & Collections
  - String Handling & Regular Expressions

- Exception Handling & Error Management
- Collections Framework - Part 1
- Collections Framework - Part 2
- Generics & Advanced Collections
- Month 5: File I/O, Multithreading & Modern Java
- File I/O & Serialization
- Multithreading & Concurrency - Part 1
- Multithreading & Concurrency - Part 2
- Java 8+ Modern Features
- Month 6: Design Patterns, JDBC & Testing
- Design Patterns - Part 1 (Creational)
- Design Patterns - Part 2 (Structural & Behavioral)
- JDBC & Database Programming
- Unit Testing with JUnit

- PHASE 3: Enterprise Java & Web Development (Months 7-9, Weeks 27-39) Master enterprise Java development with Servlets, JSP, Spring Framework, Spring Boot, Hibernate, and RESTful APIs.
  - Month 7: Web Development & Spring Framework
  - Servlets & JSP Fundamentals
  - Spring Framework Core
  - Spring Boot Fundamentals
  - Spring Data JPA & Hibernate
  - Month 8: Advanced Spring Boot & Microservices Basics
  - Spring Security & Authentication
  - Spring Boot Advanced Features
  - RESTful API Best Practices & Microservices Intro
  - Spring Boot with External Services
  - Testing Spring Boot Applications
  - Month 9: Production Java: Deployment, Monitoring & Security
  - Database Design & Optimization
  - Application Deployment & DevOps
  - Monitoring, Logging & Performance
  - Security Best Practices & API Standards

- PHASE 4: The Finale (Month 10, Weeks 40-44) The capstone month: spec, build, ship and defend, then the final exam that decides the certificate.
  - Month 10: Capstone and the Final Exam
  - Capstone Spec and Setup
  - Capstone Build
  - Ship and Polish
  - Demo Day and the Final Exam

Projects students build: Hello World variations with personalized messages; Simple output programs using System.out.println; Personal information display program; ASCII art generator in Java; Simple calculator (four basic operations); Temperature converter (Celsius, Fahrenheit, Kelvin); Age calculator with detailed output; BMI calculator

with health categories; Currency converter; Area and perimeter calculator for shapes; Compound interest calculator; Number guessing game with attempts limit; Grade calculator with letter grades; Even/odd checker and list generator; Prime number checker and generator - plus 247 more on the course page.

Java for Teens: Complete Course from Beginner to Advanced

`/courses/java-programming-masterclass-for-teens` · 10-12 months (40-48 weeks) · Absolute beginner, ages 13 to 18

- PHASE 1: Java Foundations and OOP (Months 1-3, Weeks 1-12) From the first program to real object-oriented design. Java's strictness becomes an advantage: every concept is understood, not guessed.
  - Month 1: First Programs
  - Introduction and Setup
  - Variables, Types and Operations
  - Control Flow: Making Decisions
  - Loops: Repetition and Patterns
  - Month 2: Arrays, Methods, Strings and Files
  - Arrays
  - Methods: Reusable Code
  - Strings and Text Processing
  - Files and Exceptions
  - Month 3: Object-Oriented Programming
  - Classes and Objects
  - Encapsulation and Static
  - Inheritance
  - Polymorphism and Interfaces
- PHASE 2: Collections, Apps, Games and Minecraft (Months 4-6, Weeks 13-24) Modern Java and things you can see: the collections framework, desktop apps with JavaFX, a complete 2D game, and your own Minecraft mods.
  - Month 4: Collections and Modern Java
  - The Collections Framework
  - Generics
  - Lambdas and Streams
  - Exceptions and Debugging Like a Professional
  - Month 5: Desktop Apps with JavaFX
  - JavaFX Fundamentals
  - Tables, Charts and Real Controls
  - Structuring a Real App with MVC
  - Databases for Desktop Apps
  - Month 6: Games and Minecraft Modding
  - Game Development Basics
  - Build a Complete 2D Game
  - Minecraft Modding
  - Phase 2 Capstone and Review
- PHASE 3: Data Structures and Algorithms (Months 7-8, Weeks 25-32) The serious core of computer science, built by hand in Java: structures, sorting, graphs, recursion, and a first look at threads.
  - Month 7: Structures Built from Scratch

    - Lists, Stacks and Queues by Hand
    - Hash Tables and Trees
    - Sorting, Searching and Big O
    - Problem-Solving Patterns
    - Month 8: Graphs, Recursion and Threads
    - Graphs
    - Recursion and Backtracking
    - Multithreading, the Honest Introduction
    - DSA Capstone
- PHASE 4: APIs, AI and the Capstone (Months 9-10, Weeks 33-40) Where teen Java meets the real world: a REST API with Spring Boot, AI models called from Java, Git and JUnit, and a final capstone shipped properly.
    - Month 9: APIs and AI
    - How the Web Works, for Java Developers
    - Your First REST API with Spring Boot
    - Saving Data: JPA Without the Jargon
    - Calling AI Models from Java
    - Month 10: Quality, Capstone and Demo Day
    - Git, GitHub and JUnit
    - Final Capstone Build
    - Demo Day and What Comes Next

Projects students build: Set up complete Java development environment; Create and run Hello World in 3 different ways; Build a simple personal introduction program; Interactive calculator application; Temperature converter (Celsius/Fahrenheit/Kelvin); Simple cashier program with tax calculation; Mad Libs story generator; Grade calculator with letter grades; Simple adventure game with choices; Rock-Paper-Scissors game; Age-appropriate movie recommendation system; Number guessing game with attempts; Multiplication table generator; Pattern printer (pyramids, diamonds); Simple password validator with retry - plus 128 more on the course page.

JavaScript for Teens: Interactive Websites & Browser Games

`/courses/javascript-course-for-teens-beginners-interactive-web` · 6 months (24 weeks) · Beginner, ages 13 to 18

- PHASE 1: The Language and the Page (Months 1-2, Weeks 1-8) JavaScript from the first line: values, decisions, loops, and functions, then the DOM and events so real pages respond to real users.
    - Month 1: JavaScript from the First Line
    - First Lines of JavaScript
    - Making Decisions
    - Loops and Repetition
    - Functions
    - Month 2: The DOM and Events
    - Meeting the DOM
    - Events: Pages That Listen
    - Interactive Widgets
    - Project Week: The Interactive Quiz

- PHASE 2: Data and the Network (Months 3-4, Weeks 9-16) Arrays, objects, and JSON give projects real data to work with. Then fetch opens the door to public APIs and pages built on live information.
  - Month 3: Arrays, Objects, and JSON
  - Arrays
  - Array Methods That Do the Work
  - Objects
  - JSON and Saving Data
  - Month 4: Fetch and Public APIs
  - What an API Is
  - async, await, and Things Going Wrong
  - Search Interfaces
  - Project Week: The Two-API Dashboard
- PHASE 3: Canvas Games and the Capstone (Months 5-6, Weeks 17-24) A month of real game programming on the HTML canvas, then a capstone month: scope, build, deploy, and present an interactive site of your own.
  - Month 5: Games on the Canvas
  - Drawing and the Game Loop
  - Player Control
  - Collisions, Score, and Lives
  - Finish and Polish the Game
  - Month 6: The Capstone Site
  - Scoping the Capstone
  - Build Sprint One: Core Features
  - Build Sprint Two: Data and Fit
  - Ship and Present

Projects students build: Story generator: a script that assembles a silly story from variables, then from user input via prompt; Number guessing game, round one: the computer picks, you guess, it answers higher or lower; Times-table printer with formatting; Guessing game, round two: limited tries, a running score, play-again logic; Tip calculator and unit converter built as a small library of reusable functions; Mood page: buttons that change the page's colors, text, and heading live; Click counter with milestones; Live character counter for a message box, with a limit warning; Dark mode toggle for a full page; FAQ accordion that opens one answer at a time; Interactive quiz app: questions, scoring, a results screen, and a restart button; To-do list, version one: add, display, and delete tasks backed by an array; Movie list page: search box and filter buttons that narrow a list of films live; Contact cards: render a grid of profile cards from an array of person objects; To-do list, version two: tasks survive a page refresh using localStorage - plus 12 more on the course page.

JEE Foundation Maths Class 8-10: Proofs & Problem Solving

`/courses/jee-foundation-maths-course-class-8-10` · 12 months (48 weeks) · Class 8 to 10 students, batched by class

- PHASE 1: Numbers and Algebra at Depth (Months 1-3, Weeks 1-12) The chapters every entrance exam quietly assumes: number theory basics, exponents and surds, identities, factorisation, and equations, taken well past the textbook stopping point.
  - Month 1: Number Systems, Properly
  - Weeks 1-2: The Number Line, End to End
  - Weeks 3-4: Divisibility and Remainders
  - Month 2: Exponents, Surds and Identities
  - Weeks 5-6: Exponents and Surds

    - Weeks 7-8: Identities and Factorisation
    - Month 3: Equations and Inequalities
    - Weeks 9-10: Linear Equations and Systems
    - Weeks 11-12: Inequalities and a First Look at Quadratics
- PHASE 2: Geometry as a Proof Discipline (Months 4-6, Weeks 13-24) Geometry is where students first learn what mathematical certainty means. Congruence, similarity, quadrilaterals and circles, with proof writing drilled from the first week.
    - Month 4: Angles, Triangles and Congruence
    - Weeks 13-14: Lines, Angles and What a Proof Is
    - Weeks 15-16: Congruence
    - Month 5: Similarity, Pythagoras and Quadrilaterals
    - Weeks 17-18: Similarity and Pythagoras
    - Weeks 19-20: Quadrilaterals and the Midpoint Theorem
    - Month 6: Circles and the Geometry Workshop
    - Weeks 21-22: Circle Theorems
    - Weeks 23-24: The Geometry Problem Workshop
- PHASE 3: Mensuration, Trigonometry and Coordinates (Months 7-9, Weeks 25-36) The toolkit chapters every entrance exam draws on: 2D and 3D mensuration, introductory trigonometry with heights and distances, and coordinate geometry.
    - Month 7: Mensuration in Two and Three Dimensions
    - Weeks 25-26: Areas in the Plane
    - Weeks 27-28: Solids and Scaling
    - Month 8: Introductory Trigonometry
    - Weeks 29-30: Ratios and Identities
    - Weeks 31-32: Heights and Distances
    - Month 9: Coordinate Geometry
    - Weeks 33-34: The Plane and Its Formulas
    - Weeks 35-36: Lines and Coordinate Problem Solving
- PHASE 4: Problem Solving and the MCQ Phase (Months 10-12, Weeks 37-48) The part school never teaches: heuristics for unfamiliar problems, olympiad-style questions, then a full timed MCQ and mock phase in the style of NTSE-type talent exams and entrance papers.
    - Month 10: How Hard Problems Are Actually Solved
    - Weeks 37-38: The Heuristics
    - Weeks 39-40: Counting and Logical Structure
    - Month 11: MCQ Craft Under Time
    - Weeks 41-42: The Craft of the Multiple Choice Question
    - Weeks 43-44: Sectional Timing and the Error Log
    - Month 12: Mocks and the Readiness Review
    - Weeks 45-46: The Mock Series
    - Weeks 47-48: Final Mocks and the Road to Class 11

Projects students build: Number-line dossier: one page classifying 20 assorted numbers with a one-line justification each; Divisibility rule proof sheet: the rules for 3, 9 and 11 explained in the student's own words with examples; Simplification gauntlet: 10 layered exponent-surd expressions reduced step by step, each step justified; Identity map:

every identity in the phase on one sheet with a numeric example and one exam use each; Translation drill sheet: 12 word problems converted to equations before any are solved; Personal error log opened: every phase 1 test miss classified as concept, method or slip, used all year; First proof portfolio entries: angle-sum and exterior-angle proofs written in full four-part format; Criterion sorting sheet: 12 figures matched to their congruence criterion with the given parts marked; Proof portfolio extended: BPT and the similarity proof of Pythagoras written in full; Quadrilateral family tree: the shapes and the exact conditions separating them, made by the student; Circle theorem atlas: every theorem drawn, stated and proved or justified on the student's own pages; Workshop set: 6 multi-step geometry problems solved with the construction decision written out for each; Decomposition sheet: 8 shaded-region problems with the cut lines drawn and named before any formula is used; Scaling experiment write-up: one solid scaled by 2 and by 3, with areas and volumes tabulated and the pattern stated; Two-triangle derivation page: the 30-60-90 and 45-45-90 triangles built and every standard value read off them - plus 10 more on the course page.

Kotlin and Android Course: Zero to Published-Ready Apps

`/courses/complete-kotlin-programming-masterclass-professional` · 10-12 months (44-52 weeks) · Complete beginner (18+); college students, graduates and working professionals

- PHASE 1: Foundation & Core Kotlin Skills (Months 1-3, Weeks 1-13) Build rock-solid Kotlin fundamentals. Learn programming logic, master Kotlin syntax, OOP principles, functional programming, and create your first applications.
  - Months 1-2: Kotlin Fundamentals & Programming Basics
  - Introduction to Kotlin & Development Environment Setup
  - Variables, Data Types & Operators
  - Control Flow & Expressions
  - Functions & Collections Basics
  - Month 3: Object-Oriented Programming & Functional Concepts
  - Classes, Objects & OOP in Kotlin
  - Inheritance, Interfaces & Polymorphism
  - Functional Programming in Kotlin
- PHASE 2: Advanced Kotlin & Modern Features (Months 4-6, Weeks 14-26) Master advanced Kotlin features, coroutines, DSLs, delegation, generics, and professional coding patterns.
  - Month 4: Advanced Language Features & Coroutines
  - Generics & Type System
  - Delegation & Property Delegates
  - Collections Deep Dive
  - Coroutines Fundamentals
  - Advanced Coroutines & Flow
  - Month 5: DSLs, Reflection & Professional Patterns
  - Domain-Specific Languages (DSLs)
  - Reflection & Annotations
  - Design Patterns in Kotlin
  - Testing in Kotlin
  - Month 6: Server-Side Kotlin with Ktor
  - Ktor Framework - Part 1
  - Ktor Framework - Part 2
  - Database Access with Kotlin
  - Build Tools & Kotlin Scripting

- PHASE 3: Android Development Mastery (Months 7-9, Weeks 27-39) Master modern Android development with Kotlin, Jetpack Compose, Material Design, Architecture Components, and professional app development.
  - Month 7: Android Fundamentals & Jetpack Compose
  - Android Basics & Setup
  - Jetpack Compose Fundamentals
  - Advanced Compose & Navigation
  - Android Architecture Components
  - Local Data Storage
  - Month 8: Networking, APIs & Advanced Android
  - Networking & REST APIs
  - Image Loading & Media
  - Advanced UI & Material Design
  - Background Work & Services
  - Testing Android Apps
  - Month 9: Ship-Quality Android: Performance, Publishing & Security
  - Performance & Optimization
  - Publishing & Deployment
  - Security Best Practices
- PHASE 4: The Finale (Month 10, Weeks 40-44) The capstone month: spec, build, ship and defend, then the final exam that decides the certificate.
  - Month 10: Capstone and the Final Exam
  - Capstone Spec and Setup
  - Capstone Build
  - Ship and Polish
  - Demo Day and the Final Exam

Projects students build: Hello World variations with string templates; Simple output programs using println; Personal information display with string interpolation; ASCII art generator in Kotlin; Interactive REPL experiments; Null-safe calculator with Kotlin operators; Temperature converter with smart casts; Age calculator with null safety; BMI calculator with safe operations; Currency converter with type-safe design; Area calculator using when expressions; Compound interest calculator with ranges; String manipulation utility; Number guessing game with when expression; Grade calculator using when - plus 249 more on the course page.

KS2 SATs Maths: Arithmetic, Reasoning and Times Tables

`/courses/ks2-sats-maths-course` · 8 months (32 weeks), timed to finish before the May tests · Children in Years 4, 5 and 6 at primary schools in England, ages 8 to 11

- PHASE 1: Times Tables to Instant Recall (Months 1-2, Weeks 1-8) Every table up to 12 by 12 and its division facts, learned through patterns first and speed second. Year 4 children practise in the format of the multiplication tables check; older children use it as a warm-up for the papers.
  - Month 1: Tables by Pattern
  - Weeks 1-2: Diagnostic and the Easy Tables
  - Weeks 3-4: The Harder Tables
  - Month 2: Speed and Division Facts
  - Weeks 5-6: Division Facts and Missing Numbers
  - Weeks 7-8: Six-Second Recall

- PHASE 2: The Arithmetic Paper (Months 3-4, Weeks 9-16) Paper 1 is 40 marks in 30 minutes, all calculation. Each written method is taught, practised and checked until it is automatic, then mixed under time.
  - Month 3: Whole Numbers and Written Methods
  - Weeks 9-10: Place Value and Addition and Subtraction
  - Weeks 11-12: Multiplication and Division
  - Month 4: Fractions, Decimals and Percentages
  - Weeks 13-14: Fraction Calculations
  - Weeks 15-16: Decimals, Percentages and the Full Paper
- PHASE 3: The Reasoning Papers (Months 5-6, Weeks 17-24) Papers 2 and 3 are 35 marks and 40 minutes each, and they test whether a child can use maths in context and explain it. Each question type is taught on its own, then mixed.
  - Month 5: Number Reasoning and Measures
  - Weeks 17-18: Multi-Step Word Problems
  - Weeks 19-20: Measures, Money and Time
  - Month 6: Geometry, Statistics and Explaining
  - Weeks 21-22: Geometry and Statistics
  - Weeks 23-24: Explain, Show and Check
- PHASE 4: Full Papers Under Timing (Months 7-8, Weeks 25-32) No new content. Full sets of three papers under real timing, marked against the published mark schemes, with a short review after each one and a calm plan for test week.
  - Month 7: Paper Sets
  - Weeks 25-26: First Full Sets
  - Weeks 27-28: Targeted Repair
  - Month 8: Ready for Test Week
  - Weeks 29-30: Final Sets
  - Weeks 31-32: Calm Before the Tests

Projects students build: Fact chart started: every fact up to 12 by 12 coloured by speed after the diagnostic; Fact chart updated: amber and red facts listed with a hook for each; Fact family cards made for the ten facts the child finds slowest; Fact chart completed: the aim is every fact green; Method book started: one worked example per method, written by the child; Method book entry: long multiplication and long division set out step by step; Method book entry: every fraction method with a worked example; Arithmetic tracker: score and time recorded for every practice paper; Problem journal started: one solved problem per question type with a bar model; Problem journal entry: a measures question for each unit type; Problem journal entry: geometry and statistics questions with labelled diagrams; Explanation bank: model answers to ten explain questions, written in the child's own words; Paper tracker: scores for each paper on one chart; Repair list: each weak area with the date it was fixed; Paper tracker completed - plus 1 more on the course page.

Maths for Data Science: Statistics, Linear Algebra and ML

`/courses/data-analytics-mathematics-masterclass` · 12-14 months (48-56 weeks) · School-level maths assumed; built for college students and working professionals

- PHASE 1: Statistics That Tell the Truth (Months 1-3, Weeks 1-12) The bedrock: describing data honestly, visualizing without lying, and the probability language every model speaks.
  - Month 1: Describing Data Honestly
  - Introduction to Statistical Thinking
  - Measures of Central Tendency and Spread
  - Month 2: Visualization and Probability
  - Data Visualization and Graphical Analysis

    - Probability Fundamentals
    - Month 3: The Great Distributions
    - Discrete Probability Distributions
    - Continuous Probability Distributions
- PHASE 2: Linear Algebra and Statistical Inference (Months 4-6, Weeks 13-24) The two pillars: the vector and matrix language models are written in, and inference, how honest conclusions get drawn from samples.
    - Month 4: Linear Algebra for Data
    - Linear Algebra for Data Science - Vectors
    - Linear Algebra for Data Science - Matrices
    - Month 5: Eigenvalues, PCA and Sampling
    - Eigenvalues, Eigenvectors and PCA
    - Sampling Distributions and CLT
    - Month 6: Inference Done Honestly
    - Confidence Intervals
    - Hypothesis Testing Fundamentals
- PHASE 3: The Mathematics of Machine Learning (Months 7-9, Weeks 25-36) Models from first principles: regression, regularization, classification, trees and clustering, with evaluation treated as the moral core of the discipline.
    - Month 7: Regression from First Principles
    - Simple Linear Regression
    - Multiple Linear Regression
    - Month 8: Regularization and Classification
    - Regularized Regression
    - Classification Fundamentals
    - Month 9: Trees, Clusters and Honest Evaluation
    - Tree-Based Methods
    - Clustering Algorithms
- PHASE 4: Optimization, Neural Networks and Modern Practice (Months 10-12, Weeks 37-48) The mathematics behind modern AI and modern analytics: optimization, neural networks, Bayesian methods, time series, experiments, and a defensible capstone.
    - Month 10: Optimization and Neural Network Mathematics
    - Optimization Theory for ML
    - Neural Network Fundamentals
    - Month 11: Bayesian Methods and Time Series
    - Bayesian Fundamentals
    - Time Series Analysis
    - Month 12: Experiments and the Capstone
    - A/B Testing and Experimental Design
    - Capstone and Final Exam

Projects students build: Design a data collection strategy; Data quality assessment tool; Sampling simulation study; Statistical calculator from scratch; Outlier detection system; Interactive visualization dashboard; Build comprehensive EDA toolkit; Create interactive data dashboard; Visualization best practices guide; Probability simulator; Bayes theorem calculator; Monte Carlo estimation tool; Distribution calculator and visualizer; A/B test simulator; Discrete event simulator - plus 53 more on the course page.

Maths Olympiad & Competition Course: AMC, AIME to IMO

`/courses/olympiad-competition-mathematics-mastery` · 12-14 months (52-60 weeks) · Intermediate to International Competition Level

- PHASE 1: Competition Fundamentals and Number Theory (Weeks 1-13) Build strong foundations in competition problem-solving, master number theory, and develop combinatorial thinking.
  - Months 1-2: Competition Mathematics Basics & Number Theory
  - Introduction to Competition Mathematics
  - Divisibility and Prime Numbers
  - Modular Arithmetic
  - Advanced Number Theory
  - Month 3: Combinatorics Fundamentals
  - Counting Principles and Techniques
  - Graph Theory Basics
  - Phase 1 Review and Competition
- PHASE 2: Advanced Algebra and Polynomial Theory (Weeks 14-26) Master algebraic manipulations, polynomial theory, sequences, and functional equations for competitions.
  - Months 4-5: Competition Algebra & Polynomials
  - Advanced Algebraic Techniques
  - Polynomial Theory
  - Sequences and Series
  - Equations and Systems
  - Complex Numbers in Competitions
  - Month 6: Functional Equations & Advanced Topics
  - Functional Equations
  - Mathematical Induction Advanced
  - Pigeonhole Principle & Extremal Problems
  - Invariants and Monovariants
  - Phase 2 Review and Competition
- PHASE 3: Competition Geometry and Trigonometry (Weeks 27-39) Master advanced geometric techniques, trigonometric identities, and coordinate geometry for olympiad success.
  - Months 7-8: Euclidean Geometry & Triangle Theory
  - Advanced Triangle Geometry
  - Circle Geometry
  - Similarity and Homothety
  - Geometric Transformations
  - Construction Problems
  - Month 9: Trigonometry & Coordinate Geometry
  - Advanced Trigonometry
  - Analytic Geometry
  - Vectors in Geometry
  - Area and Volume Methods
  - Phase 3 Review and Competition

- PHASE 4: Inequalities, Olympiad Practice and Final Revision (Weeks 40-52) Master inequalities, advanced problem-solving techniques, and prepare for international competitions.
  - Month 10: Inequalities & Optimization
  - Classical Inequalities
  - Advanced Inequality Techniques
  - Optimization Problems
  - Advanced Combinatorics
  - Advanced Number Theory Topics
  - Month 11: Problem-Solving Mastery & Competition Strategy
  - IMO Problem Analysis
  - Putnam Competition Preparation
  - Asian Pacific Mathematics Olympiad
  - Competition Psychology & Peak Performance
  - Month 12: Mock Competitions & Final Preparation
  - National Olympiad Simulations
  - International Competition Week
  - Month 13: Final Assessments & Future Planning
  - Comprehensive Review & Mastery
  - Final Competition Series

Projects students build: Solve 50 AMC 8 problems; Create problem-solving strategy guide; Analyze past competition papers; Implement prime generation algorithms; Solve 30 number theory competition problems; Create divisibility proof portfolio; Modular arithmetic problem set; CRT application problems; Create modular arithmetic reference guide; Advanced number theory problem collection; Historical theorems exploration; IMO number theory problems analysis; Combinatorial identity proofs; Counting problems compilation; Create combinatorics formula sheet - plus 102 more on the course page.

Maths Through Coding: Learn Math in Python (Ages 10-15)

`/courses/maths-through-coding` · 9 months (36 weeks) · Ages 10-15 (grades 5-10); no coding experience required

- PHASE 1: Numbers as Programs (Months 1-3) Python foundations learned through number theory a student can touch: parity, divisibility, primes, factors and fractions. By phase end the student programs comfortably and, the real goal, has met arithmetic ideas so concretely they can never again be mysterious.
  - Month 1: First Programs, First Number Ideas
  - Hello Python: Editor, Print and Variables
  - Arithmetic Operators and Order of Operations
  - Integer Division, Remainders and Modulo
  - Conditionals and Divisibility Rules
  - Month 2: Loops Meet Number Theory
  - Loops and Times-Table Patterns
  - Factor Finders and Prime Testers
  - Month 3: The Fraction Machine
  - GCD and the Fraction Simplifier
  - Fraction Arithmetic and Phase Demo Day
- PHASE 2: Shape and Change (Months 4-6) Geometry becomes visceral through turtle graphics, exterior angles are unforgettable once you have steered them, and algebra comes alive as code: variables that actually vary, functions as

machines, and graphs the student plots themselves.
    - Month 4: Turtle Geometry
    - Turtle Basics and the Exterior-Angle Discovery
    - Star Polygons, Spirals and Angle Art
    - Month 5: Coordinates and Real Variables
    - The Coordinate Plane in Code
    - Algebra as Code: Expressions and Equations
    - Month 6: Functions as Machines, Literally
    - Functions as Machines: Input, Rule, Output
    - The Grapher Project and Phase Demo Day
- PHASE 3: Chance, Data and the Capstone (Months 7-9) Probability stops being formulas when you can roll ten thousand dice per second: simulators settle intuitions, real datasets get summarized and questioned, and the course closes with a capstone the student designs, a working program where the mathematics is the star.
    - Month 7: Probability by Simulation
    - Randomness: Coin Flippers and Dice Rollers
    - Simulating Classic Probability Puzzles
    - Month 8: Statistics on Real Data
    - Mean, Median and Range in Code
    - Exploring a Real Dataset
    - Month 9: The Capstone
    - Capstone Chosen and Scoped
    - Capstone Build, Test and Demo Day

Projects students build: Write a Python script that prints a personalised greeting built from variables; Write a Python calculator that evaluates a multi-step expression and prints the result; Write a Python script that labels every number from 1 to 50 as even or odd using modulo; Write a Python program that reports which of 2, 3, 5 and 10 a number is divisible by; Write a Python script that visualises a times-table as a grid of rows and columns; Write a Python program that lists every factor of a number; Write a Python prime tester that prints all primes up to 100; Write a Python fraction simplifier that reduces any fraction to lowest terms using the GCD; Write a Python fraction calculator that adds, subtracts and simplifies two fractions; Write a Python turtle program that draws any regular polygon from the number of sides; Write a Python turtle program that draws a star polygon or spiral of your own design; Write a Python program that plots points and draws the line and midpoint between two of them; Write a Python script that solves a linear equation by guess-check-refine and prints each step; Write a Python function that takes x and returns a rule such as 2x plus 1, then tabulates it; Write a Python grapher that plots y = mx + c for chosen values of m and c - plus 7 more on the course page.

Mental Maths for Kids: Number Sense, Not Tricks (Ages 5-10)

`/courses/mental-maths-mastery-kids` · 12 months (52 weeks) · Ages 5-10 (roughly grades K-5), all starting levels

- PHASE 1: Number Sense Foundations (Months 1-4) Before speed comes seeing: numbers as quantities that break apart and recombine. This phase builds subitizing, part-whole thinking and the bonds of 10 and 20 through concrete materials and games, tuned to each child's starting stage.
    - Month 1: Seeing Numbers
    - Getting to Know Your Number Sense
    - Seeing How Many at a Glance
    - Numbers Are Made of Smaller Numbers
    - Living on the Number Line
    - Months 2-3: The Bonds That Power Everything

    - The Pairs That Make Ten
    - Doubles and Their Neighbours
    - Making Ten to Add Bigger
    - Bonds to Twenty and Fact Families
    - Month 4: Subtraction as Distance + Stage Checkpoint
    - Two Ways to Subtract
    - The Shopkeeper's Counting-Up Trick
    - Many Roads to the Same Answer
    - Phase One Check Through Play
- PHASE 2: The Strategy Toolkit (Months 5-8) The heart of mental maths: named strategies the child chooses between, make-ten, compensation, doubling and halving, plus multiplication met as structure and arrays rather than chanted tables. Choice is the skill; speed is the side effect.
    - Month 5: Two-Digit Courage
    - Adding Two-Digit Numbers in Jumps
    - The Compensation Superpower
    - Month 6: Multiplication as Structure
    - Multiplication as Groups You Can See
    - The Clever Route Through the Tables
    - Month 7: The Full Tables, Owned
    - Taming the Trickiest Facts
    - Division Is Multiplication Backwards
    - Month 8: Doubling, Halving and Strategy Choice
    - Doubling and Halving Magic
    - Strategy Tournament and Phase Two Check
- PHASE 3: Big Numbers, Estimation and Durable Speed (Months 9-12) The toolkit scales up: multi-digit mental arithmetic, the beginnings of fraction sense, estimation as judgment, and, now that understanding holds, genuine speed work. The course closes with each child measurably faster and, more importantly, able to explain every move.
    - Month 9: Multi-Digit Mental Arithmetic
    - Big Numbers Without Fear
    - Multiplying Beyond the Tables
    - Month 10: Estimation as Judgment
    - Rounding to Get Close Fast
    - Does This Answer Make Sense?
    - Month 11: Fraction Sense Beginnings
    - Halves and Quarters of Things
    - Half, Point Five and Fifty Percent
    - Month 12: Speed With Understanding + Graduation
    - Beat Your Own Record
    - Graduation and the Road Ahead

MERN Stack Course: MongoDB, Express, React and Node

`/courses/mern-stack-development-masterclass-college` · 10-12 months (44-52 weeks) · Complete beginner (18+); college students, graduates and working professionals

- PHASE 1: Web Development Foundation (Months 1-3, Weeks 1-13) Build solid foundations in HTML, CSS, JavaScript, and modern web development tools.
  - Month 1: HTML, CSS & Web Basics
  - Introduction to Web Development
  - CSS Fundamentals & Styling
  - Advanced CSS & Modern Techniques
  - JavaScript Fundamentals
  - Month 2: Advanced JavaScript & DOM
  - DOM Manipulation & Events
  - Asynchronous JavaScript
  - Object-Oriented & Functional Programming
  - Build Tools & Modern Workflow
  - Phase 1 Capstone Project
  - Month 3: Advanced Frontend & Introduction to React
  - Modern JavaScript & TypeScript
  - Introduction to React
  - React Hooks & Modern Patterns
  - Component Libraries & Styling
- PHASE 2: React Mastery & Advanced Frontend (Months 4-6, Weeks 14-26) Master React ecosystem, state management, advanced patterns, and modern frontend development.
  - Month 4: Advanced React & State Management
  - React Router & Navigation
  - State Management with Redux
  - Alternative State Management
  - Performance Optimization
  - Testing React Applications
  - Month 5: Next.js & Server-Side Rendering
  - Next.js Fundamentals
  - Advanced Next.js Features
  - GraphQL & Modern APIs
  - Progressive Web Apps
  - Month 6: Frontend Polish: Animation, Accessibility & Security
  - Advanced Animation & Graphics
  - Accessibility & Internationalization
  - Security & Best Practices
- PHASE 3: Backend Development with Node.js (Months 7-9, Weeks 27-39) Master Node.js, Express, MongoDB, and build production-ready backend systems.
  - Month 7: Node.js & Express Fundamentals
  - Node.js Fundamentals
  - Express.js Framework
  - Database Design & MongoDB
  - Mongoose ODM & Data Modeling
  - RESTful API Design

    - Month 8: Authentication & Advanced Backend
    - Authentication & Authorization
    - Real-time Communication
    - File Handling & Cloud Storage
    - Email & Notification Systems
    - Caching & Performance
    - Month 9: GraphQL, Testing & Security
    - GraphQL Backend
    - Testing & Quality Assurance
    - Security & Compliance
- PHASE 4: The Finale (Month 10, Weeks 40-44) The capstone month: spec, build, ship and defend, then the final exam that decides the certificate.
    - Month 10: Capstone and the Final Exam
    - Capstone Spec and Setup
    - Capstone Build
    - Ship and Polish
    - Demo Day and the Final Exam

Projects students build: Personal portfolio HTML structure; Multi-page website; Contact form with validation; Responsive portfolio design; Landing page with animations; CSS art and illustrations; Company website with Tailwind; Dashboard UI with Bootstrap; Accessible web application; Interactive calculator; Todo list application; Quiz application; Dynamic content management system; Drag-and-drop task board; Image gallery with lazy loading - plus 101 more on the course page.

Microsoft Office for Kids: Word, PowerPoint and Excel

`/courses/microsoft-office-kids-mastery` · 5-6 months (20-24 weeks) · Complete beginner, ages 7 to 12

- Month 1: Windows Basics & Digital Art Windows fundamentals, tidy file habits, and creative confidence with Paint, Photos and Clipchamp.
    - Introduction to Windows & Computer Basics
    - File Management & Organization
    - Microsoft Paint Fundamentals
    - Photos, Clipchamp and Creative Projects
- Month 2: Microsoft Word Mastery Become a Word expert, creating professional documents, reports, and creative writing projects.
    - Word Basics & Text Formatting
    - Advanced Formatting & Page Layout
    - Working with Images & Graphics
    - Tables, References & Collaboration
- Month 3: PowerPoint Presentation Excellence Master the art of creating engaging, professional presentations with PowerPoint.
    - PowerPoint Fundamentals
    - Animations & Transitions
    - Multimedia & Interactive Elements
    - Advanced Design & Presenting

- Month 4: Excel and Data Skills Learn spreadsheet basics, data management, charts, and basic formulas with Excel.
  - Excel Basics & Data Entry
  - Formulas & Functions
  - Charts & Data Visualization
  - Data Management & Analysis
- Month 5: OneNote, Teams and the Grand Finale The organizational tools school life runs on, one integrated project that uses everything, and the final exam.
  - OneNote Digital Notebook
  - Microsoft Teams for Students
  - The Integrated Project
  - Final Exam and Demo Day

Projects students build: Customize desktop wallpaper and theme; Create desktop shortcuts; Organize taskbar with favorite apps; Personal desktop setup; Create organized folder system for schoolwork; Digital filing cabinet setup; Photo organization project; Backup important files; Create pixel art characters; Design birthday card; Draw house and landscape; Make school poster; Create emoji collection; Edited photo set: before and after; A 60-second family slideshow video in Clipchamp - plus 60 more on the course page.

Middle School Math Competitions: MATHCOUNTS, AMC 8 and Math Kangaroo Prep

`/courses/middle-school-math-competitions-course` · 6 months (24 weeks), repeatable as a second season with new problem sets · Students roughly aged 10 to 14 (grades 5 to 8) who are comfortable with school maths and want more challenge

- PHASE 1: The Problem-Solving Base (Months 1-2, Weeks 1-8) Fast, reliable number work and the first big competition ideas: divisibility, primes, ratios and counting.
  - Month 1: Number Sense and Number Theory
  - Weeks 1-2: Diagnostic, Contest Formats and Fast Arithmetic
  - Weeks 3-4: Primes, Factors and Divisibility
  - Month 2: Ratios, Word Problems and Counting
  - Weeks 5-6: Ratios, Rates and Algebra Word Problems
  - Weeks 7-8: Counting Basics
- PHASE 2: Core Contest Topics (Months 3-4, Weeks 9-16) Probability, geometry and the patterns and logic questions that appear across all three contests.
  - Month 3: Probability and Plane Geometry
  - Weeks 9-10: Probability
  - Weeks 11-12: Angles, Triangles and Area
  - Month 4: Circles, Solids, Patterns and Logic
  - Weeks 13-14: Circles and Solids
  - Weeks 15-16: Patterns, Sequences, Remainders and Logic
- PHASE 3: Contest Craft and Mock Contests (Months 5-6, Weeks 17-24) Turning knowledge into results on the day: round-by-round strategy for MATHCOUNTS, multiple-choice technique for the AMC 8 and Math Kangaroo, and full mock contests.
  - Month 5: MATHCOUNTS Round Strategy
  - Weeks 17-18: Sprint and Countdown Speed
  - Weeks 19-20: Target and Team Strategy
  - Month 6: Multiple-Choice Craft and Mock Contests

- Weeks 21-22: Multiple-Choice Technique for the AMC 8 and Math Kangaroo
- Weeks 23-24: Final Mocks and the Next Season

Projects students build: Personal diagnostic summary with three target topics and an opened error log; Number theory toolkit page: each rule with a worked contest-style example; Word problem casebook: ten problem types, each with a model solution; Counting toolkit page: when to list, multiply, arrange, choose or subtract; Probability lab: run a small experiment, compare it with the calculated answer and explain the difference; Geometry fact sheet with a diagram for every fact; Shaded-region and solids casebook with ten worked problems; Patterns and logic casebook, with a one-line explanation of why each pattern holds; Two timed Sprint-style rounds with a personal pacing plan written after each; Full MATHCOUNTS-style mock: Sprint, Target and Team rounds, with a written review; Timed multiple-choice mock papers in the AMC 8 and Math Kangaroo styles, with written reviews; Final mock contest and a personal next-season plan based on the error log.

Middle School Mathematics Mastery: Pre-Algebra & Geometry

`/courses/comprehensive-middle-school-mathematics-mastery` · 12-14 months (52-60 weeks) · Complete Beginner to Advanced Middle School Level

- PHASE 1: Number Systems and Fundamental Operations (Weeks 1-13) Build unshakeable foundations in number concepts, operations, and mathematical thinking.
  - Months 1-2: Number Systems and Basic Operations
  - Introduction to Number Systems
  - Addition and Subtraction Mastery
  - Multiplication Fundamentals
  - Division and Factors
  - Month 3: Order of Operations and Problem Solving
  - Order of Operations (PEMDAS/BODMAS)
  - Problem-Solving Strategies
  - Phase 1 Review and Assessment
- PHASE 2: Fractions, Decimals and Proportional Reasoning (Weeks 14-26) Master rational numbers, proportional relationships, and their real-world applications.
  - Months 4-5: Fractions and Mixed Numbers
  - Understanding Fractions
  - Operations with Fractions
  - Decimals and Place Value
  - Multiplying and Dividing Decimals
  - Percentages and Applications
  - Month 6: Ratios and Proportional Relationships
  - Understanding Ratios
  - Proportions and Scale
  - Real-World Applications
  - Data with Fractions, Decimals, and Percents
  - Phase 2 Review and Assessment
- PHASE 3: Algebraic Thinking and Pre-Algebra (Weeks 27-39) Develop algebraic reasoning, solve equations, and understand functions and patterns.
  - Months 7-8: Introduction to Algebra
  - Variables and Expressions

    - One-Step Equations
    - Two-Step and Multi-Step Equations
    - Inequalities
    - Introduction to Functions
    - Month 9: Coordinate Geometry and Graphing
    - The Coordinate Plane
    - Linear Relationships
    - Patterns and Sequences
    - Polynomials Introduction
    - Phase 3 Review and Assessment
- PHASE 4: Geometry, Statistics and Final Revision (Weeks 40-52) Master geometric concepts, statistical analysis, probability, and complex problem-solving strategies.
    - Month 10: Geometry Foundations
    - Basic Geometric Concepts
    - Triangles and Quadrilaterals
    - Circles
    - Area and Perimeter
    - 3D Geometry and Volume
    - Month 11: Statistics and Data Analysis
    - Data Collection and Representation
    - Measures of Central Tendency
    - Probability Fundamentals
    - Statistical Analysis and Interpretation
    - Problem Solving with Multiple Concepts
    - Month 12: Advanced Topics and Test Preparation
    - Competition Mathematics
    - Test Preparation and Strategies
    - Month 13: Final Projects and Comprehensive Review
    - Comprehensive Review and Integration

Projects students build: Create a number system timeline; Design a place value game; Real-world number investigation project; Budget planning project; Distance calculation map activity; Integer game design; Multiplication strategy booklet; Area calculation for room design; Array art project; Factor tree artwork; Divisibility rule investigation; Prime number sieve project; PEMDAS puzzle creation; Expression evaluation game; Calculator investigation project - plus 105 more on the course page.

Minecraft Coding for Kids: From Blocks to Real Code

`/courses/minecraft-coding-for-kids-course` · 4 months (16 weeks) · Beginner, ages 7 to 12

- PHASE 1: Code That Builds (Months 1-2, Weeks 1-8) From the first chat command to an automated farm: children learn sequencing, loops, variables, and decisions by making Minecraft do the building for them.
    - Month 1: First Commands and the Agent
    - Hello, Code Builder
    - The Agent, Your Robot
    - Loops: Building at Superspeed

    - Big Builds with Loops
    - Month 2: Variables and Decisions
    - Variables: Code That Remembers
    - Decisions: Code That Checks
    - Events: Code That Reacts
    - Project Week: The Auto-Farm
- PHASE 2: Code That Plays (Months 3-4, Weeks 9-16) The building skills become game-making skills: randomness, scores, and timers combine into real mini-games, and the course ends with a student-designed capstone and a peek at real typed code.
    - Month 3: Mini-Games
    - Randomness
    - Keeping Score
    - Timers and Pressure
    - Project Week: The Arena Game
    - Month 4: The Capstone and the Code Peek
    - Functions: Naming Your Powers
    - The JavaScript Peek
    - Capstone Build Sprint
    - Finish and Showcase

Projects students build: Magic words: three chat commands that summon a block tower, a splash of flowers, and a chicken; Maze runner: program the agent to walk a maze you built for it, placing a torch at the exit; Wall factory: one program that builds a wall of any length, then a full square fort using nested loops; Pyramid of Giza: a layered pyramid built entirely by code, with a hollow secret chamber inside; Any-size house: one program that builds a house small, medium, or giant by changing a single number; Smart explorer: an agent that crosses rough ground by detecting obstacles and stepping around them; Trap gauntlet: a walkway with three coded surprises, from harmless confetti to a drop into a pool; Agent auto-farm: a robot farmer that tills the soil, plants crops in rows, and harvests when ready; Treasure hunt: a diamond block hidden at a random spot each round, with hot-and-cold chat hints; Collector clash: gather the glowing blocks scattered by code, one point each, first to ten wins; Build rush: players race a two-minute timer to copy a target structure, with a code-checked finish; Falling-floor arena: a coded mini-game where floor sections vanish on a timer and the last player standing wins; Village in a minute: houses, paths, and lamp posts, each a function, assembled into a whole village program; Two-view build: a fountain program written in blocks, then modified once in JavaScript view to change its size; Capstone, part one: the core of an original mini-game or automation, planned and working end to end - plus 1 more on the course page.

MySQL Course: SQL, Database Design and Real Administration

`/courses/mysql-database-complete-masterclass-college` · 7-8 months (28-32 weeks) · Complete beginner; college students and working professionals (18+)

- PHASE 1: SQL Foundations (Months 1-2, Weeks 1-8) The language of data learned properly: definitions, manipulation and SELECT mastery on datasets that feel real.
    - Months 1-2: The SQL Core
    - Introduction to Databases & MySQL Setup
    - SQL Basics - Data Definition Language (DDL)
    - SQL Basics - Data Manipulation Language (DML)
    - Querying Data - SELECT Mastery

- PHASE 2: Design and Joins (Months 3-4, Weeks 9-16) Where amateurs are separated from professionals: relationships, joins without fear, subqueries, and schema design as a deliberate craft.
  - Months 3-4: Relationships to Real Design
  - Database Relationships
  - Mastering Joins
  - Subqueries and Set Operations
  - Schema Design Done Properly
- PHASE 3: The Programmable Database (Months 5-6, Weeks 17-24) MySQL beyond queries: views and indexes, stored procedures, triggers, transactions argued about properly, and Python integration.
  - Months 5-6: Views to Python
  - Views & Indexes
  - Stored Procedures
  - Transactions & Concurrency
  - MySQL with Python
- PHASE 4: The Production Month (Month 7, Weeks 25-28) What teams need before they trust you with data: security, backups, performance tuning with EXPLAIN, and the capstone exam.
  - Month 7: Production Essentials and the Finale
  - Users, Security and Backups
  - Performance Tuning with EXPLAIN
  - Capstone Build
  - Demo Day and Final Exam

Projects students build: Install MySQL on local machine; Set up MySQL Workbench; Create first database and tables; Configure basic security settings; Design employee database schema; Create online store database structure; Build student management system tables; Library management database design; Populate employee database with data; Create product catalog with 1000+ items; Build customer records system; Inventory management data setup; Sales reporting queries; Customer analytics dashboard queries; Product search functionality - plus 43 more on the course page.

MySQL for Teens: SQL from First Query to Real Apps

`/courses/mysql-mastery-for-teens` · 5-6 months (20-24 weeks) · Absolute beginner, ages 13 to 18

- Month 1: SQL Foundations Databases demystified and the four verbs of data: CREATE, INSERT, SELECT, UPDATE and DELETE, used safely from the start.
  - Introduction to Databases & MySQL Setup
  - SQL Basics: Creating and Managing Databases
  - Data Manipulation: INSERT, SELECT Basics
  - UPDATE, DELETE, and Data Integrity
- Month 2: Query Power The everyday toolkit: string and numeric functions, dates, aggregation with GROUP BY, and first subqueries.
  - MySQL Functions: String and Numeric
  - Date/Time Functions and Operations
  - Aggregate Functions and Grouping
  - Subqueries and Nested Queries
- Month 3: Real Database Design The part that separates users from designers: relationships, joins, ER diagrams, normalization and constraints.

    - Table Relationships and JOINS
    - Advanced JOINS and Set Operations
    - Database Design & Normalization
    - Constraints and Data Validation
- Month 4: Power Features What professionals actually lean on: views, stored procedures, transactions with ACID honesty, and indexes that make queries fly.
    - Views and Virtual Tables
    - Stored Procedures and Functions
    - Transactions and Concurrency
    - Indexing and Query Optimization
- Month 5: Real Apps and the Final Exam Securing the database, backing it up, driving it from Python, and the capstone defended at demo day.
    - Users, Security and Backups
    - MySQL from Python: Data Becomes an App
    - Capstone Build
    - Demo Day and Final Exam

Projects students build: Install and configure MySQL environment; Create 'MyLife' database for personal data; Design a simple contact list database; School database with students and classes; Gaming stats tracker database; Music library database structure; Populate school database with student data; Create and query a movie ratings database; Build a sports team roster system; Grade management system with updates; Inventory system with stock updates; Social media profile manager; Username generator with string functions; Grade calculator with numeric functions; Data cleaning toolkit - plus 41 more on the course page.

National 5 and Higher Maths Course Online (Scotland)

`/courses/national-5-and-higher-maths-course` · About 6 months per level: National 5, then Higher (12 months for both) · S3 to S6 learners and adults in Scotland taking National 5 or Higher Mathematics

- PHASE 1: National 5 Skills (Months 1-5, Weeks 1-20) The skills sampled in National 5 Mathematics, taught strand by strand with reasoning questions in every month.
    - Month 1: Numerical Skills
    - Weeks 1-2: Diagnostic, Surds and Indices
    - Weeks 3-4: Percentages, Fractions and Appreciation
    - Month 2: Algebraic Skills, Part One
    - Weeks 5-6: Expressions and Factorising
    - Weeks 7-8: Straight Lines and Equations
    - Month 3: Algebraic Skills, Part Two
    - Weeks 9-10: Quadratics
    - Weeks 11-12: Functions and Mixed Algebra
    - Month 4: Geometric Skills
    - Weeks 13-14: Shape, Area and Volume
    - Weeks 15-16: Vectors and Coordinates
    - Month 5: Trigonometric and Statistical Skills
    - Weeks 17-18: Trigonometry
    - Weeks 19-20: Statistics

- PHASE 2: National 5 Papers (Month 6, Weeks 21-24) Full National 5 papers under real timing: Paper 1 without a calculator, 40 marks in 1 hour, and Paper 2, 50 marks in 1 hour 30 minutes.
  - Month 6: Full National 5 Papers
  - Weeks 21-22: Prelim-Style Papers
  - Weeks 23-24: Final Papers and Next Steps
- PHASE 3: Higher Skills (Months 7-11, Weeks 25-44) The skills sampled in Higher Mathematics: algebraic and trigonometric, geometric and calculus skills, with reasoning throughout. Learners joining at Higher start here after a diagnostic.
  - Month 7: Algebra and Functions
  - Weeks 25-26: Polynomials and Quadratic Theory
  - Weeks 27-28: Functions and Graphs
  - Month 8: Trigonometry at Higher
  - Weeks 29-30: Radians, Formulae and Identities
  - Weeks 31-32: The Wave Function
  - Month 9: Straight Line, Circle, Vectors and Recurrence
  - Weeks 33-34: The Straight Line and the Circle
  - Weeks 35-36: Vectors and Recurrence Relations
  - Month 10: Differentiation
  - Weeks 37-38: Differentiating Functions
  - Weeks 39-40: Applying Differentiation
  - Month 11: Integration
  - Weeks 41-42: Integrating Functions
  - Weeks 43-44: Areas and Mixed Calculus
- PHASE 4: Higher Papers (Month 12, Weeks 45-48) Full Higher papers under real timing: Paper 1 without a calculator, 55 marks in 1 hour 15 minutes, and Paper 2, 65 marks in 1 hour 30 minutes.
  - Month 12: Full Higher Papers
  - Weeks 45-46: Prelim-Style Papers
  - Weeks 47-48: Final Papers and Next Steps

Projects students build: Skills checklist started: every National 5 skill coloured by confidence; Money file: interest and depreciation problems solved and explained; Algebra method sheet: one worked example of every technique; Equation bank: simultaneous equation problems built from real contexts; Parabola file: six quadratics sketched with roots and turning points; Skills checklist updated after the first three months; Geometry sheet: every formula and property with a worked example; Vector diagram set: five shapes with pathways labelled; Triangle casebook: when to use each rule, with a solved example; Skills checklist completed for National 5; Paper tracker started for National 5; Completed National 5 paper tracker and error log; Higher skills checklist started; Graph file: transformations and log graphs annotated; Trigonometry sheet: exact values, formulae and identities - plus 9 more on the course page.

Olympiad Mathematics: IOQM, INMO and AMC Preparation

`/courses/olympiad-mathematics-premium-course` · 12 months (48 weeks), joinable any month · Students roughly aged 12 to 18 who are strong at school maths and want genuine olympiad problem solving

- PHASE 1: Proof Technique and Number Theory How to argue rigorously, then the pillar that best rewards it.
  - Months 1 to 2: Proof and Foundations
  - What Counts as a Proof
  - Induction and Invariants

    - Number Theory
- PHASE 2: Algebra and Combinatorics The two pillars that most often decide an IOQM or AMC score.
    - Months 3 to 5: Algebra
    - Polynomials and Functional Equations
    - Inequalities
    - Combinatorics
- PHASE 3: Geometry and Full Contest Simulation The pillar students most often avoid, then the contests themselves rehearsed properly.
    - Months 6 to 9: Geometry
    - Synthetic Geometry
    - Advanced Geometry Techniques
    - Mixed Problem Solving
    - Months 10 to 12: Contest Simulation
    - IOQM and AMC Format Training
    - INMO and AIME Level, and Peak Form

Projects students build: Write five full proofs and have every line challenged in class; Solve a set of invariant problems and articulate the invariant explicitly in each; Solve a graded ladder of number theory problems from IOQM level upward; Work a set of Vieta and functional equation problems from past papers; Prove a graded set of inequalities, each with a fully justified argument; Solve a counting problem two different ways and reconcile the results; Solve a ladder of synthetic geometry problems with full written proofs; Attack the same hard problem three ways and compare which was cleanest; Weekly mixed problem sets with no topic labels; Full timed IOQM and AMC papers every week; Full INMO-style and AIME-style papers, marked on rigour.

Ontario Computer Science Companion: ICS3U and ICS4U (Python and Java)

`/courses/ics3u-ics4u-computer-science-companion-course` · 6 months (24 weeks) per plan, joinable any month and paced to your school course · Ontario students in Grades 11 and 12 (roughly ages 15 to 18) taking ICS3U or ICS4U at school, in Python or Java

- PHASE 1: Problem Solving and the ICS3U Core (Months 1-2, Weeks 1-8) How a programmer thinks before typing, then the building blocks every ICS3U program uses, in Python or Java.
    - Month 1: Algorithms, Data Types and Input and Output
    - Weeks 1-2: Problem Solving Before Syntax
    - Weeks 3-4: Data Types, Variables and Expressions
    - Month 2: Control Structures
    - Weeks 5-6: Decisions
    - Weeks 7-8: Loops
- PHASE 2: Completing ICS3U (Months 3-4, Weeks 9-16) The data structures, modular design, files and classic algorithms that larger ICS3U programs need, plus the software development habits the course describes.
    - Month 3: Lists, Arrays and Modular Programming
    - Weeks 9-10: Lists and Arrays
    - Weeks 11-12: Modular Programming with Functions and Methods
    - Month 4: Strings, Files, Sorting and Searching
    - Weeks 13-14: String and File Handling
    - Weeks 15-16: Sorting, Searching and the Development Life Cycle

- PHASE 3: The ICS4U Toolkit, Final Project and Exam Review (Months 5-6, Weeks 17-24) What we teach for Grade 12: recursion, object-oriented design, efficiency and large, fully documented programs, then the final project and exam review. ICS4U batches begin with a fast review of Phases 1 and 2.
  - Month 5: Recursion and Object-Oriented Design
  - Weeks 17-18: Recursion
  - Weeks 19-20: Classes and Object-Oriented Design
  - Month 6: Efficiency, the Final Project and Exam Review
  - Weeks 21-22: Efficiency and Large Documented Programs
  - Weeks 23-24: Exam Review Technique

Projects students build: Three small problems solved twice: once as plain-word steps, once as working code; A unit converter or bill splitter with clear prompts, checked input and formatted output; A rules-based program, such as a ticket pricing or grading-rules calculator, with a written test plan; A number guessing game or a times-table quiz with scoring and replay; A class marks analyzer: store scores, report the average, the highest and lowest, and a simple bar display; Refactor an earlier project into well-named functions or methods, with a test for each; A file report tool: read a data file, summarize it and write a tidy results file; A searchable, sortable record list built from a file, with a short design document and test log; Write three recursive solutions and their loop versions, and compare them in a short written note; An object-oriented library, inventory or game roster program with a class diagram and documentation; A project plan and working first version for the student's own final project, built by the student; A personal review pack: topic summaries, a mistakes list and two reviewed timed papers.

Ontario Grade 12 University Math: Advanced Functions and Calculus and Vectors (MHF4U and MCV4U)

`/courses/ontario-grade-12-university-math-mhf4u-mcv4u-course` · 6 months (24 weeks) per plan, joinable any month and paced to your school course · Ontario students in Grade 12 (roughly ages 16 to 18) taking MHF4U, MCV4U or both at school

- PHASE 1: Advanced Functions, Part 1 (Months 1-2, Weeks 1-8) The function toolkit every Grade 12 topic depends on, then polynomial and rational functions in depth.
  - Month 1: The Function Toolkit and Polynomial Functions
  - Weeks 1-2: Starting Point and the Function Toolkit
  - Weeks 3-4: Polynomial Functions
  - Month 2: Polynomial Equations and Rational Functions
  - Weeks 5-6: Polynomial Equations and Inequalities
  - Weeks 7-8: Rational Functions
- PHASE 2: Advanced Functions, Part 2 (Months 3-4, Weeks 9-16) Trigonometry in radians, exponential and logarithmic functions, combining functions and rates of change, with MHF4U exam review.
  - Month 3: Trigonometric Functions, Identities and Equations
  - Weeks 9-10: Radians and Trigonometric Functions
  - Weeks 11-12: Identities and Trigonometric Equations
  - Month 4: Exponential and Logarithmic Functions, Combining Functions and Rates of Change
  - Weeks 13-14: Exponential and Logarithmic Functions
  - Weeks 15-16: Combining Functions, Rates of Change and MHF4U Review
- PHASE 3: Calculus and Vectors, and Exam Review (Months 5-6, Weeks 17-24) What we teach for MCV4U: limits and the derivative, derivative rules and applications, then vectors, lines and planes, ending with exam review. MCV4U batches begin with a quick review of the MHF4U ideas calculus relies on.
  - Month 5: Limits, Derivatives and Their Applications

- Weeks 17-18: Rates of Change, Limits and the Derivative
- Weeks 19-20: Curve Sketching, Optimization and Rates
- Month 6: Vectors, Lines and Planes, and Exam Review
- Weeks 21-22: Vectors in Two and Three Dimensions
- Weeks 23-24: Lines and Planes, and Exam Review Technique

Projects students build: A one-page function toolkit summary, with a sketch of each parent function and its transformations; A polynomial sketch set: ten polynomials sketched by hand from factored form, then checked with graphing technology; A worked solutions file for factoring and inequalities, with every step justified in words; A rational function sketch set with asymptotes, intercepts and behaviour near each asymptote explained; A sinusoidal model of a real periodic situation, with the equation built from the data and explained; An identity proof file: ten identities proved in full, with the strategy for each written first; An applications pack: four real situations modelled with exponential or logarithmic functions and solved in full; A personal MHF4U review pack: one-page summaries for each unit, a mistakes list and a reviewed timed paper; Three derivatives worked from first principles, then confirmed with the rules, with a short written explanation; An optimization pack: four real problems set up and solved in full, each with a domain check; A vector applications set with a labelled diagram and a full written solution for each problem; A personal MCV4U review pack: unit summaries, a mistakes list and two reviewed timed papers.

Orange Data Mining Course for College Students: Machine Learning and Analytics

`/courses/orange-data-mining-machine-learning-course-for-college-students` · 24 classes (12 weeks · 2 classes/week) · Beginner to applied practitioner (college students and graduates), no prior machine learning required

- Phase 1: Reproducible Foundations Classes 1 to 5. Set up Orange, learn the canvas properly, and build the habits that separate a project that survives a viva from one that falls apart when someone asks you to run it again. Everything in this phase is about data you can trust and workflows that reproduce.
  - Class 1: Orange, Visual Programming and Why It Is Taken Seriously
  - Class 2: Data Sources, Types and Roles
  - Class 3: Missing Data, Outliers and Defensible Cleaning
  - Class 4: Joins, Aggregation and Reshaping
  - Class 5: Preprocess, Reproducibility and Workflow Engineering
- Phase 2: Exploratory Analysis and Feature Engineering Classes 6 to 10. Model performance is decided long before the learner widget. This phase covers reading a dataset properly and then constructing the features that make the difference, along with the diagnostics that tell you when a feature is helping and when it is cheating.
  - Class 6: Distributions, Dispersion and Group Comparison
  - Class 7: Bivariate Analysis and Informative Projections
  - Class 8: Correlation, Multicollinearity and Distance
  - Class 9: Feature Engineering, Discretisation and Encoding
  - Class 10: Communicating Analysis with the Orange Report
- Phase 3: Modelling and Rigorous Evaluation Classes 11 to 16. The modelling half of a data mining syllabus, taught with the validation rigour that distinguishes a result from a coincidence. Classification and regression, simple models and ensembles, and tuning that does not quietly contaminate the test set.
  - Class 11: The Modelling Frame, Baselines and Validation Design
  - Class 12: Trees, Rules and Interpretable Models
  - Class 13: Distance and Probability Models, Regression Begins
  - Class 14: Evaluation in Depth, from Confusion Matrix to Calibration
  - Class 15: Ensembles and Neural Networks
  - Class 16: Tuning, Deployment and the Traps That Invalidate Results

- Phase 4: Unsupervised, Explainable and Specialised Data Classes 17 to 21. The rest of a data mining syllabus, taught to the same standard: clustering with validity measures rather than eyeballing, dimensionality reduction, association rules, model explainability, and the two data types that dominate project work, text and time series.
  - Class 17: Clustering and Cluster Validity
  - Class 18: Dimensionality Reduction, Outliers and Association Rules
  - Class 19: Explainability and Fairness
  - Class 20: Text Mining and Document Analysis
  - Class 21: Time Series and Spatial Data
- Phase 5: The Python Bridge and Capstone Classes 22 to 24. Leave the course able to work in both worlds. Orange is a Python library, so the last phase connects the canvas to code, sets the ethical standard for the work, and produces a capstone that reproduces on a machine that is not yours.
  - Class 22: The Python Script Widget and Orange as a Library
  - Class 23: Build and Defend Your Capstone
  - Class 24: Report, Present and Continue

Projects students build: Install Orange, build a File to Data Table to Distributions canvas on a bundled dataset, then deliberately change the upstream file and document exactly which downstream widgets recomputed; Load one awkward real-world .csv, correct every mistyped column with Edit Domain, assign roles deliberately, and write a data dictionary describing every variable, its type and its role; Build a fully annotated cleaning pipeline on a messy dataset, recording instance counts before and after each step, and write a cleaning log justifying every decision; Build an entity-level analysis dataset from at least two source tables using Merge Data and Group by, engineer three derived features with Formula, and document what one row represents at each stage; Package everything from Classes 2 to 4 as a reproducible project folder: annotated .ows workflow, raw data file and a README, then have a classmate rerun it from scratch and report any step they could not reproduce; Produce a full univariate profile of your dataset, every numeric variable charted and described, every categorical variable tabulated, ending with three written hypotheses worth testing; Rank every feature by at least three scoring methods, reconcile the disagreements in writing, and build the informative projection that best separates your target classes; Diagnose multicollinearity in a numeric dataset, decide which features to drop with a written justification, and demonstrate the effect on a linear model's coefficients before and after; Engineer at least five new features from domain reasoning, then run a cross validated with-and-without comparison for each and keep only the ones that measurably earned their place; Produce a complete exploratory data analysis report on your project dataset: question, data dictionary, univariate and bivariate evidence, engineered features, and a stated set of limitations, exported as PDF; Write and register your evaluation protocol for the course project, then establish both baselines with stratified 10-fold cross validation and record the numbers every later model must beat; Train a tuned decision tree and a CN2 rule set on the same problem, extract the decision logic from both as written rules, and compare their cross validated performance against your baselines; Build a full regression pipeline on a continuous target, compare linear regression with and without regularisation against kNN regression, and report RMSE and R squared under identical cross validation; Evaluate every model built so far on one problem with a full evaluation dossier: metrics table, confusion matrices with stated costs, ROC comparison, calibration plot, and a recommended operating threshold with its justification; Run a full learner tournament, baseline through neural network and stacking, under one fixed cross validation, and write a model selection memo that justifies your winner on grounds beyond the top accuracy figure - plus 9 more on the course page.

Orange Data Mining Course for Teens: Machine Learning Without Code

`/courses/orange-data-mining-visual-machine-learning-course-for-teens` · 24 classes (12 weeks · 2 classes/week) · Beginner-friendly (ages 13-18), no programming experience required

- Phase 1: The Canvas and Your Data Classes 1 to 5. Install Orange, learn how visual programming actually works, and get genuinely good at the unglamorous part every real analyst spends most of their time on: loading, reading, repairing and reshaping a dataset before a single model is trained.
  - Class 1: What Data Mining Is, and Meeting Orange

    - Class 2: Loading Data and Reading It Honestly
    - Class 3: Fixing the Data Nobody Wants to Fix
    - Class 4: Reshaping, Combining and Summarising Data
    - Class 5: Preprocess, Save and Share Your Workflow
- Phase 2: Seeing the Data Classes 6 to 10. Charts are not decoration, they are how you find the question worth modelling. This phase turns you into someone who can look at an unfamiliar dataset and, within ten minutes, produce the three visuals that explain what is going on.
    - Class 6: Distributions, Box Plots and Violin Plots
    - Class 7: Scatter Plots and Finding Informative Projections
    - Class 8: Bar Plots, Line Plots and Categorical Relationships
    - Class 9: Heat Maps, Correlations and Distance Maps
    - Class 10: Telling the Story with the Orange Report
- Phase 3: Your First Machine Learning Models Classes 11 to 16. Training a model in Orange takes about thirty seconds. Knowing whether the model is any good takes the rest of this phase, and it is the part that actually matters. Every model you build here is tested properly before you are allowed to be impressed by it.
    - Class 11: Supervised Learning and the Baseline You Must Beat
    - Class 12: Decision Trees, the Model You Can Actually Read
    - Class 13: k Nearest Neighbours, Naive Bayes and Preprocessing That Matters
    - Class 14: Testing Honestly with Cross Validation and Confusion Matrices
    - Class 15: Logistic Regression, ROC Curves and Nomograms
    - Class 16: Ensembles, Neural Networks and Making Predictions
- Phase 4: Finding Hidden Structure, Text and Images Classes 17 to 21. Not every dataset comes with answers attached. This phase covers unsupervised learning, where the model finds structure nobody labelled, and then applies the same canvas to two data types that do not look like spreadsheets at all: text and images.
    - Class 17: k Means Clustering and Silhouette Scores
    - Class 18: Hierarchical Clustering, DBSCAN and Distance
    - Class 19: PCA, t-SNE and Outliers
    - Class 20: Text Mining, from Words to Sentiment
    - Class 21: Image Analytics and Your First Image Classifier
- Phase 5: Ethics, Capstone and Showcase Classes 22 to 24. A model that is technically correct and socially careless is still a bad model. You finish the course by learning what can go wrong, then building and presenting an end to end project of your own from raw data to defended conclusion.
    - Class 22: Bias, Leakage and Honest Conclusions
    - Class 23: Build Your Capstone
    - Class 24: Present, Publish and Where Data Takes You Next

Projects students build: Install Orange on your own computer, open a blank canvas, place a File widget and a Data Table widget, connect them, and take a screenshot proving data flowed from one to the other; Load a real .csv you care about (school marks, cricket or football statistics, weather, a game leaderboard), inspect it in Data Table and Data Info, and write a one paragraph description of what each column means; Take a deliberately messy dataset provided in class, and build a five widget repair pipeline that renames variables, fixes types, filters bad rows and imputes missing values, ending in a clean Data Table; Combine two related datasets with Merge Data, create one new calculated column with Formula, and produce a Pivot Table that answers a specific question you write down first; Turn your Class 3 and Class 4 work into one tidy, annotated, left-to-right workflow, save it as an .ows file, and swap it with a classmate to check that they can rerun it with the data file; Build a three-chart comparison of one numeric variable across one categorical group in your dataset, using Distributions, Box Plot and Violin Plot, and write which chart told you the most; Use Find

Informative Projections to identify the two most separating variables in a classification dataset, then build the scatter plot it suggests and select the most interesting cluster of points into a Data Table; Build a two-variable categorical analysis using Sieve Diagram and Mosaic Display, then present the same finding once honestly and once misleadingly with a Bar Plot, and explain exactly what you changed; Build a Correlations and Heat Map pair on a numeric dataset, identify one pair of variables that are effectively duplicates, and justify which one you would keep; Produce a complete visual story on your own dataset: one question, three charts chosen deliberately, written commentary on each, exported as a PDF report; Take a classification dataset, chart its target distribution, run the Constant baseline through Test and Score, and write down the accuracy number that every later model in this course must beat; Train a decision tree on your dataset, open Tree Viewer, and write out the three clearest decision rules in plain English, then deliberately overfit by removing the depth limit and describe what changed; Compare kNN with and without normalisation in the same Test and Score, add Naive Bayes as a third learner, and write a paragraph explaining the accuracy gap that normalisation caused; Run every model you have built so far through Test and Score with 10-fold cross validation against the Class 11 baseline, then open Confusion Matrix and describe, in consequences rather than numbers, what each type of error would mean; Train logistic regression alongside your decision tree, compare them in ROC Analysis, then use the Nomogram to write down the three features that most influence the prediction and in which direction - plus 9 more on the course page.

PCAP Certification Prep: Certified Associate in Python Programming

`/courses/pcap-python-certification-prep-course` · 4 months (16 weeks), joinable any month · Anyone with basic Python (PCEP level or equivalent) preparing for the PCAP associate certification

- PHASE 1: Modules, Packages, Strings and Exceptions The first block of exam objectives, taught as real Python and drilled in exam form.
  - Month 1: Modules, Packages and the Standard Library
  - Importing and Module Basics
  - Standard Library Essentials
  - Packages, **init** and Distribution
  - Strings in Depth
  - Month 2: Exception Handling and Consolidation
  - The Exception Hierarchy
  - Custom Exceptions and Defensive Code
  - Data Aggregates Refresher
  - Functions, Scope and Arguments
- PHASE 2: Object-Oriented Python The block that decides most PCAP results, taught until class behaviour is predictable rather than surprising.
  - Month 3: Classes, Inheritance and Special Methods
  - Classes, Instances and Attributes
  - Inheritance and Polymorphism
  - Special Methods and Introspection
  - OOP Consolidation
- PHASE 3: Generators, Closures, File Processing and Full Mocks The last objectives, then the exam itself rehearsed until the result is predictable.
  - Month 4: Advanced Python and Exam Rehearsal
  - Comprehensions, Generators and Iterators
  - Closures, Lambdas and Functional Tools
  - File Processing
  - Full Timed Mock Exams

Projects students build: Write a small multi-module program and import across it every supported way; Solve a set of tasks using only the standard library, no third-party packages; Build a small package with nested sub-packages and import from it correctly; Write a text-processing utility using only string methods, no regular expressions; Take a fragile script and make it robust with correctly ordered handlers; Design a small exception hierarchy for a described domain and use it properly; Solve a data-shaping task choosing the right structure at each step and justifying it; Write functions exercising every argument form, then predict their behaviour before running them; Build a class where class and instance variables are deliberately contrasted, then predict every output; Design a class hierarchy with overriding and demonstrate the resolution order; Write a class with operator overloading and full introspection support; A full OOP-only mock section, reviewed question by question; Rewrite an eager data pipeline as a lazy generator pipeline and compare behaviour; Build a small closure-based counter and function factory; Write a program that reads, transforms and writes files with full error handling - plus 1 more on the course page.

PCEP and PCAP Python Certification Course

`/courses/pcep-pcap-python-certification-course` · 5 months (20 weeks) for PCEP then PCAP, joinable any month · Anyone from about 13 upward, including working adults; no prior programming required for the PCEP half

- PHASE 1: PCEP Foundations (Months 1-2) Entry-level Python taught properly rather than as exam trivia, with every topic implemented before it is tested.
  - Month 1: Syntax, Data Types and Control Flow
  - The Interpreter, Literals and Variables
  - Operators, Precedence and Type Conversion
  - Conditionals and Loops
  - Lists, Tuples, Dictionaries and Sets
  - Month 2: Functions, Scope and Exceptions
  - Functions and Parameters
  - Scope, Shadowing and the global Keyword
  - Exceptions and Data Handling
  - PCEP Timed Practice and the First Repository
- PHASE 2: PCAP Associate Material (Months 3-4) Modules, packages, object-oriented programming, exceptions in depth, and the standard library the associate exam assumes.
  - Month 3: Modules, Packages and Classes
  - Modules, Packages and the Import System
  - Classes, Objects and Attributes
  - Inheritance and Polymorphism
  - Exceptions as Objects
  - Month 4: Files, Strings and the Standard Library
  - File Handling and Streams
  - Strings in Depth
  - List Comprehensions, Lambdas and Closures
  - PCAP Timed Practice and the Portfolio
- PHASE 3: Exam Readiness and Real Evidence (Month 5) The final stretch: passing the exam, and finishing with something worth more than the certificate.
  - Month 5: Final Preparation
  - Full Mock Exams
  - Targeted Repair
  - The Repository That Outlasts the Certificate

- Booking, Sitting and What Comes After

Princess Coders: Coding Course for Girls and Women

`/courses/princess-coders-complete-coding-masterclass` · 9-11 months (36-44 weeks) · Complete beginner; school girls, college students and women switching careers

- PHASE 1: Foundations (Months 1-3, Weeks 1-12) HTML, CSS and JavaScript built properly, with creative projects deployed from the first months.
  - Month 1: First Steps
  - Welcome: Your Tech Journey Begins
  - HTML: Real Structure
  - Month 2: Style and Logic
  - CSS: Design That Holds
  - JavaScript: First Interactivity
  - Month 3: JavaScript Depth
  - Advanced JavaScript Concepts
  - Creative Coding & Visual Projects
- PHASE 2: Modern Frontend (Months 4-6, Weeks 13-24) React the way it is written now, with UI craft, TypeScript and testing.
  - Month 4: React Foundation
  - React.js Foundation
  - Advanced React Patterns
  - Month 5: State and UI Craft
  - State Management & Data Flow
  - UI/UX Design for Developers
  - Month 6: TypeScript and Quality
  - TypeScript in Practice
  - Testing and Quality
- PHASE 3: Backend Basics (Months 7-8, Weeks 25-32) The other half: Node, Express, databases, authentication and a real deployment.
  - Month 7: Node and APIs
  - Backend Fundamentals with Node
  - Building APIs with Express.js
  - Month 8: Data and Auth
  - Databases - Storing Your Data
  - Authentication and Deployment
- PHASE 4: The Finale (Month 9, Weeks 33-36) The signature capstone, the women-in-tech week, and the final exam at demo day.
  - Month 9: Capstone and Community
  - The Signature Capstone
  - Women in Tech: Community, Mentorship, Visibility
  - Demo Day and the Final Exam

Projects students build: Create your Princess Coder profile page; Design your digital business card; Build an 'About Me' interactive story; Personal blog about your interests; Recipe collection website; Digital diary or journal; Online portfolio for your hobbies; Fashion lookbook website; Interactive greeting card creator; Photo gallery with filters; Animated story presentation; Interactive quiz about your favorite topic; Simple drawing application; To-do list with style; Mood tracker application - plus 53 more on the course page.

Problem Solving and Computational Thinking for Kids

`/courses/problem-solving-and-computational-thinking-for-kids` · 6-8 months (26-32 weeks) · Complete beginner, ages 7 to 12

- THE COURSE: Thinking, Trained (Months 1-6, Weeks 1-26) Logic and patterns, applied problem solving, then advanced challenges and the exam gauntlet.
  - Months 1-2: Logic and Pattern Recognition
  - Introduction to Problem Solving
  - Algorithmic Thinking Unplugged
  - Introduction to Code.org
  - Mathematical Problem Solving
  - Months 3-4: Applied Problem Solving
  - Scratch Problem Solving
  - Game Strategy & Logic
  - Real-World Problem Solving
  - Coding Challenges Platform
  - Mid-Course Review and Showcase
  - Months 5-6: Advanced Problem Solving
  - Advanced Algorithms
  - Robotics Problem Solving
  - Data and Logic Problems
  - Creative Problem Solving
  - Capstone and the Final Exam

Projects students build: Create a puzzle book; Design a treasure hunt; Solve 20 logic puzzles; Build pattern art; Write algorithms for daily tasks; Create a board game with rules; Design a flowchart adventure; Program a 'human robot'; Complete Code.org Course A; Create digital art with code; Solve 50 coding puzzles; Design custom maze challenges; Math puzzle collection; Create a math game; Budget planning project - plus 38 more on the course page.

Problem Solving for Teens: Logic, Data Structures & Algorithms

`/courses/problem-solving-dsa-masterclass-teens` · 10-12 months (44-52 weeks) · Teenagers 13-18; no prior experience needed

- PHASE 1: Foundation & Logic Building (Months 1-3, Weeks 1-13) Build unshakeable foundations. Learn to think like a programmer, master basic syntax, and solve your first 200+ problems.
  - Month 1: Programming Fundamentals & First Steps
  - Introduction to Problem Solving & Setup
  - Conditional Logic & Decision Making
  - Loops & Iteration Mastery
  - Functions & Modular Programming
  - Month 2: Data Structures Basics & Problem Patterns

- Lists/Arrays Fundamentals
- Strings & Text Processing
- Dictionaries/Hash Maps & Sets
- Basic Algorithms & Complexity
- Month 3: Advanced Basics & Contest Preparation
- Stack & Queue Mastery
- Recursion & Backtracking Basics
- Mathematics for Programming
- Linked Lists Introduction
- Phase 1 Final Project

- PHASE 2: Core Data Structures & Algorithms (Months 4-6, Weeks 14-26) Master essential data structures, dive deep into algorithms, and start solving medium-level competitive programming problems.
  - Month 4: Trees & Advanced Sorting
  - Binary Trees Fundamentals
  - Binary Search Trees (BST)
  - Advanced Sorting Algorithms
  - Heaps & Priority Queues
  - Tries & String Algorithms
  - Month 5: Graphs & Network Algorithms
  - Graph Fundamentals
  - Graph Traversal Algorithms
  - Shortest Path Algorithms
  - Minimum Spanning Trees
  - Month 6: Phase 2 Completion & Integration
  - Algorithm Design Paradigms
  - Space & Time Optimization
  - Testing & Debugging Mastery
- PHASE 3: Advanced Algorithms & Techniques (Months 7-9, Weeks 27-39) Master dynamic programming, advanced data structures, computational geometry, and complex problem-solving techniques.
  - Month 7: Dynamic Programming Mastery
  - DP Fundamentals
  - String DP Problems
  - Grid & Matrix DP
  - Knapsack & Subset Problems
  - Tree DP
  - Month 8: Advanced DP & Optimization
  - DP with Bitmasks
  - Interval DP & Games
  - DP Optimizations
  - Probability & Expected Value DP
  - State Space Reduction
  - Month 9: Computational Geometry & Number Theory

- Computational Geometry Basics
- Advanced Number Theory
- Combinatorics & Counting

- PHASE 4: The Finale (Month 10, Weeks 40-44) The capstone month: spec, build, ship and defend, then the final exam that decides the certificate.
  - Month 10: Capstone and the Final Exam
  - Capstone Spec and Setup
  - Capstone Build
  - Ship and Polish
  - Demo Day and the Final Exam

Projects students build: Calculator for homework problems; Age calculator with fun facts; Simple chatbot that responds to inputs; Grade calculator with letter grades; Rock-Paper-Scissors game; Simple adventure game with choices; Password strength checker; Pattern printer (20+ patterns); Multiplication table generator; Prime number checker and generator; Number guessing game with attempts; Math helper library (GCD, LCM, factorial); Text analyzer (word count, character frequency); Recursive art generator; Unit converter with functions - plus 138 more on the course page.

PSLE Maths: Model Method, Problem Sums & MOE Syllabus

`/courses/psle-maths-mastery` · 12 months (52 weeks) · Primary 4-6 students on the MOE syllabus, PSLE-bound

- PHASE 1: The Method, Rebuilt Properly (Months 1-4) The gap behind most PSLE struggles is a model method learned as template instead of thinking. This phase rebuilds number fluency and model drawing from meaning, then applies both to the first problem-sum families.
  - Month 1: Diagnostic + Number Fluency, Bare-Handed
  - Diagnostic and the Honest AL Baseline
  - Whole-Number Operations at Paper 1 Tempo
  - Fractions as Numbers, From Pictures First
  - Decimals and the Fraction-Decimal-Percentage Bridge
  - Months 2-3: Model Drawing as Thinking
  - Part-Whole Models as Reasoning
  - Comparison Models Made Visible
  - Unit Thinking and Re-Cutting Bars
  - First Structure Families: Sum-and-Difference
  - Month 4: Heuristics, Named and Trained
  - Work Backwards Heuristic
  - Disciplined Guess-and-Check
  - Restate and Simplify
  - Phase 1 Checkpoint

- PHASE 2: The P5-P6 Canon, Family by Family (Months 5-9) The problem-sum territory where the PSLE decides its top bands, taught by structure family so your child recognises the skeleton under every costume: fractions of remainder, ratio and its changes, percentage, speed and geometry.
  - Month 5: Fractions of Remainder and Branch Models
  - Remainder Concept and Branch Models
  - Multi-Stage Remainder Problems
  - Month 6: Ratio, and Ratio That Changes

    - Ratio as Units
    - Before-and-After Ratio Problems
    - Month 7: Percentage in Every Costume
    - Percentage Of, Increase and Decrease
    - Reverse Percentage at Exam Standard
    - Month 8: Speed, Rate and the Journey Problems
    - Speed as a Rate With Meaning
    - Journey Problems and Average Speed
    - Month 9: Geometry, Area and the Visual Problems
    - Angles and Figures With Justification
    - Area, Perimeter and Shaded Regions
- PHASE 3: Paper Craft and the PSLE Runway (Months 10-12) Understanding becomes AL bands here: Paper 1 speed without a calculator, Paper 2 working discipline, timed full papers with review rituals, and a peak plan that walks into the PSLE calm.
    - Month 10: Paper 1 and Paper 2 as Different Skills
    - Paper 1 Craft and Mental Strategies
    - Paper 2 Craft and Method Marks
    - Month 11: Timed Papers and Mark Banking
    - Full Timed Papers and Mark Banking
    - Review Rituals and the Error Log
    - Month 12: The Calm Runway
    - Weakest-Family Rotations
    - Final Cycles and the Peak-Week Plan

Python and AI for Kids: Games, Turtle Art and Smart Projects

`/courses/python-ai-kids-masterclass` · 8-10 months (32-40 weeks) · Complete beginner, ages 9 to 12

- PHASE 1: Python Basics (Months 1-2, Weeks 1-8) The first real language, learned through play: printing, variables, decisions and loops, every week ending with something funny or clever to show at home.
    - Month 1: First Code
    - Welcome to Programming & Setup
    - Variables & Data Types - Teaching Python to Remember
    - Month 2: Decisions and Loops
    - Making Decisions with If-Else
    - Loops - Making Python Repeat
- PHASE 2: Turtle Art and Coder Powers (Months 3-4, Weeks 9-16) The famous turtle draws what the child commands: spirals, stars and snowflakes, then lists and functions turn scripts into real programs.
    - Month 3: The Turtle Awakens
    - Introduction to Turtle Graphics
    - Advanced Turtle Projects
    - Month 4: Lists and Functions
    - Lists & Collections
    - Functions - Reusable Code Blocks

- PHASE 3: Real Games (Months 5-6, Weeks 17-24) Programs that remember and games that feel real: files and saving, first object thinking, then Pygame from the game loop to finished, shareable games.
  - Month 5: Memory and Objects
  - File Handling & Data
  - Object-Oriented Programming Basics
  - Month 6: Pygame
  - Introduction to Pygame
  - Building Complete Games
- PHASE 4: Kid-Safe AI and the Finale (Months 7-8, Weeks 25-32) AI learned the honest way for this age: built small, trained by the child, tested for mistakes, and finished with a capstone at demo day.
  - Month 7: AI, Discovered Properly
  - What is Artificial Intelligence?
  - Data Detective Work
  - Month 8: Camera Magic and the Capstone
  - Camera Magic: Train Your Own Model
  - Capstone and the Final Exam

Projects students build: Personalized greeting program; Magic calculator with special messages; Story generator with your name; Interactive story with user input; Age calculator with birthday messages; Mad Libs game generator; Personal quiz about yourself; Adventure game with choices; Grade calculator with feedback; Virtual pet mood checker; Rock, Paper, Scissors game; Pattern art generator; Guessing game with attempts; Countdown timer with effects; ASCII art animation - plus 45 more on the course page.

Python Automation Course: Scripting, Scraping & Applied AI

`/courses/python-ai-automation-masterclass-college` · 10-12 months (44-52 weeks) · Complete beginner (18+); college students, graduates and working professionals

- PHASE 1: Python Foundation & Core Programming (Months 1-3, Weeks 1-13) Build rock-solid Python fundamentals. Learn programming concepts, master Python syntax, and create your first automation projects.
  - Month 1: Python Fundamentals & Programming Logic
  - Introduction to Python & Setup
  - Variables, Data Types & Operations
  - Control Flow & Loops
  - Data Structures in Python
  - Month 2: Functions, Modules & OOP
  - Functions & Functional Programming
  - Object-Oriented Programming
  - Modules, Packages & Error Handling
  - File Handling & Data Processing
  - Month 3: Advanced Python & Automation
  - Advanced Python Concepts
  - Database Programming
  - Web Development with Python
  - Network Programming & APIs

- PHASE 2: Web Scraping & Automation Tools (Months 4-6, Weeks 14-26) Master web scraping, browser automation, task automation, and building robust automation frameworks.
  - Month 4: Web Scraping & Browser Automation
  - Web Scraping Fundamentals
  - Advanced Web Scraping
  - Selenium & Browser Automation
  - Alternative Automation Tools
  - Data Processing & Analysis
  - Month 5: Enterprise Automation & Integration
  - RPA & Process Automation
  - API Development & Microservices
  - Cloud Automation & DevOps
  - Testing & Quality Assurance
  - Security & Best Practices
  - Month 6: Practical Machine Learning
  - Machine Learning Fundamentals
  - Supervised Learning Algorithms
  - Unsupervised Learning & Deep Learning Intro
- PHASE 3: Applied AI for Automation (Months 7-9, Weeks 27-39) Master advanced AI techniques, computer vision, natural language processing, and production AI systems.
  - Month 7: Computer Vision & Image Processing
  - Image Processing Fundamentals
  - Advanced Computer Vision
  - Deep Learning for Computer Vision
  - Natural Language Processing
  - Advanced NLP with Transformers
  - Month 8: Time Series, Ethics & Production AI
  - Time Series & Forecasting
  - AI Ethics & Explainable AI
  - MLOps & Production Systems
  - Month 9: Cloud AI Services in Automation
  - Cloud AI Services & Deployment
- PHASE 4: The Finale (Month 10, Weeks 40-44) The capstone month: spec, build, ship and defend, then the final exam that decides the certificate.
  - Month 10: Capstone and the Final Exam
  - Capstone Spec and Setup
  - Capstone Build
  - Ship and Polish
  - Demo Day and the Final Exam

Projects students build: Set up complete Python development environment; Simple calculator program; Personal information collector; Temperature converter (C/F/K); Text analyzer and formatter; Simple encryption/decryption tool; Number guessing game; Pattern generator (pyramids, diamonds); Prime number calculator; Password strength validator;

Student management system; Shopping cart application; Contact book with search; Data structure performance analyzer; Modular calculator with functions - plus 123 more on the course page.

Python for Teens: Complete Course from Beginner to Advanced

`/courses/python-complete-masterclass-teens` · 10-12 months (40-48 weeks) · Absolute beginner, ages 13 to 18

- PHASE 1: Python Foundations and OOP (Months 1-3, Weeks 1-12) From the first line of code to data structures, algorithms and object-oriented programming. Every week ends with something built.
  - Month 1: First Programs
  - Introduction and Setup
  - Control Flow and Logic
  - Loops and Iteration
  - Functions
  - Month 2: The Data Structures Every Program Uses
  - Lists and Tuples
  - Dictionaries and Sets
  - Strings and Text
  - Files, JSON and Errors
  - Month 3: Algorithms and Objects
  - Power Collections
  - Algorithms and Problem Solving
  - Object-Oriented Programming
  - Inheritance and Polymorphism
- PHASE 2: Games, Apps and Automation (Months 4-6, Weeks 13-24) Skills become products: real Pygame games shared online, desktop apps, automation that does actual chores, and a first honest look at data.
  - Month 4: Build Real Games
  - Pythonic Objects
  - Pygame: The Game Loop
  - Pygame: Juice and Polish
  - Game AI and Shipping Your Game
  - Month 5: Programs That Do Your Chores
  - Desktop Apps with Tkinter
  - Automation: Files, Sheets and Documents
  - Web Scraping, Politely
  - Automation Capstone
  - Month 6: Data Tells Stories
  - NumPy and pandas Foundations
  - Data Visualization
  - A Real Data Project
  - Phase 2 Capstone and Review
- PHASE 3: Python on the Web (Months 7-8, Weeks 25-32) How the web really works, then Flask: routes, templates, forms, a database, user accounts, and a deployment to a public URL.
  - Month 7: From Requests to Flask
  - How the Web Works

    - Consuming APIs
    - Flask: Your First Web App
    - Templates, Forms and Sessions
    - Month 8: Databases, Users and Deployment
    - Databases with SQLite and SQLAlchemy
    - User Accounts and Web Safety
    - Deploying to the Real Internet
    - Web Capstone
- PHASE 4: AI, Quality and the Capstone (Months 9-10, Weeks 33-40) Machine learning done honestly, AI features built on modern APIs, professional habits with Git and pytest, and a final capstone shipped like a product.
    - Month 9: AI and Real-World Tools
    - Machine Learning with scikit-learn
    - Building on AI APIs
    - An AI Feature in a Real App
    - Git and GitHub for Real Projects
    - Month 10: Quality, Capstone and Demo Day
    - Testing and Code Quality
    - Final Capstone Build
    - Demo Day and What Comes Next

Projects students build: A personal greeting bot that asks questions and answers back; Calculator with memory; Mad libs story generator; Rock-Paper-Scissors-Lizard-Spock game; Password strength analyzer with rules; Choose-your-own-adventure text game; Pattern generator (ASCII art); Prime number visualizer; Multiplication table game; Progress bar implementation; Homework helper library of reusable functions; Unit converter covering 20+ conversions; Menu-driven mini app assembled from functions; Spotify playlist manager; Tic-tac-toe with AI opponent - plus 83 more on the course page.

Python Masterclass: Zero to Advanced, Live Online

`/courses/python-programming-masterclass-zero-to-advanced-college` · 9-11 months (36-44 weeks) · Complete beginner (18+); college students, graduates and professionals

- PHASE 1: Core Python (Months 1-3, Weeks 1-12) The language itself, learned properly: syntax, control flow, functions and the core data structures, practiced through daily building.
    - Month 1: First Python
    - Introduction to Programming & Python Setup
    - Variables, Data Types & Operators
    - Month 2: Control Flow and Functions
    - Control Flow: Conditions & Loops
    - Functions & Modular Programming
    - Month 3: The Data Structures
    - Lists & List Operations
    - Tuples, Sets & Dictionaries
- PHASE 2: Professional Python (Months 4-6, Weeks 13-24) The jump from scripts to software: object-oriented design, files and exceptions, the standard library as a first resort, testing, and a real capstone.
    - Month 4: Object-Oriented Python

    - Introduction to OOP Concepts
    - OOP Principles: Inheritance & Polymorphism
    - Month 5: Files, Exceptions and the Standard Library
    - File Handling & Exception Handling
    - Modules, Packages & Standard Library
    - Month 6: Testing and the Phase Capstone
    - Testing & Debugging
    - Phase 2 Capstone
- PHASE 3: The Working Toolkit (Months 7-8, Weeks 25-32) What turns language skill into working capability: Git and GitHub, real APIs and polite scraping, automation that survives reality, and concurrency without folklore.
    - Month 7: Git, GitHub and the Living Web
    - Version Control with Git & GitHub
    - APIs and Web Scraping, Done Politely
    - Month 8: Automation and Concurrency
    - Automation and Scripting That Survives Reality
    - Concurrency Without Folklore
- PHASE 4: The Three Roads and the Finale (Month 9, Weeks 33-36) Web, data and AI, each tasted hands-on in real builds, then the final capstone and the exam that decides the certificate.
    - Month 9: Choose Your Road, Then Prove the Journey
    - The Three Roads, Tasted Honestly
    - Final Capstone Build
    - Demo Day and the Final Exam

Projects students build: Hello World variations (personalized greetings); Simple calculator using print statements; About Me program (display personal information); ASCII art creator; Temperature converter (Celsius/Fahrenheit); Age calculator with days, hours, minutes; Simple interest calculator; BMI (Body Mass Index) calculator; Tip calculator with bill splitting; Number guessing game with attempts; Grade calculator with letter grades; Even/odd number checker; Multiplication table generator; Pattern printing (stars, pyramids, diamonds); Simple password validator - plus 75 more on the course page.

Python Web Development with Django and Flask Course

`/courses/python-web-development-django-flask-course` · 6 months (24 weeks) · Intermediate, college students and working professionals with Python basics

- PHASE 1: How the Web Works, Then Flask (Months 1-2, Weeks 1-8) HTTP demystified with real requests, then Flask built up from a single route to a complete application with a database, forms, and login.
    - Month 1: HTTP and Your First Flask Apps
    - What Happens When You Load a Page
    - First Flask Application
    - Templates
    - Forms and User Input
    - Month 2: Databases and a Complete Flask App
    - SQL Before the ORM
    - The ORM: SQLAlchemy
    - CRUD End to End

    - Sessions and Login
- PHASE 2: Django Properly (Months 3-4, Weeks 9-16) The production framework, learned with Flask as the reference point: models, migrations, the admin, real authentication, relationships, and class-based views, ending in a multi-user project.
    - Month 3: Django Foundations
    - Projects, Apps, and URLs
    - Models and Migrations
    - The Admin and Django Templates
    - Django Forms
    - Month 4: Auth, Relationships, and Structure
    - Authentication
    - Relationships
    - Class-Based Views and Polish
    - Project Week: Ship the Django App
- PHASE 3: REST APIs and Production (Months 5-6, Weeks 17-24) The skills backend jobs list by name: REST API design with Django REST Framework, token auth and permissions, then real deployment and a capstone shipped to a public URL.
    - Month 5: REST APIs with Django REST Framework
    - API Thinking
    - Serializers and CRUD Endpoints
    - API Authentication and Permissions
    - Consuming and Documenting the API
    - Month 6: Deployment and the Capstone
    - Deployment, For Real
    - Capstone: Scope and Foundations
    - Capstone: Build and Review
    - Ship and Defend

Projects students build: Request detective: a written trace of one real page load, every request annotated, plus a script that fetches and inspects three sites; Personal API: a Flask app with five routes returning text and JSON, including a dynamic greeting route; Movie catalog site: a browsable list rendered from Python data with a shared base layout and detail pages; Feedback board: a form that accepts, validates, and displays entries, with flash messages for errors and success; Query workbook: a seeded database of books and members, interrogated with fifteen handwritten SQL queries; Movie catalog, database edition: the month 1 site rebuilt on SQLAlchemy models instead of Python lists; Notes application: full CRUD with create, edit, delete, and detail pages backed by the database; Notes app with accounts: registration, hashed passwords, login, logout, and notes scoped to their owner; Django hello-world done right: a two-app project with routed pages, shared base template, and static files; Job board, part one: JobPosting and Company models, migrated, seeded, and queried from the shell; Job board, part two: public listing and detail pages, plus a configured admin where postings are managed; Job board, part three: a post-a-job form with validation, plus an application form with resume upload; Job board accounts: employer and candidate signup, login, and pages that respond to who is viewing them; Job board relationships: companies, postings, tags, and saved-jobs wired together with efficient queries; Job board, refactored: listing pages moved to generic views with pagination, search, and tag filtering - plus 9 more on the course page.

Queen Coders: Advanced Engineering for Women Developers

`/courses/queen-coders-advanced-tech-leadership` · 9-11 months (36-44 weeks) · Women developers with working experience (roughly 2+ years or a strong portfolio)

- PHASE 1: Advanced Engineering (Months 1-3, Weeks 1-12) The judgment layer above syntax: design principles, cloud and data architecture, performance and security.
  - Month 1: Design and Cloud
  - Advanced Software Engineering Principles
  - Cloud Architecture & Infrastructure
  - Month 2: Data and Performance
  - Advanced Databases & Data Architecture
  - Performance Engineering & Optimization
  - Month 3: Security and APIs
  - Advanced Security Engineering
  - API Design & GraphQL Mastery
- PHASE 2: AI Engineering (Months 4-6, Weeks 13-24) The layer every senior role now assumes: ML engineering, modern AI applications, LLMs and agent development, and data engineering.
  - Month 4: ML Engineering
  - Machine Learning Engineering
  - Advanced AI Applications
  - Month 5: LLMs and Agents
  - LLMs & Generative AI
  - AI Engineering & Agent Development
  - Month 6: Data Engineering and the Phase Capstone
  - Data Engineering & Analytics
  - Phase 2 Capstone: An AI-Era System
- PHASE 3: Technical Leadership (Months 7-8, Weeks 25-32) The honest skills of staff-level work: leading through decisions, reviews and people, and choosing between management and the senior IC road.
  - Month 7: Staff-Level Craft
  - Staff/Principal Engineering Skills
  - Technical Leadership Skills
  - Month 8: Leading Engineers
  - Engineering Leadership
  - Engineering Management vs the Senior IC Road
- PHASE 4: The Finale (Month 9, Weeks 33-36) Community leadership, the architecture capstone, and the final defense.
  - Month 9: Capstone and Defense
  - Open Source and Community Leadership
  - Capstone Build: The Architecture Dossier
  - The Final Defense

Projects students build: Design and implement a distributed cache system; Build a custom ORM framework; Create a microservices architecture blueprint; Implement advanced design patterns library; Multi-region Kubernetes deployment; Serverless e-commerce backend; Infrastructure automation with Terraform; Cloud cost optimization audit tool; Build a

sharded database system; Real-time analytics pipeline with Kafka; Graph-based recommendation engine; Data warehouse ETL pipeline; Build a high-performance web server; Optimize a slow application (10x improvement); Implement custom load balancer - plus 52 more on the course page.

React Course for Teens: JavaScript to Real React Apps

`/courses/react-for-teens-complete-masterclass` · 9-11 months (36-44 weeks) · Absolute beginner, ages 13 to 18

- PHASE 1: Web and JavaScript Foundations (Months 1-3, Weeks 1-12) The real base React stands on: HTML, CSS and JavaScript learned deeply, through the DOM and modern ES6+, ending with a deployed project.
  - Month 1: The Web, Properly
  - Your First Steps in Web Development
  - CSS - Making Things Look Amazing
  - Month 2: Modern CSS and First JavaScript
  - Advanced CSS & Modern Web Design
  - JavaScript Fundamentals - Programming Basics
  - Month 3: The DOM and Modern JavaScript
  - JavaScript DOM Manipulation
  - Modern JavaScript (ES6+) for React
- PHASE 2: React Core (Months 4-6, Weeks 13-24) React the way it is actually written: components and props, state and hooks, routing, real data with honest loading states, and styling that scales.
  - Month 4: Components and State
  - Introduction to React
  - React State & Interactivity
  - Month 5: Hooks and Routing
  - React Hooks Deep Dive
  - React Router & Navigation
  - Month 6: Real Data and Styling
  - Data and APIs in React
  - Styling React Applications
- PHASE 3: React Craft (Months 7-8, Weeks 25-32) What separates builders from tutorial-followers: forms done right, state at scale, TypeScript, and testing with performance judgment.
  - Month 7: Forms and State at Scale
  - Forms & Validation in React
  - State at Scale: Context and Beyond
  - Month 8: TypeScript and Quality
  - TypeScript with React
  - Testing and Performance
- PHASE 4: Ship (Month 9, Weeks 33-36) An honest taste of Next.js, then the main event: the capstone built, deployed and defended at demo day.
  - Month 9: Next Taste, Capstone, Demo Day
  - A Taste of Next.js
  - Capstone Spec and Setup
  - Capstone Build
  - Demo Day and the Final Exam

Projects students build: Personal profile page about your interests; Fan page for your favorite artist/game/show; School club or team website; Animated landing page for a fake startup; Instagram-style photo gallery; Responsive blog design with dark mode; Animated movie poster with hover effects; Spotify-inspired music player UI; Gaming website with parallax scrolling; Grade calculator for school; Simple quiz game about your interests; Password strength checker; Interactive todo list with local storage; Countdown timer for events; Simple drawing app with canvas - plus 37 more on the course page.

React Masterclass: JavaScript to Production React

`/courses/react-js-complete-masterclass-college` · 10-12 months (44-52 weeks) · Complete beginner (18+); college students, graduates and working professionals

- PHASE 1: JavaScript & React Fundamentals (Months 1-3, Weeks 1-13) Build rock-solid foundations in JavaScript ES6+ and React core concepts, components, and hooks.
  - Months 1-2: JavaScript Mastery for React
  - Modern JavaScript Essentials
  - Introduction to React
  - Components & Props
  - State & Event Handling
  - Month 3: React Hooks Mastery
  - Essential Hooks
  - Custom Hooks & Patterns
  - Styling in React
- PHASE 2: Advanced React & State Management (Months 4-6, Weeks 14-26) Master routing, forms, API integration, and professional state management solutions.
  - Months 4-5: Routing & Data Management
  - React Router
  - Forms & Validation
  - API Integration & Data Fetching
  - Context API & State Management
  - Advanced Redux Patterns
  - Month 6: Component Patterns & Architecture
  - Advanced Component Patterns
  - Performance Optimization
  - Error Handling & Debugging
  - Accessibility & SEO
  - Phase 2 Capstone Project
- PHASE 3: TypeScript, Testing & Next.js (Months 7-9, Weeks 27-39) Master TypeScript with React, comprehensive testing, and server-side rendering with Next.js.
  - Months 7-8: TypeScript & Testing
  - TypeScript Fundamentals for React
  - TypeScript with React
  - Testing React Applications
  - End-to-End Testing
  - Introduction to Next.js
  - Month 9: Advanced Next.js & Full-Stack

    - Advanced Next.js Features
    - GraphQL with React
    - Micro-Frontends & Module Federation
    - Progressive Web Apps (PWA)
    - Phase 3 Capstone Project
- PHASE 4: The Finale (Month 10, Weeks 40-44) The capstone month: spec, build, ship and defend, then the final exam that decides the certificate.
    - Month 10: Capstone and the Final Exam
    - Capstone Spec and Setup
    - Capstone Build
    - Ship and Polish
    - Demo Day and the Final Exam

Projects students build: JavaScript utility functions library; Todo app with vanilla JavaScript; Weather app with API calls; Array manipulation exercises; First React app setup; Static website with React; Personal portfolio starter; JSX exercises and experiments; Component library creation; Blog post list component; Product card components; Navigation menu component; Interactive counter app; Form with validation; Todo list with state - plus 97 more on the course page.

Reasoning and Readiness for Young Thinkers (Ages 6 to 9)

`/courses/reasoning-and-readiness-course-for-young-thinkers` · 6 months (24 weeks), joinable any month, in two age bands: ages 6 to 7 and ages 8 to 9 · Children aged 6 to 9 (roughly kindergarten or Year 1 to grade 4 or Year 5) who enjoy puzzles; no prior experience needed

- PHASE 1: Seeing Patterns and Sorting (Months 1-2, Weeks 1-8) The first habits of reasoning: noticing what repeats, what changes and what belongs together.
    - Month 1: Patterns All Around
    - Weeks 1-2: Repeating Patterns and What Comes Next
    - Weeks 3-4: Growing Patterns and Shape Changes
    - Month 2: Alike, Different and Belonging Together
    - Weeks 5-6: Sorting and Classifying
    - Weeks 7-8: Analogies and Relationships
- PHASE 2: Spatial and Quantitative Reasoning (Months 3-4, Weeks 9-16) Thinking with shapes in space, and thinking with numbers, both built on hands-on play before pictures.
    - Month 3: Turning, Flipping and Folding
    - Weeks 9-10: Rotations, Reflections and Shape Puzzles
    - Weeks 11-12: Folding, Cutting and Picturing
    - Month 4: Number Sense and Quantitative Reasoning
    - Weeks 13-14: Number Sense That Runs Deep
    - Weeks 15-16: Balances, Number Series and Number Puzzles
- PHASE 3: Putting It Together (Months 5-6, Weeks 17-24) Harder mixed puzzles, explaining thinking clearly, and a calm, honest look at what a group screening feels like.
    - Month 5: Multi-Step Puzzles and Explaining Your Thinking
    - Weeks 17-18: Puzzles With Two Rules
    - Weeks 19-20: Listening, Choosing and Checking
    - Month 6: Familiarity, Confidence and Celebration

- Weeks 21-22: What a Group Screening Is Like
- Weeks 23-24: Puzzle Portfolio and Next Steps

Projects students build: A pattern necklace or pattern strip the child designs and explains; Build a growing pattern with blocks and draw the next two steps; A family sorting game the child invents and teaches at home; Draw three picture analogies of your own for the class to solve; A tangram picture book: five pictures built and named by the child; A folding and cutting predictions journal, checked with real paper each time; A number-line wall chart the child builds and uses in class; Invent a number series puzzle and a balance puzzle for the class; A two-rule puzzle the child designs, with a written or spoken explanation; A puzzle trail around the home with clues the child follows; A calm-day plan made with the child, in pictures; A puzzle portfolio: the child's own invented puzzles from the course.

Roblox Game Coding for Kids: Build Real Games in Luau

`/courses/roblox-game-coding-for-kids-lua-course` · 6 months (24 weeks) · Beginner, ages 8 to 14

- PHASE 1: Studio Skills and First Luau Scripts (Months 1-2, Weeks 1-8) First the tools: building worlds in Roblox Studio with confidence. Then the leap every Roblox kid dreams about: writing real Luau code that changes the world by itself.
  - Month 1: Becoming a Builder in Roblox Studio
  - Welcome to Roblox Studio
  - Parts and Properties
  - Building a World
  - Your First Script
  - Month 2: Luau from Zero
  - Variables and Values
  - Making Decisions
  - Loops
  - Functions
- PHASE 2: Events, Players, and Keeping Score (Months 3-4, Weeks 9-16) Scripts so far ran on their own. Now they respond to players: touched events, health, doors, and traps, then leaderboards, coins, and checkpoints, the machinery every real Roblox game runs on.
  - Month 3: Events and Player Interaction
  - The Touched Event
  - Changing the Player
  - Doors, Buttons, and Debounce
  - Project Week: The Scripted Obby
  - Month 4: Score, Coins, and Checkpoints
  - Leaderboards
  - Collectibles
  - Checkpoints
  - On-Screen Interfaces
- PHASE 3: Real Game Mechanics and the Published Capstone (Months 5-6, Weeks 17-24) Shops, timers, rounds, and polish turn a course into a game people replay. Then the capstone month: design, build, playtest, and publish an original game to Roblox.
  - Month 5: Mechanics That Make Games Fun
  - The Shop
  - Timers and Rounds

- Sound, Light, and Polish
- Project Week: The Complete Mini-Game
- Month 6: The Capstone, Published to Roblox
- Designing Your Game
- Build Sprint One: Core Mechanics
- Build Sprint Two: Testing and Tuning
- Publish and Present

Projects students build: First playground: a small floating island with ramps, towers, and a jump course to test; Secret hideout: a house with a hidden walk-through wall and a glass floor over a drop; Obby, part one: a ten-stage jump course across terrain you sculpted yourself; Magic brick: a part that changes color and prints a welcome message the moment the game starts; Teleporting part: a script that moves a platform to a new position, then a script that grows it step by step; Weather machine: a script that checks a variable and sets the world to day, night, or fog to match; Disco floor: a grid of tiles that flash random colors forever; Instant staircase: a for loop that builds a climbable spiral stair; Trap factory: one makeTrap function used to fill an obby stage with ten identical traps in seconds; Lava stage: an obby section with kill bricks that send careless players back to the start; Power-up alley: a course with speed strips, jump pads, a healing station, and one sneaky slow-down trap; Dungeon gate room: a button-operated gate with proper debounce and a door that only opens for players holding the right key part; Obby 2.0: a fully scripted multi-stage obby with kill bricks, power-ups, at least one gate, and a victory area; Point course: a stage where every platform reached for the first time adds points to a live leaderboard; Coin rush: a field of spinning coins with pickup sounds, a live coin counter, and coins that respawn - plus 10 more on the course page.

SAT Math 800 Prep: Live Classes for the Digital SAT

`/courses/sat-math-prep-course` · 6 months (26 weeks) · Grades 10-12, all starting scores

- PHASE 1: The Algebra Core (Weeks 1-8) The Digital SAT's biggest domain is algebra. This phase diagnoses exactly where points are leaking and rebuilds linear equations, systems, inequalities and functions to reconstruction strength, the foundation every later question type stands on.
  - Weeks 1-2: Diagnostic + Linear Equations Rebuilt
  - Weeks 3-4: Systems and Inequalities
  - Weeks 5-6: Functions as Machines
  - Weeks 7-8: Algebra Domain Checkpoint
- PHASE 2: Advanced Math + Problem-Solving & Data (Weeks 9-18) The domains that separate good scores from great ones: quadratics and exponentials taught as ideas, then the ratio-percent-data cluster where careless points go to die. Every topic is drilled at real SAT difficulty tiers, including the hard-module versions.
  - Weeks 9-11: Quadratics and Nonlinear Equations
  - Weeks 12-14: Exponential Growth, Polynomials and Rational Expressions
  - Weeks 15-18: Problem-Solving & Data Analysis
- PHASE 3: Adaptive Test Craft + Mock Cycles (Weeks 19-26) Content becomes score in this phase: adaptive module strategy, Desmos speed workflows, geometry-and-trig completion, and a full mock cycle rhythm, test, review, repair, retest, that peaks the week of the real exam.
  - Weeks 19-20: Geometry and Trigonometry Domain
  - Weeks 21-23: Adaptive Strategy and Desmos Mastery
  - Weeks 24-26: Full Mock Cycles and Peak Week

Projects students build: Personal score map: your exact domains, question types and target; First timed mini-module under real Digital SAT pacing; Break-even mini-case solved by equation, table and graph; Error-log review: your system-question mistakes classified and closed; Function-transformation exploration built live in Desmos; Mixed timed set:

algebra domain at full pace; Algebra checkpoint mock + personal pacing plan v1; Updated error log with closed vs open gap list; Projectile/revenue modeling mini-case solved by vertex reasoning; Timed hard-module quadratic set with full review; Growth-model comparison case: same data, linear vs exponential fits; Advanced Math domain checkpoint under timing; Data-interpretation sprint: 20 real chart questions under time; Full mixed-domain mock: first complete Digital SAT math section; Geometry domain checkpoint under timing - plus 5 more on the course page.

Scratch Coding for Kids: Zero to Real Games in 3 Months

`/courses/scratch-programming-complete-course` · 3-4 months (12-16 weeks) · Complete beginner, ages 6 to 12

- Month 1: Scratch Foundations & Basic Game Development Master Scratch basics, create animations, and build your first games.
  - Introduction to Scratch & Basic Motion
  - Looks, Sound, and Interactivity
  - Control Flow and Basic Logic
  - Pen Extension and Creative Drawing
- Month 2: Advanced Scratch Techniques Master variables, lists, clones, and build complex games.
  - Variables and Score Systems
  - Lists and Data Management
  - Clones and Advanced Game Mechanics
  - Broadcast Messages and Multi-Sprite Coordination
  - Advanced Game Creation
- Month 3: Mastery and Advanced Projects Create professional games, master extensions, and prepare for text coding.
  - Extensions and AI Blocks
  - Physics and Simulation
  - Optimization and Professional Polish
  - Final Projects and Portfolio

Projects students build: THE CAPSTONE: an original game designed and built by the child, with levels, scoring and a polished start screen; Classic picks: an RPG adventure with quests, an educational quiz world, or an arcade game with increasing difficulty; A portfolio page collecting the course's best 10 projects.

SHSAT Math Prep: NYC Specialized High Schools Test

`/courses/shsat-math-prep-course` · 6 months (24 weeks) per cycle, joinable any month; families usually start in grade 7 for the fall test in grade 8 · Students in grades 7 to 9 (roughly ages 12 to 15) who are confident with grade-level math and want to work on harder multi-step problems

- PHASE 1: Number Fluency Without a Calculator (Months 1-2, Weeks 1-8) The arithmetic that every SHSAT math question rests on, made fast and accurate, plus the reading routine for word problems.
  - Month 1: Rational Numbers and the Problem Routine
  - Weeks 1-2: How the Adaptive SHSAT Works and a Starting Diagnostic
  - Weeks 3-4: Fractions, Decimals and Negative Numbers
  - Month 2: Number System, Exponents and Percents
  - Weeks 5-6: Factors, Primes, Exponents and Roots
  - Weeks 7-8: Percents, Percent Change and Multi-Step Number Problems
- PHASE 2: The SHSAT Math Content Areas (Months 3-4, Weeks 9-16) Each content area NYC Public Schools names for the math section, taught at the depth multi-step questions need.
  - Month 3: Ratios, Expressions, Equations and Inequalities

    - Weeks 9-10: Ratios, Rates and Proportional Relationships
    - Weeks 11-12: Expressions, Linear Equations and Inequalities
    - Month 4: Statistics, Probability and Geometry
    - Weeks 13-14: Statistics and Probability
    - Weeks 15-16: Geometry and Measurement
- PHASE 3: Test Craft for the Adaptive Format (Months 5-6, Weeks 17-24) Pacing, accuracy and calm on a long test where each question must be answered before the next appears.
    - Month 5: One Question at a Time
    - Weeks 17-18: Pacing and Decision-Making
    - Weeks 19-20: Weak-Spot Repair
    - Month 6: Final Practice and Test Day
    - Weeks 21-22: Final Timed Practice
    - Weeks 23-24: Test Week and Beyond

Projects students build: A personal starting profile: strengths, gaps and a target topic list; A no-calculator speed sheet of our own, retaken weekly to track accuracy and time; An original number-puzzle set, each solution explained in two sentences; Write and solve three original multi-step percent problems for a classmate; A ratio problem pack of our own, each problem solved two ways; An equation-building challenge: turn ten original word problems into equations, then solve; Collect a small data set, summarize it and write three probability questions about it; A personal formula sheet built from memory, then tested with original problems; Two full timed math sections of our own, each followed by a written pacing review; A weak-spot plan with three topics, each with a completed problem set; A written test-day plan: section order, pacing checkpoints and checks; Write a full solution to your favorite problem of the course for a newer student.

Statistics & Probability: Data to Hypothesis Testing

`/courses/statistics-probability-maths-course` · 6 months (24 weeks) · College students and working professionals; no programming required

- PHASE 1: Describing Data and Probability (Months 1-2, Weeks 1-8) The two foundations everything else stands on: honest description of data, and probability as the language of uncertainty.
    - Month 1: Describing Data Honestly
    - Data: What It Is and How It Lies to You
    - Central Tendency: What Is Typical
    - Spread: How Much Things Vary
    - Charts That Tell the Truth
    - Month 2: Probability, the Grammar of Uncertainty
    - Probability from First Ideas
    - Conditional Probability and Independence
    - Bayes' Theorem: Updating Beliefs with Evidence
    - Counting and Random Variables
- PHASE 2: Distributions, Sampling and Estimation (Months 3-4, Weeks 9-16) The named distributions that model real processes, then the machinery of inference: sampling distributions, the central limit theorem seen by simulation, and confidence intervals.
    - Month 3: The Distributions That Model the World
    - The Binomial Distribution
    - Poisson and Geometric: Counts and Waits
    - Continuous Distributions and the Normal

    - Working with the Normal
    - Month 4: Sampling, the CLT and Confidence Intervals
    - Sampling: How Data Gets Collected and Corrupted
    - Sampling Distributions and the Central Limit Theorem
    - Confidence Intervals for Means
    - Proportions and Planning Sample Sizes
- PHASE 3: Hypothesis Testing, Regression and the Capstone (Months 5-6, Weeks 17-24) Testing claims with data, measuring and modelling relationships, and then a complete analysis of a real dataset of your own, written up like professional work.
    - Month 5: Hypothesis Testing Done Honestly
    - The Logic of a Hypothesis Test
    - One-Sample Tests
    - Comparing Two Groups
    - Chi-Square and the Ethics of Testing
    - Month 6: Correlation, Regression and the Capstone
    - Correlation
    - Linear Regression
    - Capstone Build
    - Capstone Write-Up and Presentation

Projects students build: First dataset walk: load a real public dataset, document its variables, units and suspicious values before computing anything; Income exercise: a salary dataset summarised with mean and median, with a written note on why they disagree and which to report; Consistency study: two players or products with the same average compared on spread, with a recommendation written up; Chart audit: find one misleading chart in the wild, explain the distortion, and rebuild it honestly from the underlying data; Simulation warm-up: estimate a dice probability by simulation, compare with the exact answer, watch the gap shrink with more trials; Two-way table study: a real dataset cross-tabulated, with conditional probabilities read off and independence checked; Bayes explainer: work the medical test problem with natural frequencies and write an explanation a friend could follow; Game analysis: compute the expected value of a real lottery or carnival game and write the verdict in two sentences; Conversion study: model a marketing conversion scenario as a binomial and answer three business questions with it; Arrivals study: fit a Poisson model to real count data, compare observed and expected counts in a table; Normal check: test the 68-95-99.7 rule against a real dataset and report where it holds and where it breaks; Field guide build: your own one-page reference mapping real situations to binomial, Poisson, geometric, uniform or normal; Survey critique: take one published poll, identify its sampling method, and write three specific bias risks; CLT simulation: run the resampling experiment yourself in the spreadsheet or Python, and keep the charts as evidence; Interval report: a confidence interval for a real dataset's mean, reported in one correct sentence and one wrong-but-common sentence, labelled - plus 9 more on the course page.

Swift and iOS Course: SwiftUI Apps from Zero

`/courses/complete-swift-programming-masterclass-college` · 10-12 months (44-52 weeks) · Complete beginner (18+); college students, graduates and working professionals

- PHASE 1: Foundation & Core Swift Skills (Months 1-3, Weeks 1-13) Build rock-solid Swift fundamentals. Learn programming logic, master Swift syntax, protocol-oriented programming, and create your first iOS applications.
    - Months 1-2: Swift Fundamentals & Programming Basics
    - Introduction to Swift & Development Environment Setup
    - Variables, Data Types & Operators
    - Control Flow Statements

    - Functions & Collections
    - Month 3: Object-Oriented & Protocol-Oriented Programming
    - Structures, Classes & Properties
    - Inheritance, Polymorphism & Memory Management
    - Protocols & Protocol-Oriented Programming
- PHASE 2: Intermediate Swift & SwiftUI Mastery (Months 4-6, Weeks 14-26) Master advanced Swift features, enumerations, generics, error handling, SwiftUI fundamentals, and basic iOS app development.
    - Month 4: Advanced Swift Features & SwiftUI Basics
    - Enumerations & Advanced Types
    - Error Handling & Advanced Error Management
    - Generics & Type System Deep Dive
    - SwiftUI Fundamentals - Part 1
    - SwiftUI Fundamentals - Part 2
    - Month 5: Advanced SwiftUI & UIKit Fundamentals
    - SwiftUI Lists, Forms & Data Display
    - SwiftUI Animations & Custom Drawing
    - UIKit Fundamentals
    - Data Persistence - UserDefaults & File System
    - Month 6: Concurrency, Core Data & Combine
    - Swift Concurrency - Async/Await
    - Core Data Fundamentals
    - Combine Framework Fundamentals
    - Swift Package Manager & Project Organization
- PHASE 3: Professional iOS Development (Months 7-9, Weeks 27-39) Master professional iOS development with networking, advanced architecture, testing, accessibility, and real-world app development patterns.
    - Month 7: Networking & Architecture
    - Networking with URLSession
    - Advanced Networking & Authentication
    - App Architecture - MVVM
    - Advanced Architecture & The Composable Architecture
    - Unit Testing & Test-Driven Development
    - Month 8: UI Testing, Accessibility & Advanced Features
    - UI Testing & Snapshot Testing
    - Accessibility & Localization
    - Maps, Location & Background Tasks
    - Push Notifications & App Extensions
    - Camera, Photos & Media
    - Month 9: Performance, Purchases & Security
    - App Performance & Optimization
    - In-App Purchases & Subscriptions
    - Security & Data Protection

- PHASE 4: The Finale (Month 10, Weeks 40-44) The capstone month: spec, build, ship and defend, then the final exam that decides the certificate.
  - Month 10: Capstone and the Final Exam
  - Capstone Spec and Setup
  - Capstone Build
  - Ship and Polish
  - Demo Day and the Final Exam

Projects students build: Hello World variations with personalized messages in Playground; Simple output programs using print() function; Personal information display program; ASCII art generator in Swift Playground; Interactive Playground with markdown documentation; Simple calculator (four basic operations) in Playground; Temperature converter (Celsius, Fahrenheit, Kelvin); Age calculator with optional handling; BMI calculator with health categories; Currency converter with type safety; Area and perimeter calculator for shapes; Compound interest calculator; String formatter and validator; Number guessing game with attempts limit; Grade calculator with letter grades using switch - plus 258 more on the course page.

TMUA and STEP Preparation (Oxford MAT Now TMUA)

`/courses/tmua-mat-step-preparation-course` · 6 months (24 weeks) per stage: a TMUA stage for Year 12 and early Year 13, and a STEP stage for Year 13 offer-holders; joinable any month · Year 12 and Year 13 students (roughly ages 16 to 18) taking A Level Maths, ideally with Further Maths, who enjoy hard problems

- PHASE 1: TMUA Content Fluency (Months 1-2, Weeks 1-8) UAT-UK's Section 1 knowledge, made fast and flexible without a calculator, and used in problems that do not look like textbook exercises.
  - Month 1: Algebra, Functions and Sequences
  - Weeks 1-2: The Tests, a Diagnostic and Algebra Without a Calculator
  - Weeks 3-4: Polynomials, Inequalities, Sequences and Series
  - Month 2: Coordinate Geometry, Trigonometry, Logarithms and Calculus
  - Weeks 5-6: Coordinate Geometry, Circles and Trigonometry
  - Weeks 7-8: Differentiation and Integration
- PHASE 2: Mathematical Reasoning for TMUA Paper 2 (Months 3-4, Weeks 9-16) UAT-UK's Section 2: the logic of arguments and mathematical proof, taught from first principles and then tested under time.
  - Month 3: The Logic of Arguments
  - Weeks 9-10: Statements, Implication and Quantifiers
  - Weeks 11-12: Proof Methods and Counterexamples
  - Month 4: Finding Errors in Proofs and Timed TMUA Papers
  - Weeks 13-14: Identifying Errors in Proofs
  - Weeks 15-16: Full TMUA-Style Practice
- PHASE 3: STEP 2 and STEP 3 (Months 5-6, Weeks 17-24) For students holding or expecting STEP offers: the specification's pure, mechanics and probability content stretched to STEP depth, and long solutions written in full.
  - Month 5: STEP Pure Mathematics
  - Weeks 17-18: How STEP Is Built, and Pure Problems That Take Time
  - Weeks 19-20: Calculus, Series and Complex Numbers at STEP Depth
  - Month 6: Mechanics, Probability and the June 2027 Papers
  - Weeks 21-22: Mechanics and Probability Questions
  - Weeks 23-24: Full Papers and the June Sittings

Projects students build: A personal starting profile: target tests, target universities and ten solved warm-ups; Write and solve five original problems that each hide a factorisation; An original geometry pack where every answer starts from a careful sketch; A calculus problem set of our own with one written explanation per answer; A logic glossary written in the student's own words with one original example each; Five short proofs of original statements, each written up twice: once rough, once clean; Write three deliberately flawed proofs of our own design and swap them with a classmate to find the errors; Two full timed TMUA-style papers of our own, each followed by a written review; Two long original problems written up in full, then rewritten after detailed feedback; A personal technique file: twelve methods, each with an original example; Two applied problems of our own written up in full with diagrams; A final full paper reviewed one to one with the teacher.

Trading Automation Course: Bots, Backtesting & Systems

`/courses/algorithmic-trading-automation-masterclass` · 10-12 months (44-52 weeks) · Complete beginner (18+); college students, graduates and working professionals

- PHASE 1: Financial Markets & Python Foundation (Months 1-3, Weeks 1-13) Build solid understanding of financial markets, trading fundamentals, and Python programming for finance.
  - Month 1: Financial Markets Fundamentals
  - Introduction to Financial Markets
  - Trading Basics & Market Mechanics
  - Python Setup for Finance
  - Financial Data Acquisition
  - Month 2: Technical Analysis & Indicators
  - Classical Technical Analysis
  - Technical Indicators Programming
  - Fundamental Analysis Automation
  - Market Analysis & Screening
  - Month 3: Strategy Development & Backtesting
  - Trading Strategy Design
  - Backtesting Frameworks
  - Performance Analytics
  - Strategy Optimization
- PHASE 2: Advanced Strategies & Portfolio Management (Months 4-6, Weeks 14-26) Master portfolio theory, risk management, advanced strategies, and quantitative methods.
  - Month 4: Portfolio Theory & Risk Management
  - Modern Portfolio Theory
  - Risk Management Systems
  - Advanced Trading Strategies
  - Market Microstructure & Execution
  - Month 5: Machine Learning for Trading
  - ML Fundamentals for Trading
  - Classification & Regression for Trading
  - Deep Learning for Markets
  - Alternative Data & NLP
  - ML Model Deployment
  - Month 6: Live Trading & Production Systems

    - Broker APIs & Connectivity
    - Paper Trading Implementation
    - Live Trading Systems
    - Cryptocurrency Trading

- PHASE 3: Production Systems and Advanced Applications (Months 7-9, Weeks 27-39) From working strategies to production-grade systems: advanced instruments, trading infrastructure, cloud deployment, monitoring, compliance awareness and the safeguards that reliable automation demands.
    - Month 7: Advanced Instruments and Institutional Concepts
    - Options Trading Automation
    - Futures & Derivatives Trading
    - High-Frequency Trading Concepts
    - Fixed Income & Forex Trading
    - Quantitative Risk Analytics
    - Month 8: Advanced Infrastructure & Deployment
    - Trading Infrastructure Design
    - Cloud Deployment for Trading
    - Monitoring & Observability
    - Compliance & Regulatory
    - Testing & Quality Assurance
    - Month 9: Advanced Applications and Market Making
    - Advanced Machine Learning Applications
    - Market Making & Liquidity Provision
    - Alternative Trading Venues

- PHASE 4: The Finale (Month 10, Weeks 40-44) The capstone month: spec, build, ship and defend, then the final exam that decides the certificate.
    - Month 10: Capstone and the Final Exam
    - Capstone Spec and Setup
    - Capstone Build
    - Ship and Polish
    - Demo Day and the Final Exam

Projects students build: Market research report on major indices; Trading account setup (paper trading); Market terminology glossary; Paper trading diary with 10 trades; Risk-reward calculator; Trading cost analyzer; Python trading environment setup; Stock price data analyzer; Market statistics calculator; Multi-source data fetcher; Historical data downloader; Real-time price tracker; Financial database creator; Candlestick pattern detector; Support/resistance calculator - plus 137 more on the course page.

TypeScript Course: Typed JavaScript, React and Node

`/courses/complete-typescript-programming-masterclass-college` · 10-12 months (44-52 weeks) · Complete beginner (18+); college students, graduates and working professionals

- PHASE 1: Foundation & TypeScript Fundamentals (Months 1-3, Weeks 1-13) Build rock-solid JavaScript and TypeScript fundamentals. Learn programming logic, master TypeScript syntax, type systems, and create your first applications.
    - Months 1-2: JavaScript & TypeScript Fundamentals
    - Introduction to Programming & JavaScript Basics

    - Variables, Data Types & Operators
    - Control Flow & Functions
    - Arrays, Objects & ES6+ Features
    - Month 3: TypeScript Core & Type System
    - TypeScript Fundamentals & Setup
    - Interfaces, Type Aliases & Advanced Types
    - Generics & Advanced TypeScript
- PHASE 2: Frontend Mastery with React & TypeScript (Months 4-6, Weeks 14-26) Master modern frontend development with React, state management, testing, and build production-ready user interfaces.
    - Months 4-5: React Fundamentals & Advanced Patterns
    - HTML, CSS & DOM Fundamentals
    - React Fundamentals & JSX
    - React Hooks & State Management
    - Advanced React Patterns
    - React Router & Navigation
    - Month 6: State Management & Testing
    - Global State Management
    - Testing React Applications
    - Build Tools & Performance
    - UI Libraries & Design Systems
    - Phase 2 Capstone Project
- PHASE 3: Backend Engineering with Node.js & TypeScript (Months 7-9, Weeks 27-39) Master server-side development with Node.js, Express, databases, REST APIs, authentication, and production deployment.
    - Month 7: Node.js & Express Fundamentals
    - Node.js Fundamentals
    - Express.js Framework
    - REST API Design & Best Practices
    - Database Fundamentals - SQL
    - ORMs - Prisma & Drizzle
    - Month 8: Production Backend: Observability, Security & Deployment
    - Authentication & Authorization
    - NoSQL Databases - MongoDB
    - Caching, Sessions & Real-time
    - Email, File Storage & External Services
    - Testing Backend Applications
    - Month 9: Production Backend: Observability, Security & Deployment
    - Logging, Monitoring & Observability
    - Security & API Protection
    - Docker & Deployment
- PHASE 4: The Finale (Month 10, Weeks 40-44) The capstone month: spec, build, ship and defend, then the final exam that decides the certificate.
    - Month 10: Capstone and the Final Exam

- Capstone Spec and Setup
- Capstone Build
- Ship and Polish
- Demo Day and the Final Exam

Projects students build: Hello World variations with personalized messages; Simple output programs using console.log; Personal information display program; ASCII art generator in JavaScript; Interactive greeting program; Simple calculator (four basic operations); Temperature converter (Celsius, Fahrenheit, Kelvin); Age calculator with detailed output; BMI calculator with health categories; Currency converter with exchange rates; Area and perimeter calculator for shapes; Compound interest calculator; Number guessing game with attempts limit; Grade calculator with letter grades; Even/odd checker and list generator - plus 192 more on the course page.

Vedic Maths Mastery: Speed Calculation with All 16 Sutras

`/courses/vedic-maths-course-speed-calculation-mastery` · 6 months (24 weeks) · Beginner friendly, ages 8 to adult

- PHASE 1: The Multiplication Engine (Months 1-2, Weeks 1-8) Multiplication shortcuts pay off fastest, so they come first: complements and base multiplication, the special patterns, then Urdhva-Tiryagbhyam for any two numbers.
  - Month 1: Complements and Base Multiplication
  - How the System Works: Complements
  - Nikhilam Multiplication Below the Base
  - Above the Base and Working Bases
  - The Special Patterns
  - Month 2: Urdhva-Tiryagbhyam, Multiplication for Any Numbers
  - Vertically and Crosswise: Two Digits
  - Three Digits and Mixed Sizes
  - Taking It Mental
  - Speed Lab One
- PHASE 2: Squares, Cubes and Division (Months 3-4, Weeks 9-16) Powers and roots with Yavadunam and the duplex method, then the part most courses skip: division done three ways, including Tirthaji's general flag method.
  - Month 3: Squares, Cubes and Roots
  - Squares Near a Base
  - The Duplex Method: Any Square
  - Square Roots and Cube Patterns
  - Cube Roots and the Powers Checkpoint
  - Month 4: Division Three Ways
  - Nikhilam Division
  - Paravartya: Transpose and Apply
  - Straight Division: The Flag Method
  - Divisibility and Speed Lab Two
- PHASE 3: Fractions, Algebra and the Capstone (Months 5-6, Weeks 17-24) The system applied where exams actually spend marks: fractions, decimals and percentages at speed, the algebra behind the sutras, and a timed capstone measured against week 1.
  - Month 5: Fractions, Decimals and Percentages at Speed
  - Recurring Decimals the Short Way
  - Fraction Arithmetic Without the Grind

- Percentages and Ratio Shortcuts
- Decimals and Speed Lab Three
- Month 6: Algebra Applications and the Speed-Test Capstone
- The Sutras Meet Algebra
- Equations at Speed
- Choosing the Right Tool
- The Capstone Speed Test

Projects students build: Personal speed log opened: diagnostic scores recorded by sum type, to be updated all course; One-page proof poster: a student's own explanation of why Nikhilam works, with one worked example per base; Worked set: 20 mixed base multiplications with the chosen base and method noted next to each; Pattern wall chart: all month 1 shortcuts on one sheet in the student's own words and examples; Cross-pattern diagram set: the student draws the crosswise structure for five sums before solving them; Worked set: 15 three-digit crosswise multiplications with compact working shown; Mental drill routine card: a 5-minute daily warm-up the student designs and follows; Speed lab paper one: a timed 60-question multiplication paper, marked and logged the same day; Worked set: squares of every number from 91 to 109 by the fastest route, method noted for each; Duplex table: the student builds a reference table of duplexes for 1 to 3 digit forms with examples; Root-finder sheet: 20 perfect squares up to 5 digits, roots found and verified by squaring back; Powers method chart: every squares, cubes and roots technique on one page with a worked example each; Side-by-side set: 10 divisions worked both by long division and Nikhilam with times recorded for each; Choice drill sheet: 20 divisions labelled Nikhilam or Paravartya before solving, choices reviewed in class; Worked set: 12 flag-method divisions including two carried to three decimal places - plus 10 more on the course page.

Vibe Coding for College: Full Stack, AI & DSA (Ages 18+)

`/courses/vibe-coding-for-college-fullstack-ai-dsa-career-course` · 3 months (12 weeks) · Intermediate to Advanced (Ages 18+ / College Students)

- PHASE 1: MERN Vibes, Full Stack Web Development (Weeks 1-4) Phase 1 builds you into a full-stack MERN developer. You'll master both the frontend (React) and backend (Node.js + Express + MongoDB), learn professional API design, authentication, and deploy your first production-level web application.
  - Week 1: JavaScript Mastery, Node.js & Your AI Development Toolkit
  - Week 2: MongoDB & Database Design, Persistent, Scalable Data
  - Week 3: React.js, Modern Frontend Development
  - Week 4: Full MERN, Authentication, Authorization & Deployment
- PHASE 2: DSA & ML Vibes, Think Deeply, Build Intelligently (Weeks 5-8) Phase 2 is the intellectual heart of the program. We go deep into Data Structures & Algorithms for placement preparation, and simultaneously build practical Machine Learning projects that solve real problems. This phase makes you stand out in every technical interview.
  - Week 5: Data Structures, The Foundation of Every Interview
  - Week 6: Trees, Graphs & Advanced Algorithms
  - Week 7: Machine Learning, Teach Python to Predict the Future
  - Week 8: Deep Learning & AI Project Deployment
- PHASE 3: Career Vibes, System Design, Capstone & Professional Launch (Weeks 9-12) The final phase transforms a skilled developer into a career-ready software engineer. System Design, advanced cloud deployment, the grand capstone project, and an intensive placement preparation program, this phase exists to get you hired.
  - Week 9: System Design & Agentic Engineering, Think Like a Senior Engineer
  - Week 10: Cloud, DevOps & Security for AI-Generated Code
  - Week 11: Placement Preparation & Professional Identity

- Week 12: Grand Capstone Launch, Showcase, Certify & Conquer

Projects students build: Products REST API, CRUD operations for a product catalog (in-memory, no DB yet); URL Shortener API, shorten URLs and redirect, stored in memory; News Aggregation Proxy, fetch and forward data from a public news API; Blogging Platform API, full CRUD for posts, with categories, tags, and pagination; Student Records System, schema design with references between students, courses, grades; E-Commerce Product Catalog, categories, variants, stock tracking in MongoDB; Task Management Dashboard, Kanban-style board with drag and React state; Movie Browser, fetches TMDB API, search, filter, detailed movie pages; Expense Tracker, add/categorize/delete expenses, charts with Chart.js; Full-Stack Social Notes App, register/login, create/edit/delete notes, private per user; Recipe Sharing Platform, MERN app with auth, image uploads, saved recipes; LeetCode Top 50 Arrays & Strings, solve 15 curated problems with explanations; Custom Hash Map Implementation, build a hash map from scratch in Python; Text Editor Undo/Redo, stack-based implementation with UI; Graph Visualizer, interactive BFS/DFS visualization built with React - plus 18 more on the course page.

Vibe Coding for Kids: AI, Scratch & Game Dev (Ages 8-12)

`/courses/vibe-coding-for-kids-beginners-ai-scratch-game-dev` · 3 months (12 weeks) · Complete Beginner (Ages 8-12)

- PHASE 1: Foundation Vibes, Scratch & Creative Coding (Weeks 1-4) Kids dive into the colourful world of Scratch and block-based programming. They create their first animations, interactive stories, and simple games while learning the core ideas of coding, loops, events, and conditionals, through hands-on fun.
  - Week 1: Welcome to Vibe Coding!, Your First Animations
  - Week 2: Storytelling with Code, Scenes, Dialogues & Adventures
  - Week 3: Events & Interactivity, Making Things Happen!
  - Week 4: Loops & Patterns, The Magic of Repetition
- PHASE 2: Game Dev Vibes, Build Your Own Games! (Weeks 5-8) Now the real fun begins! Kids learn the building blocks of game development: scoring, lives, enemies, levels, and game loops. By the end of Phase 2, every child will have built a complete, playable video game from scratch.
  - Week 5: Variables & Score Systems, 'You Win!' Moments
  - Week 6: Collision Detection & Game Mechanics, Real Game Feels
  - Week 7: Level Design & Multi-Screen Games, The Full Experience
  - Week 8: Complete Game Jam, Build Your Dream Game!
- PHASE 3: AI & Real Vibe Coding, Build Apps by Talking to AI! (Weeks 9-12) In the final phase, kids experience the real magic of vibe coding, they train their own machine learning models, build real apps by describing ideas to AI tools like Replit and Bolt.new, create music with code, design with AI, and build their capstone 'Vibe Showcase' project. This is where kids learn the skill that Andrej Karpathy says will define the future: telling AI what to build and watching it come to life.
  - Week 9: AI for Kids, Teaching Computers to See, Hear & Build!
  - Week 10: Vibe Coding Your First Apps, Build by Talking to AI!
  - Week 11: Music Coding, AI Art & Portfolio, Create Like a Pro
  - Week 12: Grand Vibe Showcase, Your Moment to Shine!

Projects students build: Animated Greeting Card, make a character say hello to the world; Dancing Pet, a sprite that moves to your favourite music; About Me Story, an interactive presentation about yourself; A 3-Scene Adventure Story, hero, challenge, and victory; Interactive Storybook, click to turn pages; Talking Animal Show, two animals have a funny conversation; Virtual Piano, play notes by pressing keyboard keys; Click-and-Colour Art Canvas, draw with code; Interactive Quiz, 5 questions with right/wrong feedback; Geometric Art Machine, generates beautiful patterns

automatically; Spinning Galaxy, looping space animation; Pattern Puzzle, create a design and challenge friends to recreate it; Catch the Falling Stars, catch sprites to earn points; Number Guessing Game, with hints and score tracking; Speed Challenge, collect 10 items before the timer runs out - plus 17 more on the course page.

Vibe Coding for Teens: Python, Web Dev & AI (Ages 13-17)

`/courses/vibe-coding-for-teens-python-web-ai-projects-course` · 3 months (12 weeks) · Beginner to Intermediate (Ages 13-17)

- PHASE 1: Python Vibes, Think Like a Developer (Weeks 1-4) Teens dive deep into Python, the world's most popular and versatile programming language. From variables and loops to building actual games and automation tools, Phase 1 transforms a complete beginner into a confident Python programmer.
  - Week 1: Python Unlocked, Your Developer Setup & First Programs
  - Week 2: Flow Control, Making Smart Programs
  - Week 3: Functions & Modules, Writing Clean, Reusable Code
  - Week 4: Data Structures & File Handling, Real Persistent Apps
- PHASE 2: Web Dev Vibes, Build the Internet (Weeks 5-8) Now teens build things the whole world can see. Phase 2 covers HTML, CSS, and JavaScript, the core technologies of every website on the internet. By Week 8, students will have built fully responsive, beautifully designed websites deployed live on the internet.
  - Week 5: HTML, Structure is Everything
  - Week 6: CSS, Make It Look Amazing
  - Week 7: JavaScript, Bring Your Website to Life
  - Week 8: APIs & Full Web Projects, Connect to the Real World
- PHASE 3: AI & Vibe Coding Mastery, Build Your Future (Weeks 9-12) The most exciting phase, teens master real vibe coding tools (Cursor IDE, Lovable, Claude/Gemini APIs), combine Python + Web skills to build AI-powered projects, set up their professional developer portfolio, and prepare for real-world opportunities: internships, hackathons, and competitive coding. This is where you become a true vibe coder, someone who can build anything by combining traditional coding skills with AI-powered development.
  - Week 9: AI Tools & Vibe Coding Mastery, Build with AI Like a Pro
  - Week 10: Vibe Coding Full Apps, Lovable, Bolt.new & Full Stack
  - Week 11: Developer Portfolio & Professional Presence
  - Week 12: Grand Vibe Showcase, Launch Your Career!

Projects students build: Personal Bio Generator, asks 5 questions and prints a formatted story about you; Simple Calculator, performs all 4 operations with user input; Mad Libs Creator, fill-in-the-blank story generator; Number Guessing Game, with hints, attempts counter, and high score; Times Table Generator, print any multiplication table on demand; Password Strength Checker, analyses a password and gives a strength rating; Dice Rolling Simulator, roll any number of sides, track statistics; Tip Calculator, restaurant bill splitter with formatted output; Word Counter, analyses a paragraph for word count, unique words, and top 5 most used; Contact Manager, add, search, update, delete contacts saved to a file; Student Grade Tracker, stores grades in JSON and calculates averages; Vocabulary Flash Card App, add words, quiz yourself, track score; Personal Portfolio Page v1, bio, skills, and contact section in pure HTML; Recipe Website, multi-page site with ingredients and instructions; Event Landing Page, HTML structure for a fictional school event - plus 19 more on the course page.

Waterloo Math Contests: Gauss to Euclid

`/courses/waterloo-math-contests-gauss-to-euclid-course` · 6 months (24 weeks) per season, joinable any month and timed to the CEMC contests each student will write · Students roughly aged 11 to 18 (Grades 7 to 12) who are comfortable with school math and want harder problems, in a Gauss track (Grades 7 and 8), a Grades 9 and 10 track and a Grades 11 and 12 track

- PHASE 1: The Shared Toolkit (Months 1-2, Weeks 1-8) Everything all three tracks need: how to read a contest problem, the core ideas of number, algebra, counting and geometry, and the first full written solutions.
  - Month 1: Reading Problems, Number Sense and Algebra
  - Weeks 1-2: How the Waterloo Contests Work and First Problems
  - Weeks 3-4: Number Sense and Algebra Habits
  - Month 2: Counting, Geometry and Writing a Full Solution
  - Weeks 5-6: Counting and Geometry Foundations
  - Weeks 7-8: Full Solutions and Multiple-Choice Technique
- PHASE 2: The Grade Tracks (Months 3-4, Weeks 9-16) The tracks run in parallel in separate batches. Each track builds the mathematics and the question types of the contests its students will write.
  - Months 3-4, Gauss Track (Grades 7 and 8): Building the Gauss Toolkit
  - Weeks 9-10: Number Theory for Grades 7 and 8
  - Weeks 11-12: Ratios, Rates and Algebra in Words
  - Weeks 13-14: Counting and Probability
  - Weeks 15-16: Geometry and Measurement
  - Months 3-4, Grades 9 and 10 Track: Pascal, Cayley, Fryer, Galois and CIMC
  - Weeks 9-10: Algebra for Contests
  - Weeks 11-12: Number Theory and Counting
  - Weeks 13-14: Geometry with Reasons
  - Weeks 15-16: Full Solutions and Mixed Rounds
  - Months 3-4, Grades 11 and 12 Track: Fermat, Hypatia, CSMC and Euclid
  - Weeks 9-10: Functions, Equations and Inequalities
  - Weeks 11-12: Sequences, Number Theory and Counting
  - Weeks 13-14: Trigonometry and Geometry
  - Weeks 15-16: Proof Writing for Full-Solution Contests
- PHASE 3: Contest Season (Months 5-6, Weeks 17-24) Timed rounds in the format of each student's next contest, polish on full solutions, the contest-day routine, then review and a plan for the next contest.
  - Month 5: Timed Rounds and Contest Craft
  - Weeks 17-18: Pacing Each Contest Format
  - Weeks 19-20: Review and Weak-Spot Repair
  - Month 6: Final Practice, Contest Days and Next Steps
  - Weeks 21-22: Final Practice Papers
  - Weeks 23-24: Contest Week and After

Projects students build: A personal starting profile: track, target contests for the year and ten solved warm-up problems; A word-problem pack of original problems, each solved with a clear equation and a check; A counting and geometry problem set of original problems, with a labelled diagram for every geometry question; Rewrite three of your own earlier answers as full solutions, then compare them with a model write-up; An original number puzzle pack, each solution explained in two or three sentences; A ratio and rate problem set solved two ways: once with a table, once with an equation; Design and solve three original counting problems for a classmate; A shaded-region problem pack of original problems, each with a labelled diagram; An original algebra problem set with full written solutions for the last three questions; A casework problem pack where each solution lists its cases clearly; Three original geometry problems solved with full written reasons; A personal model-solution file: five of your own best full solutions, rewritten after feedback; An

original functions problem set with full written solutions for every question; A sequences and counting pack where each solution proves its pattern, not just finds it; Three original geometry problems, each solved by two different methods and written up in full - plus 5 more on the course page.

Web Development for Kids: Build Real Websites

`/courses/kids-ai-web-development-course` · 8-10 months (32-40 weeks) · Complete beginner, ages 9 to 12

- PHASE 1: HTML World (Months 1-2, Weeks 1-8) The structure of every website, hand-typed: text, images, links, forms, tables and multimedia, each week ending with a page to show the family.
  - Month 1: First Pages
  - Welcome to Web Development
  - HTML Elements Zoo - Text, Images & Links
  - Month 2: HTML Powers
  - Fun with Forms & Tables
  - Multimedia Magic - Audio, Video & Canvas
- PHASE 2: CSS Magic (Months 3-4, Weeks 9-16) The art layer: colors, fonts, the box model, then the two great layout tools, flexbox and grid, used to make pages genuinely beautiful.
  - Month 3: Style Arrives
  - CSS Basics - Making Websites Beautiful
  - CSS Box Model & Spacing Magic
  - Month 4: Layout Superpowers
  - Flexbox - The Flexible Layout System
  - CSS Grid - The Ultimate Layout Tool
- PHASE 3: JavaScript Sparks (Months 5-6, Weeks 17-24) Pages that fit every screen, then the big step: first real programming, decisions, loops and little games, in the language of the web.
  - Month 5: Every Screen, First Code
  - Responsive Design - Mobile First!
  - JavaScript Basics - Making Websites Interactive
  - Month 6: Logic, Loops and Little Games
  - JavaScript Logic & Decisions
  - Loops & Arrays - Handling Multiple Items
- PHASE 4: Real Sites (Months 7-8, Weeks 25-32) Functions and DOM magic, proper publishing, one honest look at how professionals use AI, and the capstone site presented at demo day.
  - Month 7: DOM Magic
  - Functions - Reusable Code Blocks
  - DOM Manipulation - Changing Websites with JavaScript
  - Month 8: Publish, Look Ahead, and the Finale
  - Publish and Shine
  - Capstone and the Final Exam

Projects students build: Build a digital pet profile page; Make a birthday invitation webpage; Digital photo album with captions; My favorite YouTube videos collection; Interactive storybook with multiple pages; School project presentation website; Friend information collector form; Class schedule table; Restaurant menu with order form; Personal video channel page; Music playlist website; Digital art gallery with canvas; Multimedia learning resource page; Rainbow text website; Colorful mood board page - plus 40 more on the course page.

Western Canada Grade 12 Math: Pre-calculus 12 and Math 30-1

`/courses/western-canada-grade-12-math-pre-calculus-12-math-30-1-course` · 6 months (24 weeks) per plan, joinable any month and paced to your school course · Students in Grade 12 (roughly ages 16 to 18) taking Pre-calculus 12 in British Columbia or Math 30-1 in Alberta

- PHASE 1: Functions, Transformations and Polynomial, Radical and Rational Functions (Months 1-2, Weeks 1-8) The function toolkit every Grade 12 topic depends on, then the polynomial, radical and rational families.
  - Month 1: Functions and Transformations
  - Weeks 1-2: Starting Point and the Function Toolkit
  - Weeks 3-4: Transformations and Inverses
  - Month 2: Polynomial, Radical and Rational Functions
  - Weeks 5-6: Polynomial Functions
  - Weeks 7-8: Radical and Rational Functions
- PHASE 2: Exponential and Logarithmic Functions, and Trigonometry (Months 3-4, Weeks 9-16) Growth, decay and logarithms, then trigonometry in radians with identities and equations.
  - Month 3: Exponential and Logarithmic Functions
  - Weeks 9-10: Exponential Functions
  - Weeks 11-12: Logarithms
  - Month 4: Trigonometry in Radians, Identities and Equations
  - Weeks 13-14: Radians, the Unit Circle and Trigonometric Graphs
  - Weeks 15-16: Identities and Trigonometric Equations
- PHASE 3: Permutations and Combinations, Combining Functions and Exam Review (Months 5-6, Weeks 17-24) Careful counting, combining functions, then exam review for school finals and, for Alberta students, the Math 30-1 diploma exam.
  - Month 5: Permutations, Combinations and Combining Functions
  - Weeks 17-18: Permutations, Combinations and the Binomial Theorem
  - Weeks 19-20: Combining Functions
  - Month 6: Exam Review Technique
  - Weeks 21-22: Mixed Review and Written Solutions
  - Weeks 23-24: Timed Practice for School Finals and the Alberta Diploma Exam

Projects students build: A one-page function toolkit summary, with a sketch of each parent function and its key points; A transformation set: ten graphs transformed by hand from mapping rules, then checked with graphing technology; A polynomial sketch set with end behaviour, zeros and intercepts explained for each graph; A radical and rational function set with every restriction, asymptote and hole labelled; An applications pack: three real growth or decay situations modelled and solved in full; A logarithm laws file: ten equations solved in full, with each law named at the step where it is used; A sinusoidal model of a real periodic situation, with the equation built from the data and explained; An identity proof file: ten identities proved in full, with the strategy for each written first; A counting pack: twelve problems sorted by method, each solved with the reason for the method written first; A combining functions set with graphs, equations and domains explained for each; A personal review pack: unit summaries and a mistakes list with a corrected example for each mistake; Two reviewed timed papers and a written exam-week plan.

End of knowledge base. When in doubt, route to Shivam Sir at +91 9123366161.
